[85] For evidence of the depression and, indeed, utter exhaustion of France during the latter years of Louis XIV., compare *Duclos, Mémoires*, vol. i. pp. 11–18, with *Marmontel, Hist. de la Régence*, Paris, 1826, pp. 79–97. The *Lettres inédites de Madame de Maintenon* (vol. i. pp. 263, 284, 358, 389, 393, 408, 414, 422, 426, 447, 457, 463, vol. ii. pp. 19, 23, 33, 46, 56, and numerous other passages) fully confirm this, and, moreover, prove that in Paris, early in the eighteenth century, the resources, even of the wealthy classes, were beginning to fail ; while both public and private credit were so shaken that it was hardly possible to obtain money on any terms. In 1710, she, the wife of Louis XIV., complains of her inability to borrow 500 livres : "Tout mon crédit échoue souvent auprès de M. Desmaretz pour une somme de cinq cents livres." *Ibid.* vol. ii. p. 33. In 1709, she writes (vol. i. p. 447) : "Le jeu devient insipide, parce qu'il n'y a presque plus d'argent." See also vol. ii. p. 112 ; and in February, 1711 (p. 151) : "Ce n'est pas l'abondance mais l'avarice qui fait jouer nos courtisans ; on met le tout pour le tout pour avoir quelque argent, et les tables de lansquenet ont plus l'air d'un triste commerce que d'un divertissement."

In regard to the people generally, the French writers supply us with little information, because in that age they were too much occupied with their great king and their showy literature to pay attention to mere popular interests. But I have collected from other sources some information which I will now put together, and which I recommend to the notice of the next French author who undertakes to compose a history of Louis XIV.

Locke, who was travelling in France in 1676 and 1677, writes in his journal, "The rent of lands in France fallen one-half in these few years, by reason of the poverty of the people." *King's Life of Locke*, vol. i. p. 129. About the same time, Sir William Temple says (*Works*, vol. ii. p. 268), "The French peasantry are wholly dispirited by labour and want." In 1691, another observer, proceeding from Calais, writes, "From hence, travelling to Paris, there was opportunity enough to observe what a prodigious state of poverty the ambition and absoluteness of a tyrant can reduce an opulent and fertile country to. There were visible all the marks and signs of a growing misfortune ; all the dismal indications of an overwhelming calamity. The fields were uncultivated, the villages unpeopled, the houses dropping to decay." *Burton's Diary*, note by Rutt, vol. iv. p. 79. In a tract published in 1689, the author says (*Somers Tracts*, vol. x. p. 264), "I have known in France poor people sell their beds, and lie upon straw ; sell their pots, kettles, and all their necessary household goods, to content the unmerciful collectors of the king's taxes." Dr. Lister, who visited Paris in 1698, says, "Such is the vast multitude of poor wretches in all parts of this city, that whether a person is in a carriage or on foot, in the street, or even in a shop, he is alike unable to transact business, on account of the importunities of mendicants." *Lister's Account of Paris*, p. 46. Compare a *Letter from Prior*, in *Ellis's Letters of Literary Men*, p. 213. In 1708, Addison, who from personal observation was well acquainted with France, writes : "We think here as you do in the country, that France is on her last legs." *Aikin's Life of Addison*, vol. i. p. 233. Finally, in 1718—that is, three years after the death of Louis—Lady Mary Montagu gives the following account of the result of his reign, in a letter to Lady Rich, dated Paris, 10th October, 1718 : "I think nothing so terrible as objects of misery, except one had the godlike attribute of being able to redress them ; and all the country villages of France show nothing else. While the post-horses are changed, the whole town comes out to beg, with such miserable starved faces, and thin, tattered clothes, they need no other eloquence to persuade one of the wretchedness of their condition." *Works of Lady Mary Wortley Montagu*, vol. iii. p. 74, edit. 1803.

the king were indeed so serious that they could not fail to excite our sympathy if we did not know that they were the result of his own turbulent ambition, of his insufferable arrogance, but, above all, of a grasping and restless vanity, which, making him eager to concentrate on his single person all the glory of France, gave rise to that insidious policy which, with gifts, with honours, and with honied words, began by gaining the admiration of the intellectual classes, then made them courtly and time-serving, and ended by destroying all their boldness, stifling every effort of original thought, and thus postponing for an indefinite period the progress of national civilization.

CHAPTER XII.

Death of Louis XIV. Reaction against the Protective Spirit, and Preparations for the French Revolution.

At length Louis XIV. died. When it was positively known that the old king had ceased to breathe, the people went almost mad with joy.[1] The tyranny which had weighed them down was removed; and there at once followed a reaction which, for sudden violence, has no parallel in modern history.[2] The great majority indemnified themselves for their forced hypocrisy by indulging in the grossest licentiousness. But among the generation then forming there were some high-spirited youths who had far higher views, and whose notions of liberty were not confined to the licence of the gaming house and the brothel. Devoted to the great idea of restoring to France that freedom of utterance which it had lost, they naturally turned their eyes towards the only country where the freedom was practised. Their determination to search for liberty in the place where alone it could be found, gave rise to that junction of the French and English intellects which, looking at the immense chain of its effects, is by far the most important fact in the history of the eighteenth century.

During the reign of Louis XIV., the French, puffed up by national vanity, despised the barbarism of a people who were so uncivilized as to be always turning on their rulers, and who, within the space of forty years, had executed one king, and deposed another.[3] They could not believe that such a restless

[1] "L'annonce de la mort du grand roi ne produisit chez le peuple français qu'une explosion de joie." *Sismondi, Hist. des Français*, vol. xxvii. p. 220. "Le jour des obséques de Louis XIV, on établit des guinguettes sur le chemin de Saint-Denis. Voltaire, que la curiosité avoit mené aux funérailles du souverain, vit dans ces guinguettes le peuple ivre de vin et de joie de la mort de Louis XIV." *Duvernet, Vie de Voltaire*, p. 29; see also *Condorcet, Vie de Voltaire*, p. 118; *De Tocqueville, Règne de Louis XV*, vol. i. p. 18; *Duclos, Mémoires*, vol. i. p. 221; *Lemontey, Etablissement de Louis XIV*, pp. 311, 388.

[2] "Kaum hatte er aber die Augen geschlossen, als alles umschlug. Der reprimirte Geist warf sich in eine zügellose Bewegung." *Ranke, die Päpste*, vol. iii. p. 192.

[3] The shock which these events gave to the delicacy of the French mind was very serious. The learned Saumaise declared that the English are "more savage than their own mastiffs." *Carlyle's Cromwell*, vol. i. p. 444. Another writer said that we were "barbares révoltés;" and "les barbares sujets du roi." *Mém. de Motteville*, vol. ii. pp. 105, 362. Patin likened us to the Turks; and said that having executed one king, we should probably hang the next. *Lettres de Patin*, vol. i. p. 261, vol. ii. p. 518, vol. iii. p. 148. Compare *Mém. de Campion*, p. 213. After we had sent away James II., the indignation of the French rose still higher, and even the amiable Madame Sevigné, having occasion to mention Mary the wife of William III., could find no better name for her than Tullia: "la joie est universelle de la déroute de ce prince, dont la femme est une Tullie." *Lettres de Sevigné*, vol. v. p. 179. Another influential French lady mentions "la férocité des Anglais." *Lettres inédites de Maintenon*, vol. i. p. 303; and elsewhere (p. 109), "je hais les Anglais comme le peuple. . . . Véritablement je ne les puis souffrir."

I will only give two more illustrations of the wide diffusion of such feelings. In 1679

horde possessed anything worthy the attention of enlightened men. Our laws, our literature, and our manners, were perfectly unknown to them ; and I doubt if at the end of the seventeenth century there were, either in literature or in science, five persons in France acquainted with the English language.[4] But a long experience of the reign of Louis XIV. induced the French to reconsider many of their opinions. It induced them to suspect that despotism may have its disadvantages, and that a government composed of princes and bishops is not necessarily the best for a civilized country. They began to look, first with complacency, and then with respect, upon that strange and outlandish people who, though only separated from themselves by a narrow sea, appeared to be of an altogether different kind ; and who, having punished their oppressors, had carried their liberties and their prosperity to a height of which the world had seen no example. These feelings, which, before the Revolution broke out, were entertained by the whole of the educated classes in France, were in the beginning confined to those men whose intellects placed them at the head of their age. During the two generations which elapsed between the death of Louis XIV. and the outbreak of the Revolution, there was hardly a Frenchman of eminence who did not either visit England or learn English ; while many of them did both. Buffon, Brissot, Broussonnet, Condamine, Delisle, Elie de Beaumont, Gournay, Helvétius, Jussieu, Lalande, Lafayette, Larcher, L'Héritier, Montesquieu, Maupertuis, Morellet, Mirabeau, Nollet, Raynal, the celebrated Roland and his still more celebrated wife, Rousseau, Ségur, Suard, Voltaire,—all these remarkable persons flocked to London, as also did others of inferior ability, but of considerable influence, such as Brequiny, Bordes, Calonne, Coyer, Cormatin, Dufay, Dumarest, Dezallier, Favier, Girod, Grosley, Godin, D'Hancarville, Hunauld, Jars, Le Blanc, Ledru, Lescallier, Linguet, Lesuire, Lemonnier, Levesque de Pouilly, Montgolfier, Morand, Patu, Poissonier, Reveillon, Septchênes, Silhouette, Siret, Soulavie, Soulès, and Valmont de Brienne.

Nearly all of these carefully studied our language, and most of them seized the spirit of our literature. Voltaire in particular devoted himself with his usual ardour to the new pursuit, and acquired in England a knowledge of those doctrines, the promulgation of which afterwards won for him so great a reputation.[5]

an attempt was made to bring bark into discredit as a " remède anglais " (*Sprengel, Hist. de la Médecine*, vol. v. p. 430) ; and at the end of the seventeenth century, one of the arguments in Paris against coffee was that the English liked it. *Monteil, Divers Etats*, vol. vii. p. 216.

[4] " Au temps de Boileau, personne en France n'apprenait l'Anglais." *Œuvres de Voltaire*, vol. xxxviii. p. 337, and see vol. xix. p. 159. " Parmi nos grands écrivains du xvii[e] siècle, il n'en est aucun, je crois, où l'on puisse reconnaître un souvenir, une impression de l'esprit anglais." *Villemain, Lit. au XVIII[e] Siècle*, vol. iii. p. 324. Compare *Barante, XVIII[e] Siècle*, p. 47, and *Grimm, Correspond.* vol. v. p. 135, vol. xvii. p. 2.

The French, during the reign of Louis XIV., principally knew us from the accounts given by two of their countrymen, Monconys and Sorbière ; both of whom published their travels in England, but neither of whom was acquainted with the English language. For proof of this, see *Monconys, Voyages*, vol. iii. pp. 34, 69, 70, 96 ; and *Sorbière, Voyage*, pp. 45, 70.

When Prior arrived at the court of Louis XIV. as plenipotentiary, no one in Paris was aware that he had written poetry (*Lettres sur les Anglais*, in *Œuvres de Voltaire*, vol. xxvi. p. 130) ; and when Addison, being in Paris, presented Boileau with a copy of the *Musæ Anglicanæ*, the Frenchman learnt for the first time that we had any good poets : " first conceived an opinion of the English genius for poetry." Tickell's statement, in *Aikin's Life of Addison*, vol. i. p. 65. Finally, it is said that Milton's *Paradise Lost* was not even known by report in France until after the death of Louis XIV., though the poem was published in 1667, and the king died in 1715 ; " Nous n'avions jamais entendu parler de ce poëme en France, avant que l'auteur de la Henriade nous en eût donné une idée dans le neuvième chapitre de son Essai sur la poésie épique." *Dict. Philos.* article *Epopée*, in *Œuvres de Voltaire*, vol. xxxix. p. 175 ; see also vol. lxvi. p. 249.

[5] " Le vrai roi du xviii[e] siècle, c'est Voltaire ; mais Voltaire à son tour est un écolier

He was the first who popularized in France the philosophy of Newton, where it rapidly superseded that of Descartes.[6] He recommended to his countrymen the writings of Locke;[7] which soon gained immense popularity, and which supplied materials to Condillac for his system of metaphysics,[8] and to Rousseau for his theory of education.[9] Besides this, Voltaire was the first Frenchman who studied Shakespeare; to whose works he was greatly indebted, though he afterwards wished to lessen what he considered the exorbitant respect paid to them in France.[10] Indeed, so intimate was his knowledge of the English language[11] that we can trace his obligations to Butler,[12] one of the most difficult of our poets, and to Tillotson,[13] one of the dullest of our theologians. He was acquainted with the speculations of Berkeley,[14] the most subtle metaphysician who has ever written in English; and he had read the works, not only of Shaftesbury,[15] but even of Chubb, [16] Garth,[17] Mandeville,[18] and Woolston.[19] Montesquieu imbibed in our country many of his principles; he studied our language; and he always expressed admiration for England, not only in his writings but

de l'Angleterre. Avant que Voltaire eût connu l'Angleterre, soit par ses voyages, soit par ses amitiés, il n'était pas Voltaire, et le xviii[e] siècle se cherchait encore." *Cousin, Hist. de la Philos.* I. série, vol. iii. pp. 38, 39. Compare *Damiron, Hist. de la Philos. en France*, Paris, 1828, vol. i. p. 34.

[6] "J'avais été le premier qui eût osé développer à ma nation les découvertes de Newton, en langage intelligible." *Œuvres de Voltaire*, vol. i. p. 315; see also vol. xix. p. 87, vol. xxvi. p. 71; *Whewell's Hist. of Induc. Sciences*, vol. ii. p. 206; *Weld's Hist. of the Royal Society*, vol. i. p. 441. After this, the Cartesian physics lost ground every day; and in *Grimm's Correspondence*, vol. ii. p. 148, there is a letter, dated Paris, 1757, which says, "Il n'y a guère plus ici de partisans de Descartes que M. de Mairan." Compare *Observations et Pensées*, in *Œuvres de Turgot*, vol. iii. p. 298.

[7] Which he was never weary of praising; so that, as M. Cousin says (*Hist. de la Philos.* II. série, vol. ii. pp. 311, 312), "Locke est le vrai maître de Voltaire." Locke was one of the authors he put into the hands of Madame du Châtelet. *Condorcet, Vie de Voltaire*, p. 296.

[8] *Morell's Hist. of Philos.* 1846, vol. i. p. 134; *Hamilton's Discuss.* p. 3.

[9] "Rousseau tira des ouvrages de Locke une grande partie de ses idées sur la politique et l'éducation; Condillac toute sa philosophie." *Villemain, Lit. au XVIII[e] Siècle*, vol. i. p. 83. See also, on the obligations of Rousseau to Locke, *Grimm, Correspond.* vol. v. p. 97; *Musset Pathay, Vie de Rousseau*, vol. i. p. 38, vol. ii. p. 394; *Mém. de Morellet*, vol. i. p. 113; *Romilly's Memoirs*, vol. i. pp. 211, 212.

[10] In 1768, Voltaire (*Œuvres*, vol. lxvi. p. 249) writes to Horace Walpole, "Je suis le premier qui ait fait connaître Shakespeare aux Français." See also his *Lettres inédites*, vol. ii. p. 500; *Villemain, Lit. au XVIII[e] Siècle*, vol. iii. p. 325; and *Grimm, Correspond.* vol. xii. pp. 124, 125, 133.

[11] There are extant many English letters written by Voltaire, which, though of course containing several errors, also contain abundant evidence of the spirit with which he seized our idiomatic expressions. In addition to his *Lettres inédites*, published at Paris in the present year (1856), see *Chatham Correspond.* vol. ii. pp. 131–133; and *Phillimore's Mem. of Lyttelton*, vol. i. pp. 323–325, vol. ii. pp. 555, 556, 558.

[12] *Grimm, Correspond.* vol. i. p. 332; *Voltaire, Lettres inédites*, vol. ii. p. 258; and the account of Hudibras, with translations from it, in *Œuvres*, vol. xxvi. pp. 132–137; also a conversation between Voltaire and Townley, in *Nichols's Illustrations of the Eighteenth Century*, vol. iii. p. 722.

[13] Compare *Mackintosh's Memoirs*, vol. i. p. 341, with *Œuvres de Voltaire*, vol. xxxix. p. 259, vol. xlvii. p. 85.

[14] *Œuvres de Voltaire*, vol. xxxviii. pp. 216–218, vol. xlvi. p. 282, vol. xlvii. p. 439, vol. lvii. p. 178.

[16] *Œuvres*, vol. xxxiv. p. 294, vol. lvii. p. 121.

[17] *Ibid.* vol. xxxvii. pp. 407, 441. [18] *Ibid.* vol. xxxvi. p. 46.

[19] *Ibid.* vol. xxxiv. p. 288, vol. xli. pp. 212–217; *Biog. Univ.* vol. li. pp. 199, 200.

also in his private conversation.[20] Buffon learnt English, and his first appearance as an author was as the translator of Newton and of Hales.[21] Diderot, following in the same course, was an enthusiastic admirer of the novels of Richardson;[22] he took the idea of several of his plays from the English dramatists, particularly from Lillo; he borrowed many of his arguments from Shaftesbury and Collins, and his earliest publication was a translation of Stanyan's *History of Greece*.[23] Helvétius, who visited London, was never weary of praising the people; many of the views in his great work on the Mind are drawn from Mandeville; and he constantly refers to the authority of Locke, whose principles hardly any Frenchman would at an earlier period have dared to recommend.[24] The works of Bacon, previously little known, were now translated into French; and his classification of the human faculties was made the basis of that celebrated Encyclopædia which is justly regarded as one of the greatest productions of the eighteenth century.[25] The *Theory of Moral Sentiments*, by Adam Smith, was during thirty-four years translated three different times, by three different French authors.[26] And such was the general eagerness, that directly the *Wealth of Nations*, by the same great writer, appeared, Morellet, who was then high in reputation, began to turn it into French; and was only prevented from printing his translation by the circumstance that before it could be completed another version of it was published in a French periodical.[27] Coyer, who is still remembered for his Life of Sobieski, visited England; and after returning to his own country, showed the direction of his studies by rendering into French the Commentaries of Blackstone.[28] Le Blanc travelled in England, wrote a work expressly upon the English, and translated into French the Political Discourses of Hume.[29] Holbach was certainly one of the most active leaders of the liberal party in Paris; but a large part of his very numerous writings consists solely in translations of English authors.[30] Indeed it may be broadly stated that while at the end of the seventeenth century it would have been difficult to find, even among the most educated Frenchmen, a single person acquainted with English, it would in the eighteenth century have been nearly as difficult to

[29] *Burton's Life of Hume*, vol. i. pp. 365, 366, 406.

[30] See the list, in *Biog. Univ.* vol. xx. pp. 463–466; and compare *Mém. de Diderot*, vol. iii. p. 49, from which it seems that Holbach was indebted to Toland, though Diderot speaks rather doubtingly. In *Almon's Mem. of Wilkes*, 1805, vol. iv. pp. 176, 177, there is an English letter, tolerably well written, from Holbach to Wilkes.

find in the same class one who was ignorant of it. Men of all tastes, and of the most opposite pursuits, were on this point united as by a common bond. Poets, geometricians, historians, naturalists, all seemed to agree as to the necessity of studying a literature on which no one before had wasted a thought. In the course of general reading, I have met with proofs that the English language was known, not only to those eminent Frenchmen whom I have already mentioned, but also to mathematicians, as D'Alembert,[31] Darquier,[32] Du Val le Roy,[33] Jurain,[34] Lachapelle,[35] Lalande,[36] Le Cozic,[37] Montucla,[38] Pezenas,[39] Prony,[40] Romme,[41] and Roger Martin ;[42] to anatomists, physiologists, and writers on medicine, as Barthèz,[43] Bichat,[44] Bordeu,[45] Barbeu Dubourg,[46] Bosquillon,[47] Bourru,[48] Begue de Presle,[49] Cabanis,[50] Demours,[51] Duplanil,[52] Fouquet,[53] Goulin,[54] Lavirotte,[55] Lassus,[56] Petit Radel,[57] Pinel,[58] Roux,[59] Sauvages,[60] and Sue ;[61] to naturalists, as Alyon,[62] Brémond,[63] Brisson,[64] Broussonnet,[65] Dalibard,[66] Haüy,[67] Latapie,[68] Richard,[69] Rigaud,[70] and Romé de Lisle ;[71] to historians, philologists, and antiquaries, as Barthélemy,[72] Butel Dumont,[73] De Brosses,[74] Foucher,[75] Fréret,[76] Larcher, [77] Le Coq de Villeray,[78] Millot,[79] Targe,[80] Velly,[81] Volney,[82] and Wailly ; [83] to poets and dramatists, as Chéron,[84] Colardeau,[85] Delille,[86] Desforges,[87] Ducis,[88] Florian, [89] Laborde,[90] Lefèvre de Beauvray,[91] Mercier,[92] Patu,[93] Pompignan,[94] Quétant,[95] Roucher,[96] and Saint-Ange ;[97] to

Tressan,[178] Trochereau,[179] Turpin,[180] Ussieux,[181] Vaugeois,[182] Verlac,[183] and Virloys.[184] Indeed, Le Blanc, who wrote shortly before the middle of the eighteenth century, says: "We have placed English in the rank of the learned languages; our women study it, and have abandoned Italian in order to study the language of this philosophic people; nor is there to be found among us any one who does not desire to learn it."[185]

Such was the eagerness with which the French imbibed the literature of a people whom but a few years before they had heartily despised. The truth is, that in this new state of things they had no alternative. For where but in England was a literature to be found that could satisfy those bold and inquisitive thinkers who arose in France after the death of Louis XIV.? In their own country there had no doubt been great displays of eloquence, of fine dramas, and of poetry which, though never reaching the highest point of excellence, is of finished and admirable beauty. But it is an unquestionable fact, and one melancholy to contemplate, that during the sixty years which succeeded the death of Descartes, France had not possessed a single man who dared to think for himself.* Metaphysicians, moralists, historians, all had become tainted by the servility of that bad age. During two generations, no Frenchman had been allowed to discuss with freedom any question either of politics or of religion. The consequence was that the largest intellects, excluded from their legitimate field, lost their energy; the national spirit died away; the very materials and nutriment of thought seemed to be wanting. No wonder, then, if the great Frenchmen of the eighteenth century sought that aliment abroad which they were unable to find at home. No wonder if they turned from their own land, and gazed with admiration at the only people who, pushing their inquiries into the highest departments, had shown the same fearlessness in politics as in religion; a people who, having punished their kings and controlled their clergy, were storing the treasures of their experience in that noble literature which never can perish, and of which it may be said in sober truth, that it has stimulated the intellect of the most distant races, and that, planted in America and in India, it has already fertilized the two extremities of the world.

There are, in fact, few things in history so instructive as the extent to which France was influenced by this new pursuit. Even those who took part in actually consummating the Revolution were moved by the prevailing spirit. The English language was familiar to Carra,[186] Dumouriez,[187] Lafayette,[188] and Lanthénas.[189]

[* It is hardly reasonable to assert that such men as Malebranche, Fénelon, Huet, Bossuet, Fontenelle, Du Bos, and Simon did not dare to think for themselves. In England in the same period the leading names were Hobbes and Locke; and of these the latter is often accused of intellectual timidity. The innovating courses of Blount and Toland provoked abundant resentment, as did the new departures of the later free-thinkers. "To discuss with freedom," in the sense of being free to publish anything, was only relatively easier in England than in France.—Ed.]

Camille Desmoulins had cultivated his mind from the same source.[190] Marat travelled in Scotland as well as in England, and was so profoundly versed in our language that he wrote two works in it; one of which, called *The Chains of Slavery*, was afterwards translated into French.[191] Mirabeau is declared by a high authority to have owed part of his power to a careful study of the English constitution;[192] he translated not only Watson's *History of Philip II.*, but also some parts of Milton;[193] and it is said that when he was in the National Assembly, he delivered as his own passages from the speeches of Burke.[194] Mounier was well acquainted with our language, and with our political institutions both in theory and in practice;[195] and in a work which exercised considerable influence he proposed for his own country the establishment of two chambers, to form that balance of power of which England supplied the example.[196] The same idea, derived from the same source, was advocated by Le Brun, who was a friend of Mounier's, and who, like him, had paid attention to the literature and government of the English people.[197] Brissot knew English; he had studied in London the working of the English institutions, and he himself mentions that in his treatise on criminal law he was mainly guided by the course of English legislation.[198] Condorcet also proposed as a model our system of criminal jurisprudence,[199] which, bad as it was, certainly surpassed that possessed by France. Madame Roland, whose position as well as ability made her one of the leaders of the democratic party, was an ardent student of the language and literature of the English people.[200] She too, moved by the universal curiosity, came to our country; and, as if to show that persons of every shade and of every rank were actuated by the same spirit, the Duke of Orleans likewise visited England; nor did his visit fail to produce its natural results. "It was," says a celebrated writer, "in the society of London that he acquired a taste for liberty; and it was on his return from there that he brought into France a love of popular agitation, a contempt for his own rank, and a familiarity with those beneath him."[201]

This language, strong as it is, will not appear exaggerated to any one who has

[190] The last authors he read, shortly before his execution, were Young and Hervey. *Lamartine, Hist. des Girondins*, vol. viii. p. 45. In 1769 Madame Riccoboni writes from Paris that Young's *Night Thoughts* had become very popular there; and she justly adds, "c'est une preuve sans réplique du changement de l'esprit français." *Garrick Correspondence*, vol. ii. p. 566, 4to, 1832.

[199] Dupont de Nemours (*Mém. sur Turgot*, p. 117) says of criminal jurisprudence, "M. de Condorcet proposait en modèle celle des Anglais."

[200] *Mém. de Roland*, vol. i. pp. 27, 55, 89, 136, vol. ii. pp. 99, 135, 253.

[201] "Le duc d'Orléans puisa ainsi le goût de la liberté dans la vie de Londres. Il en rapporta en France les habitudes d'insolence contre la cour, l'appétit des agitations populaires, le mépris pour son propre rang, la familiarité avec la foule," &c. *Lamartine, Hist. des Girondins*, vol. ii. p. 102.

carefully studied the history of the eighteenth century. It is no doubt certain that the French Revolution was essentially a reaction against that protective and interfering spirit which reached its zenith under Louis XIV., but which, centuries before his reign, had exercised a most injurious influence over the national prosperity. While, however, this must be fully conceded, it is equally certain that the impetus to which the reaction owed its strength proceeded from England; and that it was English literature which taught the lessons of political liberty, first to France, and through France to the rest of Europe.[202] On this account, and not at all from mere literary curiosity, I have traced with some minuteness that union between the French and English minds which, though often noticed, has never been examined with the care its importance deserves. The circumstances which reinforced this vast movement will be related towards the end of the volume; at present I will confine myself to its first great consequence, namely, the establishment of a complete schism between the literary men of France and the classes who exclusively governed the country.

Those eminent Frenchmen who now turned their attention to England found in its literature, in the structure of its society, and in its government, many peculiarities of which their own country furnished no example. They heard political and religious questions of the greatest moment debated with a boldness unknown in any other part of Europe. They heard Dissenters and Churchmen, Whigs and Tories, handling the most dangerous topics, and treating them with unlimited freedom. They heard public disputes respecting matters which no one in France dared to discuss; mysteries of state and mysteries of creed unfolded and rudely exposed to the popular gaze. And what to Frenchmen of that age must have been equally amazing, they not only found a public press possessing some degree of freedom, but they found that within the very walls of parliament the administration of the crown was assailed with complete impunity, the character of its chosen servants constantly aspersed, and, strange to say, even the management of its revenue effectually controlled.[203]

The successors of the age of Louis XIV., seeing these things, and seeing moreover that the civilization of the country increased as the authority of the upper classes and of the crown diminished, were unable to restrain their wonder at so novel and exciting a spectacle. "The English nation," says Voltaire, "is the only one on the earth which, by resisting its kings, has succeeded in lessening their power."[204] "How I love the boldness of the English! how I love men who say what they think!"[205] The English, says Le Blanc, are willing to have a king, provided they are not obliged to obey him.[206] The immediate object of

[202] M. Lerminier (*Philos. du Droit*, vol. i. p. 19) says of England, "cette île célèbre donne à l'Europe l'enseignement de la liberté politique; elle en fut l'école au dix-huitième siècle pour tout ce que l'Europe eut de penseurs." See also *Soulavie, Règne de Louis XVI*, vol. iii. p. 161; *Mém. de Marmontel*, vol. iv. pp. 38, 39; *Stäudlin, Gesch. der theolog. Wissenschaften*, vol. ii. p. 291.

[203] Hume, who was acquainted with several eminent Frenchmen who visited England, says (*Philosophical Works*, vol. iii. p. 8), "nothing is more apt to surprise a foreigner than the extreme liberty which we enjoy in this country, of communicating whatever we please to the public, and of openly censuring every measure entered into by the king or his ministers."

[204] "La nation anglaise est la seule de la terre qui soit parvenue à régler le pouvoir des rois en leur résistant." *Lettre VIII sur les Anglais*, in *Œuvres de Voltaire*, vol. xxvi. p. 37.

[205] "Que j'aime la hardiesse anglaise! que j'aime les gens qui disent ce qu'ils pensent!" Letter from Voltaire in *Correspond. de Dudeffand*, vol. ii. p. 263. For other instances of his admiration of England, see *Œuvres de Voltaire*, vol. xl. pp. 105–109; vol. li. pp. 137, 390; vol. liv. pp. 298, 392; vol. lvi. pp. 162, 163, 195, 196, 270; vol. lvii. p. 500; vol. lviii. pp. 128, 267; vol. lix. pp. 265, 361; vol. lx. p. 501; vol. lxi. pp. 43, 73, 129, 140, 474, 475; vol. lxii. pp. 343, 379, 392; vol. lxiii. pp. 128, 146, 190, 196, 226, 237, 415; vol. lxiv. pp. 36, 96, 269; vol. lxvi. pp. 93, 159; vol. lxvii. pp. 353, 484.

[206] "Ils veulent un roi, aux conditions, pour ainsi dire, de ne lui point obéir." *Le Blanc, Lettres d'un François*, vol. i. p. 210.

their government, says Montesquieu, is political liberty ;[207] they possess more freedom than any republic ;[208] and their system is in fact a republic disguised as a monarchy.[209] Grosley, struck with amazement, exclaims, " Property is in England a thing sacred, which the laws protect from all encroachment, not only from engineers, inspectors, and other people of that stamp, but even from the king himself."[210] Mably, in the most celebrated of all his works, says, " The Hanoverians are only able to reign in England because the people are free, and believe they have a right to dispose of the crown. But if the kings were to claim the same power as the Stuarts, if they were to believe that the crown belonged to them by divine right, they would be condemning themselves, and confessing that they were occupying a place which is not their own."[211] In England, says Helvétius, the people are respected ; every citizen can take some part in the management of affairs ; and authors are allowed to enlighten the public respecting its own interests.[212] And Brissot, who had made these matters his especial study, cries out, " Admirable constitution ! which can only be disparaged either by men who know it not, or else by those whose tongues are bridled by slavery."[213]

Such were the opinions of some of the most celebrated Frenchmen of that time ; and it would be easy to fill a volume with similar extracts. But what I now rather wish to do is to point out the first great consequence of this new and sudden admiration * for a country which, in the preceding age, had been held in profound contempt. The events which followed are indeed of an importance impossible to exaggerate ; since they brought about that rupture between the intellectual and governing classes of which the Revolution itself was but a temporary episode.

The great Frenchmen of the eighteenth century being stimulated by the example of England into a love of progress, naturally came into collision with the governing classes, among whom the old stationary spirit still prevailed. This opposition was a wholesome reaction against that disgraceful servility for which, in the reign of Louis XIV., literary men had been remarkable ; and if the contest which ensued had been conducted with anything approaching to moderation, the ultimate result would have been highly beneficial ; since it would have secured that divergence between the speculative and practical classes which, as we have already seen, is essential to maintain the balance of civilization, and to prevent either side from acquiring a dangerous predominance. But unfortunately the nobles and clergy had been so long accustomed to power that they could not brook the slightest contradiction from those great writers, whom they ignorantly despised as their inferiors. Hence it was that when the most illustrious Frenchmen of the eighteenth century attempted to infuse into the literature of their country a spirit of inquiry similar to that which existed in

[207] " Il y a aussi une nation dans le monde qui a pour objet direct de sa constitution la liberté politique." *Esprit des Lois*, livre xi. chap. v. in *Œuvres de Montesquieu*, p. 264. Conversely De Staël (*Consid. sur la Rév.* vol. iii. p. 261), " la liberté politique est le moyen suprême."

[208] " L'Angleterre est à présent le plus libre pays qui soit au monde, je n'en excepte aucune république." *Notes sur l'Angleterre*, in *Œuvres de Montesquieu*, p. 632.

[209] " Une nation où la république se cache sous la forme de la monarchie." *Esprit des Lois*, livre v. chap. xix. in *Œuvres de Montesquieu*, p. 225 ; also quoted in *Bancroft's American Revolution*, vol. ii. p. 36.

[210] *Grosley's Tour to London*, vol. i. pp. 16, 17.

[211] *Mably, Observ. sur l'Hist. de France*, vol. ii. p. 185.

[212] *Helvétius de l'Esprit*, vol. i. pp. 102, 199 : " un pays où le peuple est respecté comme en Angleterre ; . . . un pays où chaque citoyen a part au maniement des affaires généralés, où tout homme d'esprit peut éclairer le public sur ses véritables intérêts."

[213] *Mém. de Brissot*, vol. ii. p. 25.

[* Buckle has unfortunately not traced the process chronologically ; but it is broadly clear that what he calls a " new and sudden admiration " was gradually developed through a period of sixty years. Voltaire was in England from 1726 to 1729 : Montesquieu from 1729 to 1731. It was many years before the influence was general.—Ed.]

England, the ruling classes became roused into a hatred and jealousy which broke all bounds, and gave rise to that crusade against knowledge which forms the second principal precursor of the French Revolution.

The extent of that cruel persecution to which literature was now exposed can only be fully appreciated by those who have minutely studied the history of France in the eighteenth century. For it was not a stray case of oppression, which occurred here and there; but it was a prolonged and systematic attempt to stifle all inquiry and punish all inquirers. If a list were drawn up of all the literary men who wrote during the seventy years succeeding the death of Louis XIV., it would be found that at least nine out of every ten had suffered from the government some grievous injury; and that a majority of them had been actually thrown into prison. Indeed, in saying thus much, I am understating the real facts of the case; for I question if one literary man out of fifty escaped with entire impunity. Certainly my own knowledge of those times, though carefully collected, is not so complete as I could have wished; but among those authors who were punished I find the name of nearly every Frenchman whose writings have survived the age in which they were produced. Among those who suffered either confiscation, or imprisonment, or exile, or fines, or the suppression of their works, or the ignominy of being forced to recant what they had written, I find, besides a host of inferior writers, the names of Beaumarchais, Berruyer, Bougeant, Buffon, D'Alembert, Diderot, Duclos, Fréret, Helvétius, La Harpe, Linguet, Mably, Marmontel, Montesquieu, Mercier, Morellet, Raynal, Rousseau, Suard, Thomas, and Voltaire.

The mere recital of this list is pregnant with instruction. To suppose that all these eminent men deserved the treatment they received would, even in the absence of direct evidence, be a manifest absurdity; since it would involve the supposition that, a schism having taken place between two classes, the weaker class was altogether wrong, and the stronger altogether right. Fortunately, however, there is no necessity for resorting to any merely speculative argument respecting the probable merits of the two parties. The accusations brought against these great men are before the world; the penalties inflicted are equally well known; and by putting these together we may form some idea of the state of society in which such things could be openly practised.

Voltaire, almost immediately after the death of Louis XIV., was falsely charged with having composed a libel on that prince; and for this imaginary offence, he, without the pretence of a trial, and without even the shadow of a proof, was thrown into the Bastille, where he was confined more than twelve months.[214] Shortly after he was released there was put upon him a still more grievous insult; the occurrence, and, above all, the impunity of which, supply striking evidence as to the state of society in which such things were permitted. Voltaire, at the table of the Duke de Sully, was deliberately insulted by the Chevalier de Rohan Chabot, one of those impudent and dissolute nobles who then abounded in Paris. The duke, though the outrage was committed in his own house, in his own presence, and upon his own guest, would not interfere; but seemed to consider that a poor poet was honoured by being in any way noticed by a man of rank. But as Voltaire, in the heat of the moment, let fall one of those stinging retorts which were the terror of his enemies, the chevalier determined to visit him with further punishment. The course he adopted was characteristic of the man, an' of the class to which he belonged. He caused Voltaire to be seized in the streets of Paris, and in his presence ignominiously beaten, he himself regulating the number of blows of which the chastisement was to consist. Voltaire, smarting under the insult, demanded that satisfaction which it was customary to give. This, however, did not enter into the plan of his noble assailer, who not only refused to meet him in the field, but actually obtained an order by which he was confined in the Bastille for six months, and at the end of that time was directed to quit the country.[215]

[214] *Condorcet, Vie de Voltaire*, pp. 118, 119; *Duvernet, Vie de Voltaire*, pp. 30, 32; *Longchamp et Wagnière, Mém. sur Voltaire*, vol. i. p. 22.

[215] *Duvernet, Vie de Voltaire*, pp. 46–48; *Condorcet, Vie de Voltaire*, pp. 125, 126.

Thus it was that Voltaire, having first been imprisoned for a libel which he never wrote, and having then been publicly beaten because he retorted an insult wantonly put upon him, was now sentenced to another imprisonment, through the influence of the very man by whom he had been attacked. The exile which followed the imprisonment seems to have been soon remitted; as, shortly after these events, we find Voltaire again in France, preparing for publication his first historical work, a life of Charles XII. In this there are none of those attacks on Christianity which gave offence in his subsequent writings; nor does it contain the least reflection upon the arbitrary government under which he had suffered. The French authorities at first granted that permission without which no book could then be published; but as soon as it was actually printed, the licence was withdrawn, and the history forbidden to be circulated.[216] The next attempt of Voltaire was one of much greater value; it was therefore repulsed still more sharply. During his residence in England, his inquisitive mind had been deeply interested by a state of things so different from any he had hitherto seen; and he now published an account of that remarkable people, from whose literature he had learned many important truths. His work, which he called *Philosophic Letters*, was received with general applause; but, unfortunately for himself, he adopted in it the arguments of Locke against innate ideas. The rulers of France, though not likely to know much about innate ideas, had a suspicion that the doctrine of Locke was in some way dangerous; and as they were told that it was a novelty they felt themselves bound to prevent its promulgation. Their remedy was very simple. They ordered that Voltaire should be again arrested and that his work should be burned by the common hangman.[217]

These repeated injuries might well have moved a more patient spirit than that of Voltaire.[218] Certainly those who reproach this illustrious man, as if he were the instigator of unprovoked attacks upon the existing state of things, must know very little of the age in which it was his misfortune to live. Even on what has been always considered the neutral ground of physical science, there was displayed the same despotic and persecuting spirit. Voltaire, among other schemes for benefiting France, wished to make known to his countrymen the wonderful discoveries of Newton, of which they were completely ignorant. With this view he drew up an account of the labours of that extraordinary thinker; but here again the authorities interposed, and forbade the work to be printed.[219] Indeed the rulers of France, as if sensible that their only security was the ignorance of the people, obstinately set their face against every description of knowledge. Several eminent authors had undertaken to execute, on a magnificent scale, an Encyclopædia which should contain a summary of all the branches of science and of art. This, undoubtedly the most splendid enterprise ever started by a

Compare vol. lvi. p. 162; *Lepan, Vie de Voltaire*, 1837, pp. 70, 71; and *Biog. Univ.* vol. xlix. p. 468. Duvernet, who, writing from materials supplied by Voltaire, had the best means of information, gives a specimen of the fine feeling of a French duke in the eighteenth century. He says that, directly after Rohan had inflicted this public chastisement, "Voltaire rentre dans l'hôtel, demande au duc de Sully de regarder cet outrage fait à l'un de ses convives fait à lui-même : il le sollicite de se joindre à lui pour en poursuivre la vengeance, et de venir chez un commissaire en certifier la déposition. *Le duc de Sully se refuse à tout.*"

[216] "L'Histoire de Charles XII, dont on avait arrêté une première édition après l'avoir autorisée." *Biog. Univ.* vol. xlix. p. 470. Comp. *Nichols's Lit. Anec.* vol. i. p. 388.

[217] *Duvernet, Vie de Voltaire*, pp. 63–65; *Condorcet, Vie de Voltaire*, pp. 138–140; *Lepan, Vie de Voltaire*, pp. 93, 381.

[218] The indignation of Voltaire appears in many of his letters; and he often announced to his friends his intention of quitting for ever a country where he was liable to such treatment. See *Œuvres de Voltaire*, vol. liv. pp. 58, 335, 336, vol. lv. p. 229, vol. lvi. pp. 162, 163, 358, 447, 464, 465, vol. lvii. pp. 144, 145, 155, 156, vol. lviii. pp. 36, 222, 223, 516, 517, 519, 520, 525, 526, 563, vol. lix. pp. 107, 116, 188, 208.

[219] *Œuvres de Voltaire*, vol. i. pp. 147, 315, vol. lvii. pp. 211, 215, 219, 247, 295; *Villemain, Lit. au XVIII^e Siècle*, vol. i. p. 14; *Brougham's Men of Letters*, vol. i. pp. 53, 60.

body of literary men, was at first discouraged by the government, and afterwards entirely prohibited.[220] On other occasions, the same tendency was shown in matters so trifling that nothing but the gravity of their ultimate results prevents them from being ridiculous. In 1770, Imbert translated Clarke's *Letters on Spain*; one of the best works then existing on that country. This book, however, was suppressed as soon as it appeared; and the only reason assigned for such a stretch of power is that it contained some remarks respecting the passion of Charles III. for hunting, which were considered disrespectful to the French crown, because Louis XV. was himself a great hunter.[221] Several years before this, La Bletterie, who was favourably known in France by his works, was elected a member of the French Academy. But he, it seems, was a Jansenist, and had moreover ventured to assert that the Emperor Julian, notwithstanding his apostasy, was not entirely devoid of good qualities. Such offences could not be overlooked in so pure an age; and the king obliged the academy to exclude La Bletterie from their society.[222] That the punishment extended no further was an instance of remarkable leniency; for Fréret, an eminent critic and scholar,[223] was confined in the Bastille because he stated, in one of his memoirs, that the earliest Frankish chiefs had received their titles from the Romans.[224] The same penalty was inflicted four different times upon Lenglet du Fresnoy.[225] In the case of this amiable and accomplished man, there seems to have been hardly the shadow of a pretext for the cruelty with which he was treated; though on one occasion the alleged offence was that he had published a supplement to the History of De Thou.[226]

Indeed we have only to open the biographies and correspondence of that time to find instances crowding upon us from all quarters. Rousseau was threatened with imprisonment, was driven from France, and his works were publicly burned.[227] The celebrated treatise of Helvétius on the Mind was suppressed

[220] *Grimm, Correspond.* vol. i. pp. 90–95, vol. ii. p. 399; *Biog. Univ.* vol. xi. p. 316; *Brougham's Men of Letters*, vol. ii. p. 439.

[221] *Boucher de la Richarderie, Bibliothèque des Voyages*, vol. iii. pp. 390–393, Paris, 1808: "La distribution en France de la traduction de ce voyage fut arrêtée pendant quelque temps par des ordres supérieurs du gouvernement. . . . Il y a tout lieu de croire que les ministres de France crurent, ou feignirent de croire, que le passage en question pouvoit donner lieu à des applications sur le goût effréné de Louis XV pour la chasse, et inspirèrent aisément cette prévention à un prince très-sensible, comme on sait, aux censures les plus indirectes de sa passion pour ce genre d'amusement." See also the account of Imbert, the translator, in *Biog. Univ.* vol. xxi. p. 200.

[222] *Grimm, Correspond.* vol. vi. pp. 161, 162; the crime being, "qu'un janséniste avait osé imprimer que Julien, apostat exécrable aux yeux d'un bon chrétien, n'était pourtant pas un homme sans quelques bonnes qualités à en juger mondainement."

[223] M. Bunsen (*Egypt*, vol. i. p. 14) refers to Fréret's "acute treatise on the Babylonian year;" and Turgot, in his *Etymologie*, says (*Œuvres de Turgot*, vol. iii. p. 83), "l'illustre Fréret, un des savans qui ont su le mieux appliquer la philosophie à l'érudition."

[224] This was at the very outset of his career: "En 1715, l'homme qui devait illustrer l'érudition française au xviii^e^ siècle, Fréret, était mis à la Bastille pour avoir avancé, dans un mémoire sur l'origine des Français, que les Francs ne formaient pas une nation à part, et que leurs premiers chefs avaient reçu de l'empire romain le titre de *patrices*." *Villemain, Lit. au XVIII^e^ Siècle*, vol. ii. p. 30: see also *Nichols's Lit. Anec.* vol. ii. p. 510.

[225] He was imprisoned in the Bastille, for the first time, in 1725; then in 1743, in 1750, and finally in 1751. *Biographie Universelle*, vol. xxiv. p. 85.

[226] In 1743, Voltaire writes: "On vient de mettre à la Bastille l'abbé Lenglet, pour avoir publié des mémoires déjà très connus, qui servent de supplément à l'histoire de notre célèbre De Thou. L'infatigable et malheureux Lenglet rendait un signalé service aux bons citoyens, et aux amateurs des recherches historiques. Il méritait des récompenses; on l'emprisonne cruellement à l'âge de soixante-huit ans." *Œuvres de Voltaire*, vol. i. pp. 400, 401, vol. lviii. pp. 207. 208.

[227] *Musset Pathay, Vie de Rousseau*, vol. i. pp. 68, 99, 296, 377, vol. ii. pp. 111, 385, 390; *Mercier sur Rousseau*, vol. i. p. 14, vol. ii. pp. 179, 314.

by an order from the royal council ; it was burned by the common hangman, and the author was compelled to write two letters retracting his opinions.[228] Some of the geological views of Buffon having offended the clergy, that illustrious naturalist was obliged to publish a formal recantation of doctrines which are now known to be perfectly accurate.[229] The learned Observations on the History of France, by Mably, were suppressed as soon as they appeared ; [230] for what reason it would be hard to say, since M. Guizot, certainly no friend either to anarchy or to irreligion, has thought it worth while to republish them, and thus stamp them with the authority of his own great name. The History of the Indies, by Raynal, was condemned to the flames, and the author ordered to be arrested.[231] Lanjuinais, in his well-known work on Joseph II., advocated not only religious toleration, but even the abolition of slavery ; his book, therefore, was declared to be " seditious ; " it was pronounced " destructive of all subordination," and was sentenced to be burned.[232] The Analysis of Bayle, by Marsy, was suppressed, and the author was imprisoned.[233] The History of the Jesuits, by Linguet, was delivered to the flames ; eight years later, his *Journal* was suppressed ; and three years after that, as he still persisted in writing, his Political Annals were suppressed, and he himself was thrown into the Bastille.[234] Delisle de Sales was sentenced to perpetual exile, and confiscation of all his property, on account of his work on the Philosophy of Nature.[235] The treatise by Mey, on French law, was suppressed ; [236] that by Boncerf, on feudal law, was burned.[237] The Memoirs of Beaumarchais were likewise burned ; [238] the Éloge on Fénelon by La Harpe was merely suppressed.[239] Duvernet having written a History of the Sorbonne, which was still unpublished, was seized and thrown into the Bastille, while the manuscript was yet in his own possession.[240] The celebrated work of De Lolme on the English constitution was suppressed by edict directly it appeared.[241] The fate of being suppressed, or prohibited, also awaited the Letters of Gervaise, in 1724 ; [242] the Dissertations of Courayer, in 1727 ; [243] the Letters of Montgon, in 1732 ; [244] the History of Tamerlane, by Margat, also in 1732 ; [245] the Essay on Taste, by Cartaud, in 1736 ; [246] the Life of Domat, by Prévost de la Jannès, in 1742 ; [247] the History of Louis XI., by Duclos, in 1745 ; [248] the Letters of Bargeton,

in 1750 ;[249] the Memoirs on Troyes, by Grosley, in the same year ;[250] the History of Clement XI., by Reboulet, in 1752 ;[251] the School of Man, by Génard, also in 1752 ;[252] the Therapeutics of Garlon, in 1756 ;[253] the celebrated thesis of Louis, on Generation, in 1754 ;[254] the Treatise on Presidial Jurisdiction, by Jousse, in 1755 ;[255] the Ericie of Fontenelle, in 1768 ;[256] the Thoughts of Jamin, in 1769 ;[257] the History of Siam, by Turpin, and the Éloge of Marcus Aurelius, by Thomas, both in 1770 ;[258] the works on finance by Darigrand in 1764, and by Le Trosne in 1779 ;[259] the Essay on Military Tactics, by Guibert, in 1772 ; the Letters of Boucquet, in the same year ;[260] and the Memoirs of Terrai, by Coquereau, in 1776.[261] Such wanton destruction of property was, however, mercy itself compared to the treatment experienced by other literary men in France. Desforges, for example, having written against the arrest of the Pretender to the English throne, was, solely on that account, buried in a dungeon eight feet square and confined there for three years.[262] This happened in 1749 ; and in 1770, Audra, professor at the college of Toulouse, and a man of some reputation, published the first volume of his Abridgment of General History. Beyond this the work never proceeded ; it was at once condemned by the archbishop of the diocese, and the author was deprived of his office. Audra, held up to public opprobrium, the whole of his labours rendered useless, and the prospects of his life suddenly blighted, was unable to survive the shock. He was struck with apoplexy, and within twenty-four hours was lying a corpse in his own house.[263]

It will probably be allowed that I have collected sufficient evidence to substantiate my assertion respecting the persecutions directed against every description of literature ; but the carelessness with which the antecedents of the French Revolution have been studied has given rise to such erroneous opinions on this subject that I am anxious to add a few more instances, so as to put beyond the possibility of doubt the nature of the provocations habitually received by the most eminent Frenchmen of the eighteenth century.

Among the many celebrated authors who, though inferior to Voltaire, Montesquieu, Buffon, and Rousseau, were second only to them, three of the most remarkable were Diderot, Marmontel, and Morellet. The first two are known to every reader ; while Morellet, though comparatively forgotten, had in his own time considerable influence, and had moreover the distinguished merit of being the first who popularised in France those great truths which had been recently discovered, in political economy by Adam Smith, and in jurisprudence by Beccaria.

A certain M. Cury wrote a satire upon the Duke d'Aumont, which he showed to his friend Marmontel, who, struck by its power, repeated it to a small circle of his acquaintance. The duke, hearing of this, was full of indignation, and insisted upon the name of the author being given up. This, of course, was impossible without a gross breach of confidence ; but Marmontel, to do everything in his power, wrote to the duke, stating, what was really the fact, that the lines in question had not been printed, that there was no intention of making them public, and that they had only been communicated to a few of his own particular friends. It might have been supposed that this would have satisfied even a

[262] "Il resta trois ans dans la cage ; c'est un caveau creusé dans le roc, de huit pieds en carré, où le prisonnier ne reçoit le jour que par les crevasses des marches de l'église." *Biog. Univ.* vol. xi. p. 171.

[263] *Peignot, Livres condamnés*, vol. i. pp. 14, 15.

French noble; but Marmontel, still doubting the result, sought an audience of the minister, in the hope of procuring the protection of the crown. All, however, was in vain. It will hardly be believed that Marmontel, who was then at the height of his reputation, was seized in the middle of Paris, and because he refused to betray his friend, was thrown into the Bastille. Nay, so implacable were his persecutors that after his liberation from prison, they, in the hope of reducing him to beggary, deprived him of the right of publishing the *Mercure*, upon which nearly the whole of his income depended.[264]

To the Abbé Morellet a somewhat similar circumstance occurred. A miserable scribbler named Palissot had written a comedy ridiculing some of the ablest Frenchmen then living. To this Morellet replied by a pleasant little satire, in which he made a very harmless allusion to the Princess de Robeck, one of Palissot's patrons. She, amazed at such presumption, complained to the minister, who immediately ordered the abbé to be confined in the Bastille, where he remained for some months, although he had not only been guilty of no scandal, but had not even mentioned the name of the princess.[265]

The treatment of Diderot was still more severe. This remarkable man owed his influence chiefly to his immense correspondence, and to the brilliancy of a conversation for which, even in Paris, he was unrivalled, and which he used to display with considerable effect at those celebrated dinners where, during a quarter of a century, Holbach assembled the most illustrious thinkers in France.[266] Besides this, he is the author of several works of interest, most of which are well known to students of French literature.[267] His independent spirit, and the reputation he obtained, earned for him a share in the general persecution. The first work he wrote was ordered to be publicly burned by the common hangman.[268] This, indeed, was the fate of nearly all the best literary productions of that time; and Diderot might esteem himself fortunate in merely losing his property, provided he saved himself from imprisonment. But a few years later he wrote another work, in which he said that people who are born blind have some ideas different from those who are possessed of their eyesight. This assertion is by no

[264] *Mémoires de Marmontel*, vol. ii. pp. 143–176; and see vol. iii. pp. 30–46, 95, for the treatment he afterwards received from the Sorbonne, because he advocated religious toleration. See also *Œuvres de Voltaire*, vol. liv. p. 258; and *Letters of Eminent Persons addressed to Hume*, pp. 207, 212, 213.

[265] *Mém. de Morellet*, vol. i. pp. 86–89; *Mélanges par Morellet*, vol. ii. pp. 3–12; *Œuvres de Voltaire*, vol. liv. pp. 106, 111, 114, 122, 183.

[266] Marmontel (*Mém.* vol. ii. p. 313) says, "qui n'a connu Diderot que dans ses écrits ne l'a point connu:" meaning that his works were inferior to his talk. His conversational powers are noticed by Ségur, who disliked him, and by Georgel, who hated him. *Ségur, Souvenirs*, vol. iii. p. 34; *Georgel, Mém.* vol. ii. p. 246. Compare *Forster's Life of Goldsmith*, vol. i. p. 69; *Musset Pathay, Vie de Rousseau*, vol. i. p. 95, vol. ii. p. 227; *Mémoires d'Epinay*, vol. ii. pp. 73, 74, 88; *Grimm, Corresp.* vol. xv. pp. 79–90; *Morellet, Mém.* vol. i. p. 28; *Villemain, Lit. au XVIII^e Siècle*, vol. i. p. 82.

As to Holbach's dinners, on which Madame de Genlis wrote a well-known libel, see *Schlosser's Eighteenth Century*, vol. i. p. 166; *Biog. Univ.* vol. xx. p. 462; *Jesse's Selwyn*, vol. ii. p. 9; *Walpole's Letters to Mann*, vol. iv. p. 283; *Gibbon's Miscellaneous Works*, p. 73.

[267] It is also stated by the editor of his correspondence, that he wrote a great deal for authors, which they published under their name. *Mém. et Corresp. de Diderot*, vol. iii. p. 102.

[268] This was the *Pensées Philosophiques*, in 1746, his first original work; the previous ones being translations from English. *Biog. Univ.* xi. 314. Duvernet (*Vie de Voltaire*, p. 240) says that he was imprisoned for writing it, but this I believe is a mistake; at least I do not remember to have met with the statement elsewhere, and Duvernet is frequently careless. [From Delort's *Histoire de la Détention des Philosophes et des gens de lettres à la Bastille et à Vincennes*, 1829, ii. 208–216, it appears that the writing of the *Pensées* was part of the case against Diderot when he was imprisoned in 1749.—Ed.]

means improbable,[269] and it contains nothing by which any one need be startled. The men, however, who then governed France discovered in it some hidden danger. Whether they suspected that the mention of blindness was an allusion to themselves, or whether they were merely instigated by the perversity of their temper, is uncertain ; at all events, the unfortunate Diderot, for having hazarded this opinion, was arrested, and without even the form of a trial, was confined in the dungeon of Vincennes.[270] The natural results followed. The works of Diderot rose in popularity ;[271] and he, burning with hatred against his persecutors, redoubled his efforts to overthrow those institutions under shelter of which such monstrous tyranny could be safely practised.

It seems hardly necessary to say more respecting the incredible folly with which the rulers of France, by turning every able man into a personal enemy,[272] at length arrayed against the government all the intellect of the country, and made the Revolution a matter not of choice but of necessity. I will, however, as a fitting sequel to the preceding facts, give one instance of the way in which, to gratify the caprice of the higher classes, even the most private affections of domestic life could be publicly outraged. In the middle of the eighteenth century, there was an actress on the French stage of the name of Chantilly. She, though beloved by Maurice de Saxe, preferred a more honourable attachment, and married Favart, the well-known writer of songs and of comic operas. Maurice, amazed at her boldness, applied for aid to the French crown. That he should have made such an application is sufficiently strange ; but the result of it is hardly to be paralleled except in some Eastern despotism. The government of France, on hearing the circumstance, had the inconceivable baseness to issue an order directing Favart to abandon his wife, and intrust her to the charge of Maurice, to whose embraces she was compelled to submit.[273]

[269] Dugald Stewart, who has collected some important evidence on this subject, has confirmed several of the views put forward by Diderot. *Philos. of the Mind*, vol. iii. pp. 401 seq. ; comp. pp. 57, 407, 435. Since then still greater attention has been paid to the education of the blind, and it has been remarked that "it is an exceedingly difficult task to teach them to think accurately." *M'Alister's Essay on the Blind*, in *Jour. of Stat. Soc.* vol. i. p. 378 : see also Dr. Fowler, in *Report of Brit. Assoc. for* 1847, *Transac. of Sec.* pp. 92, 93, and for 1848, p. 88. These passages unconsciously testify to the sagacity of Diderot ; and they also testify to the stupid ignorance of a government which sought to put an end to such inquiries by punishing their author. [Diderot's propositions were concerning "*la morale*" of the blind and deaf.—Ed.]

[270] *Mém. et Corresp. de Diderot*, vol. i. pp. 26–29 ; *Musset Pathay, Vie de Rousseau*, vol. i. p. 47, vol. ii. p. 276 ; *Letter to d'Argental*, in *Œuvres de Voltaire*, vol. lviii. p. 454 ; *Lacretelle, Dix-huitième Siècle*, vol. ii. p. 54. [There was an *interrogatoire* after Diderot had been imprisoned. In that, other works of his are specified.—Ed.]

[271] A happy arrangement, by which curiosity baffles despotism. In 1767, an acute observer wrote, "Il n'y a plus de livres qu'on imprime plusieurs fois que les livres condamnés. Il faut aujourd'hui qu'un libraire prie les magistrats de brûler son livre pour le faire vendre." *Grimm, Corresp.* vol. v. p. 498. To the same effect, *Mém. de Ségur*, vol. i. pp. 15, 16 ; *Mém. de Georgel*, vol. ii. p. 256.

[272] "Quel est aujourd'hui parmi nous l'homme des lettres de quelque mérite qui n'ait éprouvé plus ou moins les fureurs de la calomnie et de la persécution ?" etc. *Grimm, Corresp.* vol. v. p. 451. This was written in 1767, and during more than forty years previously we find similar expressions ; the earliest I have met with being in a letter to Thiriot, in 1723, in which Voltaire says (*Œuvres*, vol. lvi. p. 94), "la sévérité devient plus grande de jour en jour dans l'inquisition de la librairie." For other instances, see his letter to De Formont, pp. 423–425, also vol. lvii. pp. 144, 351, vol. lviii. p. 222 ; his *Lettres inédites*, vol. i. p. 547 ; *Mém. de Diderot*, vol. ii. p. 215 ; *Letters of Eminent Persons to Hume*, pp. 14, 15.

[273] Part of this is related, rather inaccurately, in *Schlosser's Eighteenth Century*, vol. iii. p. 483. The fullest account is in *Grimm, Corresp. Lit.* vol. viii. pp. 231–233 : "Le grand Maurice, irrité d'une résistance qu'il n'avait jamais éprouvée nulle part, eut la faiblesse de demander une lettre de cachet pour enlever à un mari sa femme, et pour la contraindre d'être sa concubine ; et, chose remarquable, cette lettre de cachet fut accordée et exécutée.

These are among the insufferable provocations by which the blood of men is made to boil in their veins. Who can wonder that the greatest and noblest minds in France were filled with loathing at the government by whom such things were done? If we, notwithstanding the distance of time and country, are moved to indignation by the mere mention of them, what must have been felt by those before whose eyes they actually occurred? And when to the horror they naturally inspired there was added that apprehension of being the next victim which every one might personally feel; when, moreover, we remember that the authors of these persecutions had none of the abilities by which even vice itself is sometimes ennobled;—when we thus contrast the poverty of their understandings with the greatness of their crimes, we, instead of being astonished that there was a revolution, by which all the machinery of the state was swept away, should rather be amazed at that unexampled patience by which alone the Revolution was so long deferred.

To me indeed it has always appeared that the delay of the Revolution is one of the most striking proofs history affords of the force of established habits, and of the tenacity with which the human mind clings to old associations. For if ever there existed a government inherently and radically bad, it was the government of France in the eighteenth century. If ever there existed a state of society likely, by its crying and accumulated evils, to madden men to desperation, France was in that state. The people, despised and enslaved, were sunk in abject poverty, and were curbed by laws of stringent cruelty, enforced with merciless barbarism. A supreme and irresponsible control was exercised over the whole country by the clergy, the nobles, and the crown. The intellect of France was placed under the ban of a ruthless proscription, its literature prohibited and burned, its authors plundered and imprisoned. Nor was there the least symptom that these evils were likely to be remedied. The upper classes, whose arrogance was increased by the long tenure of their power, only thought of present enjoyment: they took no heed of the future; they saw not that day of reckoning, the bitterness of which they were soon to experience. The people remained in slavery until the Revolution actually occurred; while as to the literature, nearly every year witnessed some new effort to deprive it of that share of liberty which it still retained. Having in 1764 issued a decree forbidding any work to be published in which questions of government were discussed;[274] having in 1767 made it a capital offence to write a book likely to excite the public mind;[275] and having moreover denounced the same penalty of death against any one who attacked religion,[276] as also against any one who spoke of matters of finance;[277]

Les deux époux plièrent sous le joug de la nécessité, et la petite Chantilly fut à la fois femme de Favart et maîtresse de Maurice de Saxe."

[274] "L'Averdy was no sooner named controller of finance than he published a decree, in 1764 (*arrêt du conseil*),—which, according to the state of the then existing constitution, had the force of a law,—by which every man was forbidden to print, or cause to be printed, anything whatever upon administrative affairs, or government regulations in general, under the penalty of a breach of the police-laws; by which the man was liable to be punished without defence, and not as was the case before the law-courts, where he might defend himself, and could only be judged according to law." *Schlosser's Eighteenth Century*, vol. ii. p. 166: see also *Mém. de Morellet*, vol. i. p. 141, vol. ii. p. 75, "un arrêt du conseil, qui défendait d'imprimer sur les matières d'administration."

[275] "L'ordonnance de 1767, rendue sous le ministère du chancelier Maupeou, portait la peine de mort contre tout auteur d'écrits tendant à émouvoir les esprits." *Cassagnac, Causes de la Révolution*, vol. i. p. 313.

[276] In April, 1757, D'Alembert writes from Paris, "on vient de publier une déclaration qui inflige la peine de mort à tous ceux qui auront publié des écrits tendants à attaquer la religion." *Œuvres de Voltaire*, vol. liv. p. 34. This, I suppose, is the same edict as that mentioned by M. Amédée Renée, in his continuation of *Sismondi, Histoire des Français*, vol. xxx. p. 247.

[277] "Il avait été défendu, sous peine de mort, aux écrivains de parler de finances." *Lavallée, Hist. des Français*, vol. iii. p. 490.

—having taken these steps, the rulers of France, very shortly before their final fall, contemplated another measure still more comprehensive. It is, indeed, a singular fact that only nine years before the Revolution, and when no power on earth could have saved the institutions of the country, the government was so ignorant of the real state of affairs, and so confident that it could quell the spirit which its own despotism had raised, that a proposal was made by an officer of the crown to do away with all the publishers, and not allow any books to be printed except those which issued from a press paid, appointed, and controlled by the executive magistrate.[278] This monstrous proposition, if carried into effect, would of course have invested the king with all the influence which literature can command; it would have been as fatal to the national intellect as the other measures were to national liberty; and it would have consummated the ruin of France, either by reducing its greatest men to complete silence, or else by degrading them into mere advocates of those opinions which the government might wish to propagate.

For these are by no means to be considered as trifling matters, merely interesting to men of letters. In France, in the eighteenth century, literature was the last resource of liberty. In England, if our great authors should prostitute their abilities by inculcating servile opinions, the danger would no doubt be considerable, because other parts of society might find it difficult to escape the contagion. Still, before the corruption had spread, there would be time to stop its course, so long as we possessed those free political institutions, by the mere mention of which the generous imagination of a bold people is easily fired. And although such institutions are the consequence, not the cause, of liberty, they do unquestionably react upon it, and from the force of habit they could for a while survive that from which they originally sprung. So long as a country retains its political freedom, there will always remain associations by which, even in the midst of mental degradation, and out of the depths of the lowest superstition, the minds of men may be recalled to better things. But in France such associations had no existence. In France everything was for the governors, and nothing for the governed. There was neither free press, nor free parliament, nor free debates. There were no public meetings; there was no popular suffrage; there was no discussion on the hustings; there was no habeas-corpus act; there was no trial by jury. The voice of liberty, thus silenced in every department of the state, could only be heard in the appeals of those great men who by their writings inspirited the people to resistance. This is the point of view from which we ought to estimate the character of those who are often accused of having wantonly disturbed the ancient fabric.[279] They, as well as the people at large, were cruelly oppressed by the crown, the nobles, and the church; and they used their abilities to retaliate the injury. There can be no doubt that this was the best course open to them. There can be no doubt that rebellion is the last remedy against tyranny, and that a despotic system should be encountered by a revolutionary literature. The upper classes were to blame, because they struck the first blow; but we must by no means censure those great men who, having defended themselves from aggression, eventually succeeded in smiting the government by whom the aggression was originally made.

Without, however, stopping to vindicate their conduct, we have now to consider what is much more important, namely, the origin of that crusade against Christianity in which, unhappily for France, they were compelled to embark, and the occurrence of which forms the third great antecedent of the French

[278] This was the suggestion of the avocat-général in 1780. See the proposal, in his own words, in *Grimm, Correspond.* vol. xi. pp. 143, 144. On the important functions of the avocats généraux in the eighteenth century, see a note in *Lettres d'Aguesseau*, vol. i. p. 264.

[279] And we should also remember what the circumstances were under which the accusation was first heard in France: "Les reproches d'avoir tout détruit, adressés aux philosophes du dix-huitième siècle, ont commencé le jour où il s'est trouvé en France un gouvernement qui a voulu rétablir les abus dont les écrivains de cette époque avaient accéléré la destruction." *Comte, Traité de Législation*, vol. i. p. 72.

Revolution. A knowledge of the causes of this hostility against Christianity is essential to a right understanding of the philosophy of the eighteenth century, and it will throw some light on the general theory of ecclesiastical power.

It is a circumstance well worthy of remark that the revolutionary literature which eventually overturned all the institutions of France was at first directed against those which were religious, rather than against those which were political. The great writers who rose into notice soon after the death of Louis XIV. exerted themselves against spiritual despotism ; while the overthrow of secular despotism was left to their immediate successors.[280] This is not the course which would be pursued in a healthy state of society ; and there is no doubt that to this peculiarity the crimes and the lawless violence of the French Revolution are in no small degree to be ascribed. It is evident that in the legitimate progress of a nation, political innovations should keep pace with religious innovations, so that the people may increase their liberty while they diminish their superstition. In France, on the contrary, during nearly forty years, the church was attacked, and the government was spared. The consequence was that the order and balance of the country were destroyed ; the minds of men became habituated to the most daring speculations, while their acts were controlled by the most oppressive despotism ; and they felt themselves possessed of capacities which their rulers would not allow them to employ. When, therefore, the French Revolution broke out, it was not a mere rising of ignorant slaves against educated masters, but it was a rising of men in whom the despair caused by slavery was quickened by the resources of advancing knowledge ; men who were in that frightful condition when the progress of intellect outstrips the progress of liberty, and when a desire is felt, not only to remove a tyranny, but also to avenge an insult.

There can be no doubt that to this we must ascribe some of the most hideous peculiarities of the French Revolution. It therefore becomes a matter of great interest to inquire how it was, that while in England political freedom and religious scepticism have accompanied and aided each other, there should on the other hand have taken place in France a vast movement in which, during nearly forty years, the ablest men neglected the freedom, while they encouraged the scepticism, and diminished the power of the church, without increasing the liberties of the people.

The first reason of this appears to be the nature of those ideas out of which the French had long constructed the traditions of their glory. A train of circumstances which, when treating of the protective spirit, I attempted to indicate, had secured to the French kings an authority which, by making all classes subordinate to the crown, flattered the popular vanity.[281] Hence it was, that in France the feelings of loyalty worked into the national mind deeper than in

[280] The nature of this change, and the circumstances under which it happened, will be examined in the last chapter of the present volume ; but that the revolutionary movement, while headed by Voltaire and his coadjutors, was directed against the church, and not against the state, is noticed by many writers ; some of whom have also observed, that soon after the middle of the reign of Louis XV. the ground began to be shifted, and a disposition was first shown to attack political abuses. On this remarkable fact, indicated by several authors, but explained by none, compare *Lacretelle, XVIII^e Siècle*, vol. ii. p. 305 ; *Barruel, Mém. pour l'Hist. du Jacobinisme*, vol. i. p. xviii., vol. ii. p. 113 ; *Tocqueville, L'Ancien Régime*, p. 241 ; *Alison's Europe*, vol. i. p. 165, vol. xiv. p. 286 ; *Mém. de Rivarol*, p. 35 ; *Soulavie, Règne de Louis XVI*, vol. iv. p. 397 ; *Lamartine, Hist. des Girondins*, vol. i. p. 183 ; *Œuvres de Voltaire*, vol. lx. p. 307, vol. lxvi. p. 34.

[281] See some striking remarks in M. Tocqueville's great work, *De la Démocratie*, vol. i. p. 5 ; which should be compared with the observation of Horace Walpole, who was well acquainted with French society, and who says, happily enough, that the French "love themselves in their kings." *Walpole's Mem. of George III.* vol. ii. p. 240. [This is obviously true of all monarchic peoples, and is apparent in Buckle's own praise of Elizabeth.—Ed.]

any other country of Europe, Spain alone excepted.[282] The difference between this spirit and that observable in England has been already noticed, and may be still further illustrated by the different ways in which the two nations have dealt with the posthumous reputation of their sovereigns. With the exception of Alfred, who is sometimes called the Great,[283] we in England have not sufficiently loved any of our princes to bestow upon them titles expressive of personal admiration. But the French have decorated their kings with every variety of panegyric. Thus, to take only a single name, one king is Louis the Mild, another is Louis the Saint, another is Louis the Just, another is Louis the Great, and the most hopelessly vicious of all was called Louis the Beloved.*

These are facts which, insignificant as they seem, form most important materials for real history, since they are unequivocal symptoms of the state of the country in which they exist.[284] Their relation to the subject before us is obvious. For by them, and by the circumstances from which they sprung, an intimate and hereditary association was engendered in the minds of Frenchmen, between the glory of their nation and the personal reputation of their sovereign. The consequence was, that the political conduct of the rulers of France was protected against censure by a fence far more impassable than any that could be erected

[282] Not only the political history of Spain, but also its literature, contains melancholy evidence of the extraordinary loyalty of the Spaniards, and of the injurious results produced by it. See, on this, some useful reflections in *Ticknor's Hist. of Spanish Literature*, vol. i. pp. 95, 96, 133, vol. iii. pp. 191–193.

[283] Our admiration of Alfred is greatly increased by the fact that we know very little about him. The principal authority referred to for his reign is Asser, whose work, there is reason to believe, is not genuine. See the arguments in *Wright's Biog. Brit. Lit.* vol. i. pp. 408–412. It moreover appears that some of the institutions popularly ascribed to him, existed before his time. *Kemble's Saxons in England*, vol. i. pp. 247, 248.

[284] The French writers, under the old régime, constantly boast that loyalty was the characteristic of their nation, and taunt the English with their opposite and insubordinate spirit. "Il n'est pas ici question des Français, qui se sont toujours distingués des autres nations par leur amour pour leurs rois." *Le Blanc, Lettres d'un François*, vol. iii. p. 523. "The English do not love their sovereigns as much as could be desired." *Sorbière's Voyage to England*, p. 58. "Le respect de la majesté royale, caractère distinctif des Français." *Mém. de Montbarey*, vol. ii. p. 54. "L'amour et la fidélité que les Français ont naturellement pour leurs princes." *Mém. de Motteville*, vol. ii. p. 3. "Les Français qui aiment leurs princes." *De Thou, Hist. Univ.* vol. iii. p. 381 ; and see vol. xi. p. 729. For further evidence, see *Sully, Œconomies*, vol. iv. p. 346 ; *Monteil, Divers Etats*, vol. vii. p. 105 ; *Ségur, Mémoires*, vol. i. p. 32 ; *Lamartine, Hist. des Girondins*, vol. iv. p. 58.

Now, contrast with all this the sentiments contained in one of the most celebrated histories in the English language : "There is not any one thing more certain and more evident, than that princes are made for the people, and not the people for them ; and perhaps there is no nation under heaven that is more entirely possessed with this notion of princes than the English nation is in this age ; so that they will soon be uneasy to a prince who does not govern himself by this maxim, and in time grow very unkind to him." *Burnet's History of his Own Time*, vol. vi. p. 223. This manly and wholesome passage was written while the French were licking the dust from the feet of Louis XIV. [And Burke wrote : "We fear God : we look up with awe to kings," while "the French" were pulling down their monarchy.—Ed.]

[* Buckle has forgotten Edward the Confessor, who was also a Saint, and "Richard Lion-Heart" and "Good Queen Bess." In our own day we have "Albert the Good." It is also to be remembered that "Louis the Just" was never a popular sobriquet, but was a title obscurely given to Louis XIII. because he was born under the sign of the Balances. Voltaire mentions this (*Siècle*, ch. ii.) as a little known and absurd fact. Louis XV., in turn, was called *Le Bien-Aimé* on the occasion of his being nationally prayed for in a dangerous illness. He was not generally or popularly so named, and was indeed often spoken of with contempt as early as 1740. Cp. Rocquain, *L'Esprit révolutionnaire avant la Révolution*, 1878, p. 108.—Ed.]

by the most stringent laws.* It was protected by those prejudices which each generation bequeathed to its successor. It was protected by that halo which time had thrown round the oldest monarchy in Europe.[285] And, above all, it was protected by that miserable national vanity which made men submit to taxation and to slavery in order that foreign princes might be dazzled by the splendour of their sovereign, and foreign countries intimidated by the greatness of his victories.

The upshot of all this was that when, early in the eighteenth century, the intellect of France began to be roused into action, the idea of attacking the abuses of the monarchy never occurred even to the boldest thinker. But under the protection of the crown there had grown up another institution, about which less delicacy was felt. The clergy, who for so long a period had been allowed to oppress the consciences of men, were not sheltered by those national associations which surrounded the person of the sovereign; nor had any of them, with the single exception of Bossuet, done much to increase the general reputation of France. Indeed the French church, though during the reign of Louis XIV. it possessed immense authority, had always exercised it in subordination to the crown, at whose bidding it had not feared to oppose even the pope himself.[286] It was therefore natural that in France the ecclesiastical power should be attacked before the temporal power; because, while it was as despotic, it was less influential, and because it was unprotected by those popular traditions which form the principal support of every ancient institution.

These considerations are sufficient to explain why it was that, in this respect, the French and English intellects adopted courses so entirely different. In England, the minds of men, being less hampered with the prejudices of an indiscriminate loyalty, have been able at each successive step in the great progress to direct their doubts and inquiries on politics as well as on religion; and thus establishing their freedom, as they diminished their superstition, they have maintained the balance of the national intellect without allowing to either of its divisions an excessive preponderance. But in France the admiration for royalty had become so great that this balance was disturbed; the inquiries of men, not daring to settle on politics, were fixed on religion, and gave rise to the singular phenomenon of a rich and powerful literature in which unanimous hostility to the church was unaccompanied by a single voice against the enormous abuses of the state. There was likewise another circumstance which increased this peculiar tendency. During the reign of Louis XIV. the personal character of the hierarchy had done much to secure their dominion. All the leaders of the church were men of virtue, and many were men of ability. Their conduct, tyrannical as it was, seems to have been conscientious; and the evils which it produced are merely to be ascribed to the gross impolicy of intrusting ecclesiastics with power. But after the death of Louis XIV. a great change took place. The clergy, from causes which it would be tedious to investigate, became extremely dissolute, and often very ignorant. This made their tyranny more oppressive,

[285] "La race des rois la plus ancienne." *Mém. de Genlis*, vol. ix. p. 281. "Nos rois, issus de la plus grande race du monde, et devant qui les Césars, et la plus grande partie des princes qui jadis ont commandé tant de nations, ne sont que des roturiers." *Mém. de Motteville*, vol. ii. p. 417. And a Venetian ambassador, in the sixteenth century, says, that France "è regno più antico d' ogn' altro che sia in essere al presente." *Relat. des Ambassad.* vol. i. p. 470. Compare *Boullier, Maison Militaire des Rois de France*, p. 360.

[286] *Capefigue's Louis XIV.* vol. i. pp. 204, 301; *Koch, Tableau des Révolutions*, vol. ii. p. 16. M. Ranke (*Die Päpste*, vol. ii. p. 257) ascribes this to the circumstances attending the apostasy of Henry IV.; but the cause lies much deeper, being connected with that triumph of the secular interests over the spiritual, of which the policy of Henry IV. was itself a consequence.

[* In point of fact there appeared in 1717 an audacious libel on the Regent, entitled *Les Philippiques*, and Voltaire, who was falsely suspected of writing it, was imprisoned as above mentioned.—ED.]

because to submit to it was more disgraceful. The great abilities and unblemished morals of men like Bossuet, Fénelon, Bourdaloue, Fleéchier, and Mascaron diminished in some degree the ignominy which is always connected with blind obedience. But when they were succeeded by such bishops and cardinals as Dubois, Lafiteau, Tencin, and others who flourished under the regency, it became difficult to respect the heads of the church, tainted as they were with open and notorious depravity.[287] At the same time that there occurred this unfavourable change among the ecclesiastical rulers, there also occurred that immense reaction of which I have endeavoured to trace the early workings. It was therefore at the very moment when the spirit of inquiry became stronger, that the character of the clergy became more contemptible.[288] The great writers who were now rising in France were moved to indignation when they saw that those who usurped unlimited power over consciences had themselves no consciences at all. It is evident that every argument which they borrowed from England against ecclesiastical power would gain additional force when directed against men whose personal unfitness was universally acknowledged.[289]

Such was the position of the rival parties when, almost immediately after the death of Louis XIV., there began that great struggle between authority and reason which is still unfinished, although in the present state of knowledge its result is no longer doubtful. On the one side there was a compact and numerous priesthood, supported by the prescription of centuries and by the authority of the crown. On the other side there was a small body of men, without rank, without wealth, and as yet without reputation, but animated by a love of liberty and by a just confidence in their own abilities. Unfortunately, they at the very outset committed a serious error. In attacking the clergy, they lost their respect for religion. In their determination to weaken ecclesiastical power, they attempted to undermine the foundations of Christianity.* This is deeply to be regretted for their own sake, as well as for its ultimate effects in France ; but it must not be imputed to them as a crime, since it was forced on them by the exigencies of their position. They saw the frightful evils which their country was suffering from the institution of priesthood as it then existed ; and yet they

[287] *Lavallée, Hist. des Français*, vol. iii. p. 408 ; *Flassan, Hist. de la Diplomatie*, vol. v, p. 3 ; *Tocqueville, Règne de Louis XV.*, vol. i. pp. 35, 347 ; *Duclos, Mémoires*, vol. ii. pp. 42, 43, 154, 155, 223, 224. What was if possible still more scandalous, was that in 1723 the assembly of the clergy elected as their president, unanimously (" d'une voix unanime "), the infamous Dubois, the most notoriously immoral man of his time. *Duclos, Mém.* vol. ii. p. 262.

[288] On this decline of the French clergy, see *Villemain, XVIII^e Siècle*, vol. iii. pp. 178, 179 ; *Cousin, Hist. de la Philos.* II. série, vol. i. p. 301. *Tocqueville* (*Règne de Louis XV.* vol. i. pp. 35–38, 365) says, " le clergé prêchait une morale qu'il compromettait par sa conduite ; " a noticeable remark, when made by an opponent of the sceptical philosophy, like the elder M. Tocqueville. Among this profligate crew, Massillon stood alone ; he being the last French bishop who was remarkable for virtue as well as for ability.

[289] Voltaire says of the English, " quand ils apprennent qu'en France de jeunes gens connus par leurs débauches, et élevés à la prélature par des intrigues de femmes, font publiquement l'amour, s'égaient à composer des chansons tendres, donnent tous les jours des soupers délicats et longs, et de là vont implorer les lumières du Saint-Esprit, et se nomment hardiment les successeurs des apôtres ; ils remercient Dieu d'être protestants." *Lettres sur les Anglais*, in *Œuvres*, vol. xxvi. p. 29.

[* Buckle appears here to have forgotten that in the model society of England a general attack on the foundations of Christianity had been going on almost continuously for a generation—from Collins to Dodwell : 1713 to 1743—before anything similarly outspoken appeared in France. There were very few freethinking publications in France before 1750 ; and French Deism was latterly a development from English, though Voltaire was a deist before he came to England. And although he made a hostile allusion to priests in his *Œdipe* (1718), his first writings on religious subjects (*e.g.* the *Épitre à Uranie*, written in 1722) were directed not against priests but against Christian dogmas.—Ed.]

were told that the preservation of that institution in its actual form was essential to the very being of Christianity. They had always been taught that the interests of the clergy were identical with the interests of religion ; how then could they avoid including both clergy and religion in the same hostility ? The alternative was cruel ; but it was one from which, in common honesty, they had no escape. We, judging these things by another standard, possess a measure which they could not possibly have. We should not now commit such an error, because we know that there is no connexion between any one particular form of priesthood and the interests of Christianity. We know that the clergy are made for the people, and not the people for the clergy. We know that all questions of church-government are matters not of religion but of policy, and should be settled not according to traditional dogmas but according to large views of general expediency. It is because these propositions are now admitted by all enlightened men that in our country the truths of religion are rarely attacked except by superficial thinkers. If, for instance, we were to find that the existence of our bishops, with their privileges and their wealth, is unfavourable to the progress of society, we should not on that account feel enmity against Christianity ; because we should remember that episcopacy is its accident and not its essential, and that we could do away with the institution and yet retain the religion. In the same way, if we should ever find, what was formerly found in France, that the clergy were tyrannical, this would excite in us an opposition, not to Christianity, but merely to the external form which Christianity assumed. So long as our clergy confine themselves to the beneficent duties of their calling, to the alleviation of pain and distress, either bodily or mental, so long will we respect them as the ministers of peace and of charity. But if they should ever again entrench on the rights of the laity,—if they should ever again interfere with an authoritative voice in the government of the State,—it will then be for the people to inquire whether the time has not come to effect a revision of the ecclesiastical constitution of the country. This, therefore, is the manner in which we now view these things. What we think of the clergy will depend upon themselves, but will have no connexion with what we think of Christianity. We look on the clergy as a body of men who, notwithstanding their disposition to intolerance, and notwithstanding a certain narrowness incidental to their profession, do undoubtedly form part of a vast and noble institution, by which the manners of men have been softened, their sufferings assuaged, their distresses relieved. As long as this institution performs its functions, we are well content to let it stand. If however it should be out of repair, or if it should be found inadequate to the shifting circumstances of an advancing society, we retain both the power and the right of remedying its faults ; we may, if need be, remove some of its parts ; but we would not, we dare not, tamper with those great religious truths which are altogether independent of it ; truths which comfort the mind of man, raise him above the instincts of the hour, and infuse into him those lofty aspirations which, revealing to him his own immortality, are the measure and the symptom of a future life.*

Unfortunately, this was not the way in which these matters were considered in France. The government of that country, by investing the clergy with great immunities, by treating them as if there were something sacred about their persons, and by punishing as heresy the attacks which were made on them, had established in the national mind an indissoluble connexion between their interests and the interests of Christianity. The consequence was that when the struggle began, the ministers of religion, and religion itself, were both assailed with equal zeal. The ridicule, and even the abuse, heaped on the clergy, will surprise no one who is acquainted with the provocation that had been received. And although, in the indiscriminate onslaught which soon followed, Christianity was for a time subjected to a fate which ought to have been reserved for those who called themselves her ministers, this, while it moves us to regret, ought by no means to excite our astonishment. The destruction of Christianity in France

[* See note above, p. 200.—Ed.]

was the necessary result of those opinions which bound up the destiny of the national priesthood with the destiny of the national religion. If both were connected by the same origin, both should fall in the same ruin. If that which is the tree of life were in reality so corrupt that it could only bear poisonous fruits, then it availed little to lop off the boughs and cut down the branches ; but it were better, by one mighty effort, to root it up from the ground, and secure the health of society by stopping the very source of the contagion.

These are reflections which must make us pause before we censure the deistical writers of the eighteenth century. So perverted, however, are the reasonings to which some minds are accustomed, that those who judge them most uncharitably are precisely those whose conduct forms their best excuse. Such are the men who, by putting forth the most extravagant claims in favour of the clergy, are seeking to establish the principle by the operation of which the clergy were destroyed. Their scheme for restoring the old system of ecclesiastical authority depends on the supposition of its divine origin ; a supposition which, if inseparable from Christianity, will at once justify the infidelity which they hotly attack. The increase of the power of the clergy is incompatible with the interests of civilization. If, therefore, any religion adopts as its creed the necessity of such an increase, it becomes the bounden duty of every friend to humanity to do his utmost either to destroy the creed or, failing in that, to overturn the religion. If pretensions of this sort are an essential part of Christianity, it behoves us at once to make our choice ; since the only option can be between abjuring our faith and sacrificing our liberty. Fortunately we are not driven to so hard a strait ; and we know that these claims are as false in theory as they would be pernicious in practice. It is indeed certain that if they were put into execution, the clergy, though they might enjoy a momentary triumph, would have consummated their own ruin, by preparing the way among us for scenes as disastrous as those which occurred in France.

The truth is that what is most blamed in the great French writers was the natural consequence of the development of their age. Never was there a more striking illustration of the social law already noticed, that if government will allow religious scepticism to run its course, it will issue in great things, and will hasten the march of civilization ; but that if an attempt is made to put it down with a strong hand it may no doubt be repressed for a time, but eventually will rise with such force as to endanger the foundation of society. In England we adopted the first of these courses ; in France they adopted the second. In England men were allowed to exercise their own judgment on the most sacred subjects ; and, as soon as the diminution of their credulity had made them set bounds to the power of the clergy, toleration immediately followed, and the national prosperity has never been disturbed.* In France, the authority of the clergy was increased by a superstitious king ; faith usurped the place of reason, not a whisper of doubt was allowed to be heard, and the spirit of inquiry was stifled, until the country fell to the brink of ruin. If Louis XIV. had not interfered with the natural progress, France, like England, would have continued to advance. After his death, it was, indeed, too late to save the clergy, against whom all the intellect of the nation was soon arrayed. But the force of the storm might still have been broken, if the government of Louis XV. had conciliated what it was impossible to resist ; and, instead of madly attempting to restrain opinions by laws, had altered the laws to suit the opinions. If the rulers of France, instead of exerting themselves to silence the national literature, had yielded to its suggestions, and had receded before the pressure of advancing knowledge, the fatal collision would have been avoided ; because the passions which caused the collision would have been appeased. In such case, the Church would have fallen somewhat earlier ; but the State itself would have been saved. In such case, France would, in all probability, have secured her liberties, without

[* Buckle appears to have forgotten his own demonstration (above, pp. 251–283) that the "national prosperity" in England was very much disturbed in the period of the reaction against the French Revolution.—Ed.]

increasing her crimes; and that great country, which, from her position and resources, ought to be the pattern of European civilization, might have escaped the ordeal of those terrible atrocities through which she was compelled to pass, and from the effects of which she has not yet recovered.

It must, I think, be admitted that during at all events the first half of the reign of Louis XV., it was possible, by timely concessions, still to preserve the political institutions of France. Reforms there must have been; and reforms too of a large and uncompromising character. So far however as I am able to understand the real history of that period, I make no doubt that if these had been granted in a frank and ungrudging spirit, everything could have been retained necessary for the only two objects at which government ought to aim, namely, the preservation of order and the prevention of crime. But, by the middle of the reign of Louis XV., or, at all events, immediately afterwards, the state of affairs began to alter; and, in the course of a few years, the spirit of France became so democratic, that it was impossible even to delay a revolution, which, in the preceding generation, might have been altogether averted. This remarkable change is connected with that other change already noticed, by virtue of which the French intellect began, about the same period, to direct its hostility against the State, rather than, as heretofore, against the Church.* As soon as this, which may be called the second epoch of the eighteenth century, had been fairly entered, the movement became irresistible. Event after event followed each other in rapid succession; each one linked to its antecedent, and the whole forming a tendency impossible to withstand. It was in vain that the government, yielding some points of real importance, adopted measures by which the Church was controlled, the power of the clergy diminished, and even the order of the Jesuits suppressed. It was in vain that the crown now called to its councils, for the first time, men imbued with the spirit of reform; men like Turgot and Necker, whose wise and liberal proposals would in calmer days have stilled the agitation of the popular mind. It was in vain that promises were made to equalize the taxes, to redress some of the most crying grievances, to repeal some of the most obnoxious laws. It was even in vain that the states-general were summoned, and that thus, after the lapse of a hundred and seventy years, the people were again admitted to take part in the management of their own affairs. All these things were in vain, because the time for treaty had gone by, and the time for battle had come. The most liberal concessions that could possibly have been devised would have failed to avert that deadly struggle which the course of preceding events made inevitable.† For the measure of that age was now full. The upper classes, intoxicated by the long possession of power, had provoked the crisis; and it was needful that they should abide the issue. There was no time for mercy; there was no pause, no compassion, no sympathy. The only question that remained was, to see whether they who had raised the storm could ride the whirlwind; or whether it was not rather likely that they should be the first victims of that frightful hurricane in which, for a moment, laws, religion, morals, all perished, the lowest vestiges of humanity were effaced,

[* There was no such change of direction as is here implied. The polemic against the reigning religion increased in quantity step for step with the development of the political discussion, the bulk of the former being dated after 1750. The error in the text, which is frequently repeated in a later chapter, seems to have been set up by a misreading of some writer's generalization to the effect that whereas the *opposition to the government* in the early years of Louis XV. was religious, it afterwards became political. (See this well brought out by Rocquain, *L'esprit révolutionnaire avant la Révolution*, 1878.) But the opposition in question was quite a different thing from the *opposition to religion* by the freethinkers, which spread side by side with the political development. Not till 1771 did it slacken (Rocquain, p. 297).—Ed.]

[† It is not clear how such a proposition can be proved, if by "crisis" and "hurricane" are meant the Reign of Terror. That was the result not of liberal concessions, but of the attempt to work by violence a counter-revolution. But for such resistance there need have been no panic and no bloodshed.—Ed.]

and the civilization of France not only submerged, but, as it then appeared, irretrievably ruined.

To ascertain the successive changes of this, the second epoch of the eighteenth century, is an undertaking full of difficulty ; not only on account of the rapidity with which the events occurred, but also on account of their extreme complication, and of the way in which they acted and reacted upon each other. The materials, however, for such an inquiry are very numerous ; and, as they consist of evidence supplied by all classes and all interests, it has appeared to me possible to reconstruct the history of that time according to the only manner in which history deserves to be studied ; that is to say, according to the order of its social and intellectual development. In the fourteenth chapter of the present volume, I shall therefore attempt to trace the antecedents of the French Revolution during that remarkable period in which the hostility of men, slackening in regard to the abuses of the Church, was for the first time turned against the abuses of the State. But before entering into this, which may be distinguished as the political epoch of the eighteenth century, it will be necessary, according to the plan which I have sketched, to examine the changes that occurred in the method of writing history, and to indicate the way in which those changes were affected by the tendencies of the earlier, or, as it may be termed, the ecclesiastical epoch. In this manner, we shall the more easily understand the activity of that prodigious movement which led to the French Revolution ; because we shall see that it not only affected the opinions of men in regard to what was passing under their eyes, but that it also biased their speculative views in regard to the events of preceding ages ; and thus gave rise to that new school of historical literature, the formation of which is by no means the least of the many benefits which we owe to the great thinkers of the eighteenth century.

CHAPTER XIII

State of Historical Literature in France from the End of the Sixteenth to the End of the Eighteenth Century

It may be easily supposed that those vast movements in the intellect of France which I have just traced could not fail to produce a great change in the method of writing history. That bold spirit with which men were beginning to estimate the transactions of their own time was sure to influence their opinions respecting those of a former age. In this as in every branch of knowledge the first innovation consisted in recognizing the necessity of doubting what had hitherto been believed ; and this feeling, when once established, went on increasing, destroying at each step some of those monstrous absurdities by which, as we have seen, even the best histories were disfigured. The germs of the reform may be discerned in the fourteenth century, though the reform itself did not begin until late in the sixteenth century. During the seventeenth century it advanced somewhat slowly ; but in the eighteenth century it received a sudden accession of strength, and in France in particular it was hastened by that fearless and inquisitive spirit which characterized the age, and which, purging history of innumerable follies, raised its standard, and conferred on it a dignity hitherto unknown. The rise of historical scepticism, and the extent to which it spread, do indeed form such curious features in the annals of the European intellect as to make it surprising that no one should have attempted to examine a movement to which a great department of modern literature owes its most valuable peculiarities. In the present chapter I hope to supply this deficiency so far as France is concerned ; and I shall endeavour to mark the different steps by which the progress was effected, in order that, by knowing the circumstances most favourable to the study of history, we may with the greater ease inquire into the probability of its future improvement.

There is, in reference to this subject, a preliminary consideration well worthy of notice. This is, that men seem always to have begun to doubt in matters of religion before they ventured to do so in matters of history. It might have been expected that the reproaches, and, in a superstitious age, the dangers, to which heresy is exposed, would have intimidated inquirers, and would have induced them to prefer the safer path of directing their scepticism upon questions of literary speculation. Such, however, is by no means the course which the human mind has adopted. In an early stage of society, when the clergy had universal influence, a belief in the unpardonable criminality of religious error is so deeply rooted, that it engrosses the attention of all ; it forces every one who thinks to concentrate upon theology his reflections and his doubts, and it leaves no leisure for topics which are conceived to be of inferior importance.[1] Hence,

[1] See some very just remarks in *Whewell's Philos. of the Induc. Sciences*, vol. ii. p. 143. In *Neander's Hist. of the Church*, vol. iv. pp. 41, 128, there are two curious illustrations of the universal interest which theological discussions once inspired in Europe ; and on the former subservience of philosophy to theology, compare *Hamilton's Discussions on Philosophy*, p. 197. But no one has treated this subject so ably as M. Auguste Comte, in his great work, *Philosophie Positive*. The service which the metaphysicians rendered to the Church by their development of the doctrine of transubstantiation (*Blanco White's Evidence against Catholicism*, pp. 256–258) is a striking instance of this subordination of the intellect to ecclesiastical dogmas.

during many centuries, the subtlest intellects of Europe exhausted their strength on the rites and dogmas of Christianity ; and while upon these matters they often showed the greatest ability, they upon other subjects, and especially upon history, displayed that infantine credulity of which I have already given several examples.

But when, in the progress of society, its theological element begins to decay, the ardour with which religious disputes were once conducted becomes sensibly weakened. The most advanced intellects are the first to feel the growing indifference, and therefore they are also the first to scrutinize real events with that inquisitive eye which their predecessors had reserved for religious speculations. This is a great turning-point in the history of every civilized nation. From this moment theological heresies become less frequent,[2] and literary heresies become more common. From this moment the spirit of inquiry and of doubt fastens itself upon every department of knowledge, and begins that great career of conquest in which by every succeeding discovery the power and dignity of man are increased, while at the same time most of his opinions are disturbed, and many of them are destroyed ; until, in the march of this vast but noiseless revolution, the stream of tradition is as it were interrupted, the influence of ancient authority is subverted, and the human mind, waxing in strength, learns to rely upon its own resources, and to throw off incumbrances by which the freedom of its movements had long been impaired.

The application of these remarks to the history of France will enable us to explain some interesting phenomena in the literature of that country. During the whole of the Middle Ages, and I may say till the end of the sixteenth century, France, though fertile in annalists and chroniclers, had not produced a single historian, because she had not produced a single man who presumed to doubt what was generally believed.* Indeed, until the publication of Du Haillan's history of the kings of France, no one had even attempted a critical digest of the materials which were known to be extant. This work appeared in 1576 ;[3] and the author, at the conclusion of his labours, could not disguise the pride which he felt at having accomplished so great an undertaking. In his dedication to the king he says, " I am, sire, the first of all the French who have written the history of France, and, in a polite language, shown the grandeur and dignity of our kings ; for before there was nothing but the old rubbish of chronicles which spoke of them." He adds in the preface : " Only I will say, without presumption

[2] M. Tocqueville says, what I am inclined to think is true, that an increasing spirit of equality lessens the disposition to form new religious creeds. *Démocratie en Amérique*, vol. iv. pp. 16, 17. At all events, it is certain that increasing knowledge has this effect ; for those great men whose turn of mind would formerly have made them heretics, are now content to confine their innovations to other fields of thought. If St. Augustin had lived in the seventeenth century, he would have reformed or created the physical sciences. If Sir Isaac Newton had lived in the fourth century, he would have organized a new sect, and have troubled the church with his originality. [As a matter of fact, the growth of the spirit of equality *did* evoke a multitude of new sects in Holland and England in the seventeenth century. See above, ch. vii. at note 19, the allusion to " a thousand sects." —Ed.]

[3] *Biog. Univ.* vol. xix. pp. 315, 316 ; where it is said, " l'ouvrage de Du Haillan est remarquable, en ce que c'est le premier corps d'histoire de France qui ait paru dans notre langue." See also *Dacier, Rapport sur les Progrès de l'Histoire*, p. 170 ; and *Des Réaux, Historiettes*, vol. x. p. 185.

[* This too sweeping statement does injustice to the immense labours of Joseph Scaliger on the chronological side of history, and to such historical researches as those of Francis Hotman (*Franco-Gallia*, 1573) and Etienne Pasquier (*Recherches de la France*, 1560 and thereafter), concerning whom see Prof. Flint, *History of the Philosophy of History*, 1893, pp. 187–190. Compare also the closing sentence of par. 2 in ch. ix. above, and note 2 thereafter, where assertions are made that do not quadrate with the present generalization.—Ed.]

and boasting that I have done a thing which had not been done before, or seen by any of our nation, and have given to the history of France a dress it never appeared in before." [4] Nor were these the idle boasts of an obscure man. His work went through numerous editions; was translated into Latin, and was reprinted in foreign countries. He himself was looked upon as one of the glories of the French nation, and was rewarded by the favour of the king, who conferred on him the office of secretary of finance.[5] From his work we may, therefore, gain some notion of what was then the received standard of historical literature; and with this view, it is natural to inquire what the materials were which he chiefly employed. About sixty years earlier, an Italian named Paulus Emilius had published a gossiping compilation on "the Actions of the French." [6] This book, which is full of extravagant fables, was taken by Du Haillan as the basis of his famous history of the kings of France; and from it he unhesitatingly copies those idle stories which Emilius loved to relate. This will give us some idea of the credulity of a writer who was reckoned by his contemporaries to be, beyond all comparison, the greatest historian France had produced. But this is not all. Du Haillan, not content with borrowing from his predecessor everything that was most incredible, gratifies his passion for the marvellous by some circumstances of his own invention. He begins his history with a long account of a council which, he says, was held by the celebrated Pharamond, in order to determine whether the French should be governed by a monarchy or by an aristocracy. It is, indeed, doubtful if any such person as Pharamond ever existed; and it is certain that if he did exist, all the materials had long perished from which an opinion could be formed respecting him.[7] But Du Haillan, regardless of these little difficulties, gives us the fullest information touching the great chieftain; and, as if determined to tax to the utmost the credulity of his readers, mentions, as members of the council of Pharamond, two persons, Charamond and Quadrek, whose very names are invented by the historian.[8]

Such was the state of historical literature in France early in the reign of Henry III. A great change was, however, at hand. The remarkable intellectual progress made by the French towards the close of the sixteenth century was, as I have shown, preceded by that scepticism which appears to be its necessary

[4] *Bayle*, article *Haillan*, note L.

[5] *Mercure François*, in *Bayle*, article *Haillan*, note D.

[6] *De Rebus gestis Francorum*, which appeared about 1516. *Biog. Univ.* vol. xiii. p. 119 Compare, respecting the author, *Mezeray, Hist. de France*, vol. ii. p. 363, with *Audigier, l'Origine des François*, vol. ii. p. 118, who complains of his opinion about Clovis, "quoy qu'il fasse profession de relever la gloire des François." Even the superficial Boulainvilliers (*Hist. de l'Ancien Gouvernement*, vol. ii. p. 166) contemptuously notices "les rétoriciens postérieurs, tels que Paul Emile."

[7] Compare *Sismondi, Hist. des Français*, vol. i. pp. 176, 177, with *Montlosier, Monarchie Française*, vol. i. pp. 43, 44. Philippe de Comines, though superior to Sismondi and Montlosier in point of ability, lived in the middle ages, and therefore had no idea of doubting, but simply says, "Pharamond fut esleu roy, l'an 420, et regna dix ans." *Mém. de Comines*, livre viii. chap. xxvii. vol. iii. p. 232. But De Thou, coming a hundred years after Comines, evidently suspected that it was not all quite right, and therefore puts it on the authority of others. "Pharamond, qui *selon nos historiens* a porté le premier la couronne des François." *De Thou, Hist. Univ.* vol. x. p. 530. See a singular passage on Pharamond in *Mém. de Duplessis Mornay*, vol. ii. p. 405.

[8] Sorel (*La Bibliothèque Françoise*, Paris, 1667, p. 373) says of Du Haillan, "On lui peut reprocher d'avoir donné un commencement fabuleux à son histoire, qui est entièrement de son invention, ayant fait tenir un conseil entre Pharamond et ses plus fidelles conseillers, pour sçauoir si ayant la puissance en main il deuoit reduire les François au gouvernement aristocratique ou monarchique, et faisant faire une harangue à chacun d'eux pour soustenir son opinion. On y voit les noms de Charamond et de Quadrek, personnages imaginaires." Sorel, who had a glimmering notion that this was not exactly the way to write history, adds, "C'est une chose fort surprenante. On est fort peu asseuré si Pharamond fut jamais au monde, et quoy qu'on sçache qu'il y ait esté, c'est une terrible hardiesse d'en raconter des choses qui n'ont aucun appuy."

precursor. The spirit of doubt, which had begun with religion, was communicated to literature. The impulse was immediately felt in every department of knowledge; and now it was that history first emerged from a debasement in which it had for centuries been sunk. On this subject, a mere statement of dates may be of service to those persons who, from a dislike to general reasoning, would otherwise deny the connexion which I wish to establish. In 1588 was published the first sceptical book ever written in the French language.[9] In 1598 the French government, for the first time, ventured upon a great public act of religious toleration. In 1604 De Thou published that celebrated work which is allowed by all critics to be the first great history composed by a Frenchman.[10] And at the very moment when these things were passing, another eminent Frenchman, the illustrious Sully,[11] was collecting the materials for his historical work, which, though hardly equal to that of De Thou, comes immediately after it in ability, in importance, and in reputation. Nor can we fail to remark that both these great historians, who left all their predecessors immeasurably behind them, were the confidential ministers and intimate friends of Henry IV., the first king of France whose memory is stained by the imputation of heresy, and the first who dared to change his religion, not in consequence of any theological arguments, but on the broad and notorious ground of political expediency.[12]

But it was not merely over such eminent historians as these that the sceptical spirit displayed its influence. The movement was now becoming sufficiently active to leave its marks in the writings of far inferior men. There were two particulars in which the credulity of the earlier historians was very striking. These consisted in the uncritical manner in which, by blindly copying their predecessors, they confused the dates of different events; and in the readiness with which they believed the most improbable statements, upon imperfect evidence, and often upon no evidence at all. It is surely a singular proof of that intellectual progress which I am endeavouring to trace, that within a very few years both these sources of error were removed. In 1597 Serres was appointed historiographer of France; and in the same year he published his history of that country.[13] In this work he insists upon the necessity of carefully recording the date of each event; and the example, which he first set, has since his time been generally followed.[14] The importance of this change will be willingly

[9] "Die erste Regung des skeptischen Geistes finden wir in den Versuchen des Michael von Montaigne." *Tennemann, Gesch. der Philos.* vol. ix. p. 443. [As has been above noted (pp. 293–4) this generalization overlooks the work of Bonaventure Desperiers. —Ed.]

[10] The first volume appeared in 1604. See *Le Long, Bibliothèque Historique de la France*, vol. ii. p. 375; and preface to *De Thou, Hist. Univ.* vol. i. p. iv.

[11] Sismondi has scarcely done justice to Sully; but the reader will find a fuller account of him in *Capefigue, Hist. de la Réforme*, vol. viii. pp. 101–117; and a still better one in *Blanqui, Histoire de l'Economie Politique*, vol. i. pp. 347–361.

[12] According to D'Aubigné, the king on his conversion said, "Je ferai voir à tout le monde que je n'ai esté persuadé par autre théologie que la nécessité de l'estat." *Smedley's Reformed Religion in France*, vol. ii. p. 362. That Henry felt this is certain; and that he expressed it to his friends is probable; but he had a difficult game to play with the Catholic church; and in one of his edicts we find "une grande joye de son retour à l'église, dont il attribuoit la cause à la grace du Tout-Puissant, et aux prières de ses fidèles sujets." *De Thou, Hist. Univ.* vol. xii. pp. 105, 106. Compare, at pp. 468, 469, the message he sent to the pope.

[13] *Marchand, Dictionnaire Historique*, vol. ii. pp. 205, 209, La Haye, 1758, folio. This curious and learned work, which is much less read than it deserves, contains the only good account of Serres I have been able to meet with; vol. ii. pp. 197–213.

[14] "On ne prenoit presque aucun soin de marquer les dates des événemens dans les ouvrages historiques. . . . De Serres reconnut ce défaut; et pour y remédier, il rechercha avec beaucoup de soin les dates des événemens qu'il avoit à employer, et les marqua dans son histoire le plus exactement qu'il lui fut possible. Cet exemple a été imité depuis par la plûpart de ceux qui l'ont suivi; et c'est à lui qu'on est redevable de l'avantage

acknowledged by those who are aware of the confusion into which history has been thrown, by the earlier writers having neglected what now seems so obvious a precaution. Scarcely had this innovation been established, when it was followed, in the same country, by another of still greater moment. This was the appearance, in 1621, of a history of France, by Scipio Dupleix, in which for the first time the evidence for historical facts was published with the facts themselves.[15] It is needless to insist upon the utility of a step which, more than any other, has taught historians to be industrious in collecting their authorities, and careful in scrutinizing them.[16] To this may be added, that Dupleix was also the first Frenchman who ventured to publish a system of philosophy in his own language.[17] It is true that the system itself is intrinsically of little value;[18] but at the time it appeared it was an unprecedented and, on that account, a profane attempt to unfold the mysteries of philosophy in the vulgar speech, and in this point of view supplies evidence of the increasing diffusion of a spirit bolder and more inquisitive than any formerly known. It is not therefore surprising that almost at the same moment there should be made, in the same country, the first systematic attempt at historical scepticism. The system of philosophy by Dupleix appeared in 1602; and in 1599, La Popelinière published at Paris what he calls the *History of Histories*, in which he criticizes historians themselves, and examines their works with that sceptical spirit to which his own age was deeply indebted.[19] This able man was also the author of a *Sketch of the New History of the French*; containing a formal refutation of that fable, so dear to the early historians, according to which the monarchy of France was founded by Francus, who arrived in Gaul after the conclusion of the siege of Troy.[20]

qu'on tire d'une pratique si nécessaire et si utile." *Marchand, Dict. Historique*, vol. ii. p. 206.

[15] "Il est le premier historien qui ait cité en marge ses autorités; précaution absolument nécessaire quand on n'écrit pas l'histoire de son temps, à moins qu'on ne s'en tienne aux faits connus." *Œuvres de Voltaire*, vol. xix. p. 95. And the *Biog. Univ.* vol. xii. p. 277, says, "On doit lui faire honneur d'avoir cité en marge les auteurs dont il s'est servi; précaution indispensable, que l'on connaissait peu avant lui, et que les historiens modernes négligent trop aujourd'hui." Bassompierre, who had a quarrel with Dupleix, has given some curious details respecting him and his History; but they are of course not to be relied on. *Mém. de Bassompierre*, vol. iii. pp. 356, 357. Patin speaks favourably of his history of Henry IV. *Lettres de Patin*, vol. i. p. 17; but compare *Sully, Œconomies Royales*, vol. ix. pp. 121, 249.

[16] The ancients, as is well known, rarely took this trouble. *Mure's Hist. of Greek Literature*, vol. iv. pp. 197, 306, 307. But what is much more curious is that even in scientific works there was an equal looseness; and Cuvier says that in the sixteenth century "on se bornait à dire, d'une manière générale, Aristote a dit telle chose, sans indiquer ni le passage ni le livre dans lequel la citation se trouvait." *Cuvier, Hist. des Sciences*, part ii. p. 63; and at p. 88, "suivant l'usage de son temps, Gessner n'indique pas avec précision les endroits d'où il a tiré ses citations"; see also p. 214.

[17] "Le premier ouvrage de philosophie publié dans cette langue." *Biog. Univ.* vol. xii. p. 277.

[18] So it seemed to me, when I turned over its leaves a few years ago. However, Patin says, "sa philosophie françoise n'est pas mauvaise." *Lettres de Patin*, vol. iii. p. 357. On the dialectic powers of Dupleix, see a favourable judgment in *Hamilton's Discuss. on Philos.* p. 119.

[19] *Biog. Univ.* vol. xxxv. p. 402. Sorel (*Bibliothèque Françoise*, p. 165), who is evidently displeased at the unprecedented boldness of La Popelinière, says, "il dit ses sentimens en bref des historiens de toutes les nations, et de plusieurs langues, et particulièrement des historiens françois, dont il parle avec beaucoup d'asseurance."

[20] "Il refute l'opinion, alors fort accréditée, de l'arrivée dans les Gaules de Francus et des Troyens." *Biog. Univ.* vol. xxxv. p. 402. Compare *Le Long, Bibliothèque Historique de la France*, vol. ii. p. 39. Patin says that De Thou was much indebted to him: "M. de Thou a pris hardiment de la Popelinière." *Lettres de Patin*, vol. i. p. 222. There is a notice of Popelinière, in connexion with Richer, in *Mém. de Richelieu*, vol. v. p. 349.

It would be useless to collect all the instances in which this advancing spirit of scepticism now began to purge history of its falsehoods. I will only mention two or three more of those which have occurred in my reading. In 1614, De Rubis published at Lyons a work on the European monarchies; in which he not only attacks the long-established belief respecting the descent from Francus, but boldly asserts that the Franks owe their name to their ancient liberties.[21] In 1620, Gomberville, in a dissertation on history, refutes many of those idle stories respecting the antiquity of the French which had been universally received until his time.[22] And in 1630 Berthault published at Paris the "French Florus," in which he completely upsets the old method; since he lays it down as a fundamental principle that the origin of the French must only be sought for in those countries where they were found by the Romans.[23]

All these, and similar productions, were however entirely eclipsed by Mezeray's History of France; the first volume of which was published in 1643, and the last in 1651.[24] It is perhaps hardly fair to his predecessors to call him the first general historian of France;[25] but there can be no doubt that his work is greatly superior to any that had yet been seen. The style of Mezeray is admirably clear and vigorous, rising at times to considerable eloquence. Besides this, he has two other merits much more important. These are, an indisposition to believe strange things merely because they have hitherto been believed; and an inclination to take the side of the people rather than that of their rulers.[26] Of these principles, the first was too common among the ablest Frenchmen of that time to excite much attention.[27] But the other principle enabled Mezeray to advance an important step before all his contemporaries. He was the first Frenchman who, in a great historical work, threw off that superstitious reverence for royalty which had long troubled the minds of his countrymen, and which indeed continued to haunt them for another century. As a necessary consequence, he was also the first who saw that a history, to be of real value, must be a history not only of kings but of nations.

[21] "Il refute les fables qu'on avançoit sur l'origine des François, appuyées sur le témoignage du faux Bérose. Il dit que leur nom vient de leur ancienne franchise." *Le Long, Bibliothèque Historique*, vol. ii. p. 750.

[22] Compare *Sorel, Bibliothèque Françoise*, p. 298, with *Du Fresnoy, Méthode pour étudier l'Histoire*, vol. x. p. 4, Paris, 1772. There is an account of Gomberville in *Les Historiettes de Tallemant des Réaux*, vol. viii. pp. 15–19; a singularly curious book, which is for the seventeenth century what Brantome is for the sixteenth. I ought to have mentioned earlier the inimitable ridicule with which Rabelais treats the habit historians had of tracing the genealogies of their heroes back to Noah. *Œuvres de Rabelais*, vol. i. pp. 1–3, and vol. ii. pp. 10–17; see also, at vol. v. pp. 171, 172, his defence of the antiquity of Chinon.

[23] "L'auteur croit qu'il ne faut pas la chercher ailleurs que dans le pays où ils ont été connus des Romains, c'est-à-dire entre l'Elbe et le Rhin." *Le Long, Bibliothèque Historique*, vol. ii. p. 56. This work of Berthault's was for many years a text-book in the French colleges. *Biog. Univ.* vol. iv. p. 347.

[24] The first volume in 1643; the second in 1646; and the last in 1651. *Biog. Univ.* vol. xxviii. p. 510.

[25] "The French have now their first general historian, Mezeray." *Hallam's Literature of Europe*, vol. iii. p. 228; and see *Stephen's Lectures on the History of France*, 1851, vol. i. p. 10.

[26] Bayle says that Mezeray is "de tous les historiens celui qui favorise le plus les peuples contre la cour." *Le Long, Bibliothèque Historique*, vol. iii. p. lxxxvi.

[27] Though it did not prevent him from believing that sudden tempests, and unusual appearances in the heavens, were aberrations due to supernatural interference, and, as such, were the prognosticators of political change. *Mezeray, Hist. de France*, vol. i. pp. 202, 228, 238, 241, 317, 792, vol. ii. pp. 485, 573, 1120, vol. iii. pp. 31, 167, 894; instructive passages, as proving that even in powerful minds the scientific and secular method was still feeble.

A steady perception of this principle led him to incorporate into his book matters which, before his time, no one cared to study. He communicates all the information he could collect respecting the taxes which the people had paid; the sufferings they had undergone from the griping hands of their governors; their manners, their comforts, even the state of the towns which they inhabited; in a word, what affected the interests of the French people, as well as what affected the interests of the French monarchy.[28] These were the subjects which Mezeray preferred to insignificant details respecting the pomp of courts and the lives of kings. These were the large and comprehensive matters on which he loved to dwell, and on which he expatiated; not indeed with so much fulness as we could desire, but still with a spirit and an accuracy which entitle him to the honour of being the greatest historian France produced before the eighteenth century.

This was in many respects the most important change which had yet been effected in the manner of writing history. If the plan begun by Mezeray had been completed by his successors, we should possess materials the absence of which no modern researches can possibly compensate. Some things, indeed, we should in that case have lost. We should know less than we now know of courts and of camps. We should have heard less of the peerless beauty of French queens, and of the dignified presence of French kings. We might even have missed some of the links of that evidence by which the genealogies of princes and nobles are ascertained, and the study of which delights the curiosity of antiquarians and heralds. But on the other hand we should have been able to examine the state of the French people during the latter half of the seventeenth century; while, as things now stand, our knowledge of them in that most important period is inferior in accuracy and in extent to the knowledge we possess of some of the most barbarous tribes of the earth.[29] If the example of Mezeray had been followed, with such additional resources as the progress of affairs would have supplied, we should not only have the means of minutely tracing the growth of a great and civilized nation, but we should have materials that would suggest or verify those original principles the discovery of which constitutes the real use of history.

But this was not to be. Unhappily for the interests of knowledge, the march of French civilization was at this period suddenly checked. Soon after the middle of the seventeenth century, that lamentable change took place in France which gave a new turn to the destinies of the nation. The reaction which the spirit of inquiry underwent, and the social and intellectual circumstances which, by bringing the Fronde to a premature close, prepared the way for Louis XIV., have been described in a former part of this volume, where I have attempted to indicate the general effects of the disastrous movement. It now remains for me to point out how this retrogressive tendency opposed obstacles to the improvement of historical literature, and prevented authors, not only from relating with honesty what was passing around them, but also from understanding events which had occurred before their time.

The most superficial students of French literature must be struck by the dearth of historians during that long period in which Louis XIV. held the reins

[28] What he did on these subjects is most remarkable, considering that some of the best materials were unknown, and in manuscript, and that even De Thou gives scarcely any information respecting them; so that Mezeray had no model. See, among other passages which have struck me in the first volume, pp. 145–147, 204, 353, 356, 362–365, 530, 531, 581, 812, 946, 1039. Compare his indignant expressions at vol. ii. p. 721.

[29] Those who have studied the French memoirs of the seventeenth century, know how little can be found in them respecting the condition of the people; while the fullest private correspondence, such as the letters of Sevigné and De Maintenon, is equally unsatisfactory. The greater part of the evidence now extant has been collected by M. Monteil, in his valuable work, *Histoire des divers Etats*; but whoever will put all this together must admit that we are better informed as to the condition of many savage tribes than we are concerning the lower classes of France during the reign of Louis XIV.

of government.[30] To this, the personal peculiarities of the king greatly contributed. His education had been shamefully neglected; and as he never had the energy to repair its deficiencies, he all his life remained ignorant of many things with which even princes are usually familiar.[31] Of the course of past events he knew literally nothing, and he took no interest in any history except the history of his own exploits. Among a free people, this indifference on the part of the sovereign could never have produced injurious results; indeed, as we have already seen, the absence of royal patronage is in a highly civilized country the most favourable condition of literature. But at the accession of Louis XIV. the liberties of the French were still too young, and the habits of independent thought too recent, to enable them to bear up against that combination of the crown and the church which was directed against them.* The French, becoming every day more servile, at length sunk so low that, by the end of the seventeenth century, they seemed to have lost even the wish of resistance. The king, meeting no opposition, endeavoured to exercise over the intellect of the country an authority equal to that with which he conducted its government.[32] In all the great questions of religion and of politics, the spirit of inquiry was stifled, and no man was allowed to express an opinion unfavourable to the existing state of things. As the king was willing to endow literature, he naturally thought that he had a right to its services. Authors who were fed by his hand were not to raise their voices against his policy. They received his wages, and they were bound to do the bidding of him who paid them. When Louis assumed the government, Mezeray was still living; though I need hardly say that his great work was published before this system of protection and patronage came into play. The treatment to which he, the great historian of France, was now subjected, was a specimen of the new arrangement. He received from the crown a pension of four thousand francs; but when he in 1668 published an abridgment of his History,[33] it was intimated to him, that some remarks upon the tendency of taxation were likely to cause offence in high quarters.

[30] This is noticed in *Sismondi, Hist. des Français*, vol. xxvii. pp. 181, 182; also in *Villemain, Littérature Française*, vol. ii. pp. 29, 30. Compare *D'Argenson, Réflexions sur les Historiens François*, in *Mémoires de l'Académie des Inscriptions*, vol. xxviii. p. 627, with *Boulainvilliers, Ancien Gouvernement de la France*, vol. i. p. 174.

[31] "Le jeune Louis XIV n'avait reçu aucune éducation intellectuelle." *Capefigue's Richelieu, Mazarin et la Fronde*, vol. ii. p. 245. On the education of Louis XIV. which was as shamefully neglected as that of our George III., see *Lettres inédites de Maintenon*, vol. ii. p. 369; *Duclos, Mém. Secrets*, vol. i. pp. 167, 168; *Mém. de Brienne*, vol. i. pp. 391–393.

[32] On his political maxims, see *Lemontey, Etablissement de Louis XIV.*, pp. 325–327, 407, 408. The eloquent remarks made by M. Ranke upon an Italian despotism are admirably applicable to his whole system: "Sonderbare Gestalt menschlichen Dinge! Die Kräfte des Landes bringen den Hof hervor, der Mittelpunkt des Hofes ist der Fürst, das letzte Product des gesammten Lebens ist zuletzt das Selbstgefühl des Fürsten." *Die Päpste*, vol. ii. p. 266.

[33] His *Abrégé Chronologique* was published in 1668, in three volumes quarto. *Biog. Univ.* vol. xxviii. p. 510. Le Long (*Bibliothèque Historique*, vol. iii. p. lxxxv.) says, that it was only allowed to be published in consequence of a "privilége" which Mezeray had formerly obtained. But there seems to have been some difficulty, of which these writers are not aware: for Patin, in a letter dated Paris, 23 December, 1664, speaks of it as being then in the press: "on imprime ici en grand-in-quarto un Abrégé de l'Histoire de France, par M. Mezeray." *Lettres de Patin*, vol. iii. p. 503; compare p. 665. It long remained an established school-book: see D'Argenson's Essay, in *Mém. de l'Académie*, vol. xxviii. p. 635; and *Works of Sir William Temple*, vol. iii. p. 70.

[* It will be observed that Buckle here lapses into a denial of his own previous argument, though, half conscious of his inconsistency, he tries to save his case. He distinctly ascribes the backwardness of history in France under Louis XIV. to the neglect of the king, and calls the withdrawal of Mezeray's pension a "punishment."—Ed.]

As, however, it was soon found that Mezeray was too honest and too fearless to retract what he had written, it was determined to have recourse to intimidation, and half of his pension was taken from him.[34] But as this did not produce a proper effect, another order was issued, which deprived him of the remaining half; and thus early, in this bad reign, there was set an example of punishing a man for writing with honesty upon a subject in which, of all others, honesty is the first essential.[35]

Such conduct as this showed what historians were to expect from the government of Louis XIV. Several years later, the king took another opportunity of displaying the same spirit. Fénelon had been appointed preceptor to the grandson of Louis, whose early vices his firmness and judgment did much to repress.[36] But a single circumstance was thought sufficient to outweigh the immense service which Fénelon thus rendered to the royal family, and, if his pupil had come to the throne, would have rendered prospectively to the whole of France. His celebrated romance, *Telemachus*, was published in 1699, as it appears, without his consent.[37] The king suspected that under the guise of a fiction Fénelon intended to reflect on the conduct of government. It was in vain that the author denied so dangerous an imputation. The indignation of the king was not to be appeased. He banished Fénelon from the court; and would never again admit to his presence a man whom he suspected of even insinuating a criticism upon the measures adopted by the administration of the country.[38]

If the king could on mere suspicion thus treat a great writer, who had the rank of an archbishop and the reputation of a saint, it was not likely that he would deal more tenderly with inferior men. In 1681, the Abbé Primi, an Italian, then residing at Paris, was induced to write a history of Louis XIV. The king, delighted with the idea of perpetuating his own fame, conferred several rewards upon the author; and arrangements were made that the work should be composed in Italian, and immediately translated into French. But when the history appeared there were found in it some circumstances which it was thought ought not to have been disclosed. On this account, Louis caused the book to be suppressed, the papers of the author to be seized, and the author himself to be thrown into the Bastille.[39]

Those indeed were dangerous times for independent men; times when no writer on politics or religion was safe, unless he followed the fashion of the

[34] *Barrière, Essai sur les Mœurs du Dix-septième Siècle*, prefixed to *Mém. de Brienne*, vol. i. pp. 129, 130, where reference is made to his original correspondence with Colbert. This treatment of Mezeray is noticed, but imperfectly, in *Boulainvilliers Hist. de l'Ancien Gouvernement*, vol i. p. 196; in *Lemontey, Établissement de Louis*, p. 331; and in *Palissot, Mém. pour l'Hist. de Lit.* vol. ii. p. 161.

[35] In 1685 was published at Paris what was called an improved edition of Mezeray's History; that is, an edition from which the honest remarks were expunged. See *Le Long, Bibliothèque Historique*, vol ii. p. 53, vol. iv. p. 381; and *Brunet, Manuel du Libraire*, vol. iii. p. 383, Paris, 1843. Hampden, who know Mezeray, has recorded an interesting interview he had with him in Paris, when the great historian lamented the loss of the liberties of France. See *Calamy's Life of Himself*, vol. i. pp. 392, 393.

[36] *Sismondi, Hist. des Français*, vol. xxvi. pp. 240, 241.

[37] "Par l'infidélité d'un domestique chargé de transcrire le manuscrit." *Biog. Univ.* vol. xiv. p. 289; and see *Peignot, Dict. des Livres condamnés*, vol. i. pp. 134, 135. It was suppressed in France, and appeared in Holland in the same year, 1699. *Lettres de Sevigné*, vol. vi. pp. 434, 435 note.

[38] "Louis XIV prit le Télémaque pour une personnalité. . . . Comme il (Fénelon) avait déplu au roi, il mourut dans l'exil." *Lerminier, Philos. du Droit*, vol. ii. pp. 219, 220; and see *Siècle de Louis XIV*, chap. xxxii., in *Œuvres de Voltaire*, vol. xx. p. 307.

[39] These circumstances are related in a letter from Lord Preston, dated Paris, 22 July, 1682, and printed in *Dalrymple's Memoirs*, pp. 141, 142, appendix to vol. i. The account given by M. Peignot (*Livres condamnés*, vol. ii. pp. 52, 53) is incomplete, he being evidently ignorant of the existence of Lord Preston's letter.

day, and defended the opinions of the court and the church. The king, who had an insatiable thirst for what he called glory,[40] laboured to degrade contemporary historians into mere chroniclers of his own achievements. He ordered Racine and Boileau to write an account of his reign ; he settled a pension upon them, and he promised to supply them with the necessary materials.[41] But even Racine and Boileau, poets though they were, knew that they would fail in satisfying his morbid vanity ; they therefore received the pension, but omitted to compose the work for which the pension was conferred. So notorious was the unwillingness of able men to meddle with history, that it was thought advisable to beat up literary recruits from foreign countries. The case of the Abbé Primi has just been mentioned ; he was an Italian, and only one year later a similar offer was made to an Englishman. In 1683, Burnet visited France, and was given to understand that he might receive a pension, and that he might even enjoy the honour of conversing with Louis himself, provided he would write a history of the royal affairs ; such history, it was carefully added, being on the " side " of the French king.[42]

Under such circumstances as these, it is no wonder that history, so far as its great essentials are concerned, should have rapidly declined during the power of Louis XIV. It became, as some think, more elegant ; but it certainly became more feeble. The language in which it was composed was worked with great care, the periods neatly arranged, the epithets soft and harmonious. For that was a polite and obsequious age, full of reverence, of duty, and of admiration. In history, as it was then written, every king was a hero, and every bishop was a saint. All unpleasant truths were suppressed ; nothing harsh or unkind was to be told. These docile and submissive sentiments being expressed in an easy and flowing style, gave to history that air of refinement, that gentle, unobtrusive gait, which made it popular with the classes that it flattered. But even so, while its form was polished, its life was extinct. All its independence was gone, all its honesty, all its boldness. The noblest and the most difficult department of knowledge, the study of the movements of the human race, was abandoned to every timid and creeping intellect that cared to cultivate it. There were Boulainvilliers, and Daniel, and Maimbourg, and Varillas, and Vertot, and numerous others, who in the reign of Louis XIV. were believed to be historians ; but whose histories have scarcely any merit, except that of enabling us to appreciate the period in which such productions were admired, and the system of which they were the representatives.

To give a complete view of the decline of historical literature in France, from the time of Mezeray until early in the eighteenth century, would require a summary of every history which was written ; for all of them were pervaded by the same spirit. But, as this would occupy much too large a space, it will probably be thought sufficient if I confine myself to such illustrations as will bring the tendency of the age most clearly before the reader ; and for this purpose I will notice the works of two historians I have not yet mentioned ; one of whom was celebrated as an antiquary, the other as a theologian. Both possessed

[40] An able writer has well called him " glorieux plutôt qu'appréciateur de la vraie gloire." *Flassan, Histoire de la Diplomatie Française*, vol. iv. p. 399.

[41] In 1677, Madame de Sevigné writes from Paris respecting the king : " Vous savez bien qu'il a donné deux mille écus de pension à Racine et à Despréaux, en leur commandant de travailler à son histoire, dont il aura soin de donner des Mémoires." *Lettres de Sevigné*, vol. iii. p. 362. Compare *Eloge de Valincourt*, in *Œuvres de Fontenelle*, vol. vi. p. 383 ; and *Hughes's Letters*, edit. 1773, vol. ii. pp. 74, 75.

[42] Burnet relates this with delightful simplicity : " Others more probably thought that the king, hearing I was a writer of history, had a mind to engage me to write on his side. I was told a pension would be offered me. But I made no steps towards it ; for though I was offered an audience of the king, I excused it, since I could not have the honour to be presented to that king by the minister of England." *Burnet's Own Time*, vol. ii. p. 385.

considerable learning, and one was a man of undoubted genius; their works are, therefore, worth attention, as symptoms of the state of the French intellect late in the seventeenth century.* The name of the antiquary was Audigier; the name of the theologian was Bossuet: and from them we may learn something respecting the way in which, during the reign of Louis XIV., it was usual to contemplate the transactions of past ages.

The celebrated work of Audigier, on the Origin of the French, was published at Paris in 1676.[43] It would be unjust to deny that the author was a man of great and careful reading. But his credulity, his prejudices, his reverence for antiquity, and his dutiful admiration for everything established by the church and the court, warped his judgment to an extent which in our time seems incredible; and, as there are probably few persons in England who have read his once famous book, I will give an outline of its leading views.

In this great history we are told that 3,464 years after the creation of the world, and 590 years before the birth of Christ, was the exact period at which Sigovese, nephew to the king of the Celts, was first sent into Germany.[44] Those who accompanied him were necessarily travellers; and as, in the German language, *wandeln* means *to go*, we have here the origin of the Vandals.[45] But the antiquity of the Vandals is far surpassed by that of the French. Jupiter, Pluto, and Neptune, who are sometimes supposed to be gods, were in reality kings of Gaul.[46] And, if we look back a little further, it becomes certain that Gallus, the founder of Gaul, was no other than Noah himself; for in those days the same man frequently had two names.[47] As to the subsequent history of the French, it was fully equal to the dignity of their origin. Alexander the Great, even in all the pride of his victories, never dared to attack the Scythians, who were a colony sent from France.[48] It is from these great occupiers of France that there have proceeded all the gods of Europe, all the fine arts, and all the sciences.[49] The English themselves are merely a colony of the French, as must be evident to whoever considers the similarity of the words Angles and Anjou;[50] and to this fortunate descent the natives of the British islands

[43] During many years it enjoyed great reputation; and there is no history written in that period respecting which Le Long gives so many details. See his *Bibliothèque Historique de la France*, vol. ii. pp. 13, 14. Compare *La Bibliothèque de Leber*, vol. ii. p. 110, Paris, 1839.

[44] *Audigier, L'Origine des François*, Paris, 1676, vol. i. p. 5. See also p. 45, where he congratulates himself on being the first to clear up the history of Sigovese.

[45] *Audigier*, vol. i. p. 7. Other antiquaries have adopted the same preposterous etymology. See a note in *Kemble's Saxons in England*, vol. i. p. 41.

[46] "Or le plus ancien Jupiter, le plus ancien Neptune, et le plus ancien Pluton, sont ceux de Gaule; ils la divisèrent les premiers en Celtique, Aquitaine et Belgique, et obtinrent chacun une de ces parties en partage. Jupiter, qu'on fait régner au ciel, eut la Celtique. . . . Neptune, qu'on fait régner sur les eaux, et sur les mers, eut l'Aquitaine, qui n'est appellée de la sorte qu'à cause de l'abondance de ses eaux, et de la situation sur l'océan." *Audigier, L'Origine des François*, vol. i. pp. 223, 224.

[47] See his argument, vol. i. pp. 216, 217, beginning, "le nom de Noé, que portèrent les Galates, est Gallus"; and compare vol. ii. p. 109, where he expresses surprise that so little should have been done by previous writers towards establishing this obvious origin of the French.

[48] *Audigier*, vol. i. pp. 196, 197, 255, 256.

[49] "Voilà donc les anciennes divinitez d'Europe, originaires de Gaule, aussi bien que les beaux arts et les hautes sciences." *Audigier*, vol. i. p. 234.

[50] *Ibid.* vol. i. pp. 73, 74. He sums up, "c'en est assez pour relever l'Anjou, à qui cette gloire appartient légitimement."

[* It has to be noted that while he justly criticises Bossuet's work on Universal History, Buckle below incidentally admits the power of the *Histoire des Variations*, which belongs to the historical department. He omits, however, to mention *Huet's Histoire du Commerce et de la Navigation des Anciens* (1716) and *De l'Origine des Romans* (1670), both works of sociological value.—Ed.]

are indebted for such bravery and politeness as they still possess.[51] Several other points are cleared up by this great critic with equal facility. The Salian Franks were so called from the rapidity of their flight ;[52] the Bretons were evidently Saxons ;[53] and even the Scotch, about whose independence so much has been said, were vassals to the kings of France.[54] Indeed, it is impossible to exaggerate the dignity of the crown of France ; it is difficult even to conceive its splendour. Some have supposed that the emperors are superior to the kings of France, but this is the mistake of ignorant men ; for an emperor means a mere military ruler, while the title of king includes all the functions of supreme power.[55] To put the question, therefore, on its real footing, the great king Louis XIV. is an emperor, as have been all his predecessors, the illustrious rulers of France, for fifteen centuries.[56] And it is an undoubted fact that Antichrist, about whom so much anxiety is felt, will never be allowed to appear in the world until the French empire has been destroyed. This, says Audigier, it would be idle to deny ; for it is asserted by many of the saints, and it is distinctly foreshadowed by St. Paul, in his second epistle to the Thessalonians.[57]

Strange as all this appears, there was nothing in it to revolt the enlightened age of Louis XIV. Indeed the French, dazzled by the brilliancy of their prince, must have felt great interest in learning how superior he was to all other potentates, and how he had not only been preceded by a long line of emperors, but was in fact an emperor himself. They must have been struck with awe at the information communicated by Audigier respecting the arrival of Antichrist, and the connexion between that important event and the fate of the French monarchy. They must have listened with pious wonder to the illustration of these matters from the writings of the fathers, and from the epistle to the Thessalonians. All this they would easily receive ; because to worship the king, and venerate the church, were the two cardinal maxims of that age. To obey, and to believe, were the fundamental ideas of a period in which the fine arts did for a time flourish,—in which the perception of beauty, though too fastidious, was undoubtedly keen,—in which taste and the imagination, in its lower departments, were zealously cultivated,—but in which, on the other hand, originality and independence of thought were extinguished, the greatest and the largest topics were forbidden to be discussed, the sciences were almost deserted, reforms and innovations were hated, new opinions were despised, and their authors punished, until at length, the exuberance of genius being tamed into sterility, the national intellect was reduced to that dull and monotonous level which characterizes the last twenty years of the reign of Louis XIV.

In no instance can we find a better example of this reactionary movement than in the case of Bossuet, Bishop of Meaux. The success, and indeed the mere existence, of his work on Universal History becomes from this point of view highly instructive. Considered by itself, the book is a painful exhibition of a great genius cramped by a superstitious age. But considered in reference to the time in which it appeared, it is invaluable as a symptom of the French intellect ; since it proves that towards the end of the seventeenth century, one of the most eminent men, in one of the first countries of Europe, could willingly submit to a prostration of judgment, and could display a blind credulity, of which in our day even the feeblest minds would be ashamed ; and that this, so far from causing scandal, or bringing a rebuke on the head of the author, was received with universal and unqualified applause. Bossuet was a great orator, a consummate dialectician, and an accomplished master of those vague sublimities by which most

[51] Vol. i. pp. 265, 266.
[52] Vol. i. p. 149.

[54] Vol. ii. p. 269.
[55] Vol. ii. p. 124.
[56] Vol. ii. pp. 451–454.
[57] "A quoy nous pourrions joindre un autre monument fort authentique, c'est le résultat de certains pères, et de certains docteurs de l'église, qui tiennent que l'Antechrist ne viendra point au monde qu'après la dissection, c'est-à-dire après la dissipation de nostre empire. Leur fondement est dans la seconde épistre de saint Paul aux Thessaloniciens." *Audigier*, vol. ii. p. 462.

men are easily affected. All these qualities he a few years later employed in the production of what is probably the most formidable work ever directed against Protestantism.[58] But when he, leaving these matters, entered the vast field of history, he could think of no better way of treating his new subject than by following the arbitrary rules peculiar to his own profession.[59] His work is an audacious attempt to degrade history to a mere handmaid of theology.[60] As if, on such matters, doubt were synonymous with crime, he without the slightest hesitation takes everything for granted which the church had been accustomed to believe. This enables him to speak with perfect confidence respecting events which are lost in the remotest antiquity. He knows the exact number of years which have elapsed since the moment when Cain murdered his brother; when the deluge overwhelmed the world; and when Abraham was summoned to his mission.[61] The dates of these and similar occurrences he fixes with a precision which might almost make us believe that they had taken place in his own time, if not under his own eyes.[62] It is true that the Hebrew books on which he willingly relied supply no evidence of the slightest value concerning the chronology even of their own people; while the information they contain respecting other countries is notoriously meagre and unsatisfactory.[63] But so narrow were the views of Bossuet upon history, that with all this he in his own opinion had no concern. The text of the Vulgate declared that these things had happened at a particular time; and a number of holy men, calling themselves the council of the church, had in the middle of the sixteenth century pronounced the Vulgate to be authentic, and had taken upon themselves to place it above all other versions.[64] This theological opinion was accepted by Bossuet as an historical

[58] This is the opinion of Mr. Hallam respecting Bossuet's History of the Variations of Protestant Churches. *Const. Hist.* vol. i. p. 486; compare *Lerminier, Philos. du Droit*, vol. ii p. 86. Attempts have been made by Protestant theologians to retort against the Catholics the arguments of Bossuet, on the ground that religious variations are a necessary consequence of the honest pursuit of religious truth. See *Blanco White's Evidence against Catholicism*, pp. 109–112; and his *Letters from Spain by Doblado*, p. 127. With this I fully agree; but it would be easy to show that the argument is fatal to all ecclesiastical systems with strictly defined creeds, and therefore strikes as heavily against the Protestant churches as against the Catholic. Beausobre, in his acute and learned work on Manichæism, seems to have felt this; and he makes the dangerous admission, "que si l'argument de M. de Meaux vaut quelque chose contre la Réformation, il a la même force contre le Christianisme." *Hist. de Manichée*, vol. i. p. 526. On Bossuet as a controversialist, see *Stäudlin, Geschichte der theologischen Wissenschaften*, vol. ii. pp. 43–45; and for a contemporary opinion of his great work, see a characteristic passage in *Lettres de Sevigné* vol. v. p. 409.

[59] His method is fairly stated by Sismondi, *Hist. des Francais*, vol. xxv. p. 427.

[60] See on this attempt of Bossuet's, some good remarks in *Stäudlin, Geschichte der theologischen Wissenschaften*, vol. ii. p. 198: "Kirche und Christenthum sind für diesen Bischoff der Mittelpunct der ganzen Geschichte. Aus diesem Gesichtspuncte betrachtet er nicht nur die Patriarchen und Propheten, das Judenthum und die alten Weissagungen, sondern auch die Reiche der Welt."

[61] *Bossuet, Discours sur l'Histoire Universelle*, pp. 10, 11, 16, 17; see also, at p. 90, a curious specimen of his chronological calculations.

[62] He says that if the ordinarily received dates of the Pentateuch and the Prophets are not true, then the miracles must fall, and the writings themselves are not inspired. *Hist. Univ.* p. 360. It would be hard to find, even in the works of Bossuet, a more rash assertion than this.

[63] Indeed the Jews have no consecutive chronology before Solomon. See *Bunsen's Egypt*, vol. i. pp. viii. xxv. 170, 178, 185, vol. ii. p. 399.

[64] Doing this, as they did everything else, on account not of reason but of dogma; for, as a learned writer says, "l'Église a bien distingué certains livres en apocryphes et en orthodoxes; elle s'est prononcée d'une manière formelle sur le choix des ouvrages canoniques; néanmoins sa critique n'a jamais été fondée sur un examen raisonné, mais

law; and thus the decision of a handful of cardinals and bishops, in a superstitious and uncritical age, is the sole authority for that early chronology, the precision of which is, to an uninformed reader, a matter of great admiration.[65]

In the same way, because Bossuet had been taught that the Jews are the chosen people of God, he, under the title of Universal History, almost confines his attention to them, and treats this obstinate and ignorant race as if they formed the pivot upon which the affairs of the universe had been made to turn.[66] His idea of an universal history excludes those nations who were the first to reach civilization, and to some of whom the Hebrews owed the scanty knowledge which they subsequently acquired.[67] He says little of the Persians, and less of the Egyptians; nor does he even mention that far greater people between the Indus and the Ganges, whose philosophy formed one of the elements of the school of Alexandria,* whose subtle speculations anticipated all the efforts of European metaphysics, and whose sublime inquiries, conducted in their own exquisite language, date from a period when the Jews, stained with every variety of crime, were a plundering and vagabond tribe, wandering on the face of the earth, raising their hand against every man, and every man raising his hand against them.

When he enters the more modern period, he allows himself to be governed by the same theological prejudices. So contracted is his view, that he considers the whole history of the church as the history of providential interference; and he takes no notice of the manner in which, contrary to the original scheme, it has been affected by foreign events.[68] Thus, for example, the most important fact relating to the early changes in Christianity is the extent to which its doctrines

seulement sur la question de savoir si tel ou tel écrit était d'accord avec les dogmes qu'elle enseignait." *Maury, Légendes Pieuses*, p. 224.

[65] Theologians have always been remarkable for the exactness of their knowledge on subjects respecting which nothing is known; but none of them has surpassed the learned Dr. Stukeley. In 1730, this eminent divine writes: "But according to the calculations I have made of this matter, I find God Almighty ordered Noah to get the creatures into the ark on Sunday, the 12th of October, the very day of the autumnal equinox that year; and on this present day, on the Sunday se'nnight following (the 19th of October), that terrible catastrophe began, the moon being past her third quarter." *Nichols's Illustrations of the Eighteenth Century*, vol. ii. p. 792.

[66] "Premièrement, ces empires ont pour la plupart une liaison nécessaire avec l'histoire du peuple de Dieu. Dieu s'est servi des Assyriens et des Babyloniens pour châtier ce peuple; des Perses pour le rétablir; d'Alexandre et de ses premiers successeurs pour le protéger; d'Antiochus l'Illustre et de ses successeurs pour l'exercer; des Romains pour soutenir sa liberté contre les rois de Syrie, qui ne songeaient qu'à le détruire." *Bossuet, Hist. Univ.* p. 382. Well may M. Lerminier say (*Philos. du Droit*, vol. ii. p. 87), that Bossuet "a sacrifié toutes les nations au peuple juif."

[67] On the extraordinary and prolonged ignorance of the Jews, even to the time of the Apostles, see *Mackay's Progress of the Intellect*, vol. i. pp. 13 seq.: a work of profound learning.

[68] The original scheme of Christianity, as stated by its Great Author (*Matthew* x. 6, and xv. 24), was merely to convert the Jews; and if the doctrines of Christ had never extended beyond that ignorant people, they could not have received those modifications which philosophy imposed upon them. The whole of this subject is admirably discussed in *Mackay's Progress of the Intellect in Religious Development*, vol. ii. pp. 382 seq.; and on the "universalism" first clearly announced "by the Hellenist Stephen," see p. 484. Neander makes a noticeable attempt to evade the difficulty caused by the changes in Christianity from "various outward causes"; see his *History of the Church*, vol. iii. p. 125.

[* For this view there is no good foundation. Any resemblances between Brahmanism and the Alexandrian philosophy are presumably due to common derivations from Mesopotamia.—Ed.]

have been influenced by the African form of the Platonic philosophy.[69] But this Bossuet never mentions ; nor does he even hint that any such thing had occurred. It suited his views to look upon the church as a perpetual miracle, and he, therefore, omits the most important event in its early history.[70] To descend a little later : every one acquainted with the progress of civilization will allow, that no small share of it is due to those gleams of light which, in the midst of surrounding darkness, shot from the great centres of Cordova and Bagdad. These, however, were the work of Mohammedanism ; and as Bossuet had been taught that Mohammedanism is a pestilential heresy, he could not bring himself to believe that Christian nations had derived anything from so corrupt a source. The consequence is, that he says nothing of that great religion the noise of which has filled the world ;[71] and having occasion to mention its founder, he treats him with scorn, as an impudent impostor, whose pretensions it is hardly fitting to notice.[72] The great apostle, who diffused among millions of idolaters the sublime verity of one God, is spoken of by Bossuet with supreme contempt ; because Bossuet, with the true spirit of his profession, could see nothing to admire in those whose opinions differed from his own.[73] But when he has occasion to mention some obscure member of that class to which he himself belonged, then it is that he scatters his praises with boundless profusion. In his scheme of universal history, Mohammed is not worthy to play a part. He is passed by ; but the truly great man, the man to whom the human race is really indebted, is—Martin, Bishop of Tours. He it is, says Bossuet, whose unrivalled actions filled the universe with his fame, both during his lifetime and after his death.[74] It is true that not one

[69] Neander (*Hist. of the Church*, vol. ii. p. 42) even thinks that Cerinthus, whose views are remarkable as being the point where Gnosticism and Judaism touch each other, borrowed his system from Alexandria. But this, though not unlikely, seems only to rest on the authority of Theodoret. On the influence of the Platonism of Alexandria in developing the idea of the Logos, see *Neander*, vol. ii. pp. 304, 306–314. Compare *Sharpe's Hist. of Egypt*, vol. ii. pp. 152 seq.

[70] And having to mention Clemens Alexandrinus, who was more deeply versed in the philosophy of Alexandria than were any of the other fathers, Bossuet merely says, p. 98, " à peu près dans le même temps, le saint prêtre Clément Alexandrin déterra les antiquités du paganisme pour le confondre."

[71] About the time that Bossuet wrote, a very learned writer calculated that the area of the countries which professed Mohammedanism exceeded by one fifth those where Christianity was believed. See *Brerewood's Inquiries touching the Diversity of Languages and Religions*, Lond. 1674, pp. 144, 145. The estimate of Southey (*Vindiciæ Anglicanæ*, London, 1826, p. 48) is very vague ; but it is much easier to judge of the extent of Mohammedan countries than of the extent of their population. On this latter point we have the most conflicting statements. In the nineteenth century there are, according to Sharon Turner (*Hist. of England*, vol. iii. p. 485, edit. 1839), eighty million Mohammedans ; according to Dr. Elliotson (*Human Physiology*, p. 1055, edit. 1840), more than a hundred and twenty-two million ; while, according to Mr. Wilkin (note in *Sir Thomas Browne's Works*, vol. ii. p. 37, edit. 1835), there are a hundred and eighty-eight million.

[72] " Le faux prophète donna ses victoires pour toute marque de sa mission." *Bossuet*, p. 125.

[73] The greatest Mohammedan writers have always expressed ideas regarding the Deity more lofty than those possessed by the majority of Christians. The Koran contains noble passages on the oneness of God ; and for the views of their ordinary theologians I may refer to an interesting Mohammedan sermon, in *Transactions of the Bombay Society*, vol. i. pp. 146–158. See also, in vol. iii. pp. 398–448, an Essay by Vans Kennedy ; and compare a remarkable passage, considering the quarter from which it comes, in *Autobiography of the Emperor Jehangueir*, p. 44. Those who are so thoughtless as to believe that Mohammed was a hypocrite, had better study the admirable remarks of M. Comte (*Philos. Pos.* vol. v. pp. 76, 77), who truly says, " qu'un homme vraiment supérieur n'a jamais pu exercer aucune grande action sur ses semblables sans être d'abord lui-même intimement convaincu."

[74] " Saint Martin fut fait évêque de Tours, et remplit tout l'univers du bruit de sa

educated man in fifty has ever heard the name of Martin, Bishop of Tours. But Martin performed miracles, and the church had made him a saint; his claims, therefore, to the attention of historians must be far superior to the claims of one who, like Mohammed, was without these advantages. Thus it is that, in the opinion of the only eminent writer on history during the power of Louis XIV., the greatest man Asia has ever produced, and one of the greatest the world has ever seen, is considered in every way inferior to a mean and ignorant monk, whose most important achievement was the erection of a monastery, and who spent the best part of his life in useless solitude, trembling before the superstitious fancies of his weak and ignoble nature.[75]

Such was the narrow spirit with which the great facts of history were contemplated by a writer who, when he was confined to his own department, displayed the most towering genius. This contracted view was the inevitable consequence of his attempt to explain the complicated movements of the human race by principles which he had generalized from his own inferior studies.[76] Nor need any one be offended that, from a scientific point of view, I assign to the pursuits of Bossuet a rank lower than that in which they are sometimes placed. It is certain that religious dogmas do in many cases influence the affairs of men. But it is equally certain that as civilization advances such influence decreases, and that even when the power of those dogmas was at its height, there were many other motives by which the actions of mankind were also governed. And since the study of history is the study of the aggregate of these motives, it is evident that history must be superior to theology; just as the whole is superior to a part. A neglect of this simple consideration has, with a few eminent exceptions, led all ecclesiastical authors into serious errors. It has induced in them a disposition to disregard the immense variety of external events, and to suppose that the course of affairs is regulated by some principles which theology alone can detect. This indeed is only the result of a general law of the mind, by which those who have any favourite profession are apt to exaggerate its capacity; to explain events by its maxims, and, as it were, to refract through its medium the occurrences of life.[77] Among theologians, however, such prejudices are more dangerous than in any other profession, because among them alone are they fortified by that bold assumption of supernatural authority on which many of the clergy willingly rely.

These professional prejudices, when supported by theological dogmas, in a reign like that of Louis XIV.,[78] are sufficient to account for the peculiarities

sainteté et de ses miracles, durant sa vie, et après sa mort." *Bossuet, Hist. Univ.* p. 111.

[75] The Benedictines have written the life of Martin in their *Hist. Lit. de la France*, vol. i. part ii. pp. 413–417, Paris, 1733, 4to. They say that he erected the first monastery in Gaul: "Martin, toujours passionné pour la solitude, érigea un monastère qui fut le premier que l'on eût encore vû dans les Gaules," p. 414. At p. 415, they make the unnecessary admission that the saint "n'avoit point étudié les sciences profanes." I may add that the miracles of Martin are related by Fleury, who evidently believes that they were really performed. *Fleury, Hist. Ecclésiastique*, livre xvi. no. 31, vol. iv. pp. 215–217, Paris, 1758, 12mo. Neander, having the advantage of living a hundred years later than Fleury, is content to say, "the veneration of his period denominated him a worker of miracles." *Hist. of the Church*, vol. iv. p. 494. There is a characteristic anecdote of him, from Sulpitius Severus, in *Mosheim's Eccles. Hist.* vol. i. p. 123.

[76] At pp. 479, 480, Bossuet gives a sort of summary of his historical principles; and if they are true, history is evidently impossible to be written. On this account, though fully recognizing the genius of Bossuet, I cannot agree with the remarks made upon him by M. Comte, *Philos. Pos.* vol. iv. p. 280, vol. vi. pp. 316, 317.

[77] And then, as M. Charles Comte well says, they call this prejudice their moral sense, or their moral instinct. *Comte, Traité de Législation*, vol. i. p. 116.

[78] The connexion between the opinions of Bossuet and the despotism of Louis XIV. is touched on by Montlosier, who, however, has probably laid too much stress on the influence which the civil law exercised over both. *Montlosier, Monarchie Française*, vol. ii. p. 90.

which mark the historical work of Bossuet. Besides this, in his case, the general tendency was aggravated by personal characteristics. His mind was remarkable for a haughtiness which we find constantly breaking out into a general contempt for mankind.[79] At the same time his amazing eloquence, and the effects which it never failed to produce, seemed to justify the overweening confidence that he felt in his own powers. There is indeed in some of his greatest efforts so much of the fire and majesty of genius, that we are reminded of those lofty and burning words with which the prophets of antiquity thrilled their hearers. Bossuet, thus standing, as he supposed, on an eminence which raised him above the ordinary weaknesses of men, loved to taunt them with their follies, and to deride every aspiration of their genius. Everything like intellectual boldness seemed to gall his own superiority.[80] It was this boundless arrogance with which he was filled which gives to his works some of their most marked peculiarities. It was this that made him strain every nerve to abase and vilify those prodigious resources of the human understanding which are often despised by men who are ignorant of them ; but which in reality are so great that no one has yet arisen able to scan them in the whole of their gigantic dimensions. It was this same contempt for the human intellect that made him deny its capacity to work out for itself the epochs through which it has passed, and consequently made him recur to the dogma of supernatural interference. It was this, again, that in those magnificent orations which are among the greatest wonders of modern art, caused him to exhaust the language of eulogy, not upon intellectual eminence, but upon mere military achievements, upon great conquerors, those pests and destroyers of men, who pass their lives in discovering new ways of slaying their enemies, and in devising new means of aggravating the miseries of the world. And, to descend still lower, it was this same contempt for the dearest interests of mankind which made him look with reverence upon a king who considered all those interests as nothing ; but who had the merit of enslaving the mind of France, and of increasing the power of that body of men among whom Bossuet himself was the most distinguished.

In the absence of sufficient evidence respecting the general state of the French at the end of the seventeeth century, it is impossible to ascertain to what extent such notions as these had penetrated the popular mind. But, looking at the manner in which government had broken the spirit of the country, I should be inclined to suppose that the opinions of Bossuet were very acceptable to his own generation. This however is a question rather of curiosity than of importance ; for only a few years later there appeared the first symptoms of that unprecedented movement which not merely destroyed the political institutions of France but effected a greater and more permanent revolution in every department of the national intellect. At the death of Louis XIV., in literature as well as in politics, in religion, and in morals, everything was ripe for reaction. The materials still existing are so ample that it would be possible to trace with considerable minuteness the steps of this great process ; but it will I think be more agreeable to the general scheme of this Introduction if I pass over some of the intermediate links, and confine myself to those salient instances in which the spirit of the age is most strikingly portrayed.

There is indeed something extraordinary in the change which, in France, one generation was able to effect in the method of writing history. The best way, perhaps, to form an idea of this, will be to compare the works of Voltaire with those of Bossuet ; because these great authors were probably the most able, and

[79] He belonged to a class of historians described by a celebrated writer in a single sentence : " dans leurs écrits l'auteur paraît souvent grand, mais l'humanité est toujours petite." *Tocqueville, Démocratie*, vol. iv. p. 139.

[80] Hardly any one acquainted with the writings and the history of Bossuet will require evidence of his singular arrogance. But the reader may consult *Sismondi, Hist. des Franç.* vol. xxvi. p. 247 ; and on his treatment of Fénelon, which was the most shameful transaction of his life, compare *Burnet's Own Time*, vol. iv. p. 384, with *Capefigue's Louis XIV*, vol. ii. p. 58 ; where there is printed one of the many epigrams to which the conduct of Bossuet gave rise.

were certainly the most influential, Frenchmen during the period they respectively represented. The first great improvement which we find in Voltaire, as compared with Bossuet, is an increased perception of the dignity of the human intellect. In addition to the circumstances already noticed, we must remember that the reading of Bossuet lay in a direction which prevented him from feeling this. He had not studied those branches of knowledge where great things had been achieved; but he was very conversant with the writings of the saints and fathers, whose speculations are by no means calculated to give us a high opinion of the resources of their own understanding. Thus accustomed to contemplate the workings of the mind in what is on the whole the most puerile literature Europe has ever produced, the contempt which Bossuet felt for mankind went on increasing until it reached that inordinate degree which in his later works is painfully conspicuous. But Voltaire, who paid no attention to such things as these, passed his long life in the constant accumulation of real and available knowledge. His mind was essentially modern. Despising unsupported authority, and heedless of tradition, he devoted himself to subjects in which the triumph of the human reason is too apparent to be mistaken. The more his knowledge advanced, the more he admired those vast powers by which the knowledge had been created. Hence his admiration for the intellect of man, so far from diminishing, grew with his growth; and, just in the same proportion, there was strengthened his love of humanity, and his dislike to the prejudices which had long obscured its history. That this, in the march of his mind, was the course it actually followed, will be evident to any one who considers the different spirit of his works, in reference to the different periods of life in which they were produced.

The first historical work of Voltaire was a life of Charles XII., in 1728.[81] At this time his knowledge was still scanty, and he was still influenced by the servile traditions of the preceding generation. It is not therefore wonderful that he should express the greatest respect for Charles, who, among the admirers of military fame, will always preserve a certain reputation; though his only merits are that he ravaged many countries and killed many men. But we find little sympathy with his unfortunate subjects, the accumulations of whose industry supported the royal armies;[82] nor is there much pity for those nations who were oppressed by this great robber in the immense line of his conquests from Sweden to Turkey. Indeed, the admiration of Voltaire for Charles is unbounded. He calls him the most extraordinary man the world had ever seen;[83] he declares him to be a prince full of honour;[84] and while he scarcely blames his infamous murder of Patkul,[85] he relates with evident emotion how the royal lunatic, at

[81] He says that he wrote it in 1728. *Œuvres de Voltaire*, vol. xxii. p. 5; but, according to M. Lepan (*Vie de Voltaire*, p. 382), "il parut en 1731." Both statements may be accurate, as Voltaire frequently kept his works for some time in manuscript.

[82] Sir A. Alison, who certainly cannot be accused of want of respect for military conquerors, says of Sweden, "the attempt which Charles XII. made to engage her in long and arduous wars, so completely drained the resources of the country, that they did not recover the loss for half a century." *Hist. of Europe*, vol. x. p. 504. See also, on the effects produced by the conscriptions of Charles XII., *Laing's Sweden*, p. 59; *Koch. Tableau des Révolutions*, vol. ii. p. 63; and above all, a curious passage in *Duclos, Mém. Secrets*, vol. i. p. 448. Several of the soldiers of Charles XII., who were taken prisoners, were sent into Siberia, where Bell fell in with them early in the eighteenth century. *Bell's Travels in Asia*, edit. Edinb. 1788, vol. i. pp. 223, 224.

[83] "Charles XII, l'homme le plus extraordinaire peut-être qui ait jamais été sur la terre, qui a réuni en lui toutes les grandes qualités de ses aïeux, et qui n'a eu d'autre défaut ni d'autre malheur que de les avoir toutes outrées." *Hist. de Charles XII*, livre i., in *Œuvres de Voltaire*, vol. xxii. p. 30.

[84] "Plein d'honneur." *Ibid.* in *Œuvres*, vol. xxii. p. 63.

[85] Which Burke, not without justice, compares to the murder of Monaldeschi by Christina. *Burke's Works*, vol. i. p. 412. See some remarks on the murder of Patkul in *Vattel, Droit des Gens*, vol. i. p. 230; and an account of it from Swedish authorities, in

the head of forty servants, resisted an entire army.[86] In the same way he says that after the battle of Narva all the attempts of Charles were unable to prevent medals from being struck at Stockholm in celebration of that event ;[87] although Voltaire well knew that a man of such extravagant vanity must have been pleased by so durable a homage, and although it is quite certain that if he had not been pleased the medals would never have been struck : for who would venture, without an object, to offend in his own capital one of the most arbitrary and revengeful of princes ?

So far, it might appear that little had been gained in the method of writing history.[88] But, even thus early, we find one vast improvement. In Voltaire's life of Charles XII., faulty as it is, there are none of those assumptions of supernatural interference in which Bossuet delighted, and which were natural to the reign of Louis XIV. The absence of this marks the first great stage in the French school of history in the eighteenth century ; and we find the same peculiarity in all the subsequent historians, none of whom recurred to a method which, though suitable for the purposes of theologians, is fatal to all independent inquiries, since it not only prescribes the course the inquirer is bound to take, but actually sets up a limit beyond which he is forbidden to proceed.

That Voltaire should have infringed upon this ancient method only thirteen years after the death of Louis XIV., and that he should have done this in a popular work, abounding with such dangerous adventures as are always found to tempt the mind to an opposite course, is a step of no common merit, and becomes still more worthy of remark if taken in connexion with another fact of considerable interest. This is, that the life of Charles XII. represents the first epoch not only in the eighteenth century, but also in the intellect of Voltaire himself.[89] After it

Somers Tracts, vol. xiii. pp. 879–881. For Voltaire's version, see his *Œuvres*, vol. xxii. pp. 136, 137 ; which may be contrasted with *Crichton and Wheaton's History of Scandinavia*, Edinb. 1838, vol. ii. p. 127.

[86] *Œuvres de Voltaire*, vol. xxii. pp. 250–260. It may interest some persons to hear that the litter in which this madman "was borne from the battle of Pultava" is still preserved at Moscow. *Kohl's Russia*, p. 220. It was also seen by M. Custine. *Custine's Russie*, vol. iii. p. 263.

[87] "Sa modestie ne put empêcher qu'on ne frappât à Stockholm plusieurs médailles pour perpétuer la mémoire de ces événements." *Charles XII*, livre ii. in *Œuvres*, vol. xxii. p. 70.

[88] Even some of its geographical details are said to be inaccurate. Compare *Villemain, Littérature au XVIII^e Siècle*, vol. ii. p. 33, with *Kohl's Russia*, p. 505. However, as M. Villemain says, this must always be the case when writers who only know a country from maps, attempt to enter into details respecting military geography. In regard to style, it cannot be too highly praised ; and a well-known critic, Lacretelle, calls it "le modèle le plus accompli de narration qui existe dans notre langue." *Lacretelle, Dix-huitième Siècle*, vol. ii. p. 42. In 1843 it was still used as a text-book in the French royal colleges. See *Report on Education in France*, in *Journal of Stat. Soc.* vol. vi. p. 308. Further information respecting this work may be found in *Longchamp et Wagnière, Mém. sur Voltaire*, vol. ii. p. 494 ; and in *Mém. de Genlis*, vol. viii. p. 224, vol. x. p. 304.

[89] It is evident from Voltaire's correspondence that he afterwards became somewhat ashamed of the praises he had bestowed on Charles XII. In 1735 he writes to De Formont, "si Charles XII n'avait pas été excessivement grand, malheureux, et fou, je me serais bien donné de garde de parler de lui." *Œuvres de Voltaire*, vol. lvi. p. 462. In 1758, advancing still further, he says of Charles, "voilà, monsieur, ce que les hommes de tous les temps et de tous les pays appellent un héros ; mais c'est le vulgaire de tous les temps et de tous les pays qui donne ce nom à la soif du carnage." *Ibid.* vol. lx. p. 411. In 1759 he writes that he was then engaged on the history of Peter the Great : "mais je doute que cela soit aussi amusant que la vie de Charles XII ; car ce Pierre n'était qu'un sage extraordinaire, et Charles un fou extraordinaire, qui se battait, comme Don Quichotte, contre des moulins à vent ;" vol. lxi. p. 23 ; see also p. 350. These passages prove the constant progress Voltaire was making in his conception of what history ought to be, and what its uses were.

was published, this great man turned a while from history, and directed his attention to some of the noblest subjects: to mathematics, to physics, to jurisprudence, to the discoveries of Newton, and to the speculations of Locke. In these things he perceived those capabilities of the human mind which his own country had formerly witnessed, but of which, during the authority of Louis XIV., the memory had been almost lost. Then it was that, with extended knowledge and sharpened intellect, he returned to the great field of history.[90] The manner in which he now treated his old subject showed the change that had come over him. In 1752, appeared his celebrated work on Louis XIV.,[91] the very title of which is suggestive of the process through which his mind had passed. His former history was an account of a king; this is an account of an age. To the production of his youth he gave the title of a *History of Charles XII.*; this he called the *Age of Louis XIV.* Before, he had detailed the peculiarities of a prince; now, he considered the movements of a people. Indeed, in the introduction to the work he announces his intention to describe, "not the actions of a single man, but the character of men."[92] Nor, in this point of view, is the execution inferior to the design. While he is contented with giving a summary of military achievements, on which Bossuet hung with delight, he enters at great length into those really important matters which, before his time, found no place in the history of France. He has one chapter on commerce and internal government;[93] another chapter on finances;[94] another on the history of science;[95] and three chapters on the progress of the fine arts.[96] And though Voltaire did not attach much value to theological disputes, still he knew that they have often played a great part in the affairs of men; he therefore gives several distinct chapters to a relation of ecclesiastical matters during the rei n of Louis.[97] It is hardly necessary to observe the immense superiority which a scheme like this possessed, not only over the narrow views of Bossuet but even over his own earlier history. Still it cannot be denied that we find in it prejudices from which it was difficult for a Frenchman educa ted in the reign of Louis XIV. to be entirely free. Not only does Voltaire dwell at needless length upon those amusements and debaucheries of Louis, with which history can have little concern, but he displays an evident disposition to favour the king himself, and to protect his name from the infamy with which it ought to be covered.[98]

[90] In 1741, he mentions his increasing love of history. *Corresp.* in *Œuvres de Voltaire*, vol. li. p. 96.

[91] Lord Brougham, in his life of Voltaire, says that it appeared in 1751. *Lives of Men of Letters*, vol. i. p. 106. But 1752 is the date given in *Biog. Univ.* vol. xlix. p. 478; in *Quérard, France Lit.* vol. x. p. 355; and in *Lepan, Vie de Voltaire*, p. 382.

[92] "On veut essayer de peindre à la postérité, non les actions d'un seul homme, mais l'esprit des hommes dans le siècle le plus éclairé qui fut jamais." *Siècle de Louis XIV*, in *Œuvres de Voltaire*, vol. xix. p. 213. And in his correspondence respecting his work on Louis XIV., he carefully makes the same distinction. See vol. lvi. pp. 453, 488, 489, 500, vol. lvii. pp. 337, 342–344, vol. lix. p. 103.

[93] Chap. xxix., in *Œuvres de Voltaire*, vol. xx. pp. 234–267.

[94] Chap. xxx., in *Œuvres*, vol. xx. pp. 267–291. This chapter is praised in *Sinclair's Hist. of the Public Revenue*, vol. iii. appendix, p. 77; an indifferent work, but the best we have on the important subject to which it refers.

[95] Chap. xxxi., in *Œuvres*, vol. xx. pp. 291–299; necessarily a very short chapter, because of the paucity of materials.

[96] Chapters xxxii. to xxxiv., in *Œuvres*, vol. xx. pp. 299–338.

[97] *Œuvres*, vol. xx. pp. 338–464.

[98] This disposition to favour Louis XIV. is noticed by Condorcet, who says it was the only early prejudice which Voltaire was unable to shake off: "c'est le seul préjugé de sa jeunesse qu'il ait conservé." *Condorcet, Vie de Voltaire*, in *Œuvres de Voltaire*, vol. i. p. 286. See also, on this defect, *Grimm et Diderot, Corresp. Lit.* vol. ii. p. 182; *Lemontey, Etablissement Monarchique*, pp. 451, 452; *Mém. de Brissot*, vol. ii. pp. 88, 89. It is interesting to observe that Voltaire's earlier opinions were still more favourable to Louis XIV. than those which he afterwards expressed in his history. See a letter which he wrote in 1740 to Lord Harvey, printed in *Œuvres de Voltaire*, vol. lviii. pp. 57–63.

But the next work of Voltaire showed that this was a mere personal feeling, and did not affect his general views as to the part which the acts of princes ought to occupy in history. Four years after the appearance of the Age of Louis XIV., he published his important treatise on the *Morals, Manners, and Character of Nations*.[99] This is not only one of the greatest books which appeared during the eighteenth century, but it still remains the best on the subject to which it refers. The mere reading it displays is immense ;[100] what, however, is far more admirable is the skill with which the author connects the various facts, and makes them illustrate each other, sometimes by a single remark, sometimes only by the order and position in which they are placed. Indeed, considered solely as a work of art, it would be difficult to praise it too highly ; while, as a symptom of the times, it is important to observe that it contains no traces of that adulation of royalty which characterized Voltaire in the period of his youth, and which is found in all the best writers during the power of Louis XIV. In the whole of this long and important work, the great historian takes little notice of the intrigues of courts, or of the changes of ministers, or of the fate of kings ; but he endeavours to discover and develop the different epochs through which Man has successively passed. " I wish," he says, " to write a history, not of wars, but of society ; and to ascertain how men lived in the interior of their families, and what were the arts which they commonly cultivated."[101] For, he adds, " my object is the history of the human mind, and not a mere detail of petty facts ; nor am I concerned with the history of great lords who made war upon French kings ; but I want to know what were the steps by which men passed from barbarism to civilization."[102]

It was in this way that Voltaire taught historians to concentrate their attention on matters of real importance, and to neglect those idle details with which history had formerly been filled. But what proves this to be a movement arising as much from the spirit of the age as from the individual author, is that we find precisely the same tendency in the works of Montesquieu and Turgot, who were certainly the two most eminent of the contemporaries of Voltaire ; and both of whom followed a method similar to his, in so far as, omitting descriptions of

[99] Mr. Burton, in his interesting work, *Life and Correspondence of Hume*, vol. ii. p. 129, says it was " first published in 1756 ; " and the same date is given by Quérard (*France Littéraire*, vol. x. p. 359), who is a very accurate bibliographer ; so that Condorcet (*Vie de Voltaire*, p. 199) and Lord Brougham (*Men of Letters*, vo.. i. p. 98) are probably in error in assigning it to 1757. In regard to its title, I translate " Mœurs " as " morals and manners ; " for M. Tocqueville uses " mœurs " as equivalent to the Latin word " mores." *Tocqueville, Démocratie en Amérique*, vol. iii. pp. 50, 84.

[100] Superficial writers are so much in the habit of calling Voltaire superficial, that it may be well to observe that his accuracy has been praised, not only by his own countrymen, but by several English authors of admitted learning. For three remarkable instances of this, from men whom no one will accuse of leaning towards his other opinions, see *notes to Charles V.*, in *Robertson's Works*, pp. 431, 432 ; *Barrington's Observations on the Statutes*, p. 293 ; and *Warton's Hist. of English Poetry*, vol. i. p. xvi. Even Sir W. Jones, in his preface to the *Life of Nader Shah*, says, that Voltaire is " the best historian " the French have produced. *Works of Sir William Jones*, vol. v. p. 542 ; and compare the preface to his *Persian Grammar*, in *Works*, vol. ii. p. 123.

[101] " Je voudrais découvrir quelle était alors la société des hommes, comment on vivait dans l'intérieur des familles, quels arts étaient cultivés, plutôt que de répéter tant de malheurs et tant de combats, funestes objets de l'histoire et lieux communs de la méchanceté humaine." *Essai sur les Mœurs*, chap. lxxxi., in *Œuvres*, vol. xvi. p. 381.

[102] " L'objet était l'histoire de l'esprit humain, et non pas le détail des faits presque toujours défigurés ; il ne s'agissait pas de rechercher, par exemple, de quelle famille était le seigneur de Puiset, ou le seigneur de Montlhéri, qui firent la guerre à des rois de France ; mais de voir par quels degrés on est parvenu de la rusticité barbare de ces temps à la politesse du nôtre." Supplement to *Essai sur les Mœurs*, in *Œuvres*, vol. xviii. p. 435. Compare *Fragments sur l'Histoire*, vol. xxvii. p. 214, with two letters in vol. lx. pp 153, 154, vol. lxv. p. 370.

kings, courts, and battles, they confined themselves to points which illustrate the character of mankind and the general march of civilization. And such was the popularity of this change in the old routine, that its influence was felt by other historians of inferior, but still of considerable, ability. In 1755, Mallet,[103] published his interesting, and, at the time it was written, most valuable work, on the history of Denmark;[104] in which he professes himself a pupil of the new school. "For why," he says, "should history be only a recital of battles, sieges, intrigues, and negotiations? And why should it contain merely a heap of petty facts and dates, rather than a great picture of the opinions, customs, and even inclinations of a people?"[105] Thus too, in 1765, Mably published the first part of his celebrated work on the history of France;[106] in the preface to which he complains that historians "have neglected the origin of laws and customs in favour of sieges and battles."[107] In the same spirit, Velly and Villaret, in their voluminous history of France, express regret that historians should usually relate what happens to the sovereign in preference to what happens to the people, and should omit the manners and characteristics of a nation, in order to study the acts of a single man.[108] Duclos, again, announces that his history is not of war, nor of politics, but of men and manners;[109] while, strange to say, even the courtly Hénault declares that his object was to describe laws and manners, which he calls the soul of history, or rather history itself.[110]

Thus it was that historians began to shift, as it were, the scene of their labours, and to study subjects connected with those popular interests on which the great writers under Louis XIV. disdained to waste a thought.* I need hardly observe how agreeable such views were to the general spirit of the eighteenth century, and how well they harmonized with the temper of men who were striving to lay aside their former prejudices, and despise what had once been universally admired.

[103] Mallet, though born in Geneva, was a Frenchman in the habits of his mind: he wrote in French, and is classed among French historians in the report presented to Napoleon by the Institut. *Dacier, Rapport sur les Progrès de l'Histoire*, p. 173.

[104] Göthe, in his Autobiography, mentions his obligations to this work, which, I suspect, exercised considerable influence over the early associations of his mind: "Ich hatte die Fabeln der Edda schon längst aus der Vorrede zu Mallet's Dänischer Geschichte kennen gelernt, und mich derselben sogleich bemächtigt; sie gehörten unter diejenigen Mährchen, die ich, von einer Gesellschaft aufgefordert, am liebsten erzählte." *Wahrheit u. Dichtung*, in *Goethe's Werke*, vol. ii. part ii. p. 169. Percy, a very fair judge, thought highly of Mallet's history, part of which indeed he translated. See a letter from him, in *Nichols's Illustrations of the Eighteenth Century*, vol. vii. p. 719.

[105] *Mallet's Northern Antiquities*, edit. Blackell, 1847, p. 78.

[106] The first two volumes were published in 1765; the other two in 1790. *Biog. Univ.* vol. xxvi. pp. 9, 12.

[107] *Mably, Observ. sur l'Hist. de France*, vol. i. p. ii.; and compare vol. iii. p. 289: but this latter passage was written several years later.

[108] "Bornés à nous apprendre les victoires ou les défaites du souverain, ils ne nous disent rien ou presque rien des peuples qu'il a rendus heureux ou malheureux. On ne trouve dans leurs écrits que longues descriptions de sièges et de batailles; nulle mention des mœurs et de l'esprit de la nation. Elle y est presque toujours sacrifiée à un seul homme." *Histoire de France par Velly*, Paris, 1770, 4to, vol. i. p. 6; and see, to the same effect, the *Continuation by Villaret*, vol. v. p. vi.

[109] "Si l'histoire que j'écris n'est ni militaire, ni politique, ni économique, du moins dans le sens que je conçois pour ces différentes parties, on me demandera quelle est donc celle que je me propose d'écrire. C'est l'histoire des hommes et des mœurs." *Duclos, Louis XIV et Louis XV*, vol. i. p. xxv.

[110] "Je voulois connoître nos loix, nos mœurs, et tout ce qui est l'âme de l'histoire, ou plutôt l'histoire même." *Hénault, Nouvel Abrégé chronologique de l'Histoire de France*, edit. Paris, 1775, vol. i. p. i.

[* Above, Buckle has shown that Mezeray gave much thought to the popular interest.—Ed.]

All this was but part of that vast movement which prepared the way for the Revolution, by unsettling ancient opinions, by encouraging a certain mobility and restlessness of mind, and above all by the disrespect it showed for those powerful individuals, hitherto regarded as gods rather than as men, but who now, for the first time, were neglected by the greatest and most popular historians, who passed over even their prominent actions, in order to dwell upon the welfare of nations, and the interests of the people at large.

To return, however, to what was actually effected by Voltaire, there is no doubt that in his case this tendency of the time was strengthened by a natural comprehensiveness of mind, which predisposed him to large views, and made him dissatisfied with that narrow range to which history had been hitherto confined.[111] Whatever may be thought of the other qualities of Voltaire, it must be allowed that in his intellect everything was on a great scale.[112] Always prepared for thought, and always ready to generalize, he was averse to the study of individual actions, unless they could be made available for the establishment of some broad and permanent principle. Hence his habit of looking at history with a view to the stages through which the country had passed, rather than with a view to the character of the men by whom the country had been governed. The same tendency appears in his lighter works; and it has been well observed[113] that even in his dramas he endeavours to portray not so much the passions of individuals as the spirit of epochs. In *Mahomet*, his subject is a great religion; in *Alzire*, the conquest of America; in *Brutus*, the formation of the Roman power; in the *Death of Cæsar*, the rise of the empire upon the ruins of that power.[114]

By this determination to look upon the course of events as a great and connected whole, Voltaire was led to several results which have been complacently adopted by many authors who, even while using them, revile him from whom they were taken. He was the first historian who, rejecting the ordinary method of investigation, endeavoured by large general views to explain the origin of feudality; and by indicating some of the causes of its decline in the fourteenth century[115] he laid the foundation for a philosophic estimate of that important institution.[116]

[111] In 1763, he writes to D'Argental: "il y a environ douze batailles dont je n'ai point parlé, Dieu merci, parceque j'écris l'histoire de l'esprit humain, et non une gazette." *Œuvres de Voltaire*, vol. lxiii. p. 51. See also his letter to Tabareau (*Lettres inédites de Voltaire*, vol. ii. p. 585): "Personne ne lit les détails des combats et des sièges; rien n'est plus ennuyeux que la droite et la gauche, les bastions et la contrescarpe."

[112] M. Lamartine characterizes him as "ce génie non pas le plus haut, mais le plus vaste de la France." *Hist. des Girondins*, vol. i. p. 180.

[113] *Biog. Univ.* vol. xlix. p. 493. His *Orphelin de la Chine* is taken from Chinese sources: see *Davis's China*, vol. ii. p. 258.

[114] The surprising versatility of Voltaire's mind is shown by the fact, unparalleled in literature, that he was equally great as a dramatic writer and as an historian. Mr. Forster, in his admirable *Life of Goldsmith*, 1854, says (vol. i. p. 119), "Gray's high opinion of Voltaire's tragedies is shared by one of our greatest authorities on such a matter now living, Sir Edward Bulwer Lytton, whom I have often heard maintain the marked superiority of Voltaire over all his countrymen in the knowledge of dramatic art, and the power of producing theatrical effects." Compare *Correspondence of Gray and Mason*, edit. Mitford, 1855, p. 44.

[115] *Essai sur les Mœurs*, chap. lxxxv., in *Œuvres*, vol. xvi. p. 412, and elsewhere.

[116] During the eighteenth century, and, I may say, until the publication in 1818 of Hallam's Middle Ages, there was in the English language no comprehensive account of the feudal system; unless perhaps we except that given by Robertson, who in this as in many other matters of history was a pupil of Voltaire. Not only Dalrymple, and writers of his kind, but even Blackstone, took so narrow a view of this great institution that they were unable to connect it with the general state of society to which it belonged. Some of our historians gravely traced it back to Moses, in whose laws they found the origin of allodial lands. See a charming passage in *Barry's History of the Orkney Islands*, p. 219. On the spirit of feudality, there are some remarks well worth reading in *Comte's Philos. Posit.* vol. v. pp. 393–413.

He was the author of a profound remark, afterwards adopted by Constant, to the effect that licentious religious ceremonies have no connexion with licentious national morals.[117] Another observation of his, which has been only partly used by writers on ecclesiastical history, is pregnant with instruction. He says that one of the reasons why the bishops of Rome acquired an authority so superior to that of the Eastern patriarchs was the greater sublety of the Greek mind. Nearly all the heresies proceeded from the East; and, with the exception of Honorius I., not a single pope adopted a system condemned by the church. This gave to the papal power an unity and consolidation which the patriarchal power was unable to reach; and thus the Holy See owes part of its authority to the early dulness of the European fancy.[118]

It would be impossible to relate all the original remarks of Voltaire which, when he made them, were attacked as dangerous paradoxes, and are now valued as sober truths. He was the first historian who recommended universal freedom of trade; and, although he expresses himself with great caution,[119] still the mere announcement of the idea in a popular history forms an epoch in the progress of the French mind. He is the originator of that important distinction between the increase of population and the increase of food, to which political economy has been greatly indebted;[120] a principle adopted several years later by Town-

[117] Constant, in his work on Roman polytheism, says, "des rites indécens peuvent être pratiqués par un peuple religieux avec une grande pureté de cœur. Mais quand l'incrédulité atteint ces peuples, ces rites sont pour lui la cause et le prétexte de la plus révoltante corruption." This passage is quoted by Mr. Milman, who calls it "extremely profound and just." *Milman's History of Christianity*, 1840, vol. i. p. 28. And so it is—extremely profound and just. But it happens that precisely the same remark was made by Voltaire, just about the time that Constant was born. Speaking of the worship of Priapus, he says (*Essai sur les Mœurs*, chap. cxliii., in *Œuvres de Voltaire*, vol. xvii. p. 341), "nos idées de bienséance nous portent à croire qu'une cérémonie qui nous paraît si infâme n'a été inventée que par la débauche; mais il n'est guère croyable que la dépravation des mœurs ait jamais chez aucun peuple établi des cérémonies religieuses. Il est probable, au contraire, que cette coutume fut d'abord introduite dans les temps de simplicité, et qu'on ne pensa d'abord qu'à honorer la Divinité dans le symbole de la vie qu'elle nous a donnée. Une telle cérémonie a dû inspirer la licence à la jeunesse, et paraître ridicule aux esprits sages, dans les temps plus raffinés, plus corrompus, et plus éclairés." Compare the remarks on the indecency of the Spartan customs, in *Thirlwall's Hist. of Greece*, vol. i. pp. 326, 327.

[118] *Essai sur les Mœurs*, chaps. xiv. and xxxi., in *Œuvres*, vol. xv. pp. 391, 514. Neander observes that in the Greek church there were more heresies than in the Latin church because the Greeks thought more; but he has failed to perceive how this favoured the authority of the popes. *Neander's History of the Church*, vol. ii. pp. 198, 199, vol. iii. pp. 191, 492, vol. iv. p. 90, vol. vi. p. 293, vol. viii. p. 257. [The main cause of the authority of the Popes was that no emperor reigned at Rome.—Ed.]

[119] In his account of the trade of Archangel, he says, "les Anglais obtinrent le privilége d'y commercer sans payer aucun droit; et c'est ainsi que toutes les nations devraient peut-être négocier ensemble." *Hist. de Russie*, part i. chap. i., in *Œuvres*, vol. xxiii. p. 35. Remarkable words to have been written by a Frenchman, born at the end of the seventeenth century; and yet they have, so far as I am aware, escaped the attention of all the historians of political economy. Indeed, on this as on most matters sufficient justice has not been done to Voltaire, whose opinions were more accurate than those of Quesnay and his followers. However, Mr. M'Culloch, in noticing one of the economical errors of Voltaire, honestly admits that his "opinions on such subjects are, for the most part, very correct." *M'Culloch's Principles of Political Economy*, p. 530. For proof of his sympathy with Turgot's efforts to establish free trade, compare *Lettres inédites de Voltaire*, vol. ii. pp. 367, 403, 423, with *Longchamp, Mém. sur Voltaire*, vol. i. pp. 376, 378.

[120] "The idea of the different ratios by which population and food increase was originally thrown out by Voltaire; and was picked up and expanded into many a goodly volume by our English political economists in the present century." *Laing's Notes* second series, p. 42.

send, and then used by Malthus as the basis of his celebrated work.[121] He has, moreover, the merit of being the first who dispelled the childish admiration with which the Middle Ages had been hitherto regarded, and which they owed to those dull and learned writers who in the sixteenth and seventeenth centuries were the principal investigators of the early history of Europe. These industrious compilers had collected extensive materials, which Voltaire turned to good account, and by their aid overthrew the conclusions at which the authors had themselves arrived. In his works, the Middle Ages are for the first time represented as what they really were,—a period of ignorance, ferocity, and licentiousness; a period when injuries were unredressed, crime unpunished, and superstition unrebuked. It may be said with some show of justice that Voltaire, in the picture he drew, fell into the opposite extreme, and did not sufficiently recognize the merit of those truly great men who, at long intervals, stood here and there, like solitary beacons, whose light only made the surrounding darkness more visible. Still, after every allowance for that exaggeration which a reaction of opinions always causes, it is certain that his view of the Middle Ages is not only far more accurate than that of any preceding writer, but conveys a much juster idea of the time than can be found in those subsequent compilations which we owe to the industry of modern antiquaries; a simple and plodding race, who admire the past because they are ignorant of the present, and who, spending their lives amid the dust of forgotten manuscripts, think themselves able, with the resources of their little learning, to speculate on the affairs of men, to trace the history of different periods, and even to assign to each the praise it ought to receive.

With such writers as these Voltaire was always at war; and no one has done so much to lessen the influence they once exercised over even the highest branches of knowledge. There was also another class of dictators whose authority this great man was equally successful in reducing, namely, the old class of classical scholars and commentators, who, from the middle of the fourteenth till early in the eighteenth century, were the chief dispensers of fame, and were respected as being by far the most distinguished men Europe had ever produced. The first great assaults made upon them were late in the seventeenth century, when two controversies sprung up, of which I shall hereafter give an account,—one in France, and one in England,—by both of which their power was considerably damaged. But their two most formidable opponents were undoubtedly Locke and Voltaire. The immense services rendered by Locke in lessening the reputation of the old classical school will be examined in another part of this work; at present we are only concerned with the steps taken by Voltaire.

The authority wielded by the great classical scholars rested not only on their abilities, which are undeniable, but also on the supposed dignity of their pursuits. It was generally believed that ancient history possessed some inherent superiority over modern history; and this being taken for granted, the inference naturally followed that the cultivators of the one were more praiseworthy than the cultivators of the other; and that a Frenchman, for instance, who should write the

[121] It is often said that Malthus was indebted to Townsend's writings for his views on population; but this obligation has been too strongly stated, as indeed is always the case when charges of plagiarism are brought against great works. Still, Townsend is to be considered as the precursor of Malthus; and if the reader is interested in tracing the paternity of ideas, he will find some interesting economical remarks in *Townsend's Journey through Spain*, vol. i. pp. 379, 383, vol. ii. pp. 85, 337, 387–393; which must be compared with *M'Culloch's Literature of Political Economy*, pp. 259, 281–3. Voltaire, having preceded these authors, has of course fallen into errors which they avoided; but nothing can be better than the way in which he opposes the ignorant belief of his own time, that everything should be done to increase population. "Le point principal n'est pas d'avoir du superflu en hommes, mais de rendre ce que nous en avons le moins malheureux qu'il est possible," is the summing-up of his able remarks, in *Dict. Philos.*, article *Population*, sect. 2, in *Œuvres*, vol. xli. p. 466. Godwin, in his notice of the history of these opinions, is evidently ignorant of what was done by Voltaire. *Sinclair's Corresp.* vol. i. p. 396.

history of some Greek republic, displayed a nobler turn of mind than if he had written the history of his own country. This singular prejudice had for centuries been a traditional notion which men accepted because they had received it from their fathers, and which it would have been almost an impiety to dispute. The result was that the few really able writers on history devoted themselves chiefly to that of the ancients ; or, if they published an account of modern times, they handled their theme not according to modern ideas but according to ideas gathered from their more favourite pursuit. This confusion of the standard of one age with the standard of another caused a double evil. Historians, by adopting this plan, injured the originality of their own minds ; and, what was far worse, they set a bad example to the literature of their country. For every great nation has a mode of expression and of thought peculiar to itself, and with which its sympathies are intimately connected. To introduce any foreign model, however admirable it may be, is to violate this connexion, and to impair the value of literature by limiting the scope of its action. By such a course the taste may possibly be refined, but the vigour will certainly be weakened. Indeed the refinement of the taste may well be doubted when we see what has taken place in our country, where our great scholars have corrupted the English language by a jargon so uncouth that a plain man can hardly discern the real lack of ideas which their barbarous and mottled dialect strives to hide.[122] At all events, it is certain that every people worthy of being called a nation possess in their own language ample resources for expressing the highest ideas they are able to form ; and although in matters of science it may be convenient to coin such words as are more easily understood in foreign countries, it is a grave offence to depart on other subjects from the vernacular speech ; and it is a still graver one to introduce notions and standards for action, suited perhaps to former times, but which the march of society has left far behind, and with which we have no real sympathy, though they may excite that sickly and artificial interest which the classical prejudices of early education still contrive to create.

It was against these evils that Voltaire entered the field. The wit and the ridicule with which he attacked the dreaming scholars of his own time can only be appreciated by those who have studied his works. Not, as some have supposed, that he used these weapons as a substitute for argument, still less that he fell into the error of making ridicule a test for truth. No one could reason more closely than Voltaire, when reasoning suited his purpose. But he had to deal with men impervious to argument ; men whose inordinate reverence for antiquity had only left them two ideas, namely, that everything old is right, and that everything new is wrong. To argue against these opinions would be idle indeed ; the only other resource was to make them ridiculous and weaken their influence by holding up their authors to contempt. This was one of the tasks Voltaire set himself to perform ; and he did it well.[123] He therefore used ridi-

[122] With the single exception of Porson, not one of the great English scholars has shown an appreciation of the beauties of his native language ; and many of them, such as Parr (in all his works) and Bentley (in his mad edition of Milton), have done everything in their power to corrupt it. And there can be little doubt that the principal reason why well-educated women write and converse in a purer style than well-educated men, is because they have not formed their taste according to those ancient classical standards which, admirable as they are in themselves, should never be introduced into a state of society unfitted for them. To this may be added, that Cobbett, the most racy and idiomatic of all our writers, and Erskine, by far the greatest of our forensic orators, knew little or nothing of any ancient language ; and the same observation applies to Shakespeare. On the supposed connexion between the improvement of taste and the study of classical models, there are some remarks worth attending to in *Rey's Théorie et Pratique de la Science Sociale*, vol. i. pp. 98–101.

[123] "We can best judge from the Jesuitical rage with which he was persecuted, how admirably he had delineated the weaknesses and presumption of the interpreters of the ancients, who shone in the schools and academies, and had acquired great reputation by their various and copiously exhibited learning." *Schlosser's Eighteenth Century*,

cule, not as the test of truth, but as the scourge of folly. And with such effect was the punishment administered that not only did the pedants and theologians of his own time wince under the lash, but even their successors feel their ears tingle when they read his biting words ; and they revenged themselves by reviling the memory of that great writer, whose works are as a thorn in their side, and whose very name they hold in undisguised abhorrence.

These two classes have indeed reasons enough for the hatred with which they still regard the greatest Frenchman of the eighteenth century. For Voltaire did more than any other man to sap the foundation of ecclesiastical power, and to destroy the supremacy of classical studies. This is not the place for discussing the theological opinions which he attacked ; but of the state of classical opinions an idea may be formed, by considering some of those circumstances which were recorded by the ancients respecting their history, and which, until the appearance of Voltaire, were implicitly believed by modern scholars,* and through them by the people at large.

It was believed that, in ancient times, Mars ravished a virgin, and that the offspring of the intrigue were no other than Romulus and Remus, both of whom it was intended to put to death ; but they were fortunately saved by the attentions of a she-wolf and a woodpecker ; the wolf giving them suck, and the woodpecker protecting them from insects. It was moreover believed that Romulus and Remus, when grown up to man's estate, determined to build a city, and that, being joined by the descendants of the Trojan warriors, they succeeded in erecting Rome. It was believed that both brothers came to an untimely end ; Remus being murdered, and Romulus being taken up to heaven by his father, who descended for that purpose in the midst of a tempest. The great scholars then proceeded to relate the succession of several other kings ; the most remarkable of whom was Numa, whose only communications with his wife were carried on in a sacred grove. Another of the sovereigns of Rome was Tullus Hostilius, who, having offended the clergy, perished from the effects of their anger ; his death being caused by lightning, and preceded by pestilence. Then again there was one Servius Tullius, who was also a king, and whose greatness was prognosticated by the appearance of flames round his head as he was sleeping in his cradle. After this it was but a slight matter that the ordinary laws of mortality should be suspended ; we were therefore assured that those ignorant barbarians, the early Romans, passed two hundred and forty-five years under the government of only seven kings, all of whom were elected in the prime of life, one of whom was expelled the city, and three of whom were put to death.

These are a few of the idle stories in which the great scholars took intense delight, and which, during many centuries, were supposed to form a necessary part of the annals of the Latin Empire. Indeed, so universal was the credulity that, until they were destroyed by Voltaire, there were only four writers who had ventured openly to attack them. Cluverius, Perizonius, Pouilly, and Beaufort were the names of these bold innovators ; but by none of them was any impression made on the public mind. The works of Cluverius and Perizonius, being composed in Latin, were addressed entirely to a class of readers who, infatuated with a love of antiquity, would listen to nothing that diminished the reputation of its history. Pouilly and Beaufort wrote in French ; both of them, and especially Beaufort, were men of considerable ability ; but their powers were not versatile enough to enable them to extirpate prejudices which were so strongly protected, and which had been fostered by the education of many successive generations.†

vol. i. p. 120. At p. 270 M. Schlosser says, "And it was only a man of Voltaire's wit and talents who could throw the light of an entirely new criticism upon the darkness of those grubbing and collecting pedants."

[* An over-statement. See the next note.—Ed.]

[† This summary is somewhat hasty. "Only four writers," in the circumstances, is an odd phrase ; but as it is, it overlooks Bochart, Gronovius, and above all Vico,

The service, therefore, rendered by Voltaire in purging history of these foolish conceits is, not that he was the first by whom they were attacked, but that he was the first to attack them with success; and this because he was also the first who mingled ridicule with argument, thus not only assailing the system, but also weakening the authority of those by whom the system was supported. His irony, his wit, his pungent and telling sarcasms, produced more effect than the gravest arguments could have done; and there can be no doubt that he was fully justified in using those great resources with which nature had endowed him, since by their aid he advanced the interests of truth and relieved men from some of their most inveterate prejudices.

It is not, however, to be supposed that ridicule was the only means employed by Voltaire in effecting this important object. So far from that, I can say with confidence, after a careful comparison of both writers, that the most decisive arguments advanced by Niebuhr against the early history of Rome had all been anticipated by Voltaire, in whose works they may be found by whoever will take the trouble of reading what this great man has written, instead of ignorantly railing against him. Without entering into needless detail, it is enough to mention that amidst a great variety of very ingenious and very learned discussion, Niebuhr has put forward several views with which later critics have been dissatisfied; but that there are three, and only three, principles which are fundamental to his history, and which it is impossible to refute. These are:—I. That on account of the inevitable intermixture of fable essential to a rude people, no nation can possess trustworthy details respecting its own origin. II. That even such early documents as the Romans might have possessed had been destroyed before they were incorporated into a regular history. III. That ceremonies established in honour of certain events alleged to have taken place in former times were a proof, not that the events had happened, but that they were believed to have happened. The whole fabric of the early history of Rome at once fell to pieces as soon as these three principles were applied to it. What, however, is most remarkable, is that not only are all three laid down by Voltaire, but their bearing upon Roman history is distinctly shown. He says that no nation is acquainted with its own origin; so that all primitive history is necessarily an invention.[124] He remarks that since even such historical works as the Romans once possessed were all destroyed when their city was burned, no confidence can be placed in the accounts which, at a much later period, are given by Livy and other compilers.[125] And as

[124] "C'est l'imagination seule qui a écrit les premières histoires. Non seulement chaque peuple inventa son origine, mais il inventa aussi l'origine du monde entier." *Dict. Philos.*, article *Histoire*, sec. 2, in *Œuvres*, vol. xl. p. 195. See also his article on Chronology, vol. xxxviii. p. 77, for the application of this to the history of Rome, where he says, "Tite Live n'a garde de dire en quelle année Romulus commença son prétendu règne." And at vol. xxxvi. p. 86, "tous les peuples se sont attribués des origines imaginaires; et aucun n'a touché à la véritable."

[125] "Qu'on fasse attention que la république romaine a été cinq cents ans sans historiens; que Tite Live lui-même déplore la perte des autres monuments qui périrent presque tous dans l'incendie de Rome," &c. *Dict. Philos.* in *Œuvres*, vol. xl. p. 202. At p. 188, "ce peuple, si récent en comparaison des nations asiatiques, a été cinq cents

who had brought rational criticism to bear on the subject before Voltaire. It is clear, too, that some of the fables mentioned by Buckle were recognised as such by many scholars long before. For instance, the founding of the city by Romulus is tacitly rejected in a *Discours sur les Tribus Romains* by Boindin, read to the Academy before 1710 (*Mém. de Litt.* éd. La Haye, 1719, i. 97). It is therefore unwarrantable to say that no scholars heeded Cluverius and Perizonius. As to "extirpating prejudice," it is clear that Voltaire in his turn failed, since the whole matter had to be freshly handled in the nineteenth century by Niebuhr. On the merits of Beaufort, to whom Niebuhr was less than just, and on the other pioneers, see *Prof. Flint's Hist. of the Philos. of Hist.* 1893, pp. 255–261.—Ed.]

innumerable scholars busied themselves in collecting evidence respecting ceremonies instituted in celebration of certain events, and then appealed to the evidence in order to prove the events, Voltaire makes a reflection which now seems very obvious, but which these learned men had entirely overlooked. He notices that their labour is bootless, because the date of the evidence is, with extremely few exceptions, much later than the date of the event to which it refers. In such cases, the existence of a festival or of a monument proves indeed the belief which men entertain, but by no means proves the reality of the occurrence concerning which the belief is held.[126] This simple but important maxim is, even in our own days, constantly lost sight of, while before the eighteenth century it was universally neglected. Hence it was that historians were able to accumulate fables which were believed without examination;[127] it being altogether forgotten that fables, as Voltaire says, begin to be current in one generation, are established in the second, become respectable in the third, while in the fourth generation temples are raised in honour of them.[128]

I have been the more particular in stating the immense obligations history is under to Voltaire, because in England there exists against him a prejudice which nothing but ignorance, or something worse than ignorance, can excuse;* [129]

années sans historiens. Ainsi, il n'est pas surprenant que Romulus ait été le fils de Mars, qu'une louve ait été sa nourrice, qu'il ait marché avec mille hommes de son village de Rome contre vingt-cinq mille combattants du village des Sabins."

[126] "Par quel excès de démence, par quel opiniâtreté absurde, tant de compilateurs ont-ils voulu prouver dans tant de volumes énormes, qu'une fête publique établie en mémoire d'un événement était une démonstration de la vérité de cet événement?" *Essai sur les Mœurs, in Œuvres*, vol. xv. p. 109. See also the same remark applied to monuments in chap. cxcvii., *Œuvres*, vol. xviii. pp. 412–414; and again, in vol. xl. pp. 203, 204.

[127] "La plupart des histoires ont été crues sans examen, et cette créance est un préjugé. Fabius Pictor raconte que, plusieurs siècles avant lui, une vestale de la ville d'Albe, allant puiser de l'eau dans sa cruche, fut violée, qu'elle accoucha de Romulus et de Rémus, qu'ils furent nourris par une louve, etc. Le peuple romain crut cette fable; il n'examina point si dans ce temps-là il y avait des vestales dans le Latium, s'il était vraisemblable que la fille d'un roi sortît de son couvent avec sa cruche, s'il était probable qu'une louve allaitât deux enfants au lieu de les manger; le préjugé s'établit." *Dict. Philos.* article *Préjugés*, in *Œuvres*, vol. xli. pp. 488, 489.

[128] "Les amateurs du merveilleux disaient: Il faut bien que ces faits soient vrais, puisque tants de monuments en sont la preuve. Et nous disions: Il faut bien qu'ils soient faux, puisque le vulgaire les a crus. Une fable a quelque cours dans une génération; elle s'établit dans la seconde; elle devient respectable dans la troisième; la quatrième lui élève des temples." *Fragments sur l'Histoire*, article i., in *Œuvres*, vol. xxvii. pp. 158, 159.

[129] In this case, as in many others, ignorance has been fortified by bigotry; for, as Lord Campbell truly says of Voltaire, "since the French Revolution, an indiscriminate abuse of this author has been in England the test of orthodoxy and loyalty." *Campbell's Chief-Justices*, vol. ii. p. 335. Indeed, so extensively has the public mind been prejudiced against this great man, that, until a very few years ago, when Lord Brougham published a life of him, there was no book in the English language containing even a tolerable account of one of the most influential writers France has produced. This work of Lord Brougham's, though a middling performance, is at least an honest one, and, as it harmonizes with the general spirit of our time, it has probably had considerable weight. In it he says of Voltaire, "nor can any one since the days of Luther be named, to whom the spirit of free inquiry, nay, the emancipation of the human mind from spiritual tyranny, owes a more lasting debt of gratitude." *Brougham's Life of Voltaire*, p. 132. It is certain that the better the history of the eighteenth century is understood, the more the reputation of Voltaire will increase; as was clearly foreseen by a celebrated writer nearly a generation ago. In 1831, Lerminier wrote these re-

[* Read "explain."—Ed.]

and because, taking him on the whole, he is probably the greatest historian Europe has yet produced. In reference, however, to the mental habits of the eighteenth century, it is important to show that in the same period similar comprehensiveness was being displayed by other French historians; so that in this case as in all others we shall find that a large share of what is affected, even by the most eminent men, is due to the character of the age in which they live.

The vast labours of Voltaire towards reforming the old method of writing history were greatly aided by those important works which Montesquieu put forward during the same period. In 1734,[130] this remarkable man published what may be truly called the first book in which there can be found any information concerning the real history of Rome; because it is also the first in which the affairs of the ancient world are treated in a large and comprehensive spirit.[131] Fourteen years later there appeared, by the same author, the *Spirit of Laws*; a more famous production, but, as it seems to me, not a greater one. The immense merit of the *Spirit of Laws* is indeed incontestable, and cannot be affected by the captious attempts made to diminish it by those minute critics, who seem to think that when they detect the occasional errors of a great man, they in some degree reduce him to their own level. It is not such petty cavilling which can destroy an European reputation; and the noble work of Montesquieu will long survive all attacks of this kind, because its large and suggestive generalizations would retain their value even if the particular facts of which the illustrations consist were all unfounded.[132] Still, I am inclined to believe, that in point of original thought it is barely equal to his earlier work, though it is unquestionably the fruit of much greater reading. Without, however, instituting a comparison between them, our present object is merely to consider the contributions they jointly contain towards a right understanding of history, and the way in which those contributions are connected with the general spirit of the eighteenth century.

In this point of view, there are in the works of Montesquieu two leading peculiarities. The first is, the complete rejection of those personal anecdotes, and those trivial details respecting individuals, which belong to biography, but with which, as Montesquieu clearly saw, history has no concern. The other peculiarity is the very remarkable attempt which he first made to effect

markable, and, as the result has proved, prophetic words: "Il est temps de revenir à des sentimens plus respectueux pour la mémoire de Voltaire. . . . Voltaire a fait pour la France ce que Leibnitz a fait pour l'Allemagne; pendant trois-quarts de siècle il a représenté son pays, puissant à la manière de Luther et de Napoléon; il est destiné à survivre à bien des gloires, et je plains ceux qui se sont oubliés jusqu'à laisser tomber des paroles dédaigneuses sur le génie de cet homme." *Lerminier, Philosophie du Droit*, vol. i. p. 199. Compare the glowing eulogy in *Longchamp et Wagnière, Mémoires sur Voltaire*, vol. ii. pp. 388, 389, with the remarks of Saint-Lambert, in *Mém. d'Epinay*, vol. i. p. 263.

130 *Vie de Montesquieu*, p. xiv., prefixed to his works.

131 Before Montesquieu, the only two great thinkers who had really studied Roman history were Machiavelli and Vico; but Machiavelli did not attempt anything approaching the generalizations of Montesquieu, and he suffered, moreover, from the serious deficiency of being too much occupied with the practical utility of his subject. Vico, whose genius was perhaps even more vast than that of Montesquieu, can hardly be considered his rival; for, though his *Scienza Nuova* contains the most profound views on ancient history, they are rather glimpses of truth than a systematic investigation of any one period.

132 Which M. Guizot (*Civilisation en France*, vol. iv. p. 36), in his remarks on the *Esprit des Lois*, does not take sufficiently into consideration. A juster appreciation of Montesquieu will be found in *Cousin, Hist. de la Philosophie*, part ii. vol. i. p. 182; and in *Comte, Philosophie Positive*, vol. iv. pp. 243–252, 261. Compare *Charles Comte, Traité de Législation*, vol. i. p. 125, with *Meyer, Esprit des Institutions Judiciaires*, vol. i. p. lxi. respecting the vast innovations he introduced.

an union between the history of man and those sciences which deal with the external world. As these are the two great characteristics of the method adopted by Montesquieu, it will be necessary to give some account of them, before we can understand the place he really occupies as one of the founders of the philosophy of history.

We have already seen that Voltaire had strongly insisted on the necessity of reforming history, by paying more attention to the history of the people, and less attention to that of their political and military rulers. We have also seen that this great improvement was so agreeable to the spirit of the time that it was generally and quickly adopted, and thus became an indication of those democratic tendencies of which it was in reality a result. It is not, therefore, surprising that Montesquieu should have taken the same course, even before the movement had been clearly declared; since he, like most great thinkers, was a representative of the intellectual condition, and a satisfier of the intellectual wants, of the age in which he lived.

But what constitutes the peculiarity of Montesquieu in this matter is that with him a contempt for those details respecting courts, ministers, and princes, in which ordinary compilers take great delight, was accompanied by an equal contempt for other details which are really interesting, because they concern the mental habits of the few truly eminent men who from time to time have appeared on the stage of public life. This was because Montesquieu perceived that, though these things are very interesting, they are also very unimportant. He knew, what no historian before him had even suspected, that in the great march of human affairs individual peculiarities count for nothing; and that therefore the historian has no business with them, but should leave them to the biographer, to whose province they properly belong. The consequence is that not only does he treat the most powerful princes with such disregard as to relate the reigns of six emperors in two lines,[133] but he constantly enforces the necessity, even in the case of eminent men, of subordinating their special influence to the more general influence of the surrounding society. Thus, many writers had ascribed the ruin of the Roman Republic to the ambition of Cæsar and Pompey, and particularly to the deep schemes of Cæsar. This, Montesquieu totally denies. According to his view of history, no great alteration can be effected except by virtue of a long train of antecedents, where alone we are to seek the cause of what to a superficial eye is the work of individuals. The republic, therefore, was overthrown, not by Cæsar and Pompey, but by that state of things which made the success of Cæsar and Pompey possible.[134] It is thus that the events which ordinary historians relate are utterly valueless. Such events, instead of being causes, are merely the occasions on which the real causes act.[135] They may be called the accidents of history; and they must be treated as subservient to those vast and comprehensive conditions, by which alone the rise and fall of nations are ultimately governed.[136]

This, then, was the first great merit of Montesquieu, that he effected a complete separation between biography and history, and taught historians to study,

[133] He says of the Emperor Maximin, "il fut tué avec son fils par ses soldats. Les deux premiers Gordiens périrent en Afrique. Maxime, Balbin, et le troisième Gordien furent massacrés." *Grandeur et Décadence des Romains*, chap. xvi., in *Œuvres de Montesquieu*, p. 167.

[134] *Ibid.* chap. xi., in *Œuvres de Montesquieu*, pp. 149–153. Compare a similar remark, respecting Charles XII., in *Esprit des Lois*, livre x. chap. xiii. *Œuvres*, p. 260.

[135] On the difference between cause and occasion, see *Grandeur et Décad.* chap. i. p. 126.

[136] "Il y a des causes générales, soit morales, soit physiques, qui agissent dans chaque monarchie, l'élèvent, la maintiennent, ou la précipitent; tous les accidents sont soumis à ces causes; et si le hasard d'une bataille, c'est-à-dire une cause particulière, a ruiné un état, il y avoit une cause générale qui faisoit que cet état devoit périr par une seule bataille. En un mot, l'allure principale entraîne avec elle tous les accidents particuliers." *Grand. et Décad. des Romains*, chap. xviii. p. 172.

not the peculiarities of individual character, but the general aspect of the society in which the peculiarities appeared. If this remarkable man had accomplished nothing further, he would have rendered an incalculable service to history, by pointing out how one of its most fertile sources of error might be safely removed. And although, unhappily, we have not yet reaped the full benefit of his example, this is because his successors have rarely had the capacity of rising to so high a generalization: it is however certain that since his time an approximation towards such elevated views may be noticed even among those inferior writers who, for want of sufficient grasp, are unable to adopt them to their full extent.

In addition to this, Montesquieu made another great advance in the method of treating history. He was the first who, in an inquiry into the relations between the social conditions of a country and its jurisprudence, called in the aid of physical knowledge in order to ascertain how the character of any given civilization is modified by the action of the external world. In his work on the *Spirit of Laws* he studies the way in which both the civil and political legislation of a people are naturally connected with their climate, soil, and food.[137] It is true that in this vast enterprise he almost entirely failed; but this was because meteorology, chemistry, and physiology were still too backward to admit of such an undertaking. This, however, affects the value only of his conclusions, not of his method; and here as elsewhere we see the great thinker tracing the outline of a plan which, in the then state of knowledge, it was impossible to fill up, and the completion of which he was obliged to leave to the riper experience and more powerful resources of a later age.* Thus to anticipate the march of the human intellect, and, as it were, forestall its subsequent acquisitions, is the peculiar prerogative of minds of the highest order; and it is this which gives to the writings of Montesquieu a certain fragmentary and provisional appearance, which was the necessary consequence of a profoundly speculative genius dealing with materials that were intractable, simply because science had not yet reduced them to order by generalizing the laws of their phenomena. Hence it is that many of the inferences drawn by Montesquieu are untenable; such, for instance, as those regarding the effect of diet in stimulating population by increasing the fecundity of women,[138] and the effect of climate in altering the proportion between the births of the sexes.[139] In other cases, an increased acquaintance with barbarous nations has sufficed to correct his conclusions, particularly those concerning the effect which he supposed climate to produce on individual character; for we have now the most decisive evidence, that he was wrong in asserting[140] that hot climates make people unchaste and cowardly, while cold climates make them virtuous and brave.

These, indeed, are comparatively trifling objections, because in all the highest branches of knowledge the main difficulty is not to discover facts but to discover the true method according to which the laws of the facts may be ascertained.[141] In this, Montesquieu performed a double service, since he not only enriched history but also strengthened its foundation. He enriched history by incorporating with it physical inquiries; and he strengthened history by separating it from biography, and thus freeing it from details which are always unimportant, and often unauthentic. And although he committed the error of studying the influence of nature over men considered

[137] *De l'Esprit des Lois*, books xiv. to xviii. inclusive; in *Œuvres*, pp. 302–336.

[138] *Ibid.* livre xxiii. chap. xiii. p. 395. Compare *Burdach, Traité de Physiologie*, vol. ii. p. 116.

[139] *Ibid.* livre xvi. chap. iv., and livre xxiii. chap. xii. pp. 317, 395.

[140] *Ibid.* livre xiv. chap. ii., livre xvii. chap. ii., and elsewhere.

[141] On the supreme importance of method, see my defence of Bichat in the next chapter.

[* In point of fact, Montesquieu's errors as to climate were exposed by Voltaire and by another editor in the eighteenth century. See Garnier's variorum edition.—Ed.]

as individuals,[142] rather than over men considered as an aggregate society, this arose principally from the fact that, in his time, the resources necessary for the more complicated study had not yet been created. Those resources, as I have shown, are political economy and statistics : political economy supplying the means of connecting the laws of physical agents with the laws of the inequality of wealth, and therefore with a great variety of social disturbances ; while statistics enable us to verify those laws in their widest extent, and to prove how completely the volition of individual men is controlled by their antecedents, and by the circumstances in which they are placed. It was therefore not only natural but inevitable that Montesquieu should fail in his magnificent attempt to unite the laws of the human mind with the laws of external nature. He failed, partly because the sciences of external nature were too backward, and partly because those other branches of knowledge which connect nature with man were still unformed. For, as to political economy, it had no existence as a science until the publication of the *Wealth of Nations* in 1776, twenty-one years after the death of Montesquieu. As to statistics, their philosophy is a still more recent creation, since it is only during the last thirty years that they have been systematically applied to social phenomena ; the earlier statisticians being merely a body of industrious collectors, groping in the dark, bringing together facts of every kind without selection or method, and whose labours were consequently unavailable for those important purposes to which they have been successfully applied during the present generations.

Only two years after the publication of the *Spirit of Laws*, Turgot delivered those celebrated lectures of which it has been said that in them he created the philosophy of history.[143] This praise is somewhat exaggerated ; for in the most important matters relating to the philosophy of his subject, he takes the same view as Montesquieu ; and Montesquieu, besides preceding him in point of time, was his superior certainly in learning, perhaps in genius. Still the merit of Turgot is immense ; and he belongs to that extremely small class of men who have looked at history comprehensively, and have recognised the almost boundless knowledge needed for its investigation. In this respect his method is identical with that of Montesquieu, since both of these great men excluded from their scheme the personal details which ordinary historians accumulate, and concentrated their attention upon those large general causes, by the operation of which the destinies of nations are permanently affected. Turgot clearly perceived that, notwithstanding the variety of events produced by the play of human passions, there is amid this apparent confusion a principle of order, and a regularity of march, not to be mistaken by those whose grasp is firm enough to seize the history of man as a complete and single whole.[144]

[142] How completely futile this was, as regards results, is evident from the fact that a hundred years after he wrote, we, with all our increased knowledge, can affirm nothing positively respecting the direct action of climate, food, and soil, in modifying individual character ; though it has, I trust, appeared in the second chapter of this Introduction that something can be ascertained respecting their indirect action, that is, their action on individual minds through the medium of social and economical organization.

[143] " Il a créé en 1750 la philosophie de l'histoire dans ses deux discours prononcés en Sorbonne." *Cousin, Hist. de la Philosophie*, I. série, vol. i. p. 147. There is a short notice of these striking productions in *Condorcet, Vie de Turgot*, pp. 11–16.

[144] Nothing can be better than his summary of this vast conception : " Tous les âges sont enchaînés par une suite de causes et d'effets qui lient l'état du monde à tous ceux qui l'ont précédé." *Second Discours en Sorbonne*, in *Œuvres de Turgot*, vol. ii. p. 52. Everything Turgot wrote on history is a development of this pregnant sentence. That he understood the necessity of an historian being acquainted with physical science, and with the laws of the configuration of the earth, climate, soil, and the like, is evident in his fragment, *La Géographie Politique*, in *Œuvres*, vol. ii. pp. 166–208. It is no slight proof of his political sagacity, that in 1750 he distinctly foretold the freedom of the American colonies. Compare *Œuvres de Turgot*, vol. ii. p. 66, with *Mém. sur Turgot*,

It is true that Turgot, subsequently engaged in political life, never possessed sufficient leisure to fill up the splendid outline of what he so successfully sketched: but though in the execution of his plan he fell short of Montesquieu, still the analogy between the two men is obvious, as also is their relation to the age in which they lived. They, as well as Voltaire, were the unconscious advocates of the democratic movement, inasmuch as they discountenanced the homage which historians had formerly paid to individuals, and rescued history from being a mere recital of the deeds of political and ecclesiastical rulers. At the same time, Turgot, by the captivating prospects which he held out of future progress,[145] and by the picture which he drew of the capacity of society to improve itself, increased the impatience which his countrymen were beginning to feel against that despotic government, in whose presence amelioration seemed to be hopeless. These and similar speculations, which now for the first time appeared in French literature, stimulated the activity of the intellectual classes, cheered them under the persecutions to which they were exposed, and emboldened them to the arduous enterprise of leading on the people to attack the institutions of their native land. Thus it was, that in France everything tended to the same result. Everything indicated the approach of some sharp and terrible struggle, in which the spirit of the present should war with the spirit of the past; and in which it should be finally settled whether the people of France could free themselves from the chains in which they had long been held, or whether, missing their aim, they were doomed to sink still lower in that ignominious vassalage which makes even the most splendid periods of their political history a warning and a lesson to the civilized world.

vol. i. p. 139. [The freedom of the American colonies was predicted also by Dubos in 1703, in *Les Intérêts de l'Angleterre mal entendus dans la guerre présente* (Voltaire, *Siècle de Louis XIV* : *Catalogue des Ecrivains*); by Genovesi in 1764 (Pecchio, *Storia della economia pubblica in Italia*, 1829, p. 129); and at different dates by Argenson, Choiseul and Vergennes (Lecky, *Hist. of England in Eighteenth Century*, small ed. iv. 2; Bancroft, *Hist. of U.S.*, Centennial ed. iii. 305). Montesquieu also predicted it in one of his *Pensées Diverses* (*Notes sur l'Angleterre*).—Ed.]

[145] A confidence which is apparent in his economical as well as in his historical works. In 1811, Sir James Mackintosh writes that Turgot "had more comprehensive views of the progress of society than any man since Bacon:" *Mem. of Mackintosh*, vol. ii. p. 133; and see a similar remark by Dugald Stewart, in his *Philos. of the Mind*, vol. i. p. 246.

CHAPTER XIV

Proximate Causes of the French Revolution after the Middle of the Eighteenth Century

In the last chapter but one I have attempted to ascertain what those circumstances were which, almost immediately after the death of Louis XIV., prepared the way for the French Revolution. The result of the inquiry has been that the French intellect was stimulated into activity by the examples and teachings of England ; and that this stimulus caused, or at all events encouraged, a great breach between the government of France and its literature ; —a breach the more remarkable, because during the reign of Louis XIV. the literature, notwithstanding its temporary brilliancy, had been invariably submissive, and had intimately allied itself with the government, which was always ready to reward its services.* We have also seen that, this rupture having arisen between the governing classes and the intellectual classes, it followed that the former, true to their ancient instincts, began to chastize that spirit of inquiry to which they were unaccustomed : hence those persecutions which, with hardly a single exception, were directed against every man of letters, and hence too those systematic attempts to reduce literature to a subserviency similar to that in which it had been held under Louis XIV. It has moreover appeared that the great Frenchmen of the eighteenth century, though smarting from the injuries constantly inflicted on them by the government and the church, abstained from attacking the government, but directed all their hostility against the church. This apparent anomaly, of the religious institutions being assailed, and the political institutions being spared, has been shown to be a perfectly natural circumstance, arising out of the antecedents of the French nation ; and an attempt has been made to explain what those antecedents were, and how they acted. In the present chapter I purpose to complete this inquiry by examining the next great stage in the history of the French mind. It was needful that, before both church and state could fall, men should change the ground of their hostility, and should attack political abuses with the zeal they had hitherto reserved for religious ones. The question, therefore, now arises as to the circumstances under which this change took place, and the period when it actually occurred.

The circumstances which accompanied this great change are, as we shall presently see, very complicated ; and, as they have never yet been studied in connexion with each other, I shall in the remaining part of this volume examine them at considerable length. On this point it will, I think, be practicable to arrive at some precise and well-defined results respecting the history of the French Revolution. But the other point, namely, the time at which the change took place, is not only much more obscure, but by its nature will never admit of complete precision. This, however, is a deficiency it possesses in common

[* This has not been shown above, and is not matter of fact. Much of the literature in no way connected itself with the government ; and we have the saying of Louis : "Toutes les fois que je donne une place vacante, je fais cent mécontents et un ingrat."—Ed.]

with every other change in the history of man. The circumstances of each change may always be known, provided the evidence is ample and authentic. But no amount of evidence can enable us to fix the date of the change itself. That to which attention is usually drawn by the compilers of history is not the change, but is merely the external result which follows the change. The real history of the human race is the history of tendencies which are perceived by the mind, and not of events which are discerned by the senses. It is on this account that no historical epoch will ever admit of that chronological precision familiar to antiquaries and genealogists. The death of a prince, the loss of a battle, and the change of a dynasty, are matters which fall entirely within the province of the senses; and the moment in which they happen can be recorded by the most ordinary observers. But those great intellectual revolutions upon which all other revolutions are based, cannot be measured by so simple a standard. To trace the movements of the human mind, it is necessary to contemplate it under several aspects, and then co-ordinate the results of what we have separately studied. By this means we arrive at certain general conclusions, which, like the ordinary estimate of averages, increase in value in proportion as we increase the number of instances from which they are collected. That this is a safe and available method, appears not only from the history of physical knowledge,[1] but also from the fact that it is the basis of the empirical maxims by which all men of sound understanding are guided in those ordinary transactions of life to which the generalizations of science have not yet been applied. Indeed such maxims, which are highly valuable, and which in their aggregate form what is called common sense, are never collected with anything like the precautions that the philosophic historian ought to feel himself bound to employ.

The real objection, therefore, to generalizations respecting the development of the intellect of a nation is, not that they want certainty, but that they lack precision. This is just the point at which the historian diverges from the annalist. That the English intellect, for example, is gradually becoming more democratic, or, as it is termed, more liberal, is as certain as that the crown of this country is worn by Queen Victoria. But though both these statements are equally certain, the latter statement is more precise. We can tell the very day on which the Queen ascended the throne; the moment of her death will be known with equal precision; and there can be no doubt that many other particulars respecting her will be minutely and accurately preserved. In tracing, however, the growth of English liberalism, all such exactness deserts us. We can point out the year in which the Reform Bill was passed; but who can point out the year in which the Reform Bill first became necessary? In the same way, that the Jews will be admitted into parliament, is as certain as that the Catholics have been admitted. Both these measures are the inevitable result of that increasing indifference to theological disputes, which must now be obvious to every man who does not wilfully shut his eyes. But while we know the hour in which the bill for Catholic emancipation received the assent of the crown, there is no one now living who can tell even the year in which similar justice will be granted to the Jews. The two events are equally certain, but they are not equally precise.

This distinction between certainty and precision I have stated at some length because it seems to be little understood,[2] and because it is intimately connected

[1] For a popular but able view of the value of averages in scientific inquiries, see *Herschel's Disc. on Nat. Philos.* pp. 215–219.

[2] As we see in the pretensions set forth by mathematicians, who often suppose that an amount of certainty can be attained in their own pursuits not to be found in any other. This error has probably arisen, as Locke suggests, from confusing clearness with certainty. *Essay on Human Understanding*, book iv. chap. ii. secs. 9 and 10, in *Works*, vol. ii. pp. 73, 74. See also *Comte, Philos. Pos.* vol. i. p. 103, where it is justly observed, that all branches of knowledge capable of being generalized into sciences admit of equal certainty, but not of equal precision: "si, d'après l'explication précédente, les diverses sciences doivent nécessairement présenter une précision très-inégale, il n'en est nullement ainsi de leur certitude." This is handled unsatisfactorily by Montucla (*Hist. des Mathémat.*

with the subject now before us. The fact of the French intellect having, during the eighteenth century, passed through two totally distinct epochs can be proved by every description of evidence ;* but it is impossible to ascertain the precise time when one epoch succeeded the other. All that we can do is, to compare the different indications which the history of that age presents, and arrive at an approximation which may guide future inquirers. It would perhaps be more prudent to avoid making any particular statement ; but as the employment of dates seems necessary to bring such matters clearly before the mind, I will, by way of provisional hypothesis, fix on the year 1750 as the period when those agitations of society which caused the French Revolution entered into their second and political stage.

That this was about the period when the great movement, hitherto directed against the church, began to be turned against the state,† is an inference which many circumstances seem to warrant. We know on the best authority that, towards the year 1750, the French began their celebrated inquiries respecting political economy,[3] and that in their attempt to raise it to a science they were led to perceive the immense injury which the interference of government had produced on the material interests of the country.[4] Hence a conviction arose that, even in regard to the accumulation of wealth, the authority possessed by the rulers of France was mischievous, since it enabled them, under the notion of protecting commerce, to trouble the freedom of individual action, and to prevent trade from running into those profitable channels which traders are best able to select for themselves. Scarcely had a knowledge of this important truth been diffused, when its consequences were quickly seen in the national literature and in the habits of national thought. The sudden increase in France of works

vol. i. p. 33), who says, that the principal cause of the peculiar certainty reached by the mathematician is that " d'une idée claire it ne déduit que des conséquences claires et incontestables." Similarly, Cudworth (*Intellect. System*, vol. iii. p. 377): "nay the very essence of truth here is this clear perceptibility, or intelligibility." On the other hand, Kant, a far deeper thinker, avoided this confusion, by making mathematical clearness the mark of a *kind* of certainty rather than of a *degree* of it : " Die mathematische Gewissheit heisst auch Evidenz,weil ein intuitives Erkenntniss klärer ist,als ein discursives. Obgleich also beides, das mathematische und das philosophische Vernunfterkenntniss, an sich gleich gewiss ist, so ist doch die Art der Gewissheit in beiden verschieden." *Logik, Einleitung*, sec. 9, in *Kant's Werke*, vol. i. p. 399. On the opinions of the ancients respecting certainty, compare *Matter, Hist. de l'Ecole d'Alexandrie*, vol. i. p. 195, with *Ritter's Hist. of Ancient Philos.* vol. ii. p. 46, vol. iii. pp. 74, 426, 427, 484, 614.

[3] " Vers 1750, deux hommes de génie, observateurs judicieux et profonds, conduits par une force d'attention très-soutenue à une logique rigoureuse, animés d'un noble amour pour la patrie et pour l'humanité, M. Quesnay et M. de Gournay, s'occupèrent avec suite de savoir si la nature des choses n'indiquerait pas une science de l'économie politique, et quels seraient les principes de cette science." *Additions aux Œuvres de Turgot*, vol. iii. p. 310. M. Blanqui (*Hist. de l'Économie Politique*, vol. ii. p. 78) also says, " vers l'année 1750 ; " and Voltaire (*Dict. Philos.*, article *Blé*, in *Œuvres*, vol. xxxvii. p. 384) says, " vers l'an 1750, la nation, rassasiée de vers, de tragédies, de comédies, d'opéra, de romans, d'histoires romanesques, de réflexions morales plus romanesques encore, et de disputes théologiques sur la grace et sur les convulsions, se mit enfin à raisonner sur les blés."

[4] The revolutionary tendency of this economical movement is noticed in *Alison's Europe*, vol. i. pp. 184, 185 ; where, however, its commencement is erroneously assigned to " about the year 1761." See also, on the hostility this caused against government, *Mém. de Campan*, vol. i. pp. 7–8 ; *Mém. of Mallet du Pan*, vol. i. p. 32 ; and *Barruel, Hist. du Jacobinisme*, vol. i. p. 193, vol. ii. p. 152.

[* Unfortunately for the argument, the allegation of " two totally distinct epochs," as we have seen, is a concrete error, refutable by precise evidence.—Ed.]

[† As has been noted above, p. 435, there were not two distinct stages. The great majority of the books attacking religion were produced after 1750, alongside of the political movement ; and the largest rate of output was between 1764 and 1770.—Ed.]

relating to finance and to other questions of government is indeed one of the most remarkable features of that age. With such rapidity did the movement spread, that we are told that soon after 1755 the economists effected a schism between the nation and the government;[5] and Voltaire, writing in 1759, complains that the charms of lighter literature were entirely neglected amidst the general zeal for these new studies.[6] It is not necessary to follow the subsequent history of this great change; nor need I trace the influence exercised shortly before the Revolution by the later economists, and particularly by Turgot, the most eminent of their leaders.[7] It is enough to say that within about twenty years after the movement was first clearly seen, the taste for economical and financial inquiries became so common that it penetrated those parts of society where habits of thought are not very frequent; since we find that, even in fashionable life, the conversation no longer turned upon new poems and new plays, but upon political questions and subjects immediately connected with them.[8] Indeed, when Necker in 1781 published his celebrated Report on the Finances of France, the eagerness to obtain it was beyond all bounds; six thousand copies were sold the first day; and the demand still increasing, two presses were kept constantly at work in order to satisfy the universal curiosity.[9] And what makes the democratic tendency of all this the more obvious is, that

[5] "D'ailleurs la nation s'étoit accoutumée à se séparer toujours de plus en plus de son gouvernement, en raison même de ce que ses écrivains avoient commencé à aborder les études politiques. C'étoit l'époque où la secte des économistes se donnoit le plus de mouvement, depuis que le marquis de Mirabeau avoit publié, en 1755, son *Ami des Hommes*." *Sismondi, Hist. des Franç.* vol. xxix. p. 269. Compare *Tocqueville, Règne de Louis XV*, vol. ii. p. 58. In this same year, 1755, Goldsmith was in Paris, and was so struck by the progress of insubordination that he foretold the freedom of the people; though I need hardly say that he was not a man to understand the movement of the economists. *Prior's Life of Goldsmith*, vol. i. pp. 198, 199; *Forster's Life of Goldsmith*, vol. i p. 66.

[6] In February, 1759, he writes to Madame du Boccage: "Il me paraît que les graces et le bon goût sont bannis de France, et ont cédé la place à la métaphysique embrouillée, à la politique des cerveaux creux, à des discussions énormes sur les finances, sur le commerce, sur la population, qui ne mettront jamais dans l'état ni un écu, ni un homme de plus." *Œuvres de Voltaire*, vol. lx. p. 485. In 1763 (vol. lxiii. p. 204): "Adieu nos beaux arts, si les choses continuent comme elles sont. La rage des remontrances et des projets sur les finances a saisi la nation." Many of the ablest men being thus drawn off from mere literary pursuits, there began, about twenty years before the Revolution, a marked deterioration in style, particularly among prose writers. Compare *Lettres de Dudeffand à Walpole*, vol. ii. p. 358, vol. iii. pp. 163, 299; *Mém. de Genlis*, vol. ii. p. 374, vol. v. p. 123, vol. viii. pp. 180, 275; *Mercier sur Rousseau*, vol. ii. p. 151.

[7] Georgel, who hated Turgot, says of him: "son cabinet et ses bureaux se transformèrent en ateliers où les économistes forgeoient leur système et leurs spéculations." *Mém. de Georgel*, vol. i. p. 406; see also *Blanqui, Hist. de l'Econ. Politique*, vol. ii. pp. 96–112; *Condorcet, Vie de Turgot*, pp. 32–35; *Twiss, Progress of Political Econ.* pp. 142 seq.

[8] Sismondi, under the year 1774, notices "les écrits innombrables que chaque jour voyoit éclore sur la politique, et qui avoient désormais remplacé dans l'intérêt des salons ces nouveautés littéraires, ces vers, ces anecdotes galantes, dont peu d'années auparavant le public étoit uniquement occupé." *Hist. des Français*, vol. xxix. p. 495; and a similar remark in *Schlosser's Eighteenth Century*, vol. ii. p. 126.

[9] See the account, written in Feb., 1781, in *Grimm, Corr. Lit.* vol. xi., p. 260, where it is said of Necker's *Compte Rendu*, "La sensation qu'a faite cet ouvrage est, je crois, sans exemple; il s'en est débité plus de six mille exemplaires le jour même qu'il a paru, et depuis, le travail continuel de deux imprimeries n'a pu suffire encore aux demandes multipliées de la capitale, des provinces, et des pays étrangers." Ségur (*Souvenirs*, vol. i. p. 138) mentions, that Necker's work was "dans la poche de tous les abbés, et sur la toilette de toutes les dames." The daughter of Necker, Madame de Staël, says of her father's work, *Administration des Finances*, "on en vendit quatre vingt mille exemplaires," *De Staël sur la Révolution*, vol. i. p. 111.

Necker was at that time one of the servants of the crown ; so that his work, looking at its general spirit, has been truly called an appeal to the people against the king by one of the ministers of the king himself.[10]

This evidence of the remarkable change which, in or about 1750, the French mind underwent, and which formed what I term the second epoch of the eighteenth century, might be easily strengthened by a wider survey of the literature of that time. Immediately after the middle of the century, Rousseau published those eloquent works which exercised immense influence, and in which the rise of the new epoch is very observable ; for this most powerful writer abstained from those attacks on Christianity [11] which unhappily had been too frequent, and exerted himself almost exclusively against the civil and political abuses of the existing society.[12] To trace the effects which this wonderful, but in some instances misguided man produced on the mind of his own and of the succeeding generation, would occupy too large a share of this Introduction ; though the inquiry is full of interest, and is one which it were to be wished some competent historian would undertake.[13] Inasmuch, however, as the philosophy of Rousseau was itself only a single phase of a far larger movement, I shall at present pass over the individual, in order to consider the general spirit of an age in which he played a vast, but still a subsidiary part.

The formation of a new epoch in France, about the year 1750, may be further illustrated by three circumstances of considerable interest, all pointing in the same direction. The first circumstance is, that not a single great French writer attacked

[10] The expression of the Baron de Montyon : see *Adolphus's History of George III.*, vol. iv. p. 290 ; and on the revolutionary tendency of Necker's financial works, *Soulavie, Règne de Louis XVI*, vol. ii. pp. xxxvii. xxxviii., vol. iv. pp. 18, 143. Necker published a justification of his book, "malgré la défense du roi." *Du Mesnil, Mém. sur Lebrun*, p. 108.

[11] So far as I remember, there is not a single instance in any of his works ; and those who assail him on this ground should adduce the passages on which they rely, instead of bringing vague general charges. Compare *Life of Rousseau*, in *Brougham's Men of Letters*, vol. i. p. 189 ; *Stäudlin, Gesch. der theolog. Wissenschaften*, vol. ii. p. 442 ; *Mercier sur Rousseau*, 1791, vol. i. pp. 27–32, vol. ii. pp. 279, 280. [In the *Contrat Social* (l. iv. ch. 8.), Rousseau writes that "the Christian law is at bottom more injurious than useful to the sound constitution of the State" ; and the *Confession of Faith of a Savoyard Vicar* in the *Emile* was regarded by the clergy as an attack on revelation, and denounced accordingly.—Ed.]

[12] "Rousseau, qui déjà en 1753 avoit touché aux bases mêmes de la société humaine, dans son *Discours sur l'origine de l'inégalité parmi les hommes*." *Sismondi*, vol. xxix. p. 270. Schlosser (*Hist. of the Eighteenth Century*, vol. i. p. 138) notices "the entirely new system of absolute democracy which was brought forward by J. J. Rousseau" ; see also p. 289, and *Soulavie, Régne de Louis XVI*, vol. v. p. 208.

[13] Napoleon said to Stanislas Girardin respecting Rousseau, "sans lui la France n'auroit pas eu de révolution." *Holland's Foreign Reminiscences*, Lond. 1850, p. 261. This is certainly an exaggeration ; but the influence of Rousseau was, during the latter half of the eighteenth century, most extraordinary. In 1765, Hume writes from Paris : "It is impossible to express or imagine the enthusiasm of this nation in his favour ; . . . no person ever so much engaged their attention as Rousseau. Voltaire and everybody else are quite eclipsed by him." *Burton's Life of Hume*, vol. ii p. 299. A letter written in 1754 (in *Grimm, Correspond.* vol. i. p. 122) says that his Dijon Discourse "fit une espèce de révolution à Paris." The circulation of his works was unprecedented ; and when *La Nouvelle Héloïse* appeared, "les libraires ne pouvaient suffire aux demandes de toutes les classes. On louait l'ouvrage à tant par jour, ou par heure. Quand il parut, on exigeait douze sous par volume, en n'accordant que soixante minutes pour le lire." *Musset Pathay, Vie de Rousseau*, vol. ii. p. 361. For further evidence of the effect produced by his works, see *Lerminier, Philos. du Droit*, vol. ii. p. 251 ; *Mém. de Roland*, vol. i. p. 196, vol. ii. pp. 337, 359 ; *Mém. de Genlis*, vol. v. p. 193, vol. vi. p. 14 ; *Alison's Europe*, vol. i. p. 170, vol. iii. p. 369, vol. iv. p. 376 : *Mém. de Morellet*, vol. i. p. 116 ; *Longchamp, Mém. sur Voltaire*, vol. ii. p. 50 ; *Life of Romilly*, vol. i. p. 267 ; *Mem. of Mallet du Pan*, vol. i. p. 127 ;

the political institutions of the country before the middle of the century ;* while after that period, the attacks of the ablest men were incessant. The second circumstance is, that the only eminent Frenchmen who continued to assail the clergy, and yet refused to interfere in politics, were those who, like Voltaire, had already reached an advanced age, and had, therefore, drawn their ideas from the preceding generation, in which the church had been the sole object of hostility. The third circumstance, which is even more striking than the other two, is that almost at the same moment there was seen a change in the policy of the government ; since, singularly enough, the ministers of the crown displayed for the first time an open enmity against the church, just as the intellect of the country was preparing for its decisive onslaught on the government itself. Of these three propositions, the first two will probably be admitted by every student of French literature : at all events, if they are false, they are so exact and peremptory that it will be easy to refute them by giving examples to the contrary. But the third proposition, being more general, is less susceptible of a negative, and will therefore require the support of that special evidence which I will now adduce.

The great French writers having by the middle of the eighteenth century succeeded in sapping the foundations of the church,† it was natural that the government should step in and plunder an establishment which the course of events had weakened. This, which took place in France under Louis XV., was similar to what occurred in England under Henry VIII. ; for in both cases a remarkable intellectual movement, directed against the clergy, preceded and facilitated the attacks made on them by the crown. It was in 1749 that the French government took the first decisive step against the church. And what proves the hitherto backward state of the country in such matters is that this consisted of an edict against mortmain, a simple contrivance for weakening the ecclesiastical power, which we in England had adopted long before. Machault, who had recently been raised to the office of controller-general, has the glory of being the originator of this new policy. In August, 1749, [14] he issued that celebrated edict which forbade the formation of any religious establishment without the consent of the crown, duly expressed in letters-patent, and registered in parliament ; effective precautions, which, says the great historian of France, show that Machault "considered not only the increase but even the existence of these ecclesiastical properties, as a mischief to the kingdom."[15]

This was an extraordinary step on the part of the French government ; but

Burke's Works, vol. i. p. 482 ; *Cassagnac, Causes de la Rév.* vol. iii. p. 549 ; *Lamartine, Hist. des Girondins.* vol. ii. p. 38, vol. iv. p. 93, vol. viii. p. 125 ; *Wahrheit und Dichtung*, in *Göthe's Werke*, Stuttgart, 1837, vol. ii. part ii. pp. 83, 104 ; *Grimm, Correspond. Lit.* vol. xii. p. 222 ; *De Staël, Consid. sur la Rév.* vol. ii. p. 371.

[14] Sismondi (xxix. p. 20), Lacretelle (*XVIIIe Siècle*, vol. ii. p. 110), and Tocqueville (*Règne de Louis XV*, vol. ii. p. 103), give the date 1749 ; so that 1747, in *Biog. Univ.* vol. xxvi. v. 46, is apparently a misprint.

[15] "Laissant voir dans toute cette loi, qui est assez longue, qu'il regardoit non-seulement l'accroissement, mais l'existence de ces propriétés ecclésiastiques, comme un mal pour le royaume." *Sismondi, Hist. des Franç.* vol. xxix. p. 21. This, I suppose, is the edict mentioned by Turgot, who wished to push the principle still further. *Œuvres de Turgot*, vol. iii. pp. 254, 255 ; a bold and striking passage.

[* It is obvious that no book attacking the political institutions of the country *could be published* at that period ; but the Marquis d'Argenson had *written* before 1739 his *Considérations sur le Gouvernement de France*, in which he argued for decentralisation, municipal and cantonal councils, free trade, and a more careful choice of officials. Before him, Vauban and Bois-Guillebert had striven for economic reforms, and Fénelon for political. Cp. Duruy, *Hist. de France*, ii. 418. The statement in the next clause, that "the attacks of the ablest men were incessant," is an extreme exaggeration.—Ed.]

[† See notes on pp. 435, 473, 487.—Ed.]

what followed showed that it was only the beginning of a much larger design.[16] Machault, so far from being discountenanced, was, the year after he had issued this edict, intrusted with the seals in addition to the controllership ;[17] for, as Lacretelle observes, the court " thought the time had now come to tax the property of the clergy."[18] During the forty years which elapsed between this period and the beginning of the Revolution, the same anti-ecclesiastical policy prevailed. Among the successors of Machault, the only three of much ability were Choiseul, Necker, and Turgot, all of whom were strenuous opponents of that spiritual body which no minister would have assailed in the preceding generation. Not only these eminent statesmen, but even such inferior men as Calonne, Malesherbes, and Terray, looked on it as a stroke of policy to attack privileges which superstition had consecrated, and which the clergy had hitherto reserved, partly to extend their own influence, and partly to minister to those luxurious and profligate habits which in the eighteenth century were a scandal to the ecclesiastical order.*

While these measures were being adopted against the clergy, another important step was taken in precisely the same direction. Now it was that the government began to favour that great doctrine of religious liberty, the mere defence of which it had hitherto punished as a dangerous speculation. The connexion between the attacks on the clergy and the subsequent progress of toleration may be illustrated not only by the rapidity with which one event succeeded the other, but also by the fact that both of them emanated from the same quarter. Machault, who was the author of the edict of mortmain, was also the first minister who showed a wish to protect the Protestants against the persecutions of the Catholic priesthood.[19] In this he only partly succeeded ; but the impetus thus given soon became irresistible. In 1760, that is only nine years later, there was seen a marked change in the administration of the laws ; and the edicts against heresy, though not yet repealed, were enforced with unprecedented mildness.[20] The movement

[16] Mably mentions the excitement caused by this proceeding of Machault, *Observations sur l'Histoire de France*, vol. ii. p. 415 : " On attaqua alors, dans plusieurs écrits, les immunités du clergé." On the dislike felt by the clergy against the minister, see *Ségur, Souvenirs*, vol. i. p. 35 ; *Soulavie, Règne de Louis XVI*, vol. i. pp. 283, 310, vol. ii. p. 146.

[17] In 1750, " Machault obtint les sceaux en conservant le contrôle-général." *Biog. Univ.* vol. xxvi. p. 46.

[18] " Croyait surtout que le temps était venu d'imposer les biens du clergé." *Lacretelle, XVIII^e Siècle*, vol. ii. p. 107. Nearly the same words are used in *Biog. Univ.* vol. xxvi. p. 46.

[19] On which account, he still further provoked the indignation of the Catholic clergy. See *Felice, Hist. of the Protest. of France*, pp. 401, 402 ; a letter written in 1751.

[20] " The approach of the year 1760 witnessed a sensible relaxation of persecution. . . . The clergy perceived this with dismay ; and, in their general assembly of 1760, they addressed urgent remonstrances to the king against this remission of the laws." *Felice, Protest. of France*, p. 422. Comp. an interesting letter from Nismes in 1776, in *Thicknesse's Journey through France*, London, 1777, vol. i. p. 66. [Felice, however, goes on to tell how in 1762 the pastor Rochette was hanged and the three Greniers beheaded at Toulouse on charges of contravention of laws as to religious assemblies, and of constructive sedition ; and how in the same year and at the same place, the aged Jean Calas was broken on the wheel on an improbable charge, proved later to be false. In the same year, Sirven escaped the same fate at the same place on a similar charge only by flight ; and in 1766, La Barre, a lad of eighteen, was executed at Amiens on a trumped-up charge of blasphemy. It was from this period that there began the fiercest polemic against religion, Voltaire taking for its motto *Ecrasez l'infâme*.—Ed.]

[* The anti-clerical policy of Machault was so on purely fiscal grounds, there being no other practicable way of helping the revenues. It was the financial straits of the State that forced an ever-increasing discussion and resentment, the burden of taxation having more than doubled since the previous reign, while the resources of the taxpayers had not. Cp. Duruy, ii. 395, 402, 407, 411, 415, 419.—Ed.]

quickly spread from the capital to the remoter parts of the kingdom ; and we are assured that after the year 1762 the reaction was felt even in those provinces, which, from their backward condition, had always been most remarkable for religious bigotry.[21] At the same time, as we shall presently see, a great schism arose in the church itself, which lessened the power of the clergy, by dividing them into two hostile parties. Of these factions, one made common cause with the state, still further aiding the overthrow of the ecclesiastical hierarchy. Indeed, the dissensions became so violent that the last great blow dealt to spiritual ascendency by the government of Louis XVI. proceeded not from the hands of a layman, but from one of the leaders of the church ; a man who, from his standing, would under ordinary circumstances have protected the interests which he now eagerly attacked. In 1787, only two years before the Revolution, Brienne, Archbishop of Toulouse,[22] who was then minister, laid before the parliament of Paris a royal edict by which the discouragement hitherto thrown upon heresy was suddenly removed. By this law the Protestants were invested with all those civil rights which the Catholic clergy had long held out as the reward of adherence to their own opinions.[23] It was therefore natural that the more orthodox party should condemn, as an impious innovation,[24] a measure which, by placing the two sects in some degree on the same footing, seemed to sanction the progress of error ; and which certainly deprived the French church of one of the chief attractions by which men had hitherto been induced to join her communion. Now, however, all these considerations were set at naught. Such was the prevailing temper, that the parliament, though then in a mood very refractory to the royal authority, did not hesitate to register the edict of the king ; and this great measure became law ; the dominant party being astonished, we are told, that any doubt could be entertained as to the wisdom of the principles on which it was based.[25]

These were omens of the coming storm ; signs of the time, which those who run may read. Nor are there wanting other marks by which the true complexion of that age may be clearly seen. In addition to what has been just related, the government, soon after the middle of the eighteenth century, inflicted a direct and fatal injury upon the spiritual authority. This consisted in the expulsion of the Jesuits ; which is an event important not only for its ultimate effects but also as an evidence of the feelings of men, and of what could be peaceably accomplished by the government of him who was called " the most Christian king."[26]

[21] Sismondi says of 1762, " Dès lors, la réaction de l'opinion publique contre l'intolérance pénétra jusque dans les provinces les plus fanatiques." *Hist. des Franç.* vol. xxix. p. 296. See also a letter to Damilaville, dated 6th of May, 1765, in *Lettres inédites de Voltaire*, vol. i. p. 412 ; and two other letters in *Œuvres de Voltaire*, vol. lxiv. p. 225, vol. lxvi. p. 417.

[22] Of whom Hume, several years before, had formed a very high opinion. See *Burton's Life of Hume*, vol. ii. p. 497 ; a too favourable judgment, which should be contrasted with the opposite exaggerations, in *Mém. de Genlis*, vol. ix. pp. 360–363, and *Barruel, Hist. du Jacobinisme*, vol. i. pp. 87, 199.

[23] *Lavallée, Hist. des Franç.* iii. p. 516 ; *Biog. Univ.* vol. xxiv. p. 656.

[24] *Georgel, Mémoires*, vol. ii. pp. 293, 294 ; a violent outbreak against " l'irréligieux édit . . . . qui autorise tous les cultes."

[25] " Le parlement de Paris discutait l'édit sur les protestans. Vingt ans plus tôt, combien une telle résolution n'eût-elle pas agité et divisé les esprits ? En 1787, on ne s'étonnait que d'une chose : c'était qu'il put y avoir une discussion sur des principes évidens." *Lacretelle, XVIII^e Siècle*, vol. iii. pp. 342, 343. In 1776, Malesherbes, who was then minister, wished to secure nearly the same privileges for the Protestants, but was prevented from doing so. *Dutens, Mémoires*, vol. ii. pp. 56–58. Dutens was himself concerned in the negotiation.

[26] Henry II. used to refer to this title, by way of justifying his persecution of the Protestants (*Ranke's Civil Wars in France*, vol. i. p. 241) ; and great account was made of it by that exemplary prince, Louis XV. *Soulavie, Règne de Louis XVI*, vol. i. p. 155. The French antiquaries trace it back to Pepin, the father of Charlemagne. *Barrington's Observations on the Statutes*, p. 168.

The Jesuits, for at least fifty years after their institution, rendered immense services to civilization, partly by tempering with a secular element the more superstitious views of their great predecessors, the Dominicans and Franciscans, and partly by organizing a system of education far superior to any yet seen in Europe. In no university could there be found a scheme of instruction so comprehensive as theirs; and certainly nowhere was displayed such skill in the management of youth, or such insight into the general operations of the human mind. It must in justice be added that this illustrious society, notwithstanding its eager and often unprincipled ambition, was during a considerable period the steady friend of science * as well as of literature; and that it allowed to its members a freedom and a boldness of speculation which had never been permitted by any other monastic order.

As, however, civilization advanced, the Jesuits, like every spiritual hierarchy the world has yet seen, began to lose ground; and this not so much from their own decay as from a change in the spirit of those who surrounded them. An institution admirably adapted to an early form of society was ill suited to the same society in its maturer state. In the sixteenth century the Jesuits were before their age; in the eighteenth century they were behind it. In the sixteenth century they were the great missionaries of knowledge; because they believed that by its aid they could subjugate the consciences of men. But in the eighteenth century their materials were more refractory; they had to deal with a perverse and stiff-necked generation; they saw in every country the ecclesiastical authority rapidly declining; and they clearly perceived that their only chance of retaining their old dominion was by checking that knowledge the progress of which they had formerly done much to accelerate.[27]

Under these circumstances, the statesmen of France, almost immediately after the middle of the eighteenth century, determined to ruin an order which had long ruled the world, and which was still the greatest bulwark of the church. In this design they were aided by a curious movement which had taken place in the church itself, and which, being connected with views of much wider import, deserves the attention even of those for whom theological controversies have no interest.

Among the many points on which metaphysicians have wasted their strength, that of free-will has provoked the hottest disputes. And what has increased the acerbity of their language is that this, which is eminently a metaphysical question, has been taken up by theologians, who have treated it with that warmth for which they are remarkable.[28] From the time of Pelagius, if not earlier,[29]

[27] The Prince de Montbarey, who was educated by the Jesuits about 1740, says that, in their schools, the greatest attention was paid to pupils intended for the church; while the abilities of those destined for secular professions were neglected. See this statement, which, coming from such a quarter, is very remarkable, in *Mémoires de Montbarey*, vol. i. pp. 12, 13. Montbarey, so far from being prejudiced against the Jesuits, ascribes the Revolution to their overthrow. *Ibid.* vol. iii. p. 94. For other evidence of the exclusive and unsecular character of their education in the eighteenth century, see *Schlosser's Eighteenth Century*, vol. iv. pp. 29, 30, 245.

[28] See some singular observations in Parr's first sermon on faith and morals (*Parr's Works*, vol. vi. p. 598), where we are told that, in the management of the feud between Calvinists and Arminians, "the steadiness of defence should be proportionate to the impetuosity of assault;" unnecessary advice, so far as his own profession is concerned. However, the Mohammedan theologians are said to have been even keener than the Christians on this subject. See *Troyer's Discourse on the Dabistan*, vol. i. p. cxxxv.; an important work on the Asiatic religions.

[29] Neander (*Hist. of the Church*, vol. iv. p. 105) finds the germ of the Pelagian controversy in the dispute between Athanasius and Apollinaris. Compare, respecting its origin, a note in *Milman's Hist. of Christianity*, 1840, vol. iii. pp. 270, 271.

[* It would be more accurate to say that many Jesuits cultivated the sciences. They were none the less the persecutors of Galileo, and they sought to have the *Discours* of Descartes condemned.—Ed.]

Christianity has been divided into two great sects, which, though in some respects uniting by insensible shades, have always preserved the broad features of their original difference. By one sect, the freedom of the will is virtually and often expressly denied; for it is asserted, not only that we cannot of our own will effect anything meritorious, but that whatever good we may do will be useless, since the Deity has predestined some men to perdition, others to salvation. By the other sect, the freedom of the will is as strongly upheld; good works are declared essential to salvation; and the opposite party is accused of exaggerating that state of grace of which faith is a necessary accompaniment.[30]

These opposite principles, when pushed to their logical consequences, must lead the first sect into antinomianism,[31] and the second sect into the doctrine of supererogatory works.[32] But since, on such subjects, men feel far more than they reason, it usually happens that they prefer following some common and accredited standard, or appealing to some ancient name:[33] and they therefore generally class themselves on the one side under Augustin, Calvin, and Jansenius; on the other side under Pelagius, Arminius, and Molina.

Now it is an interesting fact that the doctrines which in England are called Calvinistic have been always connected with a democratic spirit; while those of Arminianism have found most favour among the aristocratic or protective party. In the republics of Switzerland, of North America, and of Holland, Calvinism was always the popular creed.[34] On the other hand, in those evil days immediately after the death of Elizabeth, when our liberties were in imminent peril; when the Church of England, aided by the crown, attempted to subjugate the consciences of men; and when the monstrous claim of the divine right of episcopacy was first put forward;[35]—then it was that Arminianism became the cherished doctrine of the ablest and most ambitious of the ecclesiastical party[36]

[30] No writer I have met with has stated so fairly and clearly the theological boundaries of these doctrines as Göthe. *Wahrheit und Dichtung*, in *Werke*, vol. ii. part ii. p. 200, Stuttgart, 1837.

[31] Compare *Butler's Mem. of the Catholics*, vol. iii. p. 224; *Copleston on Necessity and Predestination*, pp. 25, 26; *Mosheim's Eccles. History*, vol. ii. p. 254.

[32] Hence the theory of indulgences, constructed by the Church of Rome with perfect consistency, and against which most of the Protestant arguments are illogical.

[33] This seems to be the natural tendency, and has been observed by Neander in his instructive account of the Gnostics, *History of the Church*, vol. ii. p. 121: "The custom with such sects to attach themselves to some celebrated name or other of antiquity."

[34] The Dutch church was the first which adopted as an article of faith the doctrine of election held at Geneva. *Mosheim's Eccles. History*, vol. ii. p. 112. See also, on this doctrine in the Netherlands, *Sinclair's Corresp.* vol. ii. p. 199; *Coventry's Speech in* 1672, in *Parl. Hist.* vol. iv. p. 537; and *Stäudlin, Gesch. der theolog. Wissenschaften*. vol. i. p. 262: "In den Niederlanden wurde der Calvinische Lehrbegriff zuerst in eine scholastische Form gebracht."

As to the Calvinism of North America, compare *Bancroft's American Revolution*, vol. i. pp. 165, 173, 174, vol. ii. pp. 329, 363, vol. iii. p. 213; *Lyell's Second Visit to the United States*, 1849, vol. i. p. 51; and *Combe's Notes on the United States*, vol. i. pp. 35, 99, 223, vol. iii. pp. 88, 118, 219, 226.

[35] It is sometimes said that this was advocated by Bancroft as early as 1588; but this assertion appears to be erroneous, and Mr. Hallam can find no instance before the reign of James I. *Const. Hist.* vol. i. p. 390. The dogma, though new in the Church of England, was of great antiquity. See, on its origin among the early Christians, *Klimrath, Hist. du Droit*, vol. i. p. 253.

[36] The spread of Arminianism was frequently noticed in parliament during the reign of Charles I. *Parl. Hist.* vol. ii. pp. 444, 452, 455, 470, 484, 487, 491, 660, 947, 1368. On the decline of Calvinism at the Universities of Oxford and Cambridge early in the seventeenth century, see a curious letter from Beale in *Boyle's Works*, vol. v. p. 483; and on this movement in the church after Elizabeth, compare *Yonge's Diary*, p. 93. edit. Camden Soc. 1848; *Orme's Life of Owen*, p. 32; *Harris's Lives of the Stuarts*, vol. i. pp. 154–156, vol. ii. pp. 208, 213, 214; *Hutchinson's Mem.* pp. 66, 77; *Hallam's Const. Hist.* vol. i. p. 466; *Des Maizeaux's Life of Chillingworth*, p. 112.

And in that sharp retribution which followed, the Puritans and Independents, by whom the punishment was inflicted, were with scarcely an exception Calvinists: [37] nor should we forget that the first open movement against Charles proceeded from Scotland, where the principles of Calvin had long been in the ascendant.

This different tendency of these two creeds is so clearly marked, that an inquiry into its causes becomes a necessary part of general history, and, as we shall presently see, is intimately connected with the history of the French Revolution.

The first circumstance by which we must be struck is, that Calvinism is a doctrine for the poor, and Arminianism for the rich. A creed which insists upon the necessity of faith must be less costly than one which insists upon the necessity of works. In the former case, the sinner seeks salvation by the strength of his belief; in the latter case, he seeks it by the fulness of his contributions.* And as those contributions, wherever the clergy have much power, always flow in the same direction, we find that in countries which favour the Arminian doctrine of works the priests are better paid, and the churches more richly ornamented, than they are where Calvinism has the upper hand. Indeed it is evident to the most vulgar calculation that a religion which concentrates our charity upon ourselves is less expensive than one which directs our charity to others.

This is the first great practical divergence of the two creeds: a divergence which may be verified by any one who is acquainted with the histories of different Christian nations, or who has even travelled in countries where the different tenets are professed. It is also observable that the Church of Rome, whose worship is addressed mainly to the senses, and who delights in splendid cathedrals and pompous ceremonies, has always displayed against the Calvinists an animosity far greater than she has done against any other Protestant sect.[38]

Out of these circumstances inevitably arose the aristocratic tendency of Arminianism, and the democratic tendency of Calvinism. The people love pomp and pageantry as much as the nobles do, but they do not love to pay for them. Their untutored minds are easily captivated by the array of a numerous priesthood, and by the gorgeousness of a well-appointed temple. Still, they know full well that these things absorb a large part of that wealth which would otherwise flow into their own cottages. On the other hand, the aristocracy, by their standing, their habits, and the traditions of their education, naturally contract a taste for expense, which makes them unite splendour with religion, and connect pomp with piety. Besides this, they have an intuitive and well-founded belief that their own interests are associated with the interests of the priesthood, and that whatever weakens the one will hasten the downfall of the other. Hence it is that every Christian democracy has simplified its external worship; every Christian aristocracy has embellished it. By a parity of reasoning, the more any society tends to equality, the more likely it is that its theological opinions will be Calvinistic; while the more a society tends towards inequality, the greater the probability of those opinions being Arminian.

[37] Respecting the Calvinism of the opponents of the king, see *Clarendon's Rebellion*, pp. 36, 37; *Bulstrode's Memoirs*, pp. 8, 9; *Burton's Diary*, vol. iii. p. 206; *Carlyle's Cromwell*, vol. i. p. 68; and on its influence in the House of Commons, in 1628, *Carwithen's Hist. of the Church of England*, vol. ii. p. 64.

[38] Heber (*Life of Jeremy Taylor*, p. cxx.) says that Calvinism is "a system of all others the least attractive to the feelings of a Roman Catholic." Philip II., the great Catholic champion, especially hated the Calvinists, and in one of his edicts calls their sect "detestable." *De Thou, Hist.* vol. x. p. 705: compare vol. xi. p. 458. To give an earlier instance: when the Roman inquisition was revived in 1542, it was ordered that heretics, and in particular Calvinists, should not be tolerated: "besonders Calvinisten." *Ranke, Die Päpste*, vol. i. p. 211.

[* This is hardly a fair account of Arminianism. It was a natural reaction against the antinomian tendencies of popular Calvinism; and its adherents certainly did not in general hope to secure salvation by large "contributions."—Ed.]

It would be easy to push this contrast still further, and to show that Calvinism is more favourable to the sciences, Arminianism to the arts ;[39] and that, on the same principle, the first is better suited to thinkers, the other to scholars.[40] But without pretending to trace the whole of this divergence, it is very important to observe that the professors of the former religion are more likely to acquire habits of independent thinking that those of the latter. And this on two distinct grounds. In the first place, even the most ordinary of the Calvinistic party are, by the very terms of their creed, led in religious matters to fix their attention on their own minds rather than on the minds of others. They therefore, as a body, are intellectually more narrow than their opponents, but less servile ; their views, though generalized from a smaller field, are more independent ; they are less attached to antiquity, and more heedless of those traditions to which the Arminian scholars attach great importance. In the second place, those who associate metaphysics with their religion are led by Calvinism into the doctrine of necessity ;[41] a theory which, though often misunderstood, is pregnant with great truths, and is better calculated than any other system to develop the intellect, because it involves that clear conception of law, the attainment of which is the highest point the human understanding can reach.

These considerations will enable the reader to see the immense importance of that revival of Jansenism which took place in the French church during the eighteenth century. For, Jansenism being essentially Calvinistic,[42] those tendencies appeared in France by which Calvinism is marked. There appeared the inquisitive, democratic, and insubordinate spirit, which has always accompanied

[39] By way of illustrating this, I may mention that an intelligent observer, who travelled all through Germany, remarked in 1780 that the Calvinists, though richer than their opponents, had less taste for the arts. *Riesbeck's Travels through Germany*, London, 1787, vol. ii. p. 240. An interesting passage ; in which, however, the author has shown himself unable to generalize the facts which he indicates. [It has been stated above that the Arminians are usually the rich and Calvinists usually the poor. If Germany be an exception, an explanation is needed. There, Calvinism had from the first been a choice of princes and not of people (Gardiner, *Thirty Years' War*, p. 17), apparently because the popular mind was given to Lutheranism beforehand.—ED.]

[40] The Arminians have had among them many men of great learning, particularly of patristic learning ; but the most profound thinkers have been on the other side, as in the instances of Augustin, Pascal, and Jonathan Edwards. To these Calvinistic metaphysicians the Arminian party can oppose no one of equal ability ; and it is remarkable that the Jesuits, by far the most zealous Arminians in the Romish Church, have always been celebrated for their erudition, but have paid so little attention to the study of the mind that, as Sir James Mackintosh says (*Dissert. on Ethical Philos.* p. 185), Buffier is " the only Jesuit whose name has a place in the history of abstract philosophy." And it is interesting to observe that this superiority of thought on the part of the Calvinists, accompanied by an inferiority of learning, existed from the beginning ; for Neander (*History of the Church*, vol. iv. p. 299) remarks, that Pelagius " was not possessed of the profound speculative spirit which we find in Augustin," but that " in learning he was Augustin's superior."

[41] " A philosophical necessity, grounded on the idea of God's foreknowledge, has been supported by theologians of the Calvinistic school, more or less rigidly, throughout the whole of the present century." *Morell's Speculative Philosophy of Europe*, 1846, vol. i. p. 366. Indeed this tendency is so natural that we find the doctrine of necessity, or something extremely like it, laid down by Augustin. See the interesting extracts in *Neander's Hist. of the Church*, vol. vi. pp. 424, 425 ; where, however, a loophole is left to let in the idea of interference, or at all events of superintendence.

[42] " The five principal tenets of Jansenism, which amount in fact to the doctrine of Calvin." *Palmer on the Church*, vol. i. p. 320 ; and see the remarks of Mackintosh in his *Memoirs*, vol. i. p. 411. According to the Jesuits, " Paulus genuit Augustinum, Augustinus Calvinum, Calvinus Jansenium, Jansenius Sancryanum, Sancryanus Arnaldum et fratres ejus." *Des Réaux, Historiettes*, vol. iv. pp. 71, 72. Compare *Huetius de Rebus ad eum pertinentibus*, p. 64 : " Jansenium dogmata sua ex Calvinianis fontibus derivasse."

that creed. A further confirmation of the truth of the principles just laid down is that Jansenism originated with a native of the Dutch Republic ; [43] that it was introduced into France during the glimpse of freedom which preceded the power of Louis XIV. ; [44] that it was forcibly repressed in his arbitrary reign ; [45] and that before the middle of the eighteenth century it again arose, as the natural product of a state of society by which the French Revolution was brought about.

The connexion between the revival of Jansenism and the destruction of the Jesuits, is obvious. After the death of Louis XIV., the Jansenists rapidly gained ground, even in the Sorbonne ; [46] and by the middle of the eighteenth century they had organized a powerful party in the French parliament.[47] About the same period, their influence began to show itself in the executive government and among the officers of the crown. Machault, who held the important post of controller-general, was known to favour their opinions ; [48] and a few years after his retirement Choiseul was called to the head of affairs ; a man of considerable ability, by whom they were openly protected.[49] Their views were likewise supported by Laverdy, controller-general in 1764, and by Terray, controller of finances in 1769.[50] The procureur-general, Gilbert des Voisins, was a Jansenist ; [51] so also was one of his successors, Chauvelin ; [52] and so was the advocate-general, Pelletier de Saint-Fargeau ;[53] and so too was Camus, the well-known advocate of the clergy.[54] Turgot, the greatest statesman of the age, is said to have embraced the same opinions ; [55] while Necker, who on two different occasions possessed almost supreme power, was notoriously a rigid Calvinist. To this may be added, that not only Necker, but also Rousseau, to whom a large share in causing the Revolution is justly ascribed, were born in Geneva, and drew their earliest ideas from that great nursery of the Calvinistic theology.

In such a state of things as this, it was impossible that a body like the Jesuits should hold their ground. They were the last defenders of authority and

[43] Jansenius was born in a village near Leerdam, and was educated, if I mistake not, in Utrecht.

[44] The introduction of Jansenism into France is superficially related by Duvernet (*Hist. de la Sorbonne*, vol. ii. pp. 170–175) ; but the reader will find a contemporary and highly characteristic account in *Mém. de Motteville*, vol. ii. pp. 224–227. The connexion between it and the spirit of insubordination was remarked at the time ; and Des Réaux, who wrote in the middle of the seventeenth century, mentions an opinion that the Fronde "étoit venue du Jansénisme." *Historiettes*, vol. iv. p. 72 Omer Talon too says that, in 1648, "il se trouvoit que tous ceux qui étoient de cette opinion n'aimoient pas le gouvernement présent de l'état." *Mém. d'Omer Talon*, vol. ii. pp. 280, 281.

[45] Brienne, who knew Louis XIV. personally, says, "Jansénisme, l'horreur du roi." *Mém. de Brienne*, vol. ii. p. 240. Compare *Duclos, Mém. Secrets*, vol. i. p. 112. At the end of his reign he promoted a bishop on the avowed ground of his opposition to the Jansenists ; this was in 1713. *Lettres inédites de Maintenon*, vol. ii. pp. 396, 406 ; and see further vol. i. pp. 220, 222.

[46] "La Sorbonne, moliniste sous Louis XIV, fut janséniste sous le régent, et toujours divisée." *Duvernet, Hist. de la Sorbonne*, vol. ii. p. 225.

[47] On the strength of the Jansenists in the parliament of Paris, see *Tocqueville, Règne de Louis XV*, vol. i. p. 352, vol. ii. p. 176 ; *Flassan, Diplomatie*, vol. vi. p. 486 ; *Mém. de Georgel*, vol. ii. p. 262 ; *Mém. de Bouillé*, vol. i. p. 67 ; *Palmer's Treatise on the Church*, vol. i. pp. 327, 328.

tradition,* and it was natural that they should fall in an age when statesmen were sceptics, and theologians were Calvinists. Even the people had already marked them for destruction; and when Damiens, in 1757, attempted to assassinate the king, it was generally believed that they were the instigators of the act.[56] this we now know to be false; but the existence of such a rumour is evidence of the state of the popular mind. At all events, the doom of the Jesuits was fixed. In April, 1761, parliament ordered their constitutions to be laid before them.[57] In August, they were forbidden to receive novices, their colleges were closed, and a number of their most celebrated works were publicly burned by the common hangman.[58] Finally, in 1762, another edict appeared, by which the Jesuits were condemned without even being heard in their own defence; [59] their property was directed to be sold, and their order secularized; they were declared "unfit to be admitted into a well-governed country," and their institute and society were formally abolished.[60]

Such was the way in which this great society, long the terror of the world, fell before the pressure of public opinion. What makes its fall the more remarkable is that the pretext which was alleged to justify the examination of its constitutions, was one so slight, that no former government would have listened to it for a single moment. This immense spiritual corporation was actually tried by a temporal court for ill faith in a mercantile transaction, and for refusing to pay a sum of money said to be due! [61] The most important body in the Catholic church, the spiritual leaders of France, the educators of her youth, and the confessors of her kings, were brought to the bar, and sued in their collective capacity, for the fraudulent repudiation of a common debt! [62] So marked was the predisposition of affairs that it was not found necessary to employ for the destruction of the Jesuits any of those arts by which the popular mind is commonly inflamed. The charge upon which they were sentenced was not that they had plotted against the state; nor that they had corrupted the public morals; nor that they wished to subvert religion. These were the accusations which were brought in the seventeenth century, and which suited the genius of that age. But, in the eighteenth century, all that was required was some trifling accident that might serve as a pretence to justify what the nation had already determined. To ascribe, therefore, this great event to the

[56] "The Jesuits are charged by the vulgar as promoters of that attempt." Letter from Stanley, written in 1761, in *Chatham Correspond.* vol. ii. p. 127. Compare *Campan, Mém. de Marie Antoinette,* vol. iii. pp. 19, 21; *Sismondi, Hist. des Franç.* vol. xxix, pp. 111, 227. [The damaging circumstance was that the Jesuit Busenbaum had justified regicide in a work of which an edition appeared in 1757. D'Alembert, *Des Jésuites,* ed. 1821, p. 226. See Nicolini, *History of the Jesuits,* 1853, p. 346, as to the beliefs of Louis XV. on the subject.—Ed.]

[57] *Lavallée, Hist. des Français,* vol. iii. p. 476.

[58] *Flassan, Diplomatie Franç.* vol. vi. p. 491.

[59] "Sans que les accusés eussent été entendus." *Lavallée,* vol. iii. p. 477. "Pas un seul n'a été entendu dans leur cause." *Barruel sur l'Hist. du Jacobinisme,* vol. ii. p. 264.

[60] *Lavallée,* vol. iii. p. 477; *Flassan,* vol. vi. pp. 504, 505; *Sismondi,* xxix. p. 234; and the letters written by Diderot, who, though he was in Paris at the time, gives rather an incomplete account. *Mém. de Diderot,* vol. ii. pp. 127, 130–132.

[61] *Flassan, Hist. de la Diplomatie,* vol. vi. pp. 486–488.

[62] "Enfin ils furent mis en cause, et le parlement de Paris eut l'étonnement et la joie de voir les jésuites amenés devant lui comme de vils banqueroutiers." *Lacretelle, XVIII^e Siècle,* vol. ii. p. 252. "Condemned in France as fraudulent traders." *Schlosser's Eighteenth Century,* vol. iv. p. 451.

[* This statement requires to be modified. The Jansenists were just as anxious as the Jesuits to defend religious authority and tradition; and an authoritarian party was never absent from either the church or the laity.—Ed.]

bankruptcy of a trader, or the intrigues of a mistress,[63] is to confuse the cause of an act with the pretext under which the act is committed. In the eyes of the men of the eighteenth century, the real crime of the Jesuits was that they belonged to the past rather than to the present, and that by defending the abuses of ancient establishments they obstructed the progress of mankind. They stood in the way of the age, and the age swept them from its path.* This was the real cause of their abolition : a cause not likely to be perceived by those writers who, under the guise of historians, are only collectors of the prattle and gossip of courts ; and who believe that the destinies of great nations can be settled in the ante-chambers of ministers, and in the councils of kings.

After the fall of the Jesuits, there seemed to be nothing remaining which could save the French church from immediate destruction.[64] The old theological spirit had been for some time declining, and the clergy were suffering from their own decay even more than from the attacks made upon them. The advance of knowledge was producing in France the same results as those which I have pointed out in England ; and the increasing attractions of science drew off many illustrious men, who in a preceding age would have been active members of the spiritual profession. That splendid eloquence for which the French clergy had been remarkable was now dying away, and there were no longer heard the voices of those great orators, at whose bidding the temples had formerly been filled.[65] Massillon was the last of that celebrated race who had so enthralled the mind, and the magic of whose fascination it is even now hard to withstand. He died in 1742 ; and after him the French clergy possessed no eminent men of any kind, neither thinkers, nor orators, nor writers.[66] Nor did there seem the least possibility of their recovering their lost position. While society was advancing, they were receding. All the sources of their power

[63] Several writers attribute the destruction of the Jesuits to the exertions of Madame de Pompadour !

[64] Choiseul is reported to have said of the Jesuits : " leur éducation détruite, tous les autres corps religieux tomberont d'eux-mêmes." *Barruel, Hist. du Jacobinisme*, vol. i. p. 63.

[65] In 1771, Horace Walpole writes from Paris that the churches and convents were become so empty, as to " appear like abandoned theatres destined to destruction ; " and this he contrasts with his former experience of a different state of things. *Walpole's Letters*, vol. v. p. 310, edit. 1840.

[66] " So low had the talents of the once illustrious church of France fallen, that in the latter part of the eighteenth century, when Christianity itself was assailed, not one champion of note appeared in its ranks ; and when the convocation of the clergy, in 1770, published their famous anathema against the dangers of unbelief, and offered rewards for the best essays in defence of the Christian faith, the productions called forth were so despicable that they sensibly injured the cause of religion." *Alison's Hist. of Europe*, vol. i. pp. 180, 181. [Buckle here quotes Alison as to a great attack on religion in the latter part of the century, after repeatedly stating that the attack was then mainly upon the abuses of the state. Yet the error is immediately repeated, though in the next paragraph there is made the new statement that from 1751 there began a new propaganda of atheism.—Ed.]

[* Here again " the age " is somewhat indiscriminately handled. It was not merely the progressive minds who opposed the Jesuits. Their habits of intrigue excited the dislike of many conservative churchmen—for instance, of Cardinal Fleury (D'Alembert, *Des Jésuites*, éd. 1821, p. 183) ; and their enemies, the Jansenists, were hardly more enlightened than they. It was the meddling of the Jesuits, and not their backwardness, that won them the detestation of Pombal in Portugal (*Id.* p. 229. Cp. Comte Saint-Priest, *Hist. of the Fall of the Jesuits*, Eng. tr. 1845, p. 14). They had further been repeatedly censured by the Papacy, and in particular denounced by Benedict XIV. in 1741 as *inobedientes, contumaces, captiosi, et perditi homines*. Nicolini, *History of the Jesuits*, 1853, pp. 127–8.—Ed.]

were dried up. They had no active leaders; they had lost the confidence of government; they had forfeited the respect of the people; they had become a mark for the gibes of the age.[67]

It does at first sight seem strange that, under these circumstances, the French clergy should have been able, for nearly thirty years after the abolition of the Jesuits, to maintain their standing, so as to interfere with impunity in public affairs.[68] The truth, however, is that this temporary reprieve of the ecclesiastical order was owing to that movement which I have already noticed, and by virtue of which the French intellect, during the latter half of the eighteenth century, changed the ground of its attack, and, directing its energies against political abuses, neglected in some degree those spiritual abuses to which its attention had been hitherto confined. The result was that in France the government enforced a policy which the great thinkers had indeed originated, but respecting which they were becoming less eager. The most eminent Frenchmen were beginning their attacks upon the state, and in the heat of their new warfare they slackened their opposition to the church.* But in the meantime, the seeds they had sown germinated in the state itself. So rapid was the march of affairs that those anti-ecclesiastical opinions which a few years earlier were punished as the paradoxes of designing men, were now taken up and put into execution by senators and ministers. The rulers of France carried into effect principles which had hitherto been simply a matter of theory; and thus it happened, as is always the case, that practical statesmen only apply and work out ideas which have long before been suggested by more advanced thinkers.†

Hence it followed that at no period during the eighteenth century did the speculative classes and practical classes thoroughly combine against the church: since, in the first half of the century, the clergy were principally assailed by the literature, and not by the government; in the latter half of the century, by the government, and not by the literature.‡ Some of the circumstances of this singular transition have been already stated, and I hope clearly brought before the mind of the reader. I now purpose to complete the generalization, by proving that a corresponding change was taking place in all other branches of inquiry; and that while in the first period attention was chiefly directed towards mental phenomena, it was in the second period more directed towards physical phenomena. From this the political movement received a vast accession of

[67] In 1766, the Rev. William Cole writes to Alban Butler: "I travelled to Paris through Lille and Cambray in their public voitures, and was greatly scandalized and amazed at the open and unreserved disrespect, both of the trading and military people, for their clergy and religious establishment. When I got to Paris, it was much worse." *Ellis's Original Letters*, second series, vol. iv. p. 485. See also *Walpole's Letters to Lady Ossory*, vol. ii. p. 513, edit. 1848; and the complaint made at Besançon in 1761, in *Lepan, Vie de Voltaire*, p. 113.

[68] And also to retain their immense property, which, when the Revolution occurred, was estimated at 80,000,000*l.* English money, bringing in a yearly revenue of "somewhat under 75,000,000 francs." *Alison's Europe*, vol. i. p. 183, vol. ii. p. 20, vol. xiv. pp. 122, 123.

[* This repeated error must be again noted. It is from the date of the fall of the Jesuits that Voltaire begins his most strenuous attack, and the whole output of the *philosophes* multiplies in the same period. Cp. Rocquain, *L'Esprit Révolutionnaire avant la Révolution*, 1878, p. 236. And see the next paragraph of the text.—Ed.]

[† What happened was simply that the statesmen of 1750 turned hopefully to the project of taxing the wealth of the church, which those of 1710 had attempted and been forced to abandon. This project was wholly independent of the polemic of the "advanced thinkers." It had been broached at the *États Généraux* of Pontoise in 1561 (Duruy, ii. 419), as it had been by the Lollards in England at the beginning of the previous century, and by Arnold of Brescia in the twelfth.—Ed.]

[‡ See notes on previous paragraph.—Ed.]

strength. For the French intellect, shifting the scene of its labours, diverted the thoughts of men from the internal to the external, and concentrating attention upon their material rather than upon their spiritual wants, turned against the encroachments of the state an hostility formerly reserved for the encroachments of the church. Whenever a tendency arises to prefer what comes from without to what comes from within, and thus to aggrandize matter at the expense of mind, there will also be a tendency to believe that an institution which hampers our opinions is less hurtful than one which controls our acts. Precisely in the same way, men who reject the fundamental truths of religion will care little for the extent to which those truths are perverted. Men who deny the existence of the Deity and the immortality of the soul will take no heed of the way in which a gross and formal worship obscures those sublime doctrines. All the idolatry, all the ceremonials, all the pomp, all the dogmas, and all the traditions by which religion is retarded, will give them no disquietude, because they consider the opinions that are checked to be equally false with those that are favoured. Why should they to whom transcendental truths are unknown labour to remove the superstitions which darken the truths? Such a generation, so far from attacking ecclesiastical usurpations, would rather look on the clergy as convenient tools to ensnare the ignorant and control the vulgar. Therefore it is that we rarely hear of a sincere atheist being a zealous polemic.* But if that should occur, which a century ago occurred in France; if it should happen that men of great energy, and actuated by the feelings I have described, were to find themselves in the presence of a political despotism,—they would direct against it the whole of their powers; and they would act with the more determined vigour, because, believing that their all was at stake, temporal happiness would be to them not only the first, but also the sole consideration.

It is from this point of view that the progress of those atheistical opinions, which now rose in France, becomes a matter of great though painful interest. And the date at which they appeared fully corroborates what I have just said respecting the change that took place in the middle of the eighteenth century.† The first great work in which they were openly promulgated, was the celebrated Encyclopædia, published in 1751.[69] Before that time such degrading opinions, though occasionally broached, were not held by any men of ability; nor could they in the preceding state of society have made much impression upon the age. But during the latter half of the eighteenth century, they affected every department of French literature. Between 1758 and 1770, atheistical tenets rapidly gained ground; [70] and in 1770 was published the famous work called the *System*

[69] M. Barante (*Littérature Française au XVIII^e Siècle*, p. 94) says, "On arriva bientôt à tout nier; déjà l'incrédulité avait rejeté les preuves divines de la révélation, et avait abjuré les devoirs et les souvenirs chrétiens: on vit alors l'athéisme lever un front plus hardi, et proclamer que tout sentiment religieux était une rêverie et un désordre de l'esprit humain. C'est de l'époque de l'Encyclopédie que datent les écrits où cette opinion est le plus expressément professée. Ils furent peu imités." This last sentence is erroneous, I am sorry to say. [Only the *first volume* of the *Encyclopédie* was published in 1751. In contradicting the last sentence of Barante, Buckle accepts the one preceding, which is the contradiction of his own repeated statement. But atheism was *not* expounded in the *Encyclopédie*, and could not possibly have been, even if the contributors had all been atheists, which they certainly were not. Voltaire was the chief, and he always opposed atheism.—Ed.]

[70] "Dans un intervalle de douze années, de 1758 à 1770, la littérature française fut souillée par un grand nombre d'ouvrages où l'athéisme étoit ouvertement professé."

[* See this *à priori* proposition contradicted in the next paragraph.—Ed.]

[† This statement must be pronounced unintelligible. The previous statement, many times repeated, was that at the middle of the century the literary attack was turned away from the church and against the state. It is now asserted that what happened was a development of atheistic propaganda, dating from 1751. Neither statement is accurate.—Ed.]

of Nature; the success and, unhappily, the ability of which, makes its appearance an important epoch in the history of France. Its popularity was immense;[71] and the views it contained are so clearly and methodically arranged as to have earned for it the name of the code of atheism.[72] Five years later, the Archbishop of Toulouse, in a formal address to the king on behalf of the clergy, declared that atheism had now become the prevailing opinion.[73] This, like all similar assertions, must have been an exaggeration: but that there was a large amount of truth in it is known to whoever has studied the mental habits of the generation immediately preceding the Revolution. Among the inferior class of writers, Damilaville, Deleyre, Maréchal, Naigeon, Toussaint, were active supporters* of that cold and gloomy dogma which, in order to extinguish the hope of a future life, blots out from the mind of man the glorious instincts of his own immortality.[74] And, strange to say, several even of the higher intellects were unable to escape the contagion. Atheism was openly advocated by Condorcet, by D'Alembert, by Diderot, by Helvétius, by Lalande, by Laplace, by Mirabeau, and by Saint Lambert.[75] Indeed, so thoroughly did all this harmonize with the general temper, that in society men boasted of what in other countries and in other days has been a rare and singular error, an eccentric taint, which those affected by it were willing to conceal.† In 1764 Hume met, at the house of Baron

Lacretelle, XVIII^e Siècle, vol. ii. p. 310. [No titles being given, it must suffice to say that the "grand nombre d'ouvrages" in question, if they existed, have passed out of knowledge. Only a few atheistic works are known to have been published in the period named.—Ed.]

[71] Voltaire, who wrote against it, mentions its diffusion among all classes, and says it was read by "des savants, des ignorants, des femmes." *Dict. Philos.* article *Dieu*, section iv., in *Œuvres de Voltaire*, vol. xxxviii. p. 366: see also vol. lxvii. p. 260; *Longchamp et Wagnière, Mém. sur Voltaire*, vol. i. pp. 13, 334; *Lettres inédites de Voltaire*, vol. ii. pp. 210, 216; and a letter from him in *Correspond. de Dudeffand*, vol. ii. p. 329. Compare *Tennemann, Gesch. der Philos.* vol. xi. p. 320: "mit ungetheiltem Beifalle aufgenommen worden und grossen Einfluss gehabt hat."

[72] "Le code monstrueux d'athéisme." *Biog. Univ.* vol. xxix. p. 88. Morellet, who in such matters was by no means a harsh judge, says, "*Le Système de la Nature*, surtout, est un catéchisme d'athéisme complet." *Mém. de Morellet*, vol. i. p. 133. Stäudlin (*Gesch. der theolog. Wissenschaften*, vol. ii. p. 440) calls it "ein System des entschiedenen Atheismus:" while Tennemann, who has given by far the best account of it I have met with, says, "Es machte bei seinem Erscheinen gewaltiges Aufsehen, und ist fast immer als das Handbuch des Atheismus betrachtet worden." *Gesch. der Philos.* vol. xi. p. 349.

[73] "Le monstrueux athéisme est devenu l'opinion dominante." *Soulavie, Règne de Louis XVI*, vol. iii. p. 16: the address of the archbishop with a deputation, "muni des pouvoirs de l'assemblée générale du clergé," in September 1775.

[74] *Biog. Univ.* vol. x. pp. 471, 669, vol. xxvii. p. 8, vol. xxx. p. 542; *Mém. de Brissot*, vol. i. p. 305; *Tocqueville, Règne de Louis XV*, vol. ii. p. 77.

[75] *Mém. of Mallet du Pan*, vol. i. p. 50; *Soulavie, Règne de Louis XVI*, vol. v. p. 127; *Barruel, Hist. du Jacobin*, vol. i. pp. 104, 135, 225, vol. ii. p. 23, vol. iii. p. 200; *Life of Romilly*, vol. i. pp. 46, 145; *Stäudlin, Theolog. Wissenschaften*, vol. ii. p. 440; *Georgel, Mém.* vol. ii. pp. 250, 350; *Grimm, Correspond.* vol. xv. p. 87; *Mém. de Morellet*, vol. i. p. 130; *Lepan, Vie de Voltaire*, p. 369; *Tennemann, Gesch. der Philos.* vol. xi. p. 350; *Musset Pathay, Vie de Rousseau*, vol. ii. pp. 177, 297; *Mém. de Genlis*, vol. v. p. 180; *Hitchcock's Geol.* p. 263; *Mém. d'Epinay*, vol. ii. pp. 63, 66, 76.

[* Damilaville, Deleyre, and Toussaint published no atheistic works: and it is only a guess that the first-named had a hand in the *System of Nature*. Maréchal's atheistic works were published *after* the Revolution.—Ed.]

[† For "willing to conceal" read "bound to conceal, if they valued their lives, or their peace." Buckle must have been aware that nowhere in the modern world, before the period in question, could a known atheist escape persecution. Vanini was burnt as an atheist in 1619.—Ed.]

d'Holbach, a party of the most celebrated Frenchmen then residing in Paris. The great Scotchman, who was no doubt aware of the prevailing opinion, took occasion to raise an argument as to the existence of an atheist, properly so called; for his own part, he said, he had never chanced to meet with one. "You have been somewhat unfortunate," replied Holbach; "but at the present moment you are sitting at table with seventeen of them." [76]

This, sad as it is, only forms a single aspect of that immense movement by which, during the latter half of the eighteenth century, the French intellect was withdrawn from the study of the internal, and concentrated upon that of the external world. Of this tendency, we find an interesting instance in the celebrated work of Helvétius, unquestionably the ablest and most influential treatise on morals which France produced at this period. It was published in 1758; [77] and although it bears the title of an essay on "the Mind," it does not contain a single passage from which we could infer that the mind, in the sense in which the word is commonly used, has any existence. In this work, which during fifty years was the code of French morals, principles are laid down which bear exactly the same relation to ethics that atheism bears to theology. Helvétius at the beginning of his inquiry assumes, as an incontestable fact that the difference between man and other animals is the result of a difference in their external form; and that if, for example, our wrists, instead of ending with hands and flexible fingers, had merely ended like a horse's foot, we should have always remained wanderers on the face of the earth, ignorant of every art, entirely defenceless, and having no other concern but to avoid the attacks of wild beasts, and find the needful supply of our daily food.[78] That the structure of our bodies is the sole cause of our boasted superiority becomes evident when we consider that our thoughts are simply the product of two faculties which we have in common with all other animals; namely, the faculty of receiving impressions from external objects, and the faculty of remembering those impressions after they are received.[79] From this, says Helvétius, it follows that the internal powers of man being the same as those of all other animals, our sensibility and our memory would be useless if it were not for those external peculiarities by which we are eminently distinguished, and to which we owe everything that is most valuable.[80] These positions being laid down, it is easy to deduce all the essential principles of moral actions. For, memory being merely one of the organs of physical sensibility,[81] and judgment being only a sensation,[82] all notions of duty and of virtue must be tested by their relation to the senses; in other words, by the gross amount of physical enjoyment to which they give rise. This is the true basis of moral philosophy. To take any other view

[76] This was related to Romilly by Diderot. *Life of Romilly*, vol. i. pp. 131, 132: see also *Burton's Life of Hume*, vol. ii. p. 220. Priestley, who visited France in 1774, says, that "all the philosophical persons to whom I was introduced at Paris (were) unbelievers in Christianity, and even professed atheists." *Priestley's Memoirs*, vol. i. p. 74. See also a letter by Horace Walpole, written from Paris in 1765 (*Walpole's Letters*, edit. 1840, vol. v. p. 96): "their avowed doctrine is atheism."

[77] *Biog. Univ.* vol. xx. p. 29.

[78] "Si la nature, au lieu de mains et de doigts flexibles, eût terminé nos poignets par un pied de cheval; qui doute que les hommes, sans art, sans habitations, sans défense contre les animaux, tout occupés du soin de pourvoir à leur nourriture et d'éviter les bêtes féroces, ne fussent encore errants dans les forêts comme des troupeaux fugitifs?" *Helvétius de l'Esprit*, vol. i. p. 2. Had Helvétius ever read the attack of Aristotle against Anaxagoras for asserting that διὰ τὸ χεῖρας ἔχειν, φρονιμώτατον εἶναι τῶν ζώων τὸν ἄνθρωπον? *Cudworth, Intellec. Syst.* vol. iii. p. 311.

[79] *De l'Esprit*, vol. i. p. 2.

[80] *Ibid.* vol. i. p. 4.

[81] "En effet la mémoire ne peut être qu'un des organes de la sensibilité physique," vol. i. p. 6. Compare what M. Lepelletier says on this, in his *Physiologie Médicale*, vol. iii. p. 272.

[82] "D'où je conclus que tout jugement n'est qu'une sensation." *De l'Esprit*, vol. i. p. 10; "*juger*, comme je l'ai déjà prouvé, n'est proprement que *sentir*," p. 41.

is to allow ourselves to be deceived by conventional expressions, which have no foundation except in the prejudices of ignorant men. Our vices and our virtues are solely the result of our passions; and our passions are caused by our physical sensibility to pain and to pleasure.[83] It was in this way that the sense of justice first arose. To physical sensibility men owed pleasure and pain; hence the feeling of their own interests, and hence the desire of living together in societies. Being assembled in society, there grew up the notion of a general interest, since without it society could not hold together; and, as actions are only just or unjust in proportion as they minister to this general interest, a measure was established by which justice is discriminated from injustice.[84] With the same inflexible spirit, and with great fulness of illustration, Helvétius examines the origin of those other feelings which regulate human actions. Thus, he says that both ambition and friendship are entirely the work of physical sensibility. Men yearn after fame, on account either of the pleasure which they expect the mere possession of it will give, or else as the means of subsequently procuring other pleasures.[85] As to friendship, the only use of it is to increase our pleasures or mitigate our pains; and it is with this object that a man longs to hold communion with his friend.[86] Beyond this, life has nothing to offer. To love what is good for the sake of the goodness, is as impossible as to love what is bad for the sake of the evil.[87] The mother who weeps for the loss of her child is solely actuated by selfishness; she mourns because a pleasure is taken from her, and because she sees a void difficult to fill up.[88] So it is that the loftiest virtues as well as the meanest vices are equally caused by the pleasure we find in the exercise of them.[89] This is the great mover and originator of all. Everything that we have, and everything that we are, we owe to the external world; nor is Man himself aught else except what he is made by the objects which surround him.[90]

The views put forward in this celebrated work I have stated at some length; not so much on account of the ability with which they are advocated, as on account of the clue they furnish to the movements of a most remarkable age. Indeed, so completely did they harmonize with the prevailing tendencies that they not only quickly obtained for their author a vast European reputation,[91] but during many years they continued to increase in influence, and in France in particular they exercised great sway.[92] As that was the country in which

[83] "Ne sensible à la douleur et au plaisir, c'est à la sensibilité physique que l'homme doit ses passions; et à ses passions, qu'il doit tous ses vices et toutes ses vertus." *Ibid.* vol. ii. p. 53; and see vol. i. p. 239.

[84] "Une fois parvenu à cette vérité, je découvre facilement la source des vertus humaines; je vois que sans la sensibilité à la douleur et au plaisir physique, les hommes, sans désirs, sans passions, également indifférents à tout, n'eussent point connu d'intérêt personnel; que sans intérêt personnel ils ne se fussent point rassemblés en société, n'eussent point fait entr'eux de conventions, qu'il n'y eût point eu d'intérêt général, par conséquent point d'actions justes ou injustes; et qu'ainsi la sensibilité physique et l'intérêt personnel ont été les auteurs de toute justice." *Ibid.* vol. i. p. 278.

[85] *De l'Esprit*, vol. ii. pp. 19, 20, 30, 34, 293, 294, 318. Compare Epicurus, in *Diog. Laert. de Vit. Philos.* lib. x. seg. 120, vol. i. p. 654.

[86] *De l'Esprit*, vol. ii. p. 45. He sums up: "il s'ensuit que l'amitié, ainsi que l'avarice, l'orgueil, l'ambition et les autres passions, est l'effet immédiat de la sensibilité physique."

[87] "Il lui est aussi impossible d'aimer le bien pour le bien, que d'aimer le mal pour le mal." *Ibid.* vol. i. p. 73.

[88] *Ibid.* vol. ii. p. 249.

[89] *Ibid.* vol. ii. p. 58.

[90] "Nous sommes uniquement ce que nous font les objets qui nous environnent." *Ibid.* vol. ii. p. 306.

[91] Saint Surin, a zealous opponent of Helvétius, admits that "les étrangers les plus éminents par leurs dignités ou par leurs lumières, désiraient d'être introduits chez un philosophe dont le nom retentissait dans toute l'Europe." *Biog. Univ.* vol. xx. p. 33.

[92] Brissot (*Mémoires*, vol. i. p. 339) says, that in 1775, "le système d'Helvétius avait alors la plus grande vogue." Turgot, who wrote against it, complains that it was praised

they arose, so also was it the country to which they were best adapted. Madame Dudeffand, who passed her long life in the midst of French society, and was one of the keenest observers of her time, has expressed this with great happiness. The work of Helvétius, she says, is popular, since he is the man who has told to all their own secret.[93]

True it was that to the contemporaries of Helvétius his views, notwithstanding their immense popularity, bore the appearance of a secret; because the connexion between them and the general march of events was as yet but dimly perceived. To us, however, who after this interval of time can examine the question with the resources of a larger experience, it is obvious how such a system met the wants of an age of which it was the exponent and the mouthpiece. That Helvétius must have carried with him the sympathies of his countrymen is clear, not only from the evidence we have of his success, but also from a more comprehensive view of the general complexion of those times. Even while he was still pursuing his labours, and only four years before he published them, a work appeared in France which, though displaying greater ability and possessing a higher influence than that of Helvétius, did nevertheless point in exactly the same direction. I allude to the great metaphysical treatise by Condillac, in many respects one of the most remarkable productions of the eighteenth century; and the authority of which, during two generations, was so irresistible that without some acquaintance with it we cannot possibly understand the [illegible] of those complicated movements by which the French Revolution [illegible] about.

In 1754,[94] Condillac put forth his celebrated work on th[illegible] title of which was a proof of the bias with which it was written [illegible] profound thinker aimed at nothing less than an exhaustive analysis of the human faculties, and although he is pronounced by a very able but hostile critic to be the only metaphysician France produced during the eighteenth century,[95] still he found it utterly impossible to escape * from those tendencies towards the external which governed his own age. The consequence was, that he called his work a "Treatise on Sensations;"[96] and in it he peremptorily asserts that everything we know is the result of sensation; by which he means the effect produced on us by the action of the external world. Whatever may be thought of the accuracy of this opinion, there can be no doubt that it is enforced with closeness and severity of reasoning which deserves the highest praise. To examine, however, the arguments by which his view is supported, would lead to a discussion foreign to my present object, which is merely to point out the relation between his philosophy and the general temper of his contemporaries. Without, therefore, pretending to any thing like a critical examination of this

Mémoires, "avec une sorte de fureur" (*Œuvres de Turgot*, vol. ix. p. 297); and Georgel (e trouvoit vol. ii. p. 256) says, "ce livre, écrit avec un style plein de chaleur et d'images, s sur toutes les toilettes."

[illegible] et on [illegible] ecret prête à Mme. Dudeffand ce mot fin et profond: 'C'est un homme qui a dit le s de tout le monde.'" *Cousin, Hist. de la Philos.* I. série, vol. iii. p. 201. Compare *Corresp. de Dudeffand*, vol. i. p. xxii.; and a similar sentiment in *Mém. de Roland*, vol. i. p. 104. The relation of Helvétius's work to the prevailing philosophy is noticed in *Comte's Philos. Pos.* vol. iii. pp. 791, 792, vol. v. pp. 744, 745.

[94] *Biog. Univ.* vol ix. p. 399.

[95] "Condillac est le métaphysicien français du xviii[e] siècle." *Cousin, Hist. de la Philos.* I. série, vol. iii. p. 83.

[96] "Traité des Sensations," which, as M. Cousin says, is, "sans comparaison, le chef-d'œuvre de Condillac." *Hist. de la Philos.* II. série, vol. ii. p. 77.

[* This mode of expression reverts to the form of fallacy noted in Buckle's allusions to "laws" in his first chapter. It practically asserts an occult form of causation. Condillac was helping to make a "tendency" of his "age." Other men opposed him in the same age. Both sides developed from antecedent modes of thought.—Ed.]

celebrated book, I will simply bring together the essential positions on which it is based, in order to illustrate the harmony between it and the intellectual habits of the age in which it appeared.[97]

The materials from which the philosophy of Condillac was originally drawn were contained in the great work published by Locke about sixty years before this time. But though much of what was most essential was borrowed from the English philosopher, there was one very important point in which the disciple differed from his master. And this difference is strikingly characteristic of the direction which the French intellect was now taking. Locke, with some looseness of expression, and possibly with some looseness of thought, had asserted the separate existence of a power of reflection, and had maintained that by means of that power the products of sensation became available.[98] Condillac, moved by the prevailing temper of his own time, would not hear of such a distinction. He, like most of his contemporaries, was jealous of any claim which increased the authority of the internal, and weakened that of the external. He therefore altogether rejects the faculty of reflection as a source of our ideas; and this partly because it is but the channel through which ideas run from the senses, and partly because in its origin it is itself a sensation.[99] Therefore, according to him, the only question is as to the way in which our contact with nature supplies us with ideas. For in this scheme the faculties of man are solely caused by the operation of his senses. The judgments which we form are, says Condillac, often ascribed to the hand of the Deity; a convenient mode of reasoning, which has only arisen from the difficulty of analyzing them.[100] By considering how our judgments actually arise, we can alone remove these obscurities. The fact is that the attention we give to an object is nothing but the sensation which that object excites;[101] and what we call abstract ideas are merely different ways of being attentive.[102] Ideas being thus generated, the subsequent process is very simple. To attend to two ideas at the same time, is to compare them; so that comparison is not a result of attention, but is rather the attention itself.[103] This at once gives us the faculty of judging, because directly we institute a comparison, we do of necessity form a judgment.[104] Thus, too, memory is a transformed sensation;[105] while the imagination is nothing but memory, which, being carried to its highest possible vivacity, makes what is absent appear to

[97] On the immense influence of Condillac, compare *Renouard, Hist. de la Médecine*, vol. ii. p. 355; *Cuvier, Éloges*, vol. iii. p. 387; *Broussais, Cours de Phrénologie*, pp. 45, 68–71, 829; *Pinel, Alién. Mentale*, p. 94; *Brown's Philos. of the Mind*, p. 212.

[98] Whether or not Locke held that reflection is an independent as well as a separate faculty is uncertain; because passages could be quoted from his writings to prove either the affirmative or the negative: Dr. Whewell justly remarks that Locke uses the word so vaguely as to "allow his disciples to make of his doctrines what they please." *History of Moral Philosophy*, 1852, p. 71.

[99] "Locke distingue deux sources de nos idées, les sens et la réflexion. Il seroit plus exact de n'en reconnoître qu'une, soit parceque la réflexion n'est dans son principe que la sensation même, soit parcequ'elle est moins la source des idées, que le canal par lequel elles découlent des sens." *Condillac, Traité des Sensations*, p. 13; see also, at pp. 19, 216, the way in which sensation becomes reflection; and the summing up, at p. 416, "que toutes nos connoissances viennent des sens, et particulièrement du toucher."

[100] He says of Malebranche (*Traité des Sensations*, p. 312), "ne pouvant comprendre comment nous formerions nous-mêmes ces jugemens, il les attribue à Dieu; manière de raisonner fort commode, et presque toujours la ressource des philosophes."

[101] "Mais à peine j'arrête la vue sur un objet, que les sensations particulières que j'en reçois sont l'attention même que je lui donne." *Traité des Sensations*, p. 16.

[102] "Ne sont que différentes manières d'être attentif." p. 122.

[103] "Dès qu'il y a double attention, il y a comparaison; car être attentif à deux idées ou les comparer, c'est la même chose." p. 17.

[104] "Dès qu'il y a comparaison, il y a jugement." p. 65.

[105] "La mémoire n'est donc que la sensation transformée." p. 17. Compare p. 61.

be present.[106] The impressions we receive from the external world being therefore not the cause of our faculties, but being the faculties themselves,* the conclusion to which we are driven is inevitable. It follows, says Condillac, that in man nature is the beginning of all; that to nature we owe the whole of our knowledge; that we only instruct ourselves according to her lessons; and that the entire art of reasoning consists in continuing the work which she has appointed us to perform.[107]

It is so impossible to mistake the tendency of these views that I need not attempt to estimate their result otherwise than by measuring the extent to which they were adopted. Indeed, the zeal with which they were now carried into every department of knowledge can only surprise those who, being led by their habits of mind to study history in its separate fragments, have not accustomed themselves to consider it as an united whole, and who therefore do not perceive that in every great epoch there is some one idea at work which is more powerful than any other, and which shapes the events of the time and determines their ultimate issue. In France, during the latter half of the eighteenth century, this idea was, the inferiority of the internal to the external. It was this dangerous but plausible principle which drew the attention of men from the church to the state; † which was seen in Helvétius, the most celebrated of the French moralists, and in Condillac, the most celebrated of the French metaphysicians. It was this same principle which, by increasing, if I may so say, the reputation of Nature, induced the ablest thinkers to devote themselves to a study of her laws, and to abandon those other pursuits which had been popular in the preceding age. In consequence of this movement, such wonderful additions were made to every branch of physical science that more new truths concerning the external world were discovered in France during the latter half of the eighteenth century than during all the previous periods put together. The details of these discoveries, so far as they have been subservient to the general purposes of civilization, will be related in another place; at present I will indicate only the most prominent, in order that the reader may understand the course of the subsequent argument, and may see the connexion between them and the French Revolution.

Taking a general view of the external world, we may say that the three most important forces by which the operations of nature are effected are heat, light, and electricity; including under this last magnetic and galvanic phenomena. On all these subjects the French, for the first time, now exerted themselves with signal success. In regard to heat, not only were the materials for subsequent induction collected with indefatigable industry, but before that generation

[106] "L'imagination est la mémoire même, parvenue à toute la vivacité dont elle est susceptible." p. 78. "Or j'ai appelé imagination cette mémoire vive, qui fait paroître présent ce qui est absent." p. 245.

[107] "Il résulte de cette vérité, que la nature commence tout en nous: aussi ai-je démontré que, dans le principe ou dans le commencement, nos connoissances sont uniquement son ouvrage, que nous ne nous instruisons que d'après ses leçons, et que tout l'art de raisonner consiste à continuer comme elle nous a fait commencer." p. 178.

[* Condillac did not, as Buckle represents, first say that the "faculties of man are solely caused by the operation of his senses," and then that his "impressions" are "the faculties themselves." The line of analysis he followed excluded such propositions. His own words must be taken for his positions.—Ed.]

[† In terms of the previous exposition, there was no recognition whatever of the "inferiority" here alleged, but a denial of the old distinction. And as the attention of men was *not* thus drawn from the church to the State (the men who so changed their attitude being the believers and not the unbelievers) the theorem once more collapses. But when we further remember that it was believers who made a political revolution in England in the previous century, and that believers like Boyle and Newton had there done scientific work in the next generation, the line of inference followed by Buckle is seen to have been doubly arbitrary.—Ed.]

passed away, the induction was actually made ; for while the laws of its radiation were worked out by Prevost,[108] those of its conduction were established by Fourier, who, just before the Revolution, employed himself in raising thermotics to a science by the deductive application of that celebrated mathematical theory which he contrived, and which still bears his name.[109] In regard to electricity it is enough to notice, during the same period, the important experiments of D'Alibard, followed by those vast labours of Coulomb which brought electrical phenomena under the jurisdiction of the mathematics, and thus completed what Œpinus had already prepared.[110] As to the laws of light, those ideas were now accumulating which rendered possible the great steps that, at the close of the century, were taken by Malus, and still later by Fresnel.[111] Both of these eminent Frenchmen not only made important additions to our knowledge of double refraction, but Malus discovered the polarization of light,* undoubtedly the most splendid contribution received by optical science since the analysis of the solar rays.[112] It was also in consequence of this that Fresnel began those profound researches which placed on a solid basis that great undulatory theory of which Hooke, Huygens, and above all Young, are to be deemed the founders, and by which the corpuscular theory of Newton was finally overthrown.[113]

Thus much as to the progress of French knowledge respecting those parts

[108] Compare *Powell on Radiant Heat*, p. 261, in *Second Rep. of Brit. Assoc.* ; *Whewell's History of Sciences*, vol. ii. p. 526 ; and his *Philosophy*, vol. i. pp. 339, 340. Prévost was professor at Geneva ; but his great views were followed up in France by Dulong and Petit ; and the celebrated theory of dew by Dr. Wells is merely an application of them. *Herschel's Nat. Philosophy*, pp. 163, 315, 316. Respecting the further prosecution of these inquiries, and our present knowledge of radiant heat, see *Liebig and Kopp's Reports*, vol. i. p. 79, vol. iii. p. 30, vol. iv. p. 45.

[109] On Fourier's mathematical theory of conduction, see *Comte, Philos. Positive* vol. i. pp. 142, 175, 345, 346, 351, vol. ii. pp. 453, 551 ; *Prout's Bridgewater Treatise*, pp. 203, 204 ; *Kelland on Heat*, p. 6, in *Brit. Assoc. for* 1841 ; *Erman's Siberia*, vol. i. p. 243 ; *Humboldt's Cosmos*, vol. i. p. 169 ; *Hitchcock's Geology*, p. 198 ; *Pouillet, Elémens de Physique*, ii. 696, 697.

[110] Coulomb's memoirs on electricity and magnetism were published from 1782 to 1789. *Fifth Report of Brit. Assoc.* p. 4. Compare *Liebig and Kopp's Reports*, vol. iii. p. 128 ; and on his relation to Œpinus, who wrote in 1759, see *Whewell's Induc. Sciences*, vol. iii. pp. 24–26, 35, 36, and *Haüy, Traité de Minéralogie*, vol. iii. p. 44, vol. iv. p. 14. There is a still fuller account of what was effected by Coulomb in M. Pouillet's able work, *Elémens de Physique*, vol. i. part ii. pp. 63–79, 130–135.

[111] Fresnel belongs to the present century ; but M. Biot says that the researches of Malus began before the passage of the Rhine in 1797. *Biot's Life of Malus*, in *Biog. Univ.* vol. xxvi. p. 412.

[112] *Pouillet, Elémens de Physique*, vol. ii. part ii. pp. 484, 514 ; *Report of Brit. Assoc. for* 1832, p. 314 ; *Leslie's Nat. Philos.* p. 83 ; *Whewell's Hist. of Sciences*, vol. ii. pp. 408–410 ; *Philos. of Sciences*, vol. i. p. 350, vol. ii. p. 25 ; *Herschel's Nat. Philos.* p. 258.

[113] The struggle between these rival theories, and the ease with which a man of such immense powers as Young was put down, and as it were suppressed, by those ignorant pretenders who presumed to criticize him, will be related in another part of this work, as a valuable illustration of the history and habits of the English mind. At present the controversy is finished, so far as the advocates of emission are concerned ; but there are still difficulties on the other side, which should have prevented Dr. Whewell from expressing himself with such extreme positiveness on an unexhausted subject. This able writer says : " The undulatory theory of light ; the only discovery which can stand by the side of the theory of universal gravitation, as a doctrine belonging to the same order, for its generality, its fertility, and its certainty." *Whewell's Hist. of the Induc. Sciences*, vol. ii. p. 425 ; see also p. 508.

[* Read " polarization of light by reflexion." See Buckle's letter to Sir C. Wheatstone, in Mr. Huth's *Life*, i. 148.—Ed.]

of nature which are in themselves invisible, and of which we cannot tell whether they have a material existence, or whether they are mere conditions and properties of other bodies.[114] The immense value of these discoveries, as increasing the number of known truths, is incontestable : but at the same time another class of discoveries was made, which, dealing more palpably with the visible world, and being also more easily understood, produced more immediate results, and, as I shall presently show, exercised a remarkable influence in strengthening that democratic tendency which accompanied the French Revolution. It is impossible, within the limits I have assigned to myself, to give anything like an adequate notion of the marvellous activity with which the French now pushed their researches into every department of the organic and inorganic world ; still it is, I think, practicable to compress into a few pages such a summary of the more salient points as will afford the reader some idea of what was done by that generation of great thinkers which flourished in France during the latter half of the eighteenth century.

If we confine our view to the globe we inhabit, it must be allowed that chemistry and geology are the two sciences which not only offer the fairest promise, but already contain the largest generalizations. The reason of this will become clear if we attend to the ideas on which these two great subjects are based. The idea of chemistry is the study of composition ; [115] the idea of geology is the study of position. The object of the first is to learn the laws which govern the properties of matter ; the object of the second is to learn the laws which govern its locality.* In chemistry we experiment ; in geology we observe. In chemistry we deal with the molecular arrangement of the smallest atoms ; [116] in geology with the cosmological arrangement of the largest masses. Hence it is that the chemist by his minuteness, and the geologist by his grandeur, touch the two extremes of the material universe ; and, starting from these opposite points, have, as I could easily prove, a constantly increasing tendency to bring under their own authority sciences which have at present an independent existence, and which, for the sake of a division of labour, it is still convenient to study separately ; though it must be the business of philosophy, properly so called, to integrate them into a complete and effective whole. Indeed it is obvious that if we knew all the laws of the composition of matter, and likewise all the laws of its position, we should likewise know all the changes of which matter is capable spontaneously, that is, when uninterrupted by the mind of man. Every phenomenon which any given substance presents must be caused either by something taking place in the substance, or else by something taking place out of it, but acting upon it ; while what occurs within must be explicable by its own composition, and what occurs without must be due to its position in relation to the objects by which it is affected. This is an ex-

[114] As to the supposed impossibility of conceiving the existence of matter without properties which give rise to forces (note in *Paget's Lectures on Pathology*, 1853, vol. i. p. 61), there are two reasons which prevent me from attaching much weight to it. First, a conception which in one stage of knowledge is called impossible becomes in a later stage perfectly easy, and so natural as to be often termed necessary. Secondly, however indissoluble the connexion may appear between force and matter, it was not found fatal to the dynamical theory of Leibnitz ; it has not prevented other eminent thinkers from holding similar views ; and the arguments of Berkeley, though constantly attacked, have never been refuted.

[115] Every chemical decomposition being only a new form of composition. *Robin et Verdeil, Chimie Anatomique*, vol. i. pp. 455, 456, 498 : " de tout cela il résulte, que la dissolution est un cas particulier des combinaisons."

[116] What is erroneously called the atomic theory is, properly speaking, an hypothesis, and not a theory : but hypothesis though it be, it is by its aid that we wield the doctrine of definite proportions, the corner-stone of chemistry.

[* This definition is obviously imperfect. Air is part of the " matter " of chemistry, but not of geology.—Ed.]

haustive statement of every possible contingency, and to one of these two classes of laws everything must be referrible; even those mysterious forces which, whether they be emanations from matter, or whether they be merely properties of matter, must in an ultimate analysis depend either on the internal arrangement or else on the external locality of their physical antecedents. However convenient, therefore, it may be, in the present state of our knowledge, to speak of vital principles, imponderable fluids, and elastic æthers, such terms can only be provisional, and are to be considered as mere names for that residue of unexplained facts which it will be the business of future ages to bring under generalizations wide enough to cover and include the whole.

These ideas of composition and of position being thus the basis of all natural science, it is not surprising that chemistry and geology, which are their best, but still their insufficient representatives, should in modern times have made more progress than any other of the great branches of human knowledge. Although the chemists and geologists have not yet risen to the full height of their respective subjects,[117] there are few things more curious than to note the way in which, during the last two generations, they have been rapidly expanding their views,—encroaching on topics with which, at first sight, they appeared to have no concern,—making other branches of inquiry tributary to their own,—and collecting from every quarter that intellectual wealth which, long hidden in obscure corners, had been wasted in the cultivation of special and inferior pursuits. This, as being one of the great intellectual characteristics of the present age, I shall hereafter examine at considerable length; but what I have now to show is that in these two vast sciences, which, though still very imperfect, must eventually be superior to all others, the first important steps were made by Frenchmen during the latter half of the eighteenth century.

That we owe to France the existence of chemistry as a science will be admitted by every one who uses the word science in the sense in which alone it ought to be understood, namely, as a body of generalizations so irrefragably true that, though they may be subsequently covered by higher generalizations, they cannot be overthrown by them; in other words, generalizations which may be absorbed, but not refuted. In this point of view, there are in the history of chemistry only three great stages. The first stage was the destruction of the phlogistic theory, and the establishment, upon its ruins, of the doctrines of oxidation, combustion and respiration. The second stage was the establishment of the principle of definite proportions, and the application to it of the atomic hypothesis. The third stage, above which we have not yet risen, consists in the union of chemical and electrical laws, and in the progress we are making towards fusing into one generalization their separate phenomena. Which of these three stages was in its own age the most valuable is not now the question; but it is certain that the first of them was the work of Lavoisier, by far the greatest of the French chemists. Before him several important points had been cleared up by the English chemists, whose experiments ascertained the existence of bodies formerly unknown. The links, however, to connect the facts were still wanting; and until Lavoisier entered the field there were no generalizations wide enough to entitle chemistry to be called a science; or, to speak more properly, the only large generalization commonly received was that by Stahl, which the great Frenchman proved to be not only imperfect but altogether inaccurate. A notice of the vast discoveries of Lavoisier will be found in many well-known books:[118] it is enough to say that he not only worked out the laws of the oxidation of bodies and of their combustion, but that he is

[117] Many of them being still fettered, in geology, by the hypothesis of catastrophes; in chemistry, by the hypothesis of vital forces.

[118] See, for instance, *Cuvier, Progrès des Sciences*, vol. i. pp. 32–34, 40; *Liebig's Letters on Chemistry*, p. 282; *Turner's Chemistry*, vol. i. pp. 184, 185; *Brande's Chemistry*, vol. i. pp. lxxxv.–lxxxix. 302; *Thomson's Animal Chemistry*, pp. 520, 634, and a great part of the second volume of his *History of Chemistry*; also *Müller's Physiol.* vol. i. pp. 90, 323.

the author of the true theory of respiration, the purely chemical character of which he first demonstrated ; thus laying the foundation of those views respecting the functions of food which the German chemists subsequently developed, and which, as I have proved in the second chapter of this Introduction, may be applied to solve some great problems in the history of Man. The merit of this was so obviously due to France, that though the system now established was quickly adopted in other countries,[119] it received the name of the French chemistry.[120] At the same time, the old nomenclature being full of old errors, a new one was required, and here again France took the initiative ; since this great reformation was begun by four of her most eminent chemists, who flourished only a few years before the Revolution.[121]

While one division of the French thinkers was reducing to order the apparent irregularities of chemical phenomena, another division of them was performing precisely the same service for geology. The first step towards popularizing this noble study was taken by Buffon, who in the middle of the eighteenth century broached a geological theory which, though not quite original, excited attention by its eloquence, and by the lofty speculations with which he connected it.[122] This was followed by the more special but still important labours of Rouelle, Desmarest, Dolomieu, and Montlosier, who in less than forty years effected a complete revolution in the ideas of Frenchmen, by familiarizing them with the strange conception that the surface of our planet, even where it appears perfectly stable, is constantly undergoing most extensive changes. It began to be understood that this perpetual flux takes place not only in those parts of nature which are obviously feeble and evanescent, but also in those which seem to possess every element of strength and permanence, such as the mountains of granite which wall the globe, and are the shell and encasement in which it is held. As soon as the mind became habituated to this notion of universal change, the time was ripe for the appearance of some great thinker who should generalize the scattered observations, and form them into a science, by connecting them with some other department of knowledge, of which the laws, or at all events the empirical uniformities, had been already ascertained.

It was at this point, and while the inquiries of geologists, notwithstanding their value, were still crude and unsettled, that the subject was taken up by

[119] According to Mr. Harcourt (*Brit. Assoc. Report for* 1839, p. 10), Cavendish has this merit, so far as England is concerned : " He, first of all his contemporaries, did justice to the rival theory recently proposed by Lavoisier."

[120] " La chimie française." *Thomson's Hist. of Chemistry*, vol. ii. pp. 101, 130. On the excitement caused by Lavoisier's views, see a letter which Jefferson wrote in Paris in 1789, printed partly in *Tucker's Life of Jefferson*, vol. i. pp. 314, 315 ; and at length in *Jefferson's Correspond.* vol. ii. pp. 453–455.

[121] " The first attempt to form a systematic chemical nomenclature was made by Lavoisier, Berthollet, G. de Morveau, and Fourcroy, soon after the discovery of oxygen gas." *Turner's Chemistry*, vol. i. p. 127. Cuvier (*Progrès des Sciences*, vol. i. p. 39) and Robin et Verdeil (*Chimie Anatomique*, vol. i. pp. 602, 603) ascribe the chief merit to De Morveau. Thomson says (*Hist. of Chemistry*, vol. ii. p. 133) : " this new nomenclature very soon made its way into every part of Europe, and became the common language of chemists, in spite of the prejudices entertained against it, and the opposition which it everywhere met with."

[122] The famous central heat of Buffon is often supposed to have been taken from Leibnitz ; but though it was vaguely taught by the ancients, the real founder of the doctrine appears to have been Descartes. See *Bordas Demoulin, Cartésianisme*, Paris, 1843, vol. i. p. 312. There is an unsatisfactory note on this in *Prichard's Physical Hist.* vol. i. p. 100. Compare *Experimental Hist. of Cold*, tit. 17, in *Boyle's Works*, vol. ii. p. 308 ; *Brewster's Life of Newton*, vol. ii. p. 100. On the central heat of the Pythagoreans, see *Tennemann, Gesch. der Philos.* vol. i. p. 149 ; and as to the central fire mentioned in the so-called Oracles of Zoroaster, see *Beausobre, Hist. de Manichée*, vol. ii. p. 152. But the complete ignorance of the ancients respecting geology made these views nothing but guesses. Compare some sensible remarks in *Matter's Hist. de l'École d'Alexandrie*, vol. ii. p. 282.

Cuvier, one of the greatest naturalists Europe has ever produced. A few others there are who have surpassed him in depth ; but in comprehensiveness it would be hard to find his superior ; and the immense range of his studies gave him a peculiar advantage in surveying the operations and dependencies of the external world.[123] This remarkable man is unquestionably the founder of geology as a science, since he is not only the first who saw the necessity of bringing to bear upon it the generalizations of comparative anatomy, but he is also the first who actually, executing this great idea, succeeded in co-ordinating the study of the strata of the earth with the study of the fossil animals found in them.[124] Shortly before his researches were published, many valuable facts had indeed been collected respecting the separate strata ; the primary formations being investigated by the Germans, the secondary ones by the English.[125] But these observations, notwithstanding their merit, were isolated ; and they lacked that vast conception which gave unity and grandeur to the whole, by connecting inquiries concerning the inorganic changes of the surface of the globe with other inquiries concerning the organic changes of the animals the surface contained.

How completely this immense step is due to France, is evident not only from the part played by Cuvier, but also from the admitted fact that to the French we owe our knowledge respecting tertiary strata,[126] in which the organic remains are most numerous, and the general analogy to our present state is most intimate.[127] Another circumstance may likewise be added, as pointing to the same conclusion. This is, that the first application of the principles of comparative anatomy to the study of fossil bones was also the work of a Frenchman, the celebrated Daubenton. Hitherto these bones had been the object of stupid wonder ; some saying that they were rained from heaven, others saying that they were the gigantic limbs of the ancient patriarchs, men who were believed

[123] This comprehensiveness of Cuvier is justly remarked by M. Flourens as the leading characteristic of his mind. *Flourens, Hist. des Travaux de Cuvier*, pp. 76, 142, 306 : " ce qui caractérise partout M. Cuvier, c'est l'esprit vaste."

[124] Hence he is called by Mr. Owen, " the founder of palæontological science." *Owen on Fossil Mammalia*, in *Report of Brit. Assoc. for* 1843, p. 208. It was in 1796 that there were thus " opened to him entirely new views of the theory of the earth." p. 209. See also *Bakewell's Geology*, p. 368 ; and *Milne Edwards, Zoologie*, part ii. p. 279. The importance of this step is becoming more evident every year ; and it has been justly remarked that without palæontology there would be, properly speaking, no geology. *Balfour's Botany*, 1849, p. 591. Sir R. Murchinson (*Siluria*, 1854, p. 366) says, " it is essentially the study of organic remains which has led to the clear subdivision of the vast mass of older rocks, which were there formerly merged under the unmeaning term ' Grauwacke.' " In the same able work, p. 465, we are told that, " in surveying the whole series of formations, the practical geologist is fully impressed with the conviction that there has at all periods subsisted a very intimate connexion between the existence, or at all events the preservation of animals, and the media in which they have been fossilized." For an instance of this in the old red sandstone, see p. 329.

[125] *Whewell's Hist. of Sciences*, vol. iii. p. 679 ; *Lyell's Geol.* p. 59. Indeed gneiss received its name from the Germans. *Bakewell's Geol.* p. 108.

[126] Compare *Conybeare's Report on Geology*, p. 371 (*Brit. Assoc. for* 1832), with *Bakewell's Geol.* pp. 367, 368, 419, and *Lyell's Geol.* p. 59.

[127] In the older half of the secondary rocks, mammals are hardly to be found, and they do not become common until the tertiary. *Murchison's Siluria*, pp. 466, 467 ; and *Strickland on Ornithology*, p. 210 (*Brit. Assoc. for* 1844). So too in the vegetable kingdom, many of the plants in the tertiary strata belong to genera still existing ; but this is rarely the case with the secondary strata ; while in the primary strata even the families are different to those now found on the earth. *Balfour's Botany*, pp 592, 593. Compare Wilson's additions to *Jussieu's Botany*, 1849, p. 746 ; and for further illustration of this remarkable law of the relation between advancing time and diminished similarity, a law suggesting the most curious speculations, see *Hitchcock's Geology*, p. 21 ; *Lyell's Geology*, p. 183 ; and *Owen's Lectures on the Invertebrata*, 1855, pp. 38, 576.

to be tall because they were known to be old.[128] Such idle conceits were for ever destroyed by Daubenton, in a Memoir he published in 1762 ;[129] with which, however, we are not now concerned, except that it is evidence of the state of the French mind, and is worth noting as a precursor of the discoveries of Cuvier.

By this union of geology and anatomy, there was first introduced into the study of nature a clear conception of the magnificent doctrine of universal change ; while at the same time there grew up by its side a conception equally steady of the regularity with which the changes are accomplished, and of the undeviating laws by which they are governed. Similar ideas had no doubt been occasionally held in preceding ages ; but the great Frenchmen of the eighteenth century were the first who applied them to the entire structure of the globe, and who thus prepared the way for that still higher view for which their minds were not yet ripe,[130] but to which in our own time the most advanced thinkers are rapidly rising. For it is now beginning to be understood that since every addition to knowledge affords fresh proof of the regularity with which all the changes of nature are conducted, we are bound to believe that the same regularity existed long before our little planet assumed its present form, and long before man trod the surface of the earth. We have the most abundant evidence that the movements incessantly occurring in the material world have a character of uniformity ; and this uniformity is so clearly marked, that in astronomy, the most perfect of all the sciences, we are able to predict events many years before they actually happen ; nor can any one doubt that if on other subjects our science were equally advanced, our predictions would be equally accurate. It is therefore clear that the burden of proof lies not on those who assert the eternal regularity of nature, but rather on those who deny it ; and who set up an imaginary period, to which they assign an imaginary catastrophe, during which they say new laws were introduced and a new order established. Such gratuitous assumptions, even if they eventually turn out to be true, are in the present state of knowledge unwarrantable, and ought to be rejected as the last remains of those theological prejudices by which the march of every science has in its turn been hindered. These and all analogous notions work a double mischief. They are mischievous, because they cripple the human mind by imposing limits to its inquiries ; and above all they are mischievous, because they weaken

[128] M. Geoffroy Saint Hilaire (*Anomalies de l'Organisation*, vol. i. pp. 121–127) has collected some evidence respecting the opinions formerly held on these subjects. Among other instances, he mentions a learned man named Henrion, an academician, and, I suppose, a theologian, who in 1718 published a work in which "il assignait à Adam cent vingt trois pieds neuf pouces ;" Noah being twenty feet shorter, and so on. The bones of elephants were sometimes taken for giants : see a pleasant circumstance in *Cuvier, Hist. des Sciences*, part ii. p. 43.

[129] "Daubenton a le premier détruit toutes ces idées ; il a le premier appliqué l'anatomie comparée à la détermination de ces os. . . . Le mémoire où Daubenton a tenté, pour la première fois, la solution de ce problème important est de 1762." *Flourens, Travaux de Cuvier*, pp. 36, 37. Agassiz (*Report on Fossil Fishes*, p. 82, *Brit. Assoc. for* 1842) claims this merit too exclusively for Cuvier, overlooking the earlier researches of Daubenton ; and the same mistake is made in *Hitchcock's Geol.* p. 249, and in *Bakewell's Geol. p.* 384.

[130] Even Cuvier held the doctrine of catastrophes ; but, as Sir Charles Lyell says (*Principles of Geology*, p. 60), his own discoveries supplied the means of overthrowing it, and of familiarizing us with the idea of continuity. Indeed it was one of the fossil observations of Cuvier which first supplied the link between reptiles, fishes, and cetaceous mammals. See *Owen on Fossil Reptiles*, pp. 60, 198, *Brit. Assoc. for* 1841 ; and compare *Carus's Comparative Anatomy*, vol. i. p. 155. To this I may add that Cuvier unconsciously prepared the way for disturbing the old dogma of fixity of species, though he himself clung to it to the last. See some observations, which are very remarkable, considering the period when they were written, in *Cabanis, Rapports du Physique et du Moral*, pp. 427, 428 ; conclusions drawn from Cuvier, which Cuvier would have himself rejected.

that vast conception of continuous and uninterrupted law, which few indeed are able firmly to seize, but on which the highest generalizations of future science must ultimately depend.

It is this deep conviction that changing phenomena have unchanging laws, and that there are principles of order to which all apparent disorder may be referred,—it is this which, in the seventeenth century, guided in a limited field Bacon, Descartes, and Newton; which in the eighteenth century was applied to every part of the material universe; and which it is the business of the nineteenth century to extend to the history of the human intellect. This last department of inquiry we owe chiefly to Germany; for, with the single exception of Vico, no one even suspected the possibility of arriving at complete generalizations respecting the progress of man, until shortly before the French Revolution, when the great German thinkers began to cultivate this, the highest and most difficult of all studies. But the French themselves were too much occupied with physical science to pay attention to such matters;[131] and speaking generally, we may say that in the eighteenth century each of the three leading nations of Europe had a separate part to play. England diffused a love of freedom; France, a knowledge of physical science; while Germany, aided in some degree by Scotland, revived the study of metaphysics, and created the study of philosophic history. To this classification some exceptions may of course be made; but that these were the marked characteristics of the three countries is certain. After the death of Locke in 1704, and that of Newton in 1727, there was in

[131] Neither Montesquieu nor Turgot appears to have believed in the possibility of generalizing the past so as to predict the future; while as to Voltaire, the weakest point in his otherwise profound view of history was his love of the old saying, that great events spring from little causes; a singular error for so comprehensive a mind, because it depended on confusing causes with conditions. That a man like Voltaire should have committed what now seems so gross a blunder, is a mortifying reflection for those who are able to appreciate his vast and penetrating genius, and it may teach the best of us a wholesome lesson. This fallacy was avoided by Montesquieu and Turgot; and the former writer in particular displayed such extraordinary ability that there can be little doubt that had he lived at a later period, and thus had the means of employing in their full extent the resources of political economy and physical science, he would have had the honour not only of laying the basis, but also of rearing the structure of the philosophy of the history of Man. As it was, he failed in conceiving what is the final object of every scientific inquiry, namely, the power of foretelling the future; and after his death, in 1755, all the finest intellects in France, Voltaire alone excepted, concentrated their attention upon the study of natural phenomena. [Montesquieu and Turgot actually did "predict the future" in regard to the severance of the American colonies from Britain; and Buckle has actually noted this in regard to Turgot (ch. xiii. note 144). As to the question of causes *versus* conditions, see the argument recapitulated in *Mr. Huth's Life of Buckle*, ii. 175. Buckle's formula, however, unduly simplifies the case, as it would often be equally accurate to call the conditions "great" and the "cause" small—*e.g.* in the case of a great fire begun by a small spark, falling in combustible material and fanned by a wind. Schopenhauer argued (essay *On Style*) that "to condition" is the same thing as "to cause." And see above, ch. viii. at note 22, Buckle's specific admission as to an "accident" introducing a "most important change." As to the statement in the closing sentence of the above note, it must be cancelled. *Rousseau's Contrat Social* and *Émile* appeared in 1762; and the *Nouvelle Héloïse* in 1761; the bulk of the work of Diderot, including his writings on social and historical questions, appeared after 1755; so did the bulk of the work of Turgot, his chief economic writings being dated 1766 and 1771; Condorcet was only twenty-two in 1755, and Volney was not born. One of the most widely read books of the time was *Raynal's Histoire Philosophique et politique . . . des deux Indes* (1770), in which Diderot collaborated; and *Mably's Observations sur l'histoire de France*, praised by Buckle, appeared in 1765. The *De l'Esprit* of Helvétius, finally, appeared in 1758, and his *De l'Homme* in 1772. Before, Buckle had stated that after 1750 the French intellect turned to *political* criticism.—ED.]

England a singular dearth of great speculative thinkers ; and this not because the ability was wanting, but because it was turned partly into practical pursuits, partly into political contests.* I shall hereafter examine the causes of this peculiarity, and endeavour to ascertain the extent to which it has influenced the fortunes of the country. That the results were on the whole beneficial, I entertain no doubt ; but they were unquestionably injurious to the progress of science, because they tended to divert it from all new truths except those likely to produce obvious and practical benefit. The consequence was that though the English made several great discoveries, they did not possess, during seventy years, a single man who took a really comprehensive view of the phenomena of nature ; not one who could be compared with those illustrious thinkers who in France reformed every branch of physical knowledge. Nor was it until more than two generations after the death of Newton that the first symptoms appeared of a remarkable reaction, which quickly displayed itself in nearly every department of the national intellect. In physics, it is enough to mention Dalton, Davy, and Young, each of whom was in his own field the founder of a new epoch ; while on other subjects I can only just refer, first, to the influence of the Scotch school ; and secondly to that sudden and well-deserved admiration for the German literature, of which Coleridge was the principal exponent, and which infused into the English mind a taste for generalizations higher and more fearless than any hitherto known. The history of this vast movement, which began early in the nineteenth century, will be traced in the future volumes of this work : at present I merely notice it as illustrating the fact that until the movement began, the English, though superior to the French in several matters of extreme importance, were for many years inferior to them in those large and philosophic views without which not only is the most patient industry of no avail, but even real discoveries lose their proper value, for want of such habits of generalization as would trace their connexion with each other, and consolidate their severed fragments into one vast system of complete and harmonious truth.

The interest attached to these inquiries has induced me to treat them at greater length than I had intended ; perhaps at greater length than is suitable to the suggestive and preparatory character of this Introduction. But the extraordinary success with which the French now cultivated physical knowledge is so curious, on account of its connexion with the Revolution, that I must mention a few more of its most prominent instances : though, for the sake of brevity, I will confine myself to those three great divisions which, when put together, form what is called Natural History, and in all of which we shall see that the most important steps were taken in France during the latter half of the eighteenth century.

In the first of these divisions, namely, the department of zoology, we owe to the Frenchmen of the eighteenth century those generalizations which are still the highest this branch of knowledge has reached. Taking zoology in the proper sense of the term, it consists only of two parts, the anatomical part, which is its statics, and the physiological part, which is its dynamics : the first referring to the structure of animals ; the other to their functions.[132] Both of these

[132] The line of demarcation between anatomy as statical, and physiology as dynamical, is clearly drawn by M. Comte (*Philos. Positive*, vol. iii. p. 303) and by MM. Robin et Verdeil (*Chimie Anatomique*, vol. i. pp. 11, 12, 40, 102, 188, 434). What is said by Carus (*Comparative Anatomy*, vol. ii. p. 356) and by Sir Benjamin Brodie (*Lectures on Pathology and Surgery*, p. 6) comes nearly to the same thing, though expressed with less precision. On the other hand, M. Milne Edwards (*Zoologie*, part i. p. 9) calls physiology "la science de la vie ;" which, if true, would simply prove that there is no physiology at all, for there certainly is at present no science of life.

[* Berkeley is here oddly overlooked ; and Hume, though Scotch, should be included among the great names of English philosophy. But the admission is entirely accurate as regards the succession to Newton ; and the explanation given points to the true account of the reign of Louis XIV.—that the national energy had been turned into military channels.—Ed.]

were worked out, nearly at the same time, by Cuvier and Bichat; and the leading conclusions at which they arrived remain, after the lapse of sixty years, undisturbed in their essential points. In 1795, Cuvier laid down the great principle that the study and classification of animals was to be, not as heretofore, with a view to external peculiarities, but with a view to internal organization; and that therefore no real advance could be made in our knowledge except by extending the boundaries of comparative anatomy.[133] This step, simple as it now appears, was of immense importance, since by it zoology was at once rescued from the hands of the observer, and thrown into those of the experimenter: the consequence of which has been the attainment of that precision and accuracy of detail which experiment alone can give, and which is every way superior to such popular facts as observation supplies. By thus indicating to naturalists the true path of inquiry, by accustoming them to a close and severe method, and by teaching them to despise those vague descriptions in which they had formerly delighted, Cuvier laid the foundation of a progress which during the last sixty years has surpassed the most sanguine expectations. This, then, is the real service rendered by Cuvier, that he overthrew the artificial system which the genius of Linnæus had raised up,[134] and substituted in its place that far superior scheme which gave the freest scope to future inquiry: since according to it all systems are to be deemed imperfect and provisional so long as anything remains to be learned respecting the comparative anatomy of the animal kingdom. The influence exercised by this great view was increased by the extraordinary skill and industry with which its proposer followed it out, and proved the practicability of his own precepts. His additions to our knowledge of comparative anatomy are probably more numerous than those made by any other man; but what has gained him most celebrity is the comprehensive spirit with which he used what he acquired. Independently of other generalizations, he is the author of that vast classification of the whole animal kingdom into vertebrata, mollusca, articulata, and radiata;[135] a classification which keeps its ground, and is one of the most remarkable instances of that large and philosophic spirit which France brought to bear upon the phenomena of the material world.[136]

[133] In his *Règne Animal*, vol. i. pp. vi. vii., he says that preceding naturalists "n'avaient guère considéré que les rapports extérieurs de ces espèces, et personne ne s'était occupé de coördonner les classes et les ordres d'après l'ensemble de la structure. . . . Je dus donc, et cette obligation me prit un temps considérable, je dus faire marcher de front l'anatomie et la zoologie, les dissections et le classement. . . . Les premiers résultats de ce double travail parurent en 1795, dans un mémoire spécial sur une nouvelle division des animaux à sang blanc."

[134] On the opposition between the methods of Linnæus and of Cuvier, see *Jenyns' Report on Zoology*, pp. 144, 145, in *Brit. Assoc. for* 1834.

[135] The foundations of this celebrated arrangement were laid by Cuvier, in a paper read in 1795. *Whewell's History of the Induc. Sciences*, vol. iii. p. 494. It appears, however (*Flourens, Travaux de Cuvier*, pp. 69, 70), that it was in or just after 1791 that the dissection of some mollusca suggested to him the idea of reforming the classification of the whole animal kingdom. Compare *Cuvier, Règne Animal*, vol. i. pp. 51, 52 note.

[136] The only formidable opposition made to Cuvier's arrangement has proceeded from the advocates of the doctrine of circular progression: a remarkable theory, of which Lamarck and Macleay are the real originators, and which is certainly supported by a considerable amount of evidence. Still, among the great majority of competent zoologists, the fourfold division holds its ground, although the constantly-increasing accuracy of microscopical observations has detected a nervous system much lower in the scale than was formerly suspected, and has thereby induced some anatomists to divide the radiata into acrita and nematoneura. *Owen's Invertebrata*, 1855, pp. 14, 15; and *Rymer Jones's Animal Kingdom*, 1855, p. 4. As, however, it seems probable that all animals have a distinct nervous system, this subdivision is only provisional; and it is very likely that when our microscopes are more improved we shall have to return to Cuvier's arrangement. Some of Cuvier's successors have removed the apodous

Great, however, as is the name of Cuvier, a greater still remains behind. I allude, of course, to Bichat, whose reputation is steadily increasing as our knowledge advances, and who, if we compare the shortness of his life with the reach and depth of his views, must be pronounced the most profound thinker and the most consummate observer by whom the organization of the animal frame has yet been studied.[137] He wanted indeed that comprehensive knowledge for which Cuvier was remarkable ; but though on this account his generalizations were drawn from a smaller surface, they were on the other hand less provisional ; they were, I think, more complete, and certainly they dealt with more momentous topics. For the attention of Bichat was pre-eminently directed to the human frame [138] in the largest sense of the word ; his object being so to investigate the organization of man as to rise, if possible, to some knowledge concerning the causes and nature of life. In this magnificent enterprise, considered as a whole, he failed ; but what he effected in certain parts of it is so extraordinary, and has given such an impetus to some of the highest branches of inquiry, that I will briefly indicate his method, in order to compare it with that other method which, at the same moment, Cuvier adopted with immense success.

The important step taken by Cuvier was that he insisted on the necessity of a comprehensive study of the organs of animals, instead of following the old plan of merely describing their habits and external peculiarities. This was a vast improvement, since, in the place of loose and popular observations, he substituted direct experiment, and hence introduced into zoology a precision formerly unknown.[139] But Bichat, with a still keener insight, saw that even this was not enough. He saw that, each organ being composed of different tissues, it was requisite to study the tissues themselves before we could learn the way in which, by their combination, the organs are produced. This, like

echinoderms from the radiata ; but in this Mr. Rymer Jones (*Animal Kingdom*, p. 211) vindicates the Cuverian classification.

[137] We may except Aristotle ; but between Aristotle and Bichat I can find no middle man.

[138] But not exclusively. M. Blainville (*Physiol. comparée*, vol. ii. p. 304) says, "celui qui, comme Bichat, bornait ses études à l'anatomie humaine ; " and at p. 350, " quand on ne considère que ce qui se passe chez l'homme, ainsi que l'a fait Bichat." This, however, is much too positively stated. Bichat mentions " les expériences nombreuses que j'ai faites sur les animaux vivans." *Bichat, Anatomie Générale*, vol. i. p. 332 ; and for other instances of his experiments on animals below man, see the same work, vol. i. pp. 164, 284, 311, 312, 326, vol. ii. pp. 13, 25, 69, 73, 107, 133, 135, 225, 264, 423, vol. iii. pp. 151, 218, 242, 262, 363, 364, 400, 478, 501, vol. iv. pp. 27, 28, 34, 46, 229, 247, 471 : see also *Bichat, Recherches sur la Vie*, pp. 262, 265, 277, 312, 336, 356, 358, 360, 368, 384, 400, 411, 439, 455, 476, 482, 494, 512 ; and his *Traité des Membranes*, pp. 48, 64, 67, 130, 158, 196, 201, 224. These are all experiments on inferior animals, which aided this great physiologist in establishing those vast generalizations which, though applied to man, were by no means collected merely from human anatomy. The impossibility of understanding physiology without studying comparative anatomy is well pointed out in Mr. Rymer Jones's work, *Organization of the Animal Kingdom*, 1855, pp. 601, 791.

[139] Mr. Swainson (*Geography and Classification of Animals*, p. 170) complains, strangely enough, that Cuvier " rejects the more plain and obvious characters which every one can see, and which had been so happily employed by Linnæus, and makes the differences between these groups to depend upon circumstances which no one but an anatomist can understand." See also p. 173 : " characters which, however good, are not always comprehensible, except to the anatomist." (Compare *Hodgson on the Ornithology of Nepal*, in *Asiatic Researches*, vol. xix. p. 179, Calcutta, 1836.) In other words, this is a complaint that Cuvier attempted to raise zoology to a science, and therefore, of course, deprived it of some of its popular attractions, in order to invest it with other attractions of a far higher character. The errors introduced into the natural sciences by relying upon observation instead of experiment have been noticed by many writers ; and by none more judiciously than by M. Saint Hilaire in his *Anomalies de l'Organisation*, vol. i. p. 98.

all really great ideas, was not entirely struck out by a single man ; for the physiological value of the tissues had been recognized by three or four of the immediate predecessors of Bichat, such as Carmichael Smyth, Bonn, Bordeu, and Fallopius. These inquirers, however, notwithstanding their industry, had effected nothing of much moment, since, though they collected several special facts, there was in their observations that want of harmony and that general incompleteness always characteristic of the labours of men who do not rise to a commanding view of the subject with which they deal.[140]

It was under these circumstances that Bichat began those researches which, looking at their actual and still more at their prospective results, are probably the most valuable contribution ever made to physiology by a single mind. In 1801, only a year before his death,[141] he published his great work on anatomy, in which the study of the organs is made altogether subservient to the study of the tissues composing them. He lays it down that the body of man consists of twenty-one distinct tissues, all of which, though essentially different, have in common the two great properties of extensibility and contractility.[142] These tissues he, with indefatigable industry,[143] subjected to every sort of examination ; he examined them in different ages and diseases, with a view to ascertain the laws of their normal and pathological development.[144] He studied the way each tissue is

[140] It is very doubtful if Bichat was acquainted with the works of Smyth, Bonn, or Fallopius, and I do not remember that he anywhere even mentions their names. He had, however, certainly studied Bordeu ; but I suspect that the author by whom he was most influenced was Pinel, whose pathological generalizations were put forward just about the time when Bichat began to write. Compare *Bichat, Traité des Membranes*, pp. 3, 4, 107, 191 ; *Béclard, Anat. Gén.* pp. 65, 66 ; *Bouillaud, Philos. Médicale*, p. 26 ; *Blainville, Physiol. comparée*, vol. i. p. 284, vol. ii. pp. 19, 252 ; *Henle, Anat. Gén.* vol. i. pp. 119, 120.

[141] *Biog. Univ.* vol. iv. pp. 468, 469.

[142] For a list of the tissues, see *Bichat, Anat. Gén.* vol. i. p. 49. At p. 50 he says, " en effet, quel que soit le point de vue sous lequel on considère ces tissus, ils ne se ressemblent nullement : c'est la nature, et non la science, qui a tiré une ligne de démarcation entre eux." There is, however, now reason to think that both animal and vegetable tissues are, in all their varieties, referrible to a cellular origin. This great view, which M. Schwann principally worked out, will, if fully established, be the largest generalization we possess respecting the organic world, and it would be difficult to overrate its value. Still there is danger lest, in prematurely reaching at so vast a law, we should neglect the subordinate but strongly-marked differences between the tissues as they actually exist. Burdach (*Traité de Physiologie*, vol. vi. pp. 195, 196) has made some good remarks on the confusion introduced into the study of tissues by neglecting those salient characteristics which were indicated by Bichat.

[143] Pinel says, " dans un seul hiver il ouvrit plus de six cents cadavres." *Notice sur Bichat*, p. xiii., in vol. i. of *Anat. Gén.* By such enormous labour, and by working day and night in a necessarily polluted atmosphere, he laid the foundation for that diseased habit which caused a slight accident to prove fatal, and carried him off at the age of thirty-one. " L'esprit a peine à concevoir que la vie d'un seul homme puisse suffire à tant de travaux, à tant de découvertes, faites ou indiquées : Bichat est mort avant d'avoir accompli sa trente-deuxième année ! " *Pinel*, p. xvi.

[144] To this sort of comparative anatomy (if it may be so called), which before his time scarcely existed, Bichat attached great importance, and clearly saw that it would eventually become of the utmost value for pathology. *Anat. Gén.* vol. i. pp. 331, 332. vol. ii. pp. 234–241, vol. iv. p. 417, etc. Unfortunately these investigations were not properly followed up by his immediate successors ; and Müller, writing long after his death, was obliged to refer chiefly to Bichat for " the true principles of general pathology." *Müller's Physiology*, 1840, vol. i. p. 808. M. Vogel too, in his *Pathological Anatomy*, 1847, pp. 398, 413, notices the error committed by the earlier pathologists, in looking at changes in the organs, and neglecting those in the tissues ; and the same remark is made in *Robin et Verdeil, Chimie Anatomique*, 1853, vol. i. p. 45 ; and in *Henle, Traité d'Anatomie*, vol. i. p. vii., Paris, 1843. That " structural anatomy," and " structural development,"

affected by moisture, air, and temperature ; also the way in which their properties are altered by various chemical substances,[145] and even their effect on the taste.[146] By these means, and by many other experiments tending in the same direction, he took so great and sudden a step, that he is to be regarded not merely as an innovator on an old science, but rather as the creator of a new one.[147] And although subsequent observers have corrected some of his conclusions, this has only been done by following his method ; the value of which is now so generally recognized, that it is adopted by nearly all the best anatomists, who, differing in other points, are agreed as to the necessity of basing the future progress of anatomy on a knowledge of the tissues, the supreme importance of which Bichat was the first to perceive.[148]

The methods of Bichat and of Cuvier, when put together, exhaust the actual resources of zoological science ; so that all subsequent naturalists have been compelled to follow one of these two schemes ; that is, either to follow Cuvier in comparing the organs of animals, or else to follow Bichat in comparing the tissues which compose the organs.[149] And inasmuch as one comparison is

are to be made the foundations of pathology is moreover observed in *Simon's Pathology*, 1850, p. 115 (compare *Williams's Principles of Medicine*, 1848, p. 67), who ascribes the chief merit of this "rational pathology" to Henle and Schwann ; omitting to mention that they only executed Bichat's scheme, and (be it said with every respect for these eminent men) executed it with a comprehensiveness much inferior to that displayed by their great predecessor. In *Broussais, Examen des Doctrines Médicales*, vol. iv. pp. 106, 107, there are some just and liberal observations on the immense service which Bichat rendered to pathology. See also *Béclard, Anatomie*, Paris, 1852, p. 184.

[145] *Bichat, Anat. Gén.* vol. i. pp. 51, 160, 161, 259, 372, vol. ii. pp. 47, 448, 449, vol. iii. pp. 33, 168, 208, 309, 406, 435, vol. iv. pp. 21, 52, 455–461, 517.

[146] According to M. Comte (*Philos. Pos.* vol. iii. p. 319), no one had thought of this before Bichat. MM. Robin et Verdeil, in their recent great work, fully admit the necessity of employing this singular resource. *Chimie Anatomique*, 1853, vol. i. pp. 18, 125, 182, 357, 531.

[147] "Dès-lors il créa une science nouvelle, l'anatomie générale." *Pinel sur Bichat*, p. xii. "À Bichat appartient véritablement la gloire d'avoir conçu et surtout exécuté, le premier, le plan d'une anatomie nouvelle." *Bouillaud, Philos. Médicale*, p. 27. "Bichat fut le créateur de l'histologie, en assignant des caractères précis à chaque classe de tissus." *Burdach, Physiologie*, vol. vii. p. 111. "Le créateur de l'anatomie générale fut Bichat." *Henle, Anatomie*, vol. i. p. 120. Similar remarks will be found in *Saint Hilaire, Anomalies de l'Organisation*, vol. i. p. 10 ; and in *Robin et Verdeil, Chimie. Anat.* vol. i. p. xviii., vol. iii. p. 405.

[148] In *Béclard, Anat. Gén.* 1852, p. 61, it is said that "la recherche de ces tissus élémentaires, ou éléments organiques, est devenue la préoccupation presque exclusive des anatomistes de nos jours." Compare *Blainville, Physiol. Gén. et Comp.* vol. i. p. 93 : "Aujourd'hui nous allons plus avant, nous pénétrons dans la structure intime, non seulement de ces organes, mais encore des tissus qui concourent à leur composition ; nous faisons en un mot de la véritable anatomie, de l'anatomie proprement dite." And at p. 105 : "c'est un genre de recherches qui a été cultivé avec beaucoup d'activité, et qui a reçu une grande extension depuis la publication du bel ouvrage de Bichat." See also vol. ii. p. 303.

In consequence of this movement, there has sprung up, under the name of *Degenerations of Tissues*, an entirely new branch of morbid anatomy, of which, I believe, no instance will be found before the time of Bichat, but the value of which is now recognized by most pathologists. Compare *Paget's Surgical Pathology*, vol. i. pp. 98–112 ; *Williams's Principles of Medicine*, pp. 369–376 ; *Burdach's Physiologie*, vol. viii. p. 367 ; *Reports of Brit. Assoc.* vol. vi. p. 147 ; *Jones and Sieveking's Pathological Anatomy*, 1854, pp. 154–156, 302–304, 555–558. "They are," say these last writers, "of extremely frequent occurrence ; but their nature has scarcely been recognized until of late."

[149] Cuvier completely neglected the study of tissues ; and in the very few instances in which he mentions them, his language is extremely vague. Thus, in his *Règne Animal*, vol. i. p. 12, he says of living bodies, "leur tissu est donc composé de réseaux et de mailles, ou de fibres et de lames solides qui renferment des liquides dans leurs intervalles."

chiefly suggestive of function, and the other comparison of structure, it is evident that to raise the study of the animal world to the highest point of which it is capable, both these great plans are necessary : but if we ask which of the two plans, unaided by the other, is more likely to produce important results, the palm must, I think, be yielded to that proposed by Bichat. Certainly if we look at the question as one to be decided by authority, a majority of the most eminent anatomists and physiologists now incline to the side of Bichat, rather than to that of Cuvier ; while, as a matter of history, it may be proved that the reputation of Bichat has, with the advance of knowledge, increased more rapidly than that of his great rival. What however appears to me still more decisive is that the two most important discoveries made in our time respecting the classification of animals are entirely the result of the method which Bichat suggested. The first discovery is that made by Agassiz, who in the course of his ichthyological researches was led to perceive that the arrangement by Cuvier according to organs did not fulfil its purpose in regard to fossil fishes, because in the lapse of ages the characteristics of their structure were destroyed.[150] He therefore adopted the only other remaining plan, and studied the tissues, which, being less complex than the organs, are oftener found intact. The result was the very remarkable discovery that the tegumentary membrane of fishes is so intimately connected with their organization, that if the whole of a fish has perished except this membrane, it is practicable, by noting its characteristics, to reconstruct the animal in its most essential parts. Of the value of this principle of harmony some idea may be formed from the circumstance that on it Agassiz has based the whole of that celebrated classification of which he is the sole author, and by which fossil ichthyology has for the first time assumed a precise and definite shape.[151]

The other discovery, of which the application is much more extensive, was made in exactly the same way. It consists of the striking fact that the teeth of each animal have a necessary connexion with the entire organization of its frame ; so that within certain limits we can predict the organization by examining the tooth. This beautiful instance of the regularity of the operations of nature was not known until more than thirty years after the death of Bichat, and it is evidently due to the prosecution of that method which he sedulously inculcated. For the teeth never having been properly examined in regard to their separate tissues, it was believed that they were essentially devoid of structure, or, as some thought, were simply a fibrous texture.[152] But by minute microscopic investigations, it has been recently ascertained that the tissues of the teeth are strictly analogous to those of other parts of the body ; [153] and that the ivory, or dentine

[150] A well-known ornithologist makes the same complaint respecting the classification of birds. *Strickland on Ornithology, Brit. Assoc. for* 1844, pp. 209, 210. Even in regard to living species, Cuvier (*Règne Animal*, vol. ii. p. 128) says, " La classe des poissons est de toutes, celle qui offre le plus de difficultés quand on veut la subdiviser en ordres d'après des caractères fixés et sensibles."

[151] The discoveries of M. Agassiz are embodied in his great work, *Recherches sur les Poissons fossiles* : but the reader who may not have an opportunity of consulting that costly publication, will find two essays by this eminent naturalist, which will give an idea of his treatment of the subject, in *Reports of British Assoc. for* 1842, pp. 80–88, and for 1844, pp. 279–310. How essential this study is to the geologist, appears from the remark of Sir R. Murchison (*Siluria*, 1854, p. 417), that " fossil fishes have everywhere proved the most exact chronometers of the age of rocks."

[152] That they were composed of fibres, was the prevailing doctrine, until the discovery of their tubes, in 1835, by Purkinjé. Before Purkinjé, only one observer, Leeuwenhoek, had announced their tubular structure ; but no one believed what he said, and Purkinjé was unacquainted with his researches. Compare *Nasmyth's Researches on the Teeth*, 1839, p. 159 ; *Owen's Odontography*, 1840–1845, vol. i. pp. ix. x. ; *Henle, Anat. Gén.* vol. ii. p. 457 ; *Reports of Brit. Assoc.* vol. vii. pp. 135, 136 (*Transac. of Sections*).

[153] Mr. Nasmyth, in his valuable but, I regret to add, posthumous work, notices as the result of these discoveries " the close affinity subsisting between the dental and other

as it is now called,[154] is highly organized ; that it, as well as the enamel, is cellular, and is in fact a development of the living pulp. This discovery, which to the philosophic anatomist is pregnant with meaning, was made about 1838 ; and though the preliminary steps were taken by Purkinjé, Retzius, and Schwann, the principal merit is due to Nasmyth and Owen,[155] between whom it is disputed, but whose rival claims we are not here called upon to adjust.[156] What I wish to observe is that the discovery is similar to that which we owe to Agassiz ; similar in the method by which it was worked out, and also in the results which have followed from it. Both are due to a recognition of the fundamental maxim of Bichat, that the study of organs must be subordinate to the study of tissues, and both have supplied the most valuable aid to zoological classification. On this point, the service rendered by Owen is incontestable, whatever may be thought of his original claims. This eminent naturalist has, with immense industry, applied the discovery to all vertebrate animals ; and in an elaborate work specially devoted to the subject he has placed beyond dispute the astonishing fact that the structure of a single tooth is a criterion of the nature and organization of the species to which it belongs.[157]

Whoever has reflected much on the different stages through which our knowledge has successively passed, must, I think, be led to the conclusion that, while fully recognizing the great merit of these investigators of the animal frame, our highest admiration ought to be reserved not for those who make the discoveries, but rather for those who point out how the discoveries are to be made.[158] When the true path of inquiry has once been indicated, the rest is comparatively easy. The beaten highway is always open ; and the difficulty is, not to find those who will travel the old road, but those who will make a fresh one. Every age produces in abundance men of sagacity and of considerable industry, who, while perfectly competent to increase the details of a science, are unable to extend its distant boundaries. This is because such extension must be accompanied by a new method,[159] which, to be valuable as well as new, supposes on the part of its

organized tissues of the animal frame." *Researches on the Development, etc., of the Teeth*, 1849, p. 198. This is, properly speaking, a continuation of Mr. Nasmyth's former book, which bore the same title, and was published in 1839.

[154] This name, which Mr. Owen appears to have first suggested, has been objected to, though, as it seems to me, on insufficient grounds. Compare *Owen's Odontography*, vol. i. p. iii. with *Nasmyth's Researches*, 1849, pp. 3–4. It is adopted in *Carpenter's Human Physiol.* 1846, p. 154 ; and in *Jones and Sieveking's Patholog. Anat.* 1854, pp. 483, 486.

[155] See the correspondence in *Brit. Assoc. for* 1841, Sec., pp. 2–23.

[156] In the notice of it in *Whewell's Hist. of Sciences*, vol. iii. p. 678, nothing is said about Mr. Nasmyth ; while in that in *Wilson's Human Anatomy*, p. 65, edit. 1851, nothing is said about Mr. Owen. A specimen of the justice with which men treat their contemporaries. Dr. Grant (*Supplement to Hooper's Medical Dict.* 1848, p. 1390) says, " the researches of Mr. Owen tend to confirm those of Mr. Nasmyth." Nasmyth, in his last work (*Researches on the Teeth*, 1849, p. 81), only refers to Owen to point out an error ; while Owen (*Odontography*, vol. i. pp. xlvi.–lvi.) treats Nasmyth as an impudent plagiarist.

[157] Dr. Whewell (*Hist. of Induc. Sciences*, vol. iii. p. 678) says that " he has carried into every part of the animal kingdom an examination, founded upon this discovery, and has published the results of this in his *Odontography*." If this able but rather hasty writer had read the *Odontography*, he would have found that Mr. Owen, so far from carrying the examination " into every part of the animal kingdom," distinctly confines himself to " one of the primary divisions of the animal kingdom " (I quote his own words from *Odontography*, vol. i. p. lxvii.), and appears to think that below the vetebrata the inquiry would furnish little or no aid for the purposes of classification.

[158] But in comparing the merits of discoverers themselves, we must praise him who proves rather than him who suggests. See some sensible remarks in *Owen's Odontography*, vol. i. p. xlix. ; which, however, do not affect my observations on the superiority of method.

[159] By a new method of inquiring into a subject, I mean an application to it of generalizations from some other subject, so as to widen the field of thought. To call this a new

suggester not only a complete mastery over the resources of his subject, but also the possession of originality and comprehensiveness,—the two rarest forms of human genius. In this consists the real difficulty of every great pursuit. As soon as any department of knowledge has been generalized into laws, it contains, either in itself or in its applications, three distinct branches ; namely, inventions, discoveries, and method. Of these, the first corresponds to art ; the second to science ; and the third to philosophy. In this scale, inventions have by far the lowest place, and minds of the highest order are rarely occupied by them. Next in the series come discoveries ; and here the province of intellect really begins since here the first attempt is made to search after truth on its own account, and to discard those practical considerations to which inventions are of necessity referred. This is science properly so called ; and how difficult it is to reach this stage is evident from the fact that all half-civilized nations have made many great inventions, but no great discoveries. The highest, however, of all the three stages is the philosophy of method, which bears the same relation to science that science bears to art. Of its immense, and indeed supreme importance the annals of knowledge supply abundant evidence ; and for want of it some very great men have effected absolutely nothing, consuming their lives in fruitless industry, not because their labour was slack, but because their method was sterile. The progress of every science is effected more by the scheme according to which it is cultivated than by the actual ability of the cultivators themselves. If they who travel in an unknown country spend their force in running on the wrong road, they will miss the point at which they aim, and perchance may faint and fall by the way. In that long and difficult journey after truth which the human mind has yet to perform, and of which we in our generation can only see the distant prospect, it is certain that success will depend not on the speed with which men hasten in the path of inquiry, but rather on the skill with which that path is selected for them by those great and comprehensive thinkers who are as the lawgivers and founders of knowledge ; because they supply its deficiencies, not by investigating particular difficulties, but by establishing some large and sweeping innovation which opens up a new vein of thought, and creates fresh resources, which it is left for their posterity to work out and apply.

It is from this point of view that we are to rate the value of Bichat, whose works, like those of all men of the highest eminence,—like those of Aristotle, Bacon, and Descartes,—mark an epoch in the history of the human mind, and as such can only be fairly estimated by connecting them with the social and intellectual condition of the age in which they appeared. This gives an importance and a meaning to the writings of Bichat of which few indeed are fully aware. The two greatest recent discoveries respecting the classification of animals are, as we have just seen, the result of his teaching ; but his influence has produced other effects still more momentous. He, aided by Cabanis, rendered to physiology the incalculable service of preventing it from participating in that melancholy reaction to which France was exposed early in the nineteenth century. This is too large a subject to discuss at present ; but I may mention that when Napoleon, not from feelings of conviction, but for selfish purposes of his own, attempted to restore the power of ecclesiastical principles, the men of letters, with disgraceful subserviency, fell into his view ; * and there began a marked decline in that

method is rather vague ; but there is no other word to express the process. Properly speaking, there are only two methods, the inductive and the deductive ; which, though essentially different, are so mixed together as to make it impossible wholly to separate them. The discussion of the real nature of this difference I reserve for my comparison, in the next volume, of the German and American civilizations. [This purpose was not fulfilled.—Ed.]

[* As English physiologists are declared in the same paragraph to have shown themselves reactionary, the imputation of "disgraceful subserviency" to French men of letters seems supererogatory. Reaction was as natural to them as to any class of the community, and it spread after the Restoration. Chateaubriand, whose reactionism

independent and innovating spirit with which during fifty years the French had cultivated the highest departments of knowledge. Hence that metaphysical school arose which, though professing to hold aloof from theology, was intimately allied with it ; and whose showy conceits form, in their ephemeral splendour, a striking contrast to the severer methods followed in the preceding generation.[160] Against this movement the French physiologists have as a body always protested ; and it may be clearly proved that their opposition, which even the great abilities of Cuvier were unable to win over, is partly due to the impetus given by Bichat, in enforcing in his own pursuit the necessity of rejecting those assumptions by which metaphysicians and theologians seek to control every science. As an illustration of this, I may mention two facts worthy of note. The first is that in England, where during a considerable period the influence of Bichat was scarcely felt, many even of our eminent physiologists have shown a marked disposition to ally themselves with the reactionary party ; and have not only opposed such novelties as they could not immediately explain, but have degraded their own noble science by making it a handmaid to serve the purposes of natural theology. The other fact is that in France the disciples of Bichat have with scarcely an exception rejected the study of final causes, to which the school of Cuvier still adheres : while, as a natural consequence, the followers of Bichat are associated in geology with the doctrine of uniformity ; in zoology, with that of the transmutation of species ; and in astronomy, with the nebular hypothesis : vast and magnificent schemes, under whose shelter the human mind seeks an escape from that dogma of interference which the march of knowledge everywhere reduces, and the existence of which is incompatible with those conceptions of eternal order towards which, during the last two centuries, we have been constantly tending.

These great phenomena which the French intellect presents, and of which I have only sketched a rapid outline, will be related with suitable detail in the latter part of this work, when I shall examine the present condition of the European mind, and endeavour to estimate its future prospects. To complete, however, our appreciation of Bichat, it will be necessary to take notice of what some consider the most valuable of all his productions, in which he aimed at nothing less than an exhaustive generalization of the functions of life. It appears, indeed to me that in many important points Bichat here fell short ; but the work itself still stands alone, and is so striking an instance of the genius of the author that I will give a short account of its fundamental views.

Life considered as a whole has two distinct branches ;[161] one branch being characteristic of animals, the other of vegetables. That which is confined to animals is called animal life ; that which is common both to animals and vegetables is called organic life. While, therefore, plants have only one life, man has two distinct lives, which are governed by entirely different laws, and which, though intimately connected, constantly oppose each other. In the organic life,

[160] In literature and in theology Chateaubriand and De Maistre were certainly the most eloquent, and were probably the most influential leaders of this reaction. Neither of them liked induction, but preferred reasoning deductively from premises which they assumed, and which they called first principles. De Maistre, however, was a powerful dialectician, and on that account his works are read by many who care nothing for the gorgeous declamation of Chateaubriand. In metaphysics a precisely similar movement occurred ; and Laromiguière, Royer Collard, and Maine de Biran founded that celebrated school which culminated in M. Cousin, and which is equally characterized by an ignorance of the philosophy of induction, and by a want of sympathy with physical science.

[161] *Bichat, Recherches sur la Vie et la Mort*, pp. 5–9, 226 ; and his *Anat. Gén.* vol. i. p. 73.

suited and pleased Napoleon, boldly attacked him after the execution of the Duc d'Enghien. Neither were Fontanes, Morellet, Daunou, and Volney subservient. (Cp. Charpentier, *La Litt. Française au 19e Siècle*, pp. 7, 12, 27 ; Albert, *La Litt. Fr. sous la Révol.*, etc., 1891, p. 83. Laromiguière, mentioned in the next note, gave offence by his lectures, and had to give them up.—Ed.]

man exists solely for himself ; in the animal life he comes in contact with others. The functions of the first are purely internal, those of the second are external. His organic life is limited to the double process of creation and destruction : the creative process being that of assimilation, as digestion, circulation, and nutrition ; the destructive process being that of excretion, such as exhalation and the like. This is what man has in common with plants ; and of this life he, when in a natural state, is unconscious. But the characteristic of his animal life is consciousness, since by it he is made capable of moving, of feeling, of judging. By virtue of the first life he is merely a vegetable ; by the addition of the second he becomes an animal.

If now we look at the organs by which in man the functions of these two lives are carried on, we shall be struck by the remarkable fact that the organs of his vegetable life are very irregular, those of his animal life very symmetrical. His vegetative or organic life is conducted by the stomach, the intestines, and the glandular system in general, such as the liver and the pancreas ; all of which are irregular, and admit of the greatest variety of form and development, without their functions being seriously disturbed. But in his animal life the organs are so essentially symmetrical that a very slight departure from the ordinary type impairs their action.[162] Not only the brain, but also the organs of sense, as the eyes, the nose, the ears, are perfectly symmetrical ; and they, as well as the other organs of animal life, as the feet and hands, are double, presenting on each side of the body two separate parts which correspond with each other, and produce a symmetry unknown to our vegetative life, the organs of which are, for the most part, merely single, as in the stomach, liver, pancreas, and spleen.[163]

From this fundamental difference between the organs of the two lives there have arisen several other differences of great interest. Our animal life being double, while our organic life is single, it becomes possible for the former life to take rest, that is, stop part of its functions for a time, and afterwards

[162] " C'est de là, sans doute, que naît cette autre différence entre les organes des deux vies, savoir, que la nature se livre bien plus rarement à des écarts de conformation dans la vie animale que dans la vie organique. . . . C'est une remarque qui n'a pu échapper à celui dont les dissections ont été un peu multipliées, que les fréquentes variations de formes, de grandeur, de position, de direction des organes internes, comme la rate, le foie, l'estomac, les reins, les organes salivaires, etc. . . . Jetons maintenant les yeux sur les organes de la vie animale, sur les sens, les nerfs, le cerveau, les muscles volontaires, le larynx ; tout y est exact, précis, rigoureusement déterminé dans la forme, la grandeur et la position. On n'y voit presque jamais de variétés de conformation ; s'il en existe, les fonctions sont troublées, anéanties ; tandis qu'elles restent les mêmes dans la vie organique, au milieu des altérations diverses des parties." *Bichat sur la Vie*, pp. 23–25. Part of this view is corroborated by the evidence collected by Saint Hilaire (*Anomalies de l'Organisation*, vol. i. pp. 248 seq.) of the extraordinary aberrations to which the vegetative organs are liable ; and he mentions (vol. ii. p. 8) the case of a man in whose body, on dissection, " on reconnut que tous les viscères étaient transposés." Comparative anatomy supplies another illustration. The bodies of mollusca are less symmetrical than those of articulata ; and in the former the " vegetal series of organs," says Mr. Owen, are more developed than the animal series ; while in the articulata " the advance is most conspicuous in the organs peculiar to animal life." *Owen's Invertebrata*, p. 470. Compare *Burdach's Physiologie*, vol. i. pp. 153, 189 ; and a confirmation of the " unsymmetrical " organs of the gasteropoda, in *Grant's Comparative Anatomy* p. 461. This curious antagonism is still further seen in the circumstance that idiots, whose functions of nutrition and of excretion are often very active, are at the same time remarkable for a want of symmetry in the organs of sensation. *Esquirol, Maladies Mentales*, vol. ii. pp. 331, 332.

A result, though perhaps an unconscious one, of the application and extension of these ideas is that within the last few years there has arisen a pathological theory of what are called " symmetrical diseases," the leading facts of which have been long known, but are now only beginning to be generalized. See *Paget's Pathology*, vol. i. pp. 18–22, vol. ii. pp. 244, 245 ; *Simon's Pathology*, pp. 210, 211 ; *Carpenter's Human Physiol.* pp. 607, 608.

[163] *Bichat sur la Vie*, pp. 15–21.

renew them. But in organic life, to stop is to die. The life which we have in common with vegetables never sleeps ; and if its movements entirely cease only for a single instant, they cease for ever. That process by which our bodies receive some substances and give out others, admits of no interruption ; it is by its nature incessant, because, being single, it can never receive supplementary aid. The other life we may refresh, not only in sleep, but even when we are awake. Thus we can exercise the organs of movement while we rest the organs of thought ; and it is even possible to relieve a function while we continue to employ it, because, our animal life being double, we are able for a short time, in case of one of its parts being fatigued, to avail ourselves of the corresponding part ; using, for instance, a single eye or a single arm, in order to rest the one which circumstances may have exhausted ; an expedient which the single nature of organic life entirely prevents.[164]

Our animal life being thus essentially intermittent, and our organic life being essentially continuous,[165] it has necessarily followed that the first is capable of an improvement of which the second is incapable. There can be no improvement without comparison, since it is only by comparing one state with another that we can rectify previous errors, and avoid future ones. Now, our organic life does not admit of such comparison, because, being uninterrupted, it is not broken into stages, but when unchequered by disease, runs on in dull monotony. On the other hand, the functions of our animal life, such as thought, speech, sight, and motion, cannot be long exercised without rest ; and as they are constantly suspended, it becomes practicable to compare them, and, therefore, to improve them. It is by possessing this resource that the first cry of the infant gradually rises into the perfect speech of the man, and the unformed habits of early thought are ripened into that maturity which nothing can give but a long series of successive efforts.[166] But our organic life, which we have in common with vegetables, admits of no interruption, and consequently of no improvement. It obeys its own laws ; but it derives no benefit from that repetition to which animal life is exclusively indebted. Its functions, such as nutrition and the like, exist in man several months before he is born, and while, his animal life not having yet begun, the faculty of comparison, which is the basis of improvement, is impossible.[167] And although, as the human frame increases in size, its vegetative organs become larger, it cannot be supposed that their functions really improve, since, in ordinary cases, their duties are performed as regularly and as completely in childhood as in middle age.[168]

[164] *Ibid.* pp. 21–50.

[165] On intermittence as a quality of animal life, see *Holland's Medical Notes*, pp. 313, 314, where Bichat is mentioned as its great expounder. As to the essential continuity of organic life, see *Burdach's Physiologie*, vol. viii. p. 420. M. Comte has made some interesting remarks on Bichat's law of intermittence. *Philos. Positive*, vol. iii. pp. 300, 395, 744, 745, 750, 751.

[166] On the development arising from practice, see *Bichat sur la Vie*, pp. 207–225.

[167] *Ibid.* pp. 189–203, 225–230. M. Broussais also (in his able work, *Cours de Phrénologie*, p. 487) says that comparison only begins after birth ; but surely this must be very doubtful. Few physiologists will deny that embryological phenomena, though neglected by metaphysicians, play a great part in shaping the future character ; and I do not see how any system of psychology can be complete which ignores considerations probable in themselves, and not refuted by special evidence. So carelessly, however, has this subject been investigated, that we have the most conflicting statements respecting even the *vagitus uterinus*, which, if it exists to the extent alleged by some physiologists, would be a decisive proof that animal life (in the sense of Bichat) does begin during the fœtal period. Compare *Burdach, Physiol.* vol. iv. pp. 113, 114, with *Wagner's Physiol.* p. 182.

[168] " Les organes internes qui entrent alors en exercice, ou qui accroissent beaucoup leur action, n'ont besoin d'aucune éducation ; ils atteignent tout à coup une perfection à laquelle ceux de la vie animale ne parviennent que par habitude d'agir souvent." *Bichat sur la Vie*, p. 231.

Thus it is that, although other causes conspire, it may be said that the progressiveness of animal life is due to its intermittence ; the unprogressiveness of organic life to its continuity. It may, moreover, be said, that the intermittence of the first life results from the symmetry of its organs, while the continuity of the second life results from their irregularity. To this wide and striking generalization many objections may be made, some of them apparently insuperable ; but that it contains the germs of great truths I entertain little doubt, and at all events it is certain that the method cannot be too highly praised, for it unites the study of function and structure with that of embryology, of vegetable physiology, of the theory of comparison, and of the influence of habit ; a vast and magnificent field, which the genius of Bichat was able to cover, but of which, since him, neither physiologists nor metaphysicians have even attempted a general survey.

This stationary condition, during the present century, of a subject of such intense interest is a decisive proof of the extraordinary genius of Bichat ; since, notwithstanding the additions made to physiology, and to every branch of physics connected with it, nothing has been done at all comparable to that theory of life which he, with far inferior resources, was able to construct. This stupendous work he left, indeed, very imperfect ; but even in its deficiencies we see the hand of the great master, whom, on his own subject, no one has yet approached. His essay on life may well be likened to those broken fragments of ancient art which, imperfect as they are, still bear the impress of the inspiration which gave them birth, and present in each separate part that unity of conception which to us makes them a complete and living whole.

From the preceding summary of the progress of physical knowledge, the reader may form some idea of the ability of those eminent men who arose in France during the latter half of the eighteenth century. To complete the picture, it is only necessary to examine what was done in the two remaining branches of natural history, namely, botany and mineralogy, in both of which the first great steps towards raising each study to a science were taken by Frenchmen a few years before the Revolution.

In botany, although our knowledge of particular facts has during the last hundred years rapidly increased,[169] we are only possessed of two generalizations wide enough to be called laws of nature. The first generalization concerns the structure of plants ; the other concerns their physiology. That concerning their physiology is the beautiful morphological law, according to which the different appearance of the various organs arises from arrested development : the stamens, pistils, corolla, calyx, and bracts being simply modifications or successive stages of the leaf. This is one of many valuable discoveries we owe to Germany, it being made by Göthe late in the eighteenth century.[170] With its importance

[169] Dioscorides and Galen knew from 450 to 600 plants (*Winckler, Geschichte der Botanik*, 1854, pp. 34, 40) ; but, according to Cuvier (*Éloges*, vol. iii. p. 468), Linnæus in 1778 " en indiquait environ huit mille espèces ; " and Meyen (*Geog. of Plants*, p. 4) says, " at the time of Linnæus's death, about 8,000 species were known." Dr. Whewell, in his *Bridgewater Treatise*, p. 247, says " about 10,000." Since then the progress has been uninterrupted ; and in *Henslow's Botany*, 1837, p. 136, we are told that " the number of species already known and classified in works of botany amounts to about 60,000." Ten years later, Dr. Lindley (*Vegetable Kingdom*, 1847, p. 800) states them at 92,930 ; and two years afterwards Mr. Balfour says " about 100,000." *Balfour's Botany*, 1849, p. 560. Such is the rate at which our knowledge of nature is advancing. To complete this historical note, I ought to have mentioned that in 1812 Dr. Thomson says " nearly 30,000 species of plants have been examined and described." *Thomson's Hist. of the Royal Society*, p. 21.

[170] It was published in 1790. *Winckler, Gesch. der Botanik*, p. 389. But the historians of botany have overlooked a short passage in Göthe's works, which proves that he had glimpses of the discovery in or before 1786. See *Italiänische Reise*, in *Göthe's Werke*, vol. ii. part ii. p. 286, Stuttgart, 1837, where he writes from Padua, in September, 1786, " Hier in dieser neu mir entgegen tretenden Mannigfaltigkeit wird jener Gedanke immer lebendiger : dass man sich alle Pflanzengestalten vielleicht aus Einer entwickeln könne."

every botanist is familiar ; while to the historian of the human mind it is peculiarly interesting, as strengthening that great doctrine of development towards which the highest branches of knowledge are now hastening, and which, in the present century, has been also carried into one of the most difficult departments of animal physiology.[171]

But the most comprehensive truth with which we are acquainted respecting plants is that which includes the whole of their general structure ; and this we learnt from those great Frenchmen who in the latter half of the eighteenth century began to study the external world. The first steps were taken directly after the middle of the century, by Adanson, Duhamel de Monceau, and, above all, Desfontaines ; three eminent thinkers, who proved the practicability of a natural method hitherto unknown, and of which even Ray himself had only a faint perception.[172] This, by weakening the influence of the artificial system of Linnæus,[173] prepared the way for an innovation more complete than has been effected in any other branch of knowledge. In the very year in which the Revolution occurred, Jussieu put forward a series of botanical generalizations, of which the most important are all intimately connected, and still remain the highest this department of inquiry has reached.[174] Among these I need only mention

There are some interesting remarks on this brilliant generalization in *Owen's Parthenogenesis*, 1849, pp. 53 seq. [Compare the remarks of Virchow, *Göthe als Naturforscher*, 1861, p. 31 seq.—Ed.]

[171] That is, into the study of animal monstrosities, which, however capricious they may appear, are now understood to be the necessary result of preceding events. Within the last thirty years several of the laws of these unnatural births, as they used to be called, have been discovered ; and it has been proved that, so far from being unnatural, they are strictly natural. A fresh science has thus been created, under the name of Teratology, which is destroying the old *lusus naturæ* in one of its last and favourite strongholds. [Buckle here allows that the term "unnatural" has a meaning, but by denying it any application he makes it meaningless.—Ed.]

[172] Dr. Lindley (*Third Report of Brit. Assoc.* p. 33) says that Desfontaines was the first who demonstrated the opposite modes of increase in dicotyledonous and monocotyledonous stems. See also *Richard, Eléments de Botanique*, p. 131 ; and *Cuvier, Eloges*, vol. i. p. 64. In regard to the steps taken by Adanson and De Monceau, see *Winckler, Gesch. der Botanik*, pp. 204, 205 ; *Thomson's Chemistry of Vegetables*, p. 951 ; *Lindley's Introduc. to Botany*, vol. ii. p. 132.

[173] It is curious to observe how even good botanists clung to the Linnæan system long after the superiority of a natural system was proved. This is the more noticeable because Linnæus, who was a man of undoubted genius, and who possessed extraordinary powers of combination, always allowed that his own system was merely provisional, and that the great object to be attained was a classification according to natural families. See *Winckler, Geschichte der Botanik*, p. 202 ; and *Richard, Éléments de Botanique*, p. 570. Indeed, what could be thought of the permanent value of a scheme which put together the reed and the barberry, because they were both hexandria ; and forced sorrel to associate with saffron, because both were trigynia ? *Jussieu's Botany*, 1849, p. 524.

[174] The *Genera Plantarum* of Antoine Jussieu was printed at Paris in 1789 ; and though t is known to have been the result of many years of continued labour, some writers have asserted that the ideas in it were borrowed from his uncle, Bernard Jussieu. But assertions of this kind rarely deserve attention ; and as Bernard did not choose to publish anything of his own, his reputation ought to suffer for his uncommunicativeness. Compare *Winckler, Gesch. der Botanik*, pp. 261–272, with *Biog. Univ.* vol. xxii. pp. 162–166. I will only add the following remarks from a work of authority, *Richard, Éléments de Botanique*, Paris, 1846, p. 572 : "Mais ce ne fut qu'en 1789 que l'on eut véritablement un ouvrage complet sur la méthode des familles naturelles. Le *Genera Plantarum* d'A. L. de Jussieu présenta la science des végétaux sous un point de vue si nouveau, par la précision et l'élégance qui y règnent, par la profondeur et la justesse des principes généraux qui y sont exposés pour la première fois, que c'est depuis cette époque seulement que la méthode des familles naturelles a été véritablement créée, et que date la nouvelle ère de la science des végétaux. . . . L'auteur du *Genera Plantarum* posa le premier les bases de la science, en

the three vast propositions which are now admitted to form the basis of vegetable anatomy. The first is that the vegetable kingdom, in its whole extent, is composed of plants either with one cotyledon, or with two cotyledons, or else with no cotyledon at all. The second proposition is that this classification, so far from being artificial, is strictly natural; since it is a law of nature that plants having one cotyledon are endogenous, and grow by additions made to the centre of their stems, while on the other hand plants having two cotyledons are exogenous, and are compelled to grow by additions made not to the centre of their stems but to the circumference.[175] The third proposition is that when plants grow at their centre, the arrangement of the fruit and leaves is threefold; when however they grow at the circumference, it is nearly always fivefold.[176]

This is what was effected by the Frenchmen of the eighteenth century for the vegetable kingdom: [177] and if we now turn to the mineral kingdom, we shall find that our obligations to them are equally great. The study of minerals is the most imperfect of the three branches of natural history, because, notwithstanding its apparent simplicity, and the immense number of experiments which have been made, the true method of investigation has not yet been ascertained; it being doubtful whether mineralogy ought to be subordinated to the laws of chemistry or to those of crystallography, or whether both sets of laws will have to be considered.[178] At all events it is certain that, down to the present time, chemistry has shown itself unable to reduce mineralogical phenomena; nor has any chemist possessing sufficient powers of generalization attempted the task except Berzelius; and most of his conclusions were overthrown by the splendid discovery of isomorphism, for which, as is well known, we are indebted to Mitscherlich, one of the many great thinkers Germany has produced.[179]

faisant voir quelle était l'importance relative des différents organes entre eux, et par conséquent leur valeur dans la classification. . . . Il a fait, selon la remarque de Cuvier, la même révolution dans les sciences d'observation que la chimie de Lavoisier dans les sciences d'expérience. En effet, il a non seulement changé la face de la botanique, mais son influence s'est également exercée sur les autres branches de l'histoire naturelle, et y a introduit cet esprit de recherches, de comparaison, et cette méthode philosophique et naturelle, vers le perfectionnement de laquelle tendent désormais les efforts de tous les naturalistes."

[175] Hence the removal of a great source of error; since it is now understood that in dicotyledons alone can age be known with certainty. *Henslow's Botany*, p. 243: compare *Richard, Eléments de Botanique*, p. 159, aphorisme xxiv. On the stems of endogenous plants, which, being mostly tropical, have been less studied than the exogenous, see *Lindley's Botany*, vol. i. pp. 221–236; where there is also an account, pp. 229 seq., of the views which Schleiden advanced on this subject in 1839.

[176] On the arrangement of the leaves, now called phyllotaxis, see *Balfour's Botany*, p. 92; *Burdach's Physiologie*, vol. v. p. 518.

[177] The classification by cotyledons has been so successful that "with very few exceptions, however, nearly all plants may be referred by any botanist, at a single glance, and with unerring certainty, to their proper class; and a mere fragment even of the stem, leaf, or some other part, is often quite sufficient to enable him to decide this question." *Henslow's Botany*, p. 30. In regard to some difficulties still remaining in the way of the threefold cotyledonous division of the whole vegetable world, see *Lindley's Botany*, vol. ii. pp. 61 seq.

[178] Mr. Swainson (*Study of Natural History*, p. 356) says, "mineralogy, indeed, which forms but a part of chemistry." This is deciding the question very rapidly; but, in the meantime, what becomes of the geometrical laws of minerals? and what are we to do with that relation between their structure and optical phenomena which Sir David Brewster has worked out with signal ability?

[179] The difficulties introduced into the study of minerals by the discovery of isomorphism and polymorphism are no doubt considerable; but M. Beudant (*Minéralogie*, Paris, 1841, p. 37) seems to me to exaggerate their effect upon "l'importance des formes crystallines." They are much more damaging to the purely chemical arrangement, because our implements for measuring the minute angles of crystals are still very imperfect, and

Although the chemical department of mineralogy is in an unformed and indeed anarchical condition, its other department, namely crystallography, has made great progress ; and here again the earliest steps were taken by two Frenchmen, who lived in the latter half of the eighteenth century. About 1760, Romé de Lisle[180] set the first example of studying crystals according to a scheme so large as to include all the varieties of their primary forms, and to account for their irregularities and the apparent caprice with which they were arranged. In this investigation he was guided by the fundamental assumption, that what is called an irregularity is in truth perfectly regular, and that the operations of nature are invariable.[181] Scarcely had this great idea been applied to the almost innumerable forms into which minerals crystallize, when it was followed up with still larger resources by Haüy, another eminent Frenchman.[182] This remarkable

the goniometer may fail in detecting differences which really exist ; and therefore many alleged cases of isomorphism are probably not so in reality. Wollaston's reflecting goniometer has been long considered the best instrument possessed by crystallographers : but I learn from *Liebig and Kopp's Reports*, vol. i. pp. 19, 20, that Frankenheim has recently invented one for measuring the angles of " microscopic crystals." On the amount of error in the measurement of angles, see *Phillip's Mineralogy*, 1837, p. viii.

[180] He says, " depuis plus de vingt ans que je m'occupe de cet objet." *Romé de Lisle, Cristallographie, ou Description des Formes propres à tous les Corps du Règne Minéral*, Paris, 1783, vol. i. p. 91.

[181] See his *Essai de Cristallographie*, Paris, 1772, p. x. : " un de ceux qui m'a le plus frappé ce sont les formes régulières et constantes que prennent naturellement certains corps que nous désignons par le nom de cristaux." In the same work, p. 13, " il faut nécessairement supposer que les molécules intégrantes des corps ont chacune, suivant qui lui est propre, une figure constante et déterminée." In his later treatise (*Cristallographie*, 1783, vol. i. p. 70), after giving some instances of the extraordinary complications presented by minerals, he adds : " il n'est donc pas étonnant que d'habiles chimistes n'aient rien vu de constant ni de déterminé dans les formes cristallines, tandis qu'il n'en est aucune qu'on ne puisse, avec un peu d'attention, rapporter à la figure élémentaire et primordiale dont elle dérive." Even Buffon, notwithstanding his fine perception of law, had just declared " qu'en général la forme de cristallisation n'est pas un caractère constant, mais plus équivoque et plus variable qu'aucun autre des caractères par lesquels on doit distinguer les minéraux." *De Lisle*, vol. i. p. xviii. Compare, on this great achievement of De Lisle's, *Herschel's Nat. Philos.* p. 239 : " he first ascertained the important fact of the constancy of the angles at which their faces meet."

[18] The first work of Haüy appeared in 1784 (*Quérard, France Littéraire*, vol. iv. p. 41) ; but he had read two special memoirs in 1781. *Cuvier, Eloges*, vol. iii. p. 138. The intellectual relation between his views and those of his predecessor must be obvious to every mineralogist ; but Dr. Whewell, who has noticed this judiciously enough, adds (*Hist. of the Induc. Sciences*, vol. iii. pp. 229, 230) : " Unfortunately Romé de Lisle and Haüy were not only rivals, but in some measure enemies. . . . Haüy revenged himself by rarely mentioning Romé in his works, though it was manifest that his obligations to him were immense ; and by recording his errors while he corrected them." The truth, however, is that so far from rarely mentioning De Lisle, he mentions him incessantly ; and I have counted upwards of three hundred instances in Haüy's great work in which he is named and his writings are referred to. On one occasion he says of De Lisle, " En un mot, sa cristallographie est le fruit d'un travail immense par son étendue, presque entièrement neuf par son objet, et très précieux par son utilité." *Haüy, Traité de Minéralogie*, Paris, 1801, vol. i. p. 17. Elsewhere he calls him, " cet habile naturaliste ; ce savant célèbre," vol. ii. p. 323 ; " ce célèbre naturaliste," vol. iii. p. 442 ; see also vol. iv. pp. 51, etc. In a work of so much merit as Dr. Whewell's, it is important that these errors should be indicated, because we have no other book of value on the general history of the sciences ; and many authors have deceived themselves and their readers by implicitly adopting the statements of this able and industrious writer. I would particularly caution the student in regard to the physiological part of Dr. Whewell's History, where, for instance, the antagonism between the methods of Cuvier and Bichat is entirely lost sight of, and whilewhole pages are devoted to Cuvier, Bichat is disposed of in four lines.

man achieved a complete union between mineralogy and geometry ; and, bringing the laws of space to bear on the molecular arrangements of matter, he was able to penetrate into the intimate structure of crystals.[183] By this means he succeeded in proving that the secondary forms of all crystals are derived from their primary forms by a regular process of decrement ;[184] and that, when a substance is passing from a liquid to a solid state, its particles are compelled to cohere, according to a scheme which provides for every possible change, since it includes even those subsequent layers which alter the ordinary type of the crystal, by disturbing its natural symmetry.[185] To ascertain that such violations of symmetry are susceptible of mathematical calculation, was to make a vast addition to our knowledge ; but what seems to me still more important is that it indicates an approach to the magnificent idea that everything which occurs is regulated by law, and that confusion and disorder are impossible.[186] For, by proving that even the most uncouth and singular forms of minerals are the natural results of their antecedents, Haüy laid the foundation of what may be called the pathology of the inorganic world. However paradoxical such a notion may seem, it is certain that symmetry is to crystals what health is to animals ; so that an irregularity of shape in the first corresponds with an appearance of disease in the second.[187] When, therefore, the minds of men became familiarized with the great truth that in the mineral kingdom there is, properly speaking, no irregularity, it became more easy for them to grasp the still higher truth that the same principle holds good of the animal kingdom, although, from the superior complexity of the phenomena, it will be long before we can arrive at an equal demonstration. But that such a demonstration is possible is the principle upon which

[183] " Haüy est donc le seul véritable auteur de la science mathématique des cristaux." *Cuvier, Progrès des Sciences*, vol. i. p. 8 ; see also p. 317. Dr. Clarke, whose celebrated lectures on mineralogy excited much attention among his hearers, was indebted for some of his principal views to his conversations with Haüy : see *Otter's Life of Clarke*, vol. ii. p. 192.

[184] See an admirable statement of the three forms of decrement, in *Haüy, Traité de Minéralogie*, vol. i. pp. 285, 286. Compare *Whewell's Hist. of the Induc. Sciences*, vol. iii. pp. 224, 225 ; who, however, does not mention Haüy's classification of " décroissemens sur les bords," " décroissemens sur les angles," and " décroissemens intermédiaires."

[185] And, as he clearly saw, the proper method was to study the laws of symmetry, and then apply them deductively to minerals, instead of rising inductively from the aberrations actually presented by minerals. This is interesting to observe, because it is analogous to the method of the best pathologists, who seek the philosophy of their subject in physiological phenomena rather than in pathological ones ; striking downwards from the normal to the abnormal. " *La symétrie des formes* sous lesquelles se présentent les solides que nous avons considérés jusqu'ici, *nous a fourni des données* pour exprimer les lois de décroissemens dont ces solides sont susceptibles." *Haüy, Traité de Minéralogie*, vol. i. p. 442 ; compare vol. ii. p. 192.

[186] " Un coup d'œil peu attentif, jeté sur les cristaux, les fit appeler d'abord de *purs jeux de la nature*, ce qui n'étoit qu'une manière plus élégante de faire l'aveu de son ignorance. Un examen réfléchi nous y découvre des lois d'arrangement, à l'aide desquelles le calcul représente et enchaîne l'un à l'autre les résultats observés ; lois si variables et en même temps si précises et si régulières ; ordinairement très simples, sans rien perdre de leur fécondité." *Haüy, Minéralogie*, vol. i. pp. xiii. xiv. Again, vol. ii. p. 57, " notre but, qui est de prouver que les lois d'où dépend la structure du cristal sont les plus simples possibles dans leur ensemble." [The phrase " confusion and disorder are *impossible* " is another verbal confusion. The terms in question are significant relatively to human ideals. In this sense Buckle himself proceeds to use the term " pathology."—Ed.]

[187] On the remarkable power possessed by crystals, in common with animals, of repairing their own injuries, see *Paget's Pathology*, 1853, vol. i. pp. 152, 153, confirming the experiments of Jordan on this curious subject : " The ability to repair the damages sustained by injury . . . is not an exclusive property of living beings ; for even crystals will repair themselves when, after pieces have been broken from them, they are placed in the same conditions in which they were first formed."

the future progress of all organic, and, indeed, of all mental science depends. And it is very observable that the same generation which established the fact that the apparent aberrations presented by minerals are strictly regular, also took the first steps towards establishing the far higher fact that the aberrations of the human mind are governed by laws as unfailing as those which determine the condition of inert matter. The examination of this would lead to a digression foreign to my present design ; but I may mention that, at the end of the century, there was written in France the celebrated treatise on insanity by Pinel ; a work remarkable in many respects, but chiefly in this, that in it the old notions respecting the mysterious and inscrutable character of mental disease are altogether discarded : [188] the disease itself is considered as a phenomenon inevitably occurring under certain given conditions, and the foundation laid for supplying another link in that vast chain of evidence which connects the material with the immaterial, and thus uniting mind and matter into a single study, is now preparing the way for some generalization which, being common to both, shall serve as a centre round which the disjointed fragments of our knowledge may safely rally.

These were the views which, during the latter half of the eighteenth century, began to dawn upon French thinkers. The extraordinary ability and success with which these eminent men cultivated their respective sciences I have traced at a length greater than I had intended, but still very inadequate to the importance of the subject. Enough, however, has been brought forward to convince the reader of the truth of the proposition I wished to prove ; namely, that the intellect of France was, during the latter half of the eighteenth century, concentrated upon the external world with unprecedented zeal, and thus aided that vast movement of which the Revolution itself was merely a single consequence.* The intimate connexion between scientific progress and social rebellion is evident from the fact that both are suggested by the same yearning after improvement, the same dissatisfaction with what has been previously done, the same restless, prying, insubordinate, and audacious spirit. But in France this general analogy was strengthened by the curious circumstances I have already noticed, by virtue of which the activity of the country was, during the first half of the century, directed against the church rather than against the state † ; so that, in order to complete the antecedents of the Revolution, it was necessary that, in the latter half of the century, the ground of attack should be shifted. This is precisely what was done by the wonderful impetus given to every branch of natural science.

[188] " M. Pinel a imprimé une marche nouvelle à l'étude de la folie. . . . En la rangeant simplement, et sans différences aucunes, au nombre des autres dérangemens de nos organes, en lui assignant une place dans le cadre nosographique, il fit faire un pas immense à son histoire." *Georget, de la Folie*, Paris, 1820, p. 69. In the same work, p. 295, " M. Pinel, le premier en France, on pourrait dire en Europe, jeta les fondemens d'un traitement vraiment rationnel en rangeant la folie au nombre des autres affections organiques." M. Esquirol, who expresses the modern and purely scientific view, says in his great work (*Des Maladies Mentales*, Paris, 1838, vol. i. p. 336), " L'aliénation mentale, que les anciens peuples regardaient comme une inspiration ou une punition des dieux, qui dans la suite fut prise pour la possession des démons, qui dans d'autres temps passa pour une œuvre de la magie ; l'aliénation mentale, dis-je, avec toutes ses espèces et ses variétés innombrables, ne diffère en rien des autres maladies." The recognition of this he expressly ascribes to his predecessor : " grâce aux principes exposés par Pinel." p. 340. Pinel himself clearly saw the connexion between his own opinions and the spirit of the age : see *Pinel, Traité Médico-Philosophique sur l'Aliénation Mentale*, p. xxxii. : " Un ouvrage de médecine, publié en France à la fin du dix-huitième siècle, doit avoir un autre caractère que s'il avoit été écrit à une époque antérieure."

[* As Bichat's chief works are dated 1800 and 1801, he cannot be counted among the Revolution-makers ; and as Pinel was appointed to the Hôpital Bicêtre only in 1792, he is in the same case. As is noted above (*note* 174), Jussieu's great work, in turn, belongs to the year of the Revolution.—Ed.]

[† See edit. notes above, pp. 435, 473, 487.—Ed.]

For, the attention of men being thus steadily fixed upon the external world, the internal fell into neglect; while, as the external corresponds to the state, and the internal to the church, it was part of the same intellectual development that the assailers of the existing fabric should turn against political abuses the energy which the preceding generation had reserved for religious ones.

Thus it was that the French Revolution, like every great revolution the world has yet seen, was preceded by a complete change in the habits and associations of the national intellect. But besides this there was also taking place, precisely at the same time, a vast social movement, which was intimately connected with the intellectual movement, and indeed formed part of it, in so far as it was followed by similar results and produced by similar causes. The nature of this social revolution I shall examine only very briefly, because in a future volume it will be necessary to trace its history minutely, in order to illustrate the slighter but still remarkable changes which in the same period were going on in English society. *

In France, before the Revolution, the people, though always very social, were also very exclusive. The upper classes, protected by an imaginary superiority, looked with scorn upon those whose birth or titles were unequal to their own. The class immediately below them copied and communicated their example, and every order in society endeavoured to find some fanciful distinction which should guard them from the contamination of their inferiors. The only three real sources of superiority,—the superiority of morals, of intellect, and of knowledge,—were entirely overlooked in this absurd scheme; and men became accustomed to pride themselves not on any essential difference, but on those inferior matters which, with extremely few exceptions, are the result of accident, and therefore no test of merit.[189]

The first great blow to this state of things was the unprecedented impulse given to the cultivation of physical science. Those vast discoveries which were being made not only stimulated the intellect of thinking men, but even roused the curiosity of the more thoughtless parts of society. The lectures of chemists, of geologists, of mineralogists, and of physiologists, were attended by those who came to wonder, as well as by those who came to learn. In Paris the scientific assemblages were crowded to overflowing.[190] The halls and amphitheatres in which the great truths of nature were expounded were no longer able to hold their audiences, and in several instances it was found necessary to enlarge them.[191] The sittings of the Academy, instead of being confined to a few solitary scholars, were frequented by every one whose rank or influence enabled them to secure a place.[192] Even women of fashion, forgetting

[189] Comp. *Mém. de Ségur*, vol. i. p. 23, with the Introduction to *Des Réaux, Historiettes*, vol. i. p. 34. A good illustration of this is that the Prince de Montbarey, in his Memoirs, gently censures Louis XV., not for his scandalous profligacy, but because he selected for his mistresses some women who were not of high birth. *Mém. de Montbarey*, vol. i. p. 341, and see vol. iii. p. 117.

[190] And that too even on such a subject as anatomy. In 1768, Antoine Petit began his anatomical lectures in the great amphitheatre of the Jardin du Roi; and the press to hear him was so great, that not only all the seats were occupied, but the very window-ledges were crowded. See the animated description in *Biog. Univ.* vol. xxxiii. p. 494.

[191] Dr. Thomson (*Hist. of Chemistry*, vol. ii. p. 169) says of Fourcroy's lectures on chemistry, which began in 1774: "Such were the crowds, both of men and women, who flocked to hear him, that it was twice necessary to enlarge the size of the lecture-room." This circumstance is also mentioned in *Cuvier, Éloges*, vol. ii. p. 19.

[192] In 1779 it was remarked that "les séances publiques de l'Académie Française sont devenues une espèce de spectacle fort à la mode:" and as this continued to increase, the throng became at length so great that in 1785 it was found necessary to diminish the number of tickets of admission, and it was even proposed that ladies should be excluded, in consquence of some uproarious scenes which had happened. *Grimm et Diderot, Correspond. Lit.* vol. x. p. 341, vol. xiv. pp. 148, 149, 185, 251.

[* This plan Buckle did not live to fulfil.—Ed.]

their usual frivolity, hastened to hear discussions on the composition of a mineral, on the discovery of a new salt, on the structure of plants, on the organization of animals, on the properties of the electric fluid.[193] A sudden craving after knowledge seemed to have smitten every rank. The largest and the most difficult inquiries found favour in the eyes of those whose fathers had hardly heard the names of the sciences to which they belonged. The brilliant imagination of Buffon made geology suddenly popular; the same thing was effected for chemistry by the eloquence of Fourcroy, and for electricity by Nollet; while the admirable expositions of Lalande caused astronomy itself to be generally cultivated. In a word, it is enough to say that during the thirty years preceding the Revolution the spread of physical science was so rapid that in its favour the old classical studies were despised;[194] it was considered the essential basis of a good education, and some slight acquaintance with it was deemed necessary for every class, except those who were obliged to support themselves by their daily labour.[195]

The results produced by this remarkable change are very curious, and from their energy and rapidity were very decisive. As long as the different classes confined themselves to pursuits peculiar to their own sphere, they were encouraged to preserve their separate habits; and the subordination, or as it were the hierarchy, of society was easily maintained. But when the members of the various orders met in the same place with the same object, they became knit together by a new sympathy. The highest and most durable of all pleasures, the pleasure caused by the perception of fresh truths, was now a great link, which banded together those social elements that were formerly wrapped up in the pride of their own isolation. Besides this, there was also given to them not only a new pursuit,

[193] Goldsmith, who was in Paris in 1755, says with surprise, "I have seen as bright a circle of beauty at the chemical lectures of Rouelle as gracing the court of Versailles." *Prior's Life of Goldsmith*, vol. i. p. 180; *Forster's Life of Goldsmith*, vol. i. p. 65. In the middle of the century electricity was very popular among the Parisian ladies; and the interest felt in it was revived several years later by Franklin. Compare *Grimm, Correspondance*, vol. vii. p. 122, with *Tucker's Life of Jefferson*, vol. i. pp. 190, 191. Cuvier (*Éloges*, vol. i. p. 56) tells us that even the anatomical descriptions which Daubenton wrote for Buffon were to be found "sur la toilette des femmes." This change of taste is also noticed, though in a jeering spirit, in *Mém. de Genlis*, vol. vi. p. 32. Compare the account given by Townsend, who visited France in 1786, on his way to Spain: "A numerous society of gentlemen and ladies of the first fashion meet to hear lectures on the sciences, delivered by men of the highest rank in their profession. . . . I was much struck with the fluency and elegance of language with which the anatomical professor spoke, and not a little so with the deep attention of his auditors." *Townsend's Journey through Spain*, vol. i. p. 41: see also *Smith's Tour on the Continent in 1786*, vol. i. p. 117.

[194] In a letter written in 1756, it is said, "Mais c'est peine perdue aujourd'hui que de plaisanter les érudits; il n'y en a plus en France." *Grimm, Correspond.* vol. ii. p. 15. In 1764, "Il est honteux et incroyable à quel point l'étude des anciens est negligée," vol. iv. p. 97. In 1768, "Une autre raison qui rendra les traductions des auteurs anciens de plus en plus rares en France, c'est que depuis long-temps on n'y sait plus le Grec, et qu'on néglige l'étude du Latin tous les jours davantage." vol. vi. p. 140. Sherlock (*New Letters from an English Traveller*, London, 1781, p. 86) says, "It is very rare to meet a man in France that understands Greek." In 1785, Jefferson writes from Paris to Madison, "Greek and Roman authors are dearer here than, I believe, anywhere in the world; nobody here reads them, wherefore they are not reprinted." *Jefferson's Correspond.* vol. i. p. 301. See further, on this neglect of the ancients, a significant precursor of the Revolution, *Mém. de Montbarey*, vol. iii. p. 181; *Villemain, Littérature au XVIII^e Siècle*, vol. iii. pp. 243–248; *Schlosser's Eighteenth Century*, vol. i. p. 344.

[195] For further evidence of the popularity of physical knowledge, and of its study, even by those who might have been expected to neglect it, see *Mém. de Roland*, vol. i. pp. 115, 268, 324, 343; *Mém. de Morellet*, vol. i. p. 16; *Dupont de Nemours, Mém. sur Turgot*, pp. 45, 52, 53, 411; *Mém. de Brissot*, vol. i. pp. 62, 151, 319, 336, 338, 357; *Cuvier, Progrès des Sciences*, vol. i. p. 89.

but also a new standard of merit. In the amphitheatre and the lecture-room the first object of attention is the professor and the lecturer. The division is between those who teach and those who learn. The subordination of ranks makes way for the subordination of knowledge.[196] The petty and conventional distinctions of fashionable life are succeeded by those large and genuine distinctions by which alone man is really separated from man. The progress of the intellect supplies a new object of veneration ; the old worship of rank is rudely disturbed, and its superstitious devotees are taught to bow the knee before what to them is the shrine of a strange god. The hall of science is the temple of democracy Those who come to learn, confess their own ignorance, abrogate in some degree their own superiority, and begin to perceive that the greatness of men has no connexion with the splendour of their titles, or the dignity of their birth ; that it is not concerned with their quarterings, their escutcheons, their descents, their dexter-chiefs, their sinister-chiefs, their chevrons, their bends, their azures, their gules, and the other trumperies of their heraldry ; but that it depends upon the largeness of their minds, the powers of their intellect, and the fulness of their knowledge.

These were the views which in the latter half of the eighteenth century began to influence those classes which had long been the undisputed masters of society.[197] And what shows the strength of this great movement is that it was accompanied by other social changes which, though in themselves apparently trifling, become full of meaning when taken in connexion with the general history of the time.

While the immense progress of physical knowledge was revolutionizing society, by inspiring the different classes with an object common to all, and thus raising a new standard of merit, a more trivial but equally democratic tendency was observable even in the conventional forms of social life. To describe the whole of these changes would occupy a space disproportioned to the other parts of this Introduction ; but it is certain that, until the changes have been carefully examined, it will be impossible for any one to write a history of the French Revolution. As a specimen of what I mean, I will notice two of these innovations which are very conspicuous, and are also interesting on account of their analogy with what has happened in English society.

The first of these changes was an alteration in dress, and a marked contempt for those external appearances hitherto valued as one of the most important of all matters. During the reign of Louis XIV., and indeed during the first half of the reign of Louis XV., not only men of frivolous tastes, but even those distinguished for their knowledge, displayed in their attire a dainty precision, a nice and studied adjustment, a pomp of gold, of silver, and of ruffles, such as in our days can nowhere be seen except in the courts of European princes where a certain barbarian splendour is still retained. So far was this carried, that in the seventeenth century the rank of a person might be immediately known by his appearance ; no one presuming to usurp a garb worn by the class immediately above his own.[198] But in that democratic movement which preceded the French

[196] A celebrated writer has well said, though in a somewhat different point of view, " Il ne peut y avoir dans les sciences morales, pas plus que dans les sciences physiques, ni maîtres, ni esclaves, ni rois, ni sujets, ni citoyens, ni étrangers." *Comte, Traité de Legislation*, vol. i. p. 43.

[197] The remarks which Thomas made upon Descartes in 1765, in an *éloge* crowned by the Academy, illustrate the opinions which in the latter half of the eighteenth century were becoming rapidly diffused in France. See the passage beginning " O préjugés ! ô ridicule fierté des places et du rang ! " etc., *Œuvres de Descartes*, vol. i. p. 74. Certainly no one would have used such language, on such an occasion, thirty years earlier. So, too, the Count de Ségur says of the younger nobles before the Revolution, " nous préférions un mot d'éloges de D'Alembert, de Diderot, à la faveur la plus signalée d'un prince." *Mém. de Ségur*, vol. i. p. 142 : see also vol. ii. p. 46.

[198] Among many other illustrations which might be given of this distinction of classes by dress, see *Monteil, Hist. des divers Etats*, vol. vii. pp. 7–10 ; and *Tallemant des Réaux, Historiettes*, vol. i. p. 36, note.

Revolution, the minds of men became too earnest, too intent upon higher matters, to busy themselves with those idle devices which engrossed the attention of their fathers. A contemptuous disregard of such distinctions became general. In Paris the innovation was seen even in those gay assemblies where a certain amount of personal decoration is still considered natural. At dinners, suppers, and balls, it is noticed by contemporary observers that the dress usually worn was becoming so simple as to cause a confusion of ranks, until at length every distinction was abandoned by both sexes; the men, on such occasions, coming in a common frock-coat, the women in their ordinary morning-gowns.[199] Nay, to such a pitch was this carried that we are assured by the Prince de Montbarey, who was in Paris at the time, that shortly before the Revolution even those who had stars and orders were careful to hide them by buttoning their coats, so that these marks of superiority might no longer be seen.[200]

The other innovation to which I have referred is equally interesting as characteristic of the spirit of the time. This is, that the tendency to amalgamate the different orders of society[201] was shown in the institution of clubs; a remarkable contrivance, which to us seems perfectly natural because we are accustomed to it, but of which it may be truly said that until the eighteenth century its existence was impossible. Before the eighteenth century each class was so jealous of its superiority over the one below it, that to meet together on equal terms was impracticable; and although a certain patronizing familiarity towards one's inferiors might be safely indulged in, this only marked the immense interval of separation, since the great man had no fear of his condescension being abused. In those good old times a proper respect was paid to rank and birth; and he who could count his twenty ancestors was venerated to an extent of which we, in these degenerate days, can hardly form an idea. As to anything like social equality,

[199] In August, 1787, Jefferson writes from Paris (*Correspondence*, vol. ii. p. 224): "In society, the *habit habillé* is almost banished, and they begin to go even to great suppers in frock: the court and diplomatic corps, however, must always be excepted. They are too high to be reached by any improvement. They are the last refuge from which etiquette, formality, and folly will be driven. Take away these, and they would be on a level with other people." Jefferson was a statesman and a diplomatist, and was well acquainted with his profession. The change, however, which he noticed had been coming on some years earlier. In a letter written in May 1786, it is said: "Il est rare aujourd'hui de rencontrer dans le monde des personnes qui soient ce qu'on appelle habillées. Les femmes sont en chemise et en chapeau, les hommes en froc et en gilet." *Grimm, Correspond.* vol. xiv. p. 485; and on the increased simplicity of attire in 1780, see vol. xi. pp. 141, 142. Ségur, who witnessed these changes, and was much displeased by them, says of their advocates, "Ils ne voyaient pas que les frocs, remplaçant les amples et imposans vêtemens de l'ancienne cour, présagaient un penchant général pour l'égalité." *Mém. de Ségur*, vol. i. p. 131. Soulavie (*Règne de Louis XVI*, vol. vi. p. 38) observes that "les grands, vers les approches de la révolution, n'avoient plus que des habits simples et peu coûteux;" and that "on ne distingua plus une duchesse d'une actrice," p. 43: see also an extract from Montjoye, in *Alison's History*, vol. i. pp. 352, 353. Compare *Mém. sur Marie Antoinette*, vol. i. pp. 226, 372, vol. ii. p. 174, and *Mém. de Madame du Hausset*, introduc. p. 17.

[200] "Les personnes du premier rang et même d'un âge mûr, qui avaient travaillé toute leur vie pour obtenir les ordres du roi, preuve de la plus haute faveur, s'habituèrent à en cacher les marques distinctives sous le froc le plus simple, qui leur permettait de courir à pied dans les rues et de se confondre dans la foule." *Mém. de Montbarey*, vol. iii. pp. 161, 162. Another alteration of the same tendency is worth recording. The Baroness d'Oberkirch, who revisited Paris in 1784, remarked on her arrival that "gentlemen began about this time to go about unarmed, and wore swords only in full dress. . . . And thus the French nobility laid aside a usage which the example of their fathers had consecrated through centuries." *D'Oberkirch's Memoirs*, Lond. 1852, vol. ii. p. 211.

[201] A striking instance of which was moreover seen in the number of *mésalliances*, which first became frequent about the middle of the reign of Louis XV. Compare *Mém. de Montbarey*, vol. iii. pp. 116, 156, 157; *Lacretelle, Dix-huitième Siècle*, vol. iii. p. 220.

that was a notion too preposterous to be conceived ; nor was it possible that any institution should exist which placed mere ordinary men on a level with those illustrious characters whose veins were filled with the purest blood, and the quarterings of whose arms none could hope to rival.

But in the eighteenth century the progress of knowledge became so remarkable that the new principle of intellectual superiority made rapid encroachments on the old principle of aristocratic superiority. As soon as these encroachments had reached a certain point, they gave rise to an institution suited to them ; and thus it was that there were first established clubs in which all the educated classes could assemble without regard to those other differences which in the preceding period kept them separate. The peculiarity of this was that for mere purposes of social enjoyment men were brought into contact who, according to the aristocratic scheme, had nothing in common, but who were now placed on the same footing in so far as they belonged to the same establishment, conformed to the same rules, and reaped the same advantages. It was however expected that the members, though varying in many other respects, were to be all in some degree educated ; and in this way society first distinctly recognized a classification previously unknown ; the division between noble and ignoble being succeeded by another division between educated and uneducated.

The rise and growth of clubs is therefore to the philosophic observer a question of immense importance ; and it is one which, as I shall hereafter prove, played a great part in the history of England during the latter half of the eighteenth century. In reference to our present subject, it is interesting to observe that the first clubs, in the modern sense of the word, which ever existed in Paris, were formed about 1782, only seven years before the French Revolution. At the beginning they were merely intended to be social assemblages ; but they quickly assumed a democratic character, conformable to the spirit of the age. Their first result, as was noticed by a keen observer of what was then passing, was to make the manners of the upper classes more simple than they had hitherto been, and to weaken that love of form and ceremony suitable to their earlier habits. These clubs likewise effected a remarkable separation between the sexes ; and it is recorded that after their establishment women associated more with each other, and were oftener seen in public unaccompanied by men.[202] This had the effect of encouraging among men a republican roughness, which the influence of the other sex would have tended to keep down. All these things effaced the old lines of demarcation between the different ranks, and by merging the various classes into one, made the force of their united opposition irresistible, and speedily overthrew both the church and the state. The exact period at which the clubs became political cannot of course be ascertained, but the change seems to have taken place about 1784.[203] From this moment all was over ; and although the

[202] " Nous commençâmes aussi à avoir des clubs : les hommes s'y réunissaient, non encore pour discuter, mais pour dîner, jouer au wisk, et lire tous les ouvrages nouveaux. Ce premier pas, alors presque inaperçu, eut dans la suite de grandes, et momentanément de funestes conséquences. Dans le commencement, son premier résultat fut de séparer les hommes des femmes, et d'apporter ainsi un notable changement dans nos mœurs : elles devinrent moins frivoles, mais moins polies ; plus fortes, mais moins aimables : la politique y gagna, la société y perdit." *Mém. de Ségur*, vol. ii. p. 28. By the spring of 1786 this separation of the sexes had become still more marked ; and it was a common complaint that ladies were obliged to go to the theatre alone, men being at their clubs. See the very curious observations in *Grimm, Correspond.* vol. xiv. pp. 486–489, where there is also a notice of " le prodigieux succès qu'a eu l'établissement des clubs à l'anglaise." See also, on the diminished attention paid to women, *Williams's Letters from France*, vol. ii. p. 80, 3rd edit. 1796.

[203] The remarks of Georgel appear to apply to the political clubs only : " À Paris les assemblées de nouvellistes, les clubs qui s'étoient formés à l'instar de ceux des Anglais, s'expliquaient hautement et sans retenue sur les droits de l'homme, sur les avantages de la liberté, sur les grands abus de l'inégalité des conditions. Ces clubs, trop accrédités, avoient commencé à se former en 1784." *Mém. de Georgel*, vol. ii. p. 310.

government in 1787 issued orders to close the leading club, in which all classes discussed political questions, it was found impossible to stem the torrent. The order therefore was rescinded; the club reassembled, and no further attempt was made to interrupt that course of affairs which a long train of preceding events had rendered inevitable.[204]

While all these things were conspiring to overthrow the old institutions, an event suddenly occurred which produced the most remarkable effects in France, and is itself strikingly characteristic of the spirit of the eighteenth century. On the other side of the Atlantic a great people, provoked by the intolerable injustice of the English government, rose in arms, turned on their oppressors, and after a desperate struggle gloriously obtained their independence. In 1776 the Americans laid before Europe that noble Declaration which ought to be hung up in the nursery of every king, and blazoned on the porch of every royal palace. In words the memory of which can never die, they declared that the object of the institution of government is to secure the rights of the people; that from the people alone it derives its powers; and "that whenever any form of government becomes destructive of these ends, it is the right of the people to alter or abolish it, and to institute a new government, laying its foundations on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness." [205]

If this Declaration had been made only one generation earlier, the whole of France, with the exception of a few advanced thinkers, would have rejected it with horror and with scorn. Such, however, was now the temper of the public mind, that the doctrines it contained were not merely welcomed by a majority of the French nation, but even the government itself was unable to withstand the general feeling.[206] In 1776 Franklin arrived in France, as envoy from the American people. He met with the warmest reception from all classes,[207] and succeeded in inducing the government to sign a treaty, engaging to defend the young republic in the rights it had gloriously won.[208] In Paris the enthusiasm was irresistible.[209] From every quarter large bodies of men came forward, volunteering to cross the Atlantic and to fight for the liberties of America. The heroism

[204] "Le lieutenant de police fit fermer le club nommé *club du salon;* ordre arbitraire et inutile : ce club alors était composé de personnes distinguées de la noblesse ou de la haute bourgeoisie, ainsi que des artistes et des hommes de lettres les plus considérés. Cette réunion offrait, pour la première fois, l'image d'une égalité qui devient bientôt, plus que la liberté même, le vœu le plus ardent de la plus grande partie de la nation. Aussi le mécontentement produit par la clôture de ce club fut si vif, que l'autorité se crut obligée de le rouvrir." *Mém. de Ségur,* vol. iii. pp. 258, 259. On the increase of these clubs from 1787 to 1789, compare *Du Mesnil, Mém. sur Le Brun,* p. 148; *Mém. de Lafayette,* vol. i. pp. 312, 322, 391, 434, vol. ii. p. 9; *Barruel, Hist. du Jacob.* vol. i. p. 40, vol. ii. p. 310, vol. v. pp. 101, 168; *Thiers, Hist. de la Révolution,* vol. i. p. 36, Paris, 1834.

[205] *Mem. of Franklin,* vol. ii. pp. 14 seq.; and *Mem. of Jefferson,* vol. i. pp. 17–22, where the passages are given which Congress altered.

[206] Ségur (*Mém.* vol. i. p. 111) says that his father had been frequently told by Maurepas that public opinion forced the government, against its own wishes, to side with America. Compare *Mém. de Georgel,* vol. iv. p. 370; and *Flassan, Diplomatie Française* vol. vii. p. 166.

[207] The news of which soon reached England. In January, 1777, Burke writes (*Works,* vol. ii. p. 394), "I hear that Dr. Franklin has had a most extraordinary reception at Paris from all ranks of people." Soulavie (*Règne de Louis XVI,* vol. ii. p. 50) says, "J'ai vu Francklin devenir un objet de culte." See also, on his popularity, *Mém. d'Epinay,* vol. iii. p. 419.

[208] *Flassan, Diplomatie Française,* vol. vii. p. 159; *Life of Franklin, by Himself,* vol. ii. pp. 60, 61; *Mahon's Hist. of England,* vol. vii. pp. 197, 198.

[209] The sneering letter written from Paris by Lord Stormont, as early as December, 1774 (*Adolphus's George III.,* vol. ii. p. 316), should be compared with *Lafayette, Mémoires,* vol. i. pp. 24, 169, 229; *Dutens, Mém. d'un Voyageur,* vol. ii. p. 317; *Mém. de Ségur,* vol. i. p. 149; and *Schlosser's Eighteenth Century,* vol. v. p. 175.

with which these auxiliaries aided the noble struggle forms a cheering passage in the history of that time, but is foreign to my present purpose, which is merely to notice its effect in hastening the approach of the French Revolution. And this effect was indeed most remarkable. Besides the indirect result produced by the example of a successful rebellion, the French were still further stimulated by actual contact with their new allies. The French officers and soldiers who served in America introduced into their own country on their return those democratic opinions which they had imbibed in the infant republic.[210] By this means fresh strength was given to the revolutionary tendencies already prevalent; and it is worthy of remark that Lafayette borrowed from the same source one of his most celebrated acts. He drew his sword on behalf of the Americans; and they in their turn communicated to him that famous doctrine respecting the rights of man which, at his instigation, was formally adopted by the National Assembly.[211] Indeed there is reason to believe that the final blow the French government received was actually dealt by the hand of an American; for it is said that it was in consequence of the advice of Jefferson that the popular part of the legislative body proclaimed itself the National Assembly, and thus set the crown at open defiance.[212]

I have now brought to a close my examination of the causes of the French Revolution; but before concluding the present volume, * it appears to me that the variety of topics which have been discussed makes it advisable that I should sum up their leading points; and should state as briefly as possible the steps of that long and complicated argument by which I have attempted to prove that the Revolution was an event inevitably arising out of preceding circumstances. Such a summary, by recalling the entire subject before the reader, will remedy any confusion which the fulness of detail may have produced, and will simplify an investigation which many will consider to have been needlessly protracted; but which could not have been abridged without weakening in some essential part the support of those general principles that I seek to establish.

Looking at the state of France immediately after the death of Louis XIV., we have seen that, his policy having reduced the country to the brink of ruin, and having destroyed every vestige of free inquiry, a reaction became necessary; but that the materials for the reaction could not be found among a nation which for fifty years had been exposed to so debilitating a system. This deficiency at home caused the most eminent Frenchmen to turn their attention abroad, and gave rise to a sudden admiration for the English literature, and for those habits of thought which were then peculiar to the English people. New life being thus breathed into the wasted frame of French society, an eager and inquisitive spirit

[210] *De Staël sur la Révolution*, vol. i. p. 88; *Mém. de Montbarey*, vol. iii. pp. 134, 186; *Mém. de Ségur*, vol. i. p. 277; *Campan, Mém de Marie Antoinette*, vol. i. p. 233, vol. iii. pp. 96, 116; *Soulavie, Règne de Louis XVI*, vol. ii. pp. xxiv. li. lii.; *Dumont, Souvenirs sur Mirabeau*, p. 176; *Mém de Du Hausset*, introduc. p. 40; *Mém. de Genlis*, vol. vi. p. 57; *Jefferson's Mem. and Correspond.* vol. i. p. 59; and Maitland's speech, in *Parl. Hist.* vol. xxx. pp, 198, 199; also the remarks of the Duke of Bedford, vol. xxxi. p. 663.

[211] *Lamartine, Hist. des Girondins*, vol. i. p. 46. Dumont (*Souvenirs*, p. 97) calls this "une idée américaine;" and see to the same effect, *Mém. de Lafayette*, vol. i. pp. 193, 268, 269, 416, vol. ii. pp. 139, 140; *Jefferson's Correspond.* vol. i. p. 90; *Barruel, Hist. du Jacobinisme*, vol. v. p. 311. The influence which the American Revolution exercised over the mind of Lafayette is noticed by Bouillé, his cousin and his enemy. *Mém. de Bouillé*, vol. i. p. 102, vol. ii. pp. 131, 183.

[212] "The Duke of Dorset, the English ambassador, writing to Mr. Pitt from Paris, July 9, 1789, said, 'Mr. Jefferson, the American minister at this court, has been a great deal consulted by the principal leaders of the *tiers état*; and I have great reason to think that it was owing to his advice that order called itself *L'Assemblée Nationale*.'" *Tomline's Life of Pitt*, vol. ii. p. 266.

[* The first volume of the original edition ended with this chapter.—ED.]

was generated, such as had not been seen since the time of Descartes. The upper classes, taking offence at this unexpected movement, attempted to stifle it, and made strenuous efforts to destroy that love of inquiry which was daily gaining ground. To effect their object they persecuted literary men with such bitterness as to make it evident that the intellect of France must either relapse into its former servility or else boldly assume the offensive. Happily for the interests of civilization, the latter alternative was adopted; and, in or about 1750, a deadly struggle began, in which those principles of liberty which France borrowed from England, and which had hitherto been supposed only applicable to the church, were for the first time applied to the state. Coinciding with this movement, and indeed forming part of it, other circumstances occurred of the same character. Now it was that the political economists succeeded in proving that the interference of the governing classes had inflicted great mischief even upon the material interests of the country; and had, by their protective measures, injured what they were believed to have benefited. This remarkable discovery in favour of general freedom put a fresh weapon into the hands of the democratic party, whose strength was still further increased by the unrivalled eloquence with which Rousseau assailed the existing fabric. Precisely the same tendency was exhibited in the extraordinary impulse given to every branch of physical science, which familiarized men with ideas of progress, and brought them into collision with the stationary and conservative ideas natural to government. The discoveries made respecting the external world encouraged a restlessness and excitement of mind hostile to the spirit of routine, and therefore full of danger for institutions only recommended by their antiquity. This eagerness for physical knowledge also effected a change in education; and, the ancient languages being neglected, another link was severed which connected the present with the past. The church, the legitimate protector of old opinions, was unable to resist the passion for novelty, because she was weakened by treason in her own camp. For by this time Calvinism had spread so much among the French clergy as to break them into two hostile parties, and render it impossible to rally them against their common foe. The growth of this heresy was also important, because Calvinism being essentially democratic, a revolutionary spirit appeared even in the ecclesiastical profession, so that the feud in the church was accompanied by another feud between the government and the church. These were the leading symptoms of that vast movement which culminated in the French Revolution; and all of them indicated a state of society so anarchical and so thoroughly disorganized as to make it certain that some great catastrophe was impending. At length, and when everything was ready for explosion, the news of the American Rebellion fell like a spark on the inflammable mass, and ignited a flame which never ceased its ravages until it had destroyed all that Frenchmen once held dear, and had left for the instruction of mankind an awful lesson of the crimes into which continued oppression may hurry a generous and long-suffering people.

Such is a rapid outline of the view which my studies have led me to take of the causes of the French Revolution. That I have ascertained all the causes I do not for a moment suppose; but it will, I believe, be found that none of importance have been omitted.* It is indeed true that among the materials of which the evidence consists many deficiencies will be seen; and a more protracted labour would have been rewarded by a greater success. Of these shortcomings I am deeply sensible; and I can only regret that the necessity of passing on to a still larger field has compelled me to leave so much for future inquirers to gather in. At the same time, it ought to be remembered that this is the first attempt which has ever been made to study the antecedents of the French Revolution according to a scheme wide enough to include the whole of their intellectual bearings. In defiance of sound philosophy, and, I may say, in defiance of common understanding, historians obstinately persist in neglecting those great branches of

[*Perhaps the only serious omission is the failure to note that the progression of debt and taxation under Louis XV. provoked the attack on the State system which in the end led to its overthrow.—Ed.]

physical knowledge in which in every civilized country the operations of the human mind may be most clearly seen, and therefore the mental habits most easily ascertained. The result is that the French Revolution, unquestionably the most important, the most complicated, and the most glorious event in history, has been given over to authors, many of whom have displayed considerable ability, but all of whom have shown themselves destitute of that preliminary scientific education, in the absence of which it is impossible to seize the spirit of any period, or to take a comprehensive survey of its various parts. Thus, to mention only a single instance: we have seen that the extraordinary impulse given to the study of the external world was intimately connected with that democratic movement which overthrew the institutions of France. But this connexion historians have been unable to trace, because they were unacquainted with the progress of the various branches of natural philosophy and of natural history. Hence it is that they have exhibited their great subject maimed and mutilated, shorn of those fair proportions which it ought to possess. According to this scheme the historian sinks into the annalist; so that instead of solving a problem he merely paints a picture. Without, therefore, disparaging the labours of those industrious men who have collected materials for a history of the French Revolution, we may assuredly say that the history itself has never been written; since they who have attempted the task have not possessed such resources as would enable them to consider it as merely a single part of that far larger movement which was seen in every department of science, of philosophy, of religion, and of politics.

Whether or not I have effected anything of real value towards remedying this deficiency is a question for competent judges to decide. Of this at least I feel certain, that whatever imperfections may be observed, the fault consists, not in the method proposed, but in the extreme difficulty of any single man putting into full operation all the parts of so vast a scheme. It is on this point, and on this alone, that I feel the need of great indulgence. But as to the plan itself I have no misgivings; because I am deeply convinced that the time is fast approaching when the history of Man will be placed on its proper footing; when its study will be recognized as the noblest and most arduous of all pursuits; and when it will be clearly seen that, to cultivate it with success, there is wanted a wide and comprehensive mind, richly furnished with the highest branches of human knowledge. When this is fully admitted, history will be written only by those whose habits fit them for the task; and it will be rescued from the hands of biographers, genealogists, collectors of anecdotes, chroniclers of courts, of princes, and of nobles, —those babblers of vain things, who lie in wait at every corner and infest this, the public highway of our national literature. That such compilers should trespass on a province so far above their own, and should think that by these means they can throw light on the affairs of men, is one of many proofs of the still backward condition of our knowledge, and of the indistinctness with which its boundaries have been mapped out. If I have done anything towards bringing these intrusions into discredit, and inspiring historians themselves with a sense of the dignity of their own calling, I shall have rendered in my time some little service, and I shall be well content to have it said that in many cases I have failed in executing what I originally proposed. Indeed, that there are in this volume several instances of such failure I willingly allow; and I can only plead the immensity of the subject, the shortness of a single life, and the imperfection of every single enterprise. I therefore wish this work to be estimated, not according to the finish of its separate parts, but according to the way in which those parts have been fused into a complete and symmetrical whole. This, in an undertaking of such novelty and magnitude, I have a right to expect. And I would moreover add that if the reader has met with opinons adverse to his own, he should remember that his views are perchance the same as those which I too once held, and which I have abandoned, because, after a wider range of study, I found them unsupported by solid proof, subversive of the interests of Man, and fatal to the progress of his knowledge. To examine the notions in which we have been educated, and to turn aside from those which will not bear the test, is a task so painful that they

who shrink from the suffering should pause before they reproach those by whom the suffering is undergone. What I have put forward may no doubt be erroneous; but it is at all events the result of an honest searching after truth, of unsparing labour, of patient and anxious reflection. Conclusions arrived at in this way are not to be overturned by stating that they endanger some other conclusions; nor can they be even affected by allegations against their supposed tendency. The principles which I advocate are based upon distinct arguments, supported by well-ascertained facts. The only points, therefore, to be ascertained are whether the arguments are fair, and whether the facts are certain. If these two conditions have been obeyed, the principles follow by an inevitable inference. Their demonstration is, in the present volume, necessarily incomplete; and the reader must suspend his final judgment until the close of this Introduction, when the subject in all its bearings will be laid before him. The remaining part of the Introduction will be occupied, as I have already intimated, with an investigation of the civilizations of Germany, America,* Scotland, and Spain; each of which presents a different type of intellectual development, and has therefore followed a different direction in its religious, scientific, social and political history. The causes of these differences I shall attempt to ascertain. The next step will be to generalize the causes themselves; and having thus referred them to certain principles common to all, we shall be possessed of what may be called the fundamental laws of European thought; the divergence of the different countries being regulated either by the direction those laws take, or else by their comparative energy. To discover these fundamental laws will be the business of the Introduction; while in the body of the work I shall apply them to the history of England, and endeavour by their aid to work out the epochs through which we have successively passed, fix the basis of our present civilization, and indicate the path of our future progress.

[* See edit. notes above, pp. 508, 518.—Ed.]

CHAPTER XV

Outline of the History of the Spanish Intellect from the Fifth to the Middle of the Nineteenth Century

In the preceding volume I have endeavoured to establish four leading propositions, which, according to my view, are to be deemed the basis of the history of civilization. They are: 1st. That the progress of mankind depends on the success with which the laws of phenomena are investigated, and on the extent to which a knowledge of those laws is diffused. 2nd. That before such investigation can begin, a spirit of scepticism must arise, which, at first aiding the investigation, is afterwards aided by it. 3rd. That the discoveries thus made increase the influence of intellectual truths, and diminish, relatively, not absolutely, the influence of moral truths; moral truths being more stationary than intellectual truths, and receiving fewer additions. 4th. That the great enemy of this movement, and therefore the great enemy of civilization, is the protective spirit; by which I mean the notion that society cannot prosper unless the affairs of life are watched over and protected at nearly every turn by the state and the church; the state teaching men what they are to do, and the church teaching them what they are to believe. Such are the propositions which I hold to be the most essential for a right understanding of history, and which I have defended in the only two ways any proposition can be defended; namely, inductively and deductively. The inductive defence comprises a collection of historical and scientific facts, which suggest and authorize the conclusions drawn from them; while the deductive defence consists of a verification of those conclusions, by showing how they explain the history of different countries and their various fortunes. To the former or inductive method of defence, I am at present unable to add anything new; but the deductive defence I hope to strengthen considerably in this volume,* and by its aid confirm not only the four cardinal propositions just stated, but also several minor propositions which, though strictly speaking flowing from them, will require separate verification. According to the plan already sketched, the remaining part of the Introduction will contain an examination of the history of Spain, of Scotland, of Germany, and of the United States of America, with the object of elucidating principles on which the history of England supplies inadequate information. And as Spain is the country where what I conceive to be the fundamental conditions of national improvement have been most flagrantly violated, so also shall we find that it is the country where the penalty paid for the violation has been most heavy, and where, therefore, it is most instructive to ascertain how the prevalence of certain opinions causes the decay of the people among whom they predominate.

We have seen that the old tropical civilizations were accompanied by remarkable features which I have termed Aspects of Nature, and which, by inflaming the imagination, encouraged superstition, and prevented men from daring to analyze such threatening physical phenomena; in other words, prevented the creation of the physical sciences. Now it is an interesting fact that in these respects no European country is so analogous to the tropics as Spain. No other part of Europe is so clearly designated by nature as the seat and refuge of superstition. Recurring to what has been already proved,[1] it will be remembered that

[1] Above, pp. 67, 84.

[* The second volume of the original begins with this chapter.—Ed.]

among the most important physical causes of superstition are famines, epidemics, earthquakes, and that general unhealthiness of climate which, by shortening the average duration of life, increases the frequency and earnestness with which supernatural aid is invoked. These peculiarities, taken together, are more prominent in Spain than anywhere else in Europe ; it will therefore be useful to give such a summary of them as will exhibit the mischievous effects they have produced in shaping the national character.

If we except the northern extremity of Spain, we may say that the two principal characteristics of the climate are heat and dryness, both of which are favoured by the extreme difficulty which nature has interposed in regard to irrigation. For the rivers which intersect the land run mostly in beds too deep to be made available for watering the soil, which consequently is, and always has been, remarkably arid.[2] Owing to this, and to the infrequency of rain, there is no European country as richly endowed in other respects where droughts and therefore famines have been so frequent and serious.[3] At the same time the vicissitudes of climate, particularly in the central parts, make Spain habitually unhealthy ; and this general tendency being strengthened in the Middle Ages by the constant occurrence of famine, caused the ravages of pestilence to be unusually fatal.[4] When we moreover add that in the Peninsula, including Portugal, earthquakes have been extremely disastrous,[5] and have excited all

[2] " The low state of agriculture in Spain may be ascribed partly to physical and partly to moral causes. At the head of the former must be placed the heat of the climate and the aridity of the soil. Most part of the rivers with which the country is intersected run in deep beds, and are but little available, except in a few favoured localities, for purposes of irrigation." *M'Culloch's Geographical and Statistical Dictionary*, London, 1849, vol. ii. p. 708. See also *Laborde's Spain*, London, 1809, vol. iv. p. 284, vol. v. p. 261. The relative aridity of the different parts is stated in *Cook's Spain*, London, 1834, vol. ii. pp. 216–19.

[3] On these droughts and famines, see *Mariana, Historia de España*, Madrid, 1794, vol. ii. p. 270, vol. iii. p. 225, vol. iv. p. 32. *Conde, Historia de la Dominacion de los Arabes en España*, Paris, 1840, pp. 142, 149, 154, 170. *Davila, Historia de la Vida de Felipe Tercero*, Madrid, 1771, folio, lib. ii. p. 114. *Clarke's Letters concerning the Spanish Nation*, London, 1763, 4to, p. 282. *Udal ap Rhys' Tour through Spain*, London, 1760, pp. 292, 293. *Spain by an American*, London, 1831, vol. ii. p. 282. *Hoskins' Spain*, London, 1851, vol. i. pp. 127, 132, 152. " España es castigada frecuentemente con las sequedades y faltas de lluvias." *Muriel, Gobierno de Carlos III.*, Madrid, 1839, p. 193.

[4] " Añádase á todo esto las repetidas pestes, y mortales epidemias que han afligido á las provincias de España, mayormente á las meridionales que han sido las mas sujetas á estas plagas. De estas se hace mencion en los anales é historias muy freqüentemente ; y en su confirmacion se puede leer el tratado historico, o *epidemiológia* que sobre ellas ha publicado Don Joach n de Villalba, donde se verá con dolor y espanto con quanta freqüencia se repetian estos azotes desde mediados del siglo décimoquarto." . . . " Dos exemplos bien recientes y dolorosos hemos visto, y conservaremos en la memoria, en los formidables estragos que acaban de padecer gran parte del reyno de Sevilla, Cádiz, y sus contornos, M á laga, Cartagena, y Alicante ; sin contar la mortandad con que han afligido á la mayor parte de los pueblos de ámbas Castillas las epidemias de calenturas pútridas en el año pasado de 1805." . . . " Por otra parte la fundacion de tantas capillas y procesiones á San Roque, y á San Sebastian, como abogados contre la peste, que todavía se conservan en la mayor parte de nuestras ciudades de España, son otro testimonio de los grandes y repetidos estragos que habian padecido sus pueblos de este azote. Y el gran número de médicos españoles que publicáron tratados preservativos y curativos de la peste en los reynados de Cárlos V., Felipe II., Felipe III., y Felipe IV., confirman mas la verdad de los hechos." *Capmany, Qüestiones Criticas*, Madrid, 1807, pp. 51, 52 ; see also pp. 66, 67 ; and *Janer, Condicion Social de los Moriscos de España*, Madrid, 1857, pp. 106, 107 ; and the notice of Malaga in *Bourgoing, Tableau de l'Espagne*, Paris, 1808, vol. iii. p. 242.

[5] " Earthquakes are still often felt at Granada and along the coast of the province of Alicante, where their effects have been very disastrous. Much further in the interior,

in the small Sierra del Tremédal, or district of Albarracia, in the province of Terruel, eruptions and shocks have been very frequent since the most remote periods; the black porphyry is there seen traversing the altered strata of the oolitic formation. The old inhabitants of the country speak of sinking of the ground and of the escape of sulphureous gases when they were young; these same phenomena have occurred during four consecutive months of the preceding winter, accompanied by earthquakes, which have caused considerable mischief to the buildings of seven villages situated within a radius of two leagues. They have not, however, been attended with any loss of life, on account of the inhabitants hastening to abandon their dwellings at the first indications of danger." *Ezquerra on the Geology of Spain*, in the *Quarterly Journal of the Geological Society of London*, vol. vi. pp. 412, 413, London, 1850. "The provinces of Malaga, Murcia, and Granada, and, in Portugal, the country round Lisbon, are recorded at several periods to have been devastated by great earthquakes." *Lyell's Principles of Geology*, London, 1853, p. 358. "Los terremotos son tan sensibles y freqüentes en lo alto de las montañas, como en lo llano, pues Sevilla está sujeta á ellos hallándose situada sobre una llanura tan igual y baxa como Holanda." *Bowles, Introduccion á la Historia Natural de España*, Madrid, 1789, 4to, pp. 90, 91. "The littoral plains, especially about Cartagena and Alicante, are much subject to earthquakes." *Ford's Spain*, 1847, p. 168. "This corner of Spain is the chief volcanic district of the Peninsula, which stretches from Cabo de Gata to near Cartagena; the earthquakes are very frequent." *Ford*, p. 174. "Spain, including Portugal, in its external configuration, with its vast tableland of the two Castiles, rising nearly 2,000 feet above the sea, is perhaps the most interesting portion of Europe, not only in this respect, but as a region of earthquake disturbance, where the energy and destroying power of this agency have been more than once displayed upon the most tremendous scale." *Mallet's Earthquake Catalogue of the British Association*, Report for 1858, p. 9, London, 1858.

I quote these passages at length, partly on account of their interest as physical truths, and partly because the facts stated in them are essential for a right understanding of the history of Spain. Their influence on the Spanish character was pointed out, for I believe the first time, in my *History of Civilization*, vol. i. pp. 112, 113. On that occasion I adduced no evidence to prove the frequency of earthquakes in the Peninsula, because I supposed that all persons moderately acquainted with the physical history of the earth were aware of the circumstance. But in April, 1858, a criticism of my book appeared in the *Edinburgh Review*, in which the serious blunders which I am said to have committed are unsparingly exposed. In p. 468 of that Review, the critic, after warning his readers against my "inaccuracies," observes, "But Mr. Buckle goes on to state that 'earthquakes and volcanic eruptions are more frequent and more destructive in Italy, and in the Spanish and Portuguese peninsula, than in any other of the great countries.' Whence he infers, by a singular process of reasoning, that superstition is more rife, and the clergy more powerful; but that the fine arts flourish, poetry is cultivated, and the sciences neglected. Every link in this chain is more or less faulty. There is no volcano in the Spanish peninsula, and the only earthquake known to have occurred there was that of Lisbon." Now, I have certainly no right to expect that a reviewer, composing a popular article for an immediate purpose, and knowing that when his article is read it will be thrown aside and forgotten, should under such unfavourable circumstances be at the pains of mastering all the details of his subject. To look for this would be the height of injustice. He has no interest in being accurate; his name being concealed, his reputation, if he have any, is not at stake; and the errors into which he falls ought to be regarded with leniency, inasmuch as, their vehicle being an ephemeral publication, they are not likely to be remembered, and they are therefore not likely to work much mischief.

These considerations have always prevented me from offering any reply to anonymous criticisms. But the passage in the *Edinburgh Review* to which I have called attention displays such marvellous ignorance that I wish to rescue it from oblivion, and to put it on record as a literary curiosity. The other charges brought against me could, I need hardly say, be refuted with equal ease. Indeed, no reasonable person can possibly suppose that after years of arduous and uninterrupted study I should have committed those childish blunders with which my opponents unscrupulously taunt me. Once for all, I may say that I have made no assertion for the truth of which I do not possess ample and irrefragable evidence. But it is impossible for me to arrange and adduce all the proofs at the same time; and in so vast an enterprise I must in some degree rely, not on the

those superstitious feelings which they naturally provoke, we may form some idea of the insecurity of life, and of the ease with which an artful and ambitious priesthood could turn such insecurity into an engine for the advancement of their own power.[6]

generosity of the reader, but on his candour. I do not think that I am asking too much in requesting him, if on any future occasion his judgment should be in suspense between me and my critics, to give me the benefit of the doubt, and to bear in mind that statements embodied in a deliberate and slowly concocted work, authenticated by the author's name, are as a mere matter of antecedent probability more likely to be accurate than statements made in reviews and newspapers, which, besides being written hastily, and often at very short notice, are unsigned, and by which, consequently, their promulgators evade all responsibility, avoid all risk, and can in their own persons neither gain fame nor incur obloquy.

The simple fact is that in Spain there have been more earthquakes than in all other parts of Europe put together, Italy excepted. If the destruction of property and of life produced by this one cause were summed up, the results would be appalling. When we moreover add those alarming shocks which, though less destructive, are far more frequent, and of which not scores nor hundreds but thousands have occurred, and which by increasing the total amount of fear have to an incalculable extent promoted the growth of superstition, it is evident that such phenomena must have played an important part in forming the national character of the Spaniards. Whoever will take the trouble of consulting the following passages will find decisive proofs of the frightful ravages committed by earthquakes in Spain alone; Portugal being excluded. They all refer to a period of less than two hundred years; the first being in 1639, and the last in 1829. *Lettres de Madame de Villars, Ambassadrice en Espagne*, Amsterdam, 1759, p. 205. *Laborde's Spain*, Lond. 1809, vol. i. p. 169. *Dunlop's Memoirs of Spain*, Edinburgh, 1834, vol. ii. pp. 226, 227. *Boisel, Journal du Voyage d'Espagne*, Paris, 1669, 4to, p. 243. *Mallet's Earthquake Catalogue of the British Association*, London, 1858; Report for 1853, p. 146; for 1854, pp. 26, 27, 54, 55, 57, 58, 65, 110, 140, 173, 196, 202. *Swinburne's Travels through Spain*, London, 1787, vol. i. p. 166. *Ford's Spain*, London, 1847, p. 178. *Bacon's Six Years in Biscay*, London, 1838, p. 32, compared with *Inglis' Spain*, London, 1831, vol. i. p. 393, vol. ii. p. 289–291.

These authorities narrate the ravages committed during a hundred and ninety years. From their account it is manifest that in Spain hardly a generation passed by without castles, villages, and towns being destroyed, and men, women, and children killed by earthquakes. But according to our anonymous instructor it is doubtful if there ever was an earthquake in Spain; for he says of the whole Peninsula, including Portugal, "the only earthquake known to have occurred there was that of Lisbon."

[It is true, as has been remarked in the editor's introduction, that the great majority of the charges of error and ignorance brought against Buckle by his contemporaries fall to the ground, as does that which he has here exposed. But, as we have also seen at many points, we who stand at his point of view, looking through his new windows, and with the help of his method, do find that on a number of points he has fallen into errors of fact, as well as of argument. This, indeed, is the portion of every pioneer; and as he has admitted at the close of the preceding chapter that what he has put forward "may no doubt be erroneous," the sweeping claim to inerrancy in the foregoing note should not have been made.—Ed.]

[6] On the superstitious fears caused by earthquakes in Spain, see a good passage in *Conde, Historia de la Dominacion de los Arabes*, p. 155. "En el año 267, dia jueves, 22 de la luna de Xawâl, tembló la tierra con tan espantoso ruido y estremecimiento, que cayeron muchos alcázares y magníficos edificios, y otros quedaron muy quebrantados, se hundieron montes, se abrieron peñascos, y la tierra se hundió y tragó pueblos y alturas, el mar se retrajo y apartó de las costas, y desaparecieron islas y escollos en el mar. Las gentes abandonaban los pueblos y huian á los campos, las aves salian de sus nidos, y las fieras espantadas dejaban sus grutas y madrigueras con general turbacion y trastorno; nunca los hombres vieron ni oyeron cosa semejante; se arruinaron muchos pueblos de la costa meridional y occidental de España. Todas estas cosas influyeron tanto en los

Another feature of this singular country is the prevalence of a pastoral life, mainly caused by the difficulty of establishing regular habits of agricultural industry. In most parts of Spain the climate renders it impossible for the labourer to work the whole of the day ;[7] and this forced interruption encourages among the people an irregularity and instability of purpose which makes them choose the wandering avocations of a shepherd rather than the more fixed pursuits of agriculture.[8] And during the long and arduous war which they waged against their Mohammedan invaders they were subject to such incessant surprises and forays on the part of the enemy as to make it advisable that their means of subsistence should be easily removed ; hence they preferred the produce of their flocks to that of their lands, and were shepherds instead of agriculturists, simply because by that means they would suffer less in case of an unfavourable issue. Even after the capture of Toledo, late in the eleventh century, the inhabitants of the frontier in Estramadura, La Mancha, and New Castile, were almost entirely herdsmen, and their cattle were pastured not in private meadows

ánimos de los hombres, y en especial en la ignorante multitud, que no pudo Almondhir persuadirles que eran cosas naturales, aunque poco frecüentes, que no tenian influjo ni relacion con las obras de los hombres, ni con sus empresas, sino por su ignorancia y vanos temores, que lo mismo temblaba la tierra para los muslimes que para los cristianos, para las fieras que para las inocentes criaturas." Compare *Geddes' Tracts concerning Spain*, London, 1730, vol. i. p. 89 ; and Mariana, who, under the year 1395, says (*Historia de España*, vol. v. p. 27) : " Tembló la tierra en Valencia mediado el mes de Diciembre, con que muchos edificios cayéron por tierra, otros quedáron desplomados ; que era maravilla y lástima. El pueblo *como agorero que es, pensaba eran señales del cielo* y pronósticos de los daños que temian." The history of Spain abounds with similar instances far too numerous to quote or even to refer to. But the subject is so important and has been so misrepresented, that even at the risk of wearying the reader I will give one more illustration of the use of earthquakes in fostering Spanish superstition. In 1504 " an earthquake, accompanied by a tremendous hurricane, such as the oldest men did not remember, had visited Andalusia, and especially Carmona, a place belonging to the Queen, and occasioned frightful desolation there. The superstitious Spaniards now read in these portents *the prophetic signs by which Heaven announces some great calamity. Prayers were put up in every temple*," etc., etc. *Prescott's History of Ferdinand and Isabella*, Paris, 1842, vol. iii. p. 174. [As has been shown by Dozy in his *Histoire des Musulmans d'Espagne*, 1861, Conde's narrative is not trustworthy ; but his errors are not such as to affect Buckle's argument where he founds on him.—Ed.]

[7] Above, p. 24. See also *Laborde's Spain*, vol. iv. p. 42.

[8] A writer early in the eighteenth century notices " el gran numero de pastores que hay." *Uztariz, Theorica y Practica de Comercio*, 3rd ed. Madrid, 1757, folio, p. 20. As to the Arabic period, see *Conde, Historia de la Dominacion*, p. 244 : " Muchos pueblos, siguiendo su natural inclinacion, se entregaron á la ganaderia." Hence " the wandering life so congenial to the habits of the Spanish peasantry," noticed in *Cook's Spain*, vol. i. p. 85, where, however, the connexion between this and the physical constitution of the country is not indicated. The solution is given by Mr. Ticknor with his usual accuracy and penetration : " The climate and condition of the Peninsula, which from a very remote period had favoured the shepherd's life and his pursuits, facilitated, no doubt, if they did not occasion, the first introduction into Spanish poetry of a pastoral tone, whose echoes are heard far back among the old ballads." . . . " From the Middle Ages the occupations of a shepherd's life had prevailed in Spain and Portugal to a greater extent than elsewhere in Europe ; and, probably in consequence of this circumstance, eclogues and bucolics were early known in the poetry of both countries, and became connected in both with the origin of the popular drama." *Ticknor's History of Spanish Literature*, London, 1849, vol. iii. pp. 9, 36. On the pastoral literature of Spain, see *Bouterwek's History of Spanish Literature*, London, 1823, vol. i. pp. 123–129 ; and on the great number of pastoral romances. *Southey's Letters from Spain*, Bristol, 1799, p. 336. But these writers, not seizing the whole question, have failed to observe the relation between the literary, physical, and social phenomena.

but in the open fields.[9] All this increased the uncertainty of life, and strengthened that love of adventure and that spirit of romance which at a later period gave a tone to the popular literature. Under such circumstances everything grew precarious, restless, and unsettled ; thought and inquiry were impossible ; doubt was unknown ; and the way was prepared for those superstitious habits, and for that deep-rooted and tenacious belief, which have always formed a principal feature in the history of the Spanish nation.*

To what extent these circumstances would, if they stood by themselves, have affected the ultimate destiny of Spain, is a question hardly possible to answer ; but there can be no doubt that their effects must always have been important, though, from the paucity of evidence, we are unable to measure them with precision. In regard, however, to the actual result, this point is of little moment, because a long chain of other and still more influential events became interwoven with those just mentioned, and, tending in precisely the same direction, produced a combination which nothing could resist, and from which we may trace with unerring certainty the steps by which the nation subsequently declined. The history of the causes of the degradation of Spain will indeed become too clear to be mistaken, if studied in reference to those general principles which I have enunciated, and which will themselves be confirmed by the light they throw on this instructive though melancholy subject.

After the subversion of the Roman Empire, the first leading fact in the history of Spain is the settlement of the Visigoths and the establishment of their opinions in the Peninsula. They, as well as the Suevi, who immediately preceded them, were Arians, and Spain during a hundred and fifty years became the rallying point of that famous heresy,[10] to which indeed most of the Gothic tribes then adhered. But at the end of the fifth century the Franks, on their conversion from Paganism, adopted the opposite and orthodox creed, and were encouraged by their clergy to make war upon their heretical neighbours. Clovis, who was

[9] See the memoir by Jovellanos, in *Laborde's Spain*, vol. iv. p. 127. This was the necessary consequence of those vindictive attacks by which, for several centuries, both Mohammedans and Christians seemed resolved to turn Spain into a desert ; ravaging each other's fields, and destroying every crop they could meet with. *Conde, Dominacion de los Arabes*, pp. 75, 188, 278, 346, 396, 417, 418, 471, 499, 500, 505, 523, 539, 544, 551, 578, 645, 651, 658. To quote one of these instances, late in the eleventh century : " La constancia de Alfonso ben Ferdeland en hacer entradas y talas en tierra de Toledo dos veces cada año, fué tanta que empobreció y apuró los pueblos ; " . . . " el tirano Alfonso taló y quemó los campos y los pueblos." *Conde*, p. 346. As such havoc, which was continued with few interruptions for about seven hundred years, has done much towards forming the national character of the Spaniards, it may be worth while to refer to *Mariana, Historia de España*, vol. iii. p. 438, vol. iv. pp. 193, 314, vol. v. pp. 92, 317, 337 ; and to *Circourt, Histoire des Arabes d'Espagne*, Paris, 1846, vol. i. p. 99.

[10] The unsettled chronology of the early history of Spain appears, from the different statements of various writers respecting the duration of Arianism, a point of much more importance than the death and accession of kings. Antequera (*Historia de la Legislacion Española*, Madrid, 1849, p. 37) says, " La secta arriana, pues, segun las epocas fijadas, permanecio en España 125 años ; " Fleury (*Histoire Ecclésiastique*, vol. vii. p. 586, Paris, 1758) says " environ 180 ans ; " and M'Crie, generally well informed, says in his *History of the Reformation in Spain*, Edinburgh, 1829, p. 7, " Arianism was the prevailing and established creed of the country for nearly two centuries : " for this he refers to Gregory of Tours. With good reason therefore does M. Fauriel term it " une question qui souffre des difficultés." See his able work, *Histoire de la Gaule Méridionale*, Paris, 1836, vol. i. p. 10.

[* As habits of warfare were general in Europe up to the eleventh century, the special inference here drawn as to Spain seems unwarranted. We have already seen (above, p. 107), and shall see further, that Buckle has overrated the original religiosity of the Spaniards.—Ed.]

then king of the Franks, was regarded by the church as the champion of the faith, in whose behalf he attacked the unbelieving Visigoths.[11] His successors, moved by the same motives, pursued the same policy ;[12] and during nearly a century there was a war of opinions between France and Spain, by which the Visigothic empire was seriously endangered, and was more than once on the verge of dissolution. Hence, in Spain, a war for national independence became also a war for national religion,[13] and an intimate alliance was formed between the Arian kings and the Arian clergy. The latter class were, in those ages of ignorance, sure to gain by such a compact,[14] and they received considerable temporal advantages in return for the prayers which they offered up against the enemy, as also for the miracles which they occasionally performed. Thus early a foundation was laid for the immense influence which the Spanish priesthood have possessed ever since, and which was strengthened by subsequent events. For, late in the sixth century, the Latin clergy converted their Visigothic masters,* and the Spanish government, becoming orthodox, naturally conferred upon its

[11] In 496, the orthodox clergy looked on Clovis as "un champion qu'il peut opposer aux hérétiques visigoths et burgondes." *Fauriel, Histoire de la Gaule Méridionale*, vol. ii. p. 41. They also likened him to Gideon, p. 66. Compare *Fleury, Histoire Ecclésiastique*, vol. vii. pp. 89, 90. Ortiz is so enthusiastic that he forgets his patriotism, and warmly praises the ferocious barbarian who made war indeed on his country, but still whose speculative opinions were supposed to be sound. "Mientras Alarico desfogaba su encono contra los Católicos, tuvo la Iglesia Galicana el consuelo de ver Católico á su gran Rey Clodoveo. Era el único Monarca del mundo que á la sazon profesaba la Religion verdadera." *Ortiz, Compendio de la Historia de España*, vol. ii. p. 96, Madrid, 1796.

[12] Thus in 531 Childebert marched against the Visigoths because they were Arians. *Fauriel, Histoire de la Gaule Méridionale*, vol. ii. p. 131 ; and in 542 Childebert and Clotaire made another attack, and laid siege to Saragossa, p. 142. "No advertian los Godos lo que su falsa creencia les perjudicaba, y si lo advertian, su obcecacion les hacia no poner remedio. Los reyes francos, que eran católicos, les movian guerras en las Galias por arrianos, y los obispos catolicos de la misma Galia gótica deseaban la dominacion de los francos." *Lafuente, Historia de España*, vol. ii. p. 380, Madrid, 1850.

[13] "Los Francos por el amor que tenian á la Religion Cathólica, que poco ántes abrazaran, aborrecian á los Visigodos como gente inficionada de la secta Arriana." *Mariana, Historia de España*, vol. ii. p. 43. And of one of their great battles he says, p. 46, "vulgarmente se llamo el campo Arriano por causa de la religion que los Godos seguian."

[14] "En religion et en croyance, comme en toute chose, les Visigoths se montrèrent plus sérieux, plus profonds, plus tenaces que les Burgondes. J'ai dit ailleurs comment ils étaient devenus presque en même temps chrétiens et ariens. Transplantés en Gaule et en Espagne, non-seulement ils avaient persévéré dans leur hérésie ; ils s'y étaient affermis, affectionnés, et dans le peu que l'histoire laisse apercevoir de leur clergé, on s'assure qu'il était austère, zélé, et qu'il exercait un grand empire sur les chefs comme sur la masse de la nation visigothe." . . . . "Les rois visigoths se croyaient obligés à de grandes démonstrations de respect pour leur clergé arien." *Fauriel, Histoire de la Gaule Méridionale*, vol. i. pp. 577, 578.

[* In the preceding note, the Visigothic clergy are represented as Arians ; and it appears that when Recared turned Catholic he had to persuade them to follow him. He seems to have abjured on grounds of statecraft, seeking to set up an "orthodox" church, as against his turbulent nobles, who were Arian. He seems to have been helped by the Catholic bishop Leander ; but from the first the mass of the Hispano-Roman population had remained anti-Arian under the Arian rule of the Visigoths. See U. R. Burke's *History of Spain*, Hume's ed., 1900, i. 85–88. The elective character of the Visigothic monarchy threw the king on the one hand into the arms of the clergy, and on the other hand set the nobles on winning the clergy to their side. Of the thirteen kings who reigned from Alaric to Athanagila, 451–544, eleven were killed by their nobles (*Id.* pp. 115, 117, text and notes).—Ed

teachers an authority equal to that wielded by the Arian hierarchy.[15] Indeed, the rulers of Spain, grateful to those who had shown them the error of their ways, were willing rather to increase the power of the church than to diminish it. The clergy took advantage of this disposition ; and the result was, that before the middle of the seventh century the spiritual classes possessed more influence in Spain than in any other part of Europe.[16] The ecclesiastical synods became not only councils of the church, but also parliaments of the realm.[17] At Toledo, which was then the capital of Spain, the power of the clergy was immense, and was so ostentatiously displayed that in a council they held there in the year 633, we find the king literally prostrating himself on the ground before the bishops ;[18] and half a century later the ecclesiastical historian mentions that this humiliating practice was repeated by another king, having become, he says, an established custom.[19] That this was not a mere meaningless ceremony is moreover evident from other and analogous facts. Exactly the same tendency is seen in their jurisprudence ; since by the Visigothic code any layman, whether plaintiff or defendant, might insist on his cause being tried not by the temporal magistrate, but by the bishop of the diocese. Nay, even if both parties to the suit were agreed in preferring the civil tribunal, the bishop still retained the power of revoking the decision, if in his opinion it was incorrect ; and it was his especial business to watch over the administration of justice, and to instruct the magistrates how to perform their duty.[20] Another and more painful proof of the

[15] The abjuration of Recared took place between the years 586 and 589. *Dunham's History of Spain and Portugal*, London, 1832, vol. i. pp. 126–128. *Mariana, Historia de España*, vol. ii. pp. 99–101. *Ortiz, Compendio de la Historia de España*, vol. ii. p. 120. *Lafuente, Historia de España*, vol. ii. pp. 360–363 ; and says Lafuente, p. 384, " Recaredo fué el primero que con todo el ardor de un néofito, comenzó en el tercer concilio toledano á dar á estas asambleas conocimiento y decision en negocios pertenecientes al gobierno temporal de los pueblos." Similarly, Antequera (*Historia de la Legislacion*, p. 31) is happy to observe that " Recaredo abjuró la heregía arriana, abrazó decididamente la religion de Jesu-Cristo, y *concedió á los ministros de la iglesia una influencia en el gobierno del Estado, que vino á ser en adelante, ilimitada y absoluta.*"

[16] " As for the councils held under the Visigoth kings of Spain during the seventh century, it is not easy to determine whether they are to be considered as ecclesiastical or temporal assemblies. No kingdom was so thoroughly under the bondage of the hierarchy as Spain." *Hallam's Middle Ages*, edit. 1846, vol. i. p. 511. " Les prêtres étaient les seuls qui avaient conservé et même augmenté leur influence dans la monarchie gothespagnole." *Sempere, Histoire des Cortès d'Espagne*, Bordeaux, 1815, p. 19. Compare *Lafuente, Historia de España*, vol. ii. p. 368, on " la influencia y preponderancia del clero, no ya solo en los negocios eclesiásticos, sino tambien en los políticos y de estado."

[17] " But it is in Spain, after the Visigoths had cast off their Arianism, that the bishops more manifestly influence the whole character of the legislation. The synods of Toledo were not merely national councils, but parliaments of the realm." *Milman's History of Latin Christianity*, London, 1854, vol. i. p. 380. See also *Antequera, Historia de la Legislacion Española*, pp. 41, 42.

[18] In 633, at a council of Toledo, the king " s'étant prosterné à terre devant les évêques." *Fleury, Histoire Ecclésiastique*, vol. viii. p. 308, Paris, 1758.

[19] In 688, at a council of Toledo, " le roi Egica y étoit en personne ; et après s'être prosterné devant les évêques, *suivant la coutume*, il fit lire un mémoire où il leur demandoit conseil," etc. *Fleury, Histoire Ecclésiastique*, vol. ix. p. 89, Paris, 1758.

[20] See a short but admirable summary of this part of the Visigothic code in *Dunham's History of Spain*, vol. iv. pp. 77–78 ; perhaps the best history in the English language of a foreign modern country. " In Spain, the bishops had a special charge to keep continual watch over the administration of justice, and were summoned on all great occasions to instruct the judges to act with piety and justice." *Milman's History of Latin Christianity*, 1854, vol. i. p. 386. The council of Toledo, in 633, directs bishops to admonish judges. *Fleury, Histoire Ecclésiastique*, vol. viii. p. 313 ; and a learned Spanish lawyer, Sempere, says of the bishops, " Le code du *Fuero Juzgo* fut leur ouvrage ; les juges étaient sujets à leur juridiction ; les plaideurs, grevés par la sentence des juges,

ascendency of the clergy is that the laws against heretics were harsher in Spain than in any other country; the Jews in particular being persecuted with unrelenting rigour.[21] Indeed, the desire of upholding the faith was strong enough to produce a formal declaration that no sovereign should be acknowledged unless he promised to preserve its purity; the judges of the purity being of course the bishops themselves, to whose suffrage the king owed his throne.[22]

Such were the circumstances which, in and before the seventh century, secured to the Spanish Church an influence unequalled in any other part of Europe.[23] Early in the eighth century an event occurred which apparently broke up and dispersed the hierarchy, but which in reality was extremely favourable to them. In 711 the Mohammedans sailed from Africa, landed in the south of Spain, and in the space of three years conquered the whole country, except the almost inaccessible regions of the north-west. The Spaniards, secure in their native

pouvaient se plaindre aux évêques, et ceux-ci évoquer ainsi leurs arrêts, les réformer, et châtier les magistrats. Les procureurs du roi, comme les juges, étaient obligés de se présenter aux synodes diocésains annuels, pour apprendre des ecclésiastiques l'administration de la justice; enfin le governement des Goths n'était qu'une monarchie théocratique." *Sempere, Monarchie Espagnole*, Paris, 1826, vol. i. p. 6, vol. ii. pp. 212–214.

[21] "The terrible laws against heresy, and the atrocious juridical persecutions of the Jews, already designate Spain as the throne and centre of merciless bigotry." *Milman's History of Latin Christianity*, vol. i. p. 381. "Tan luego como la religion católica se halló dominando en el trono y en el pueblo, comenzaron los concilianos toledanos á dictar disposiciones canónicas y á prescribir castigos contra los idólatras, contra los judios, y contra los hereges." *Lafuente, Historia de España*, vol. ix. pp. 199–200. See also p. 214, and vol. ii. pp. 406, 407, 451. *Prescott's History of Ferdinand and Isabella*, vol. i. pp. 235, 236. *Johnston's Institutes of the Civil Law of Spain*, p. 262. *Circourt, Histoire des Arabes d'Espagne*, vol. i. pp. 260, 261; and *Southey's Chronicle of the Cid*, p. 18. I particularly indicate these passages, on account of the extraordinary assertion of Dr. M'Crie, that "on a review of criminal proceedings in Spain anterior to the establishment of the Court of Inquisition, it appears in general that heretics were more mildly treated there than in other countries." *M'Crie's History of the Reformation in Spain*, p. 83, the best book on the Spanish Protestants. [M'Crie's statement is perfectly accurate, and is endorsed by the latest historian of Spain, U. R. Burke. "From the death of Roderic to the birth of Isabella, no government in western Europe was less disposed to religious persecution than that of Aragon; no Christian sovereigns were less devoted to Rome than those of Castile. From the conversion of Recared to the rout of the Guadalete—a single century of unchecked and humiliating decadence—the government of Spain had indeed been distinctly and deplorably intolerant; but from the advent of Taric to the appearance of Torquemada the religious independence and the religious toleration of kings and people compare favourably with those of any country in Europe" (*History of Spain*, Hume's ed. ii. 55). Buckle has failed to discriminate between the epochs. And Milman should have remembered that persecution of Jews went on simultaneously in the East and the West in the period of which he speaks; and for the same reason—the increase of the Jews in numbers and wealth. Cp. Finlay, *History of Greece from its Conquest by the Romans*, ed. Tozer, i. 310, 315, 325, 326; ii. 34. It will be observed that the words of Lafuente, cited above, do not contradict M'Crie. See also *M. A. S. Hume's The Spanish People*, 1900, p. 177.—Ed.]

[22] A council of Toledo in 638 orders "qu'à l'avenir aucun roi ne montera sur le trône qu'il ne promette de conserver la foi catholique;" and at another council in 681, "le roi y présenta un écrit par lequel il prioit les évêques de lui assurer le royaume, qu'il tenoit de leurs suffrages." *Fleury, Histoire Ecclésiastique*, vol. viii. p. 339, vol. ix. p. 70.

[23] Those happy times have received the warm applause of a modern theologian, because in them the church "ha opuesto un muro de bronce al error;" and because there existed "la mas estrecha concordia entre el imperio y el sacerdocio, por cuyo inestimable beneficio debemos hacer incesantes votos." *Observaciones sobre El Presente y El Porvenir de la Iglesia en España, por Domingo Costa y Borras, Obispo de Barcelona*, Barcelona, 1857, pp. 73, 75.

mountains,[24] soon recovered heart, rallied their forces, and began in their turn to assail the invaders. A desperate struggle ensued, which lasted nearly eight centuries, and in which, a second time in the history of Spain, a war for independence was also a war for religion; the contest between Arabian Infidels and Spanish Christians succeeding that formerly carried on between the Trinitarians of France and the Arians of Spain. Slowly, and with infinite difficulty, the Christians fought their way. By the middle of the ninth century they reached the line of the Douro.[25] Before the close of the eleventh century they conquered as far as the Tagus, and Toledo, their ancient capital, fell into their hands in 1085.[26] Even then much remained to be done. In the south the struggle assumed its deadliest form, and there it was prolonged with such obstinacy that it was not until the capture of Malaga in 1487, and of Granada in 1492, that the Christian empire was re-established, and the old Spanish monarchy finally restored.[27]

The effect of all this on the Spanish character was most remarkable. During eight successive centuries the whole country was engaged in a religious crusade; and those holy wars which other nations occasionally waged were in Spain prolonged and continued for more than twenty generations.[28] The object being not only to regain a territory but also to re-establish a creed, it naturally happened that the expounders of that creed assumed a prominent and important position. In the camp and in the council-chamber the voice of ecclesiastics was heard and obeyed; for as the war aimed at the propagation of Christianity, it seemed right that her ministers should play a conspicuous part in a matter

[24] To which they fled with a speed which caused their great enemy, Muza, to pass upon them a somewhat ambiguous eulogy. "Dijo, son leones en sus castillos, águilas en sus caballos, y mugeres en sus escuadrones de á pié; pero si ven la ocasion la saben aprovechar, y cuando quedan vencidos son cabras en escapar á los montes, que no ven la tierra que pisan." *Conde, Historia de la Dominacion de los Arabes*, p. 30.

[25] *Prescott's History of Ferdinand and Isabella*, vol. i. pp. xxxviii. 287. Lafuente (*Historia de España*, vol. iii. p. 363) marks the epoch rather indistinctly, "basta ya el Duero." Compare *Florez, Memorias de las Reynas Catholicas*, Madrid, 4to, 1761, vol. i. p. 68.

[26] There is a spirited account of its capture in *Mariana's Historia de España*, vol. ii. pp. 506–513; after which Ortiz (*Compendio de la Historia*, vol. iii. p. 156) and Lafuente (*Historia General*, vol. iv. pp. 236–242) are rather tame. The Mohammedan view of this, the first decisive blow to their cause, will be found in *Conde, Historia de la Dominacion de los Arabes*, p. 347. "Asi se perdió aquella inclita ciudad, y acabó el reino de Toledo con grave perdida del Islam." The Christian view is that "concedió Dios al Rey la conquista de aquella capital." *Florez, Reynas Catholicas*, vol. i. p. 165.

[27] *Circourt, Histoire des Arabes*, vol. i. pp. 313, 349. *Conde, Dominacion de los Arabes*, pp. 656, 664. *Ortiz, Compendio*, vol. v. pp. 509, 561. *Lafuente, Historia*, vol. ix. pp. 341, 399.

[28] "According to the magnificent style of the Spanish historians, eight centuries of almost uninterrupted warfare elapsed, and three thousand seven hundred battles were fought, before the last of the Moorish kingdoms in Spain submitted to the Christian arms." *Robertson's Charles V.* by Prescott, London, 1857, p. 65. "En nuestra misma España, en Leon y Castilla, en esta nueva Tierra Santa, donde se sostenia una cruzada perpétua y constante contra los infieles, donde se mantenia en todo su fervor el espíritu á la vez religioso y guerrero." *Lafuente, Historia de España*, vol. v. p. 293. "Era España theatro de una continua guerra contra los enemigos de la Fe." *Florez, Reynas Catholicas*, vol. i. p. 226. "El glorioso empeño de exterminar á los enemigos de la Fe." p. 453. "Esta guerra sagrada." Vol. ii. p. 800. "Se armaron nuestros Reyes Catholicos, con zelo y animo alentado del cielo; y como la causa era de Religion para ensanchar los Dominios de la Fe, sacrificaron todas las fuerzas del Reyno, y sus mismas personas." p. 801. What was called the Indulgence of the Crusade was granted by the Popes "aux Espagnols qui combattoient contre les Mores." *Fleury, Histoire Ecclésiastique*, vol. xviii. p. xxi., vol. xix. pp. 158, 458, vol. xxi. p. 171.

which particularly concerned them.[29] The danger to which the country was exposed being moreover very imminent, those superstitious feelings were excited which danger is apt to provoke, and to which, as I have elsewhere shown,[30] the tropical civilizations owed some of their leading peculiarities. Scarcely were the Spanish Christians driven from their homes and forced to take refuge in the north, when this great principle began to operate. In their mountainous retreat they preserved a chest filled with relics of the saints, the possession of which they valued as their greatest security.[31] This was to them a national standard, round which they rallied, and by the aid of which they gained miraculous victories over their Infidel opponents. Looking upon themselves as soldiers of the Cross, their minds became habituated to supernatural considerations to an extent which we can now hardly believe, and which distinguished them in this respect from every other European nation.[32] Their young men saw visions, and their old men dreamed dreams.[33] Strange sights were vouchsafed to them from heaven; on the eve of a battle mysterious portents appeared; and it was observed that whenever the Mohammedans violated the tomb of a Christian saint, thunder and lightning were sent to rebuke the misbelievers, and, if need be, to punish their audacious invasion.[34]

[29] "En aquellos tiempos [y duró hasta todo el siglo xv. y toma de Granada] eran los obispos los primeros capitanes de los exércitos." *Ortiz, Compendio*, vol. iii. p. 189. "Los prelados habian sido siempre los primeros no solo en promover la guerra contra Moros, sino á presentarse en campaña con todo su poder y esfuerzo, animando á los demas con las palabras y el exemplo." Vol. v. pp. 507, 508.

[30] Above, pp. 67, 84.

[31] "Les chrétiens avoient apporté dans les Asturies une arche ou coffre plein de reliques, qu'ils regardèrent depuis comme la sauve-garde de leur état." . . . "Elle fut emportée et mise enfin à Oviedo, comme le lieu le plus sûr entre ces montagnes, l'ère 773, l'an 775." *Fleury, Histoire Ecclésiastique*, vol. ix. p. 190. This "arca llena de reliquias" was taken to the Asturias in 714. *Mariana, Historia de España*, vol. ii. p. 227; and, according to Ortiz (*Compendio*, vol. ii. p. 182), it was "un tesoro inestimable de sagradas reliquias." See also *Geddes' Tracts concerning Spain*, vol. ii. p. 237, London, 1730; and *Ford's Spain*, 1847, p. 388. [Such relics were similarly esteemed in all other Christian countries at that period, and for centuries afterwards.—Ed.]

[32] "But no people ever felt themselves to be so absolutely soldiers of the Cross as the Spaniards did, from the time of their Moorish wars; no people ever trusted so constantly to the recurrence of miracles in the affairs of their daily life; and therefore no people ever talked of Divine things as of matters in their nature so familiar and commonplace. Traces of this state of feeling and character are to be found in Spanish literature on all sides." *Ticknor's History of Spanish Literature*, vol. ii. p. 333. Compare *Bouterwek's History of Spanish Literature*, vol. i. pp. 105, 106; and the account of the battle of las Navas in *Circourt, Histoire des Arabes d'Espagne*, vol. i. p. 153: "On voulait trouver partout des miracles." Some of the most startling of these miracles may be found in *Lafuente, Historia de España*, vol. v. p. 227; in *Mariana, Historia de España*, vol. ii. pp. 378, 395, vol. iii. p. 338; and in *Ortiz, Compendio*, vol. iii. p. 248, vol. iv. p. 22.

[33] One of the most curious of these prophetic dreams is preserved in *Conde, Dominacion de los Arabes*, pp. 378, 379, with its interpretation by the theologians. They were for the most part fulfilled. In 844 "El Apóstol Santiago, segun que lo prometiera al Rey, fué visto en un caballo blanco, y con una bandera blanca y en medio della una cruz roxa, que capitaneaba nuestra gente." *Mariana, Historia de España*, vol. ii. pp. 310, 311. In 957 "El Apóstol Santiago fué visto entre las haces dar la victoria á los fieles," p. 382. In 1236 "Publicóse por cierto que San Jorge ayudó á los Christianos, y que se halló en la pelea." Vol. iii. p. 323. On the dreams which foreshadowed these appearances, see *Mariana*, vol. ii. pp. 309, 446, vol. iii. pp. 15, 108. [Dreams, visions, and miracles, such as are above described, were common to all Christendom at the same period.—Ed.]

[34] "Priests mingled in the council and the camp, and, arrayed in their sacerdotal robes, not unfrequently led the armies to battle. They interpreted the will of Heaven as mysteriously revealed in dreams and visions. Miracles were a familiar occurrence. The violated tombs of the saints sent forth thunders and lightnings to consume the invaders." *Prescott's History of Ferdinand and Isabella*, vol. i. p. xxxix. In the middle

Under circumstances like these the clergy could not fail to extend their influence; or, we may rather say, the course of events extended it for them. The Spanish Christians, pent up for a considerable time in the mountains of Asturias, and deprived of their former resources, quickly degenerated, and soon lost the scanty civilization to which they had attained. Stripped of all their wealth, and confined to what was comparatively a barren region, they relapsed into barbarism, and remained for at least a century without arts, or commerce, or literature.[35] As their ignorance increased, so also did their superstition; while this last, in its turn, strengthened the authority of their priests. The order of affairs, therefore, was very natural. The Mohammedan invasion made the Christians poor; poverty caused ignorance; ignorance caused credulity, and credulity, depriving men both of the power and of the desire to investigate for themselves, encouraged a reverential spirit, and confirmed those submissive habits, and that blind obedience to the Church, which form the leading and most unfortunate peculiarity of Spanish history.*

From this it appears that there were three ways in which the Mohammedan invasion strengthened the devotional feelings of the Spanish people. The first way was by promoting a long and obstinate religious war; the second was by the presence of constant and imminent dangers; and the third way was by the poverty, and therefore the ignorance, which it produced among the Christians.†

of the ninth century, there happened the following event: "En lo mas cruel de los tormentos" [to which the Christians were exposed] "subió Abderramen un dia á las azuteas ó galerias de su Palacio. Descubrió desde alli los cuerpos de los Santos martirizados en los patíbulos y atravesados con los palos, mandó los quemasen todos para que no quedase reliquia. Cumplióse luego la orden: pero aquel impio probó bien presto los rigores de la venganza divina que volvía por la sangre derramada de sus Santos. Improvisamente se le pegó la lengua al paladar y fauces; cerrósele la boca, y no pudo pronunciar una palabra, ni dar un gemido. Conduxeronle sus criados á la cama, murió aquella misma noche, y antes de apagarse las hogueras en que ardian los santos cuerpos, entró la infeliz alma de Abderramen en los eternos fuegos del infierno." *Ortiz, Compendio*, vol. iii. p. 52.

[35] Circourt (*Histoire des Arabes*, vol. i. p. 5) says, "Les chrétiens qui ne voulurent pas se soumettre furent rejetés dans les incultes ravins des Pyrénées, où ils purent se maintenir

[* The same characteristics have been above specified as well established *before* the Moslem invasion. The present argument is thus on the face of the case supererogatory, and, being deductive, cannot avail against the historical testimonies of McCrie and Burke, before cited.—Ed.]

[† It is here taken for granted that "wars of religion" always deepen or develop religious faith. In point of fact, nearly all religious wars are found to be followed by a growth of scepticism, though in some of the combatants and onlookers they may deepen fanaticism. Thus growths of scepticism certainly followed on the Crusades, the wars of Catholics and Protestants in France, the Thirty Years' War, and the Great Rebellion in England, in which religious feeling was largely involved. Buckle, in positing "scepticism" as a vital factor in progress, failed to note that this is one of the ways in which scepticism is most effectively generated in a previously uncritical community. Of course the spectacle of mere self-seeking in churchmen, apart from civil war, may act in the same way—as in the intellectual life of Renaissance Italy, and the England of the Reformation period. Taking the Spanish case inductively, we find that the period of racial strife is positively *not* one of religious earnestness or fanaticism. The wars were in general rather tribal than religious: Christians often fought with Christians, and Moslems with Moslems: pretenders of each religion sometimes found shelter and help with rulers of the other: and the Cid, in particular, was simply a free lance, who often fought for Moslems against Christians (*Burke's History*, Hume's ed., i. 185–193). Thus on neither side was there any predominant fanaticism, though both tended to be ferocious. Among the Moors, we know, there was much scepticism up to the period of decline, when fanaticism won the upper hand. Altogether, the case is much more complex than Buckle here recognises.—Ed.]

These events being preceded by the great Arian war, and being accompanied and perpetually reinforced by those physical phenomena which I have indicated as tending in the same direction, worked with such combined and accumulated energy that in Spain the theological element became not so much a component of the national character, but rather the character itself.* The ablest and most ambitious of the Spanish kings were compelled to follow in the general wake ;† and despots though they were, they succumbed to that pressure of opinions which they believed they were controlling. The war with Granada, late in the fifteenth century, was theological far more than temporal ; and Isabella, who made the greatest sacrifices in order to conduct it, and who in capacity as well as in honesty was superior to Ferdinand, had for her object not so much the acquisition of territory as the propagation of the Christian faith.[36] Indeed, any doubts which could be entertained respecting the purpose of the contest must have been dissipated by subsequent events. For scarcely was the war brought to a close, when Ferdinand and Isabella issued a decree expelling from the country every Jew who refused to deny his faith ; so that the soil of Spain might be no longer polluted by the presence of unbelievers.[37] To make them Christians, or, failing

comme les bêtes fauves se maintiennent dans les forêts." But the most curious account of the state of the Spanish Christians in the last half of the eighth century, and in the first half of the ninth, will be found in *Conde, Historia de la Dominacion*, pp. 95, 125. " Referian de estos pueblos de Galicia que son cristianos, y de los mas bravos de Afranc ; pero que viven como fieras, que nunca lavan sus cuerpos ni vestidos, que no se los mudan, y los llevan puestos hasta que se los caen despedazados en andrajos, que entran unos en las casas de otros sin pedir licencia." . . . In A.D. 815, " no habia guerra sino contra cristianos por mantener frontera, y no con deseo de ampliar y extender los limites del reino, ni por esperanza de sacar grandes riquezas, por ser los cristianos gente pobre de montaña, sin saber nada de comercio ni de buenas artes."

[36] " Isabella may be regarded as the soul of this war. She engaged in it with the most exalted views, less to acquire territory than to re-establish the empire of the Cross over the ancient domain of Christendom." *Prescott's History of Ferdinand and Isabella*, vol. i. p. 392. Compare *Fleury, Histoire Ecclésiastique*, vol. xxiii. p. 583, " bannir de toute l'Espagne la secte de Mahomet ; " and *Circourt, Histoire des Arabes d'Espagne*, vol. ii. pp. 99, 109, " pour elle une seule chose avait de l'importance ; extirper de ses royaumes le nom et la secte de Mahomet." . . . " Sa vie fut presque exclusivement consacrée à faire triompher la croix sur le croissant." Mariana (*Historia de España*, vol. v. p. 344, and vol. ii. pp. 51, 52) has warmly eulogized her character, which indeed, from the Spanish point of view, was perfect. See also *Florez, Reynas Catholicas*, vol. ii. pp. 774, 788, 829. [This is an express admission that Isabella followed her *own* bent, and was *not* coerced by a national tendency.—Ed.]

[37] " En España los Reyes Don Fernando y Doña Isabel luego que se viéron desembarazados de la guerra de los Moros, acordáron de echar de todo su reyno á los Judíos." *Mariana, Historia de España*, vol. vi. p. 303. A Spanish historian, writing less than seventy years ago, expresses his approbation in the following terms : " Arrancado de nuestra peninsula el imperio Mahometano, quedaba todavía la secta Judayca, peste acaso mas perniciosa, y sin duda mas peligrosa y extendida, por estar los Judíos establecidos en todos los pueblos de ella. Pero los Catolicos Monarcas, cuyo mayor afan era desarraigar de sus reynos toda planta y raiz infecta y contraria á la fé de Jesu-Cristo, dieron decreto en Granada dia 30 de Marzo del año mismo de 1492, mandando saliesen de sus dominios los Judíos, que no se bautizasen dentro de 4 meses." *Ortiz, Compendio*, Madrid, 1798, vol. v. p. 564. The importance of knowing how these and similar events are judged by Spaniards, induces me to give their own words at a length which otherwise would

[* On this view, a nation's " character " can change again and again ; in which case the phrase loses all specific meaning.—Ed.]

[† This is a begging of the question. The historical evidence, as noted above, p. 536, goes to show that before Ferdinand and Isabella Spain was not a specially fanatical country ; and these rulers certainly imposed the Inquisition on a resisting people. See *Burke's History*, ch. xl.—Ed.]

in that, to exterminate them, was the business of the Inquisition, which was established in the same reign, and which before the end of the fifteenth century was in full operation.[38] During the sixteenth century the throne was occupied by two princes of eminent ability, who pursued a similar course. Charles V., who succeeded Ferdinand in 1516, governed Spain for forty years, and the general character of his administration was the same as that of his predecessors.* In regard to his foreign policy, his three principal wars were against France, against the German princes, and against Turkey. Of these the first was secular; but the two last were essentially religious. In the German war he defended the church against innovation; and at the battle of Muhlberg he so completely humbled the Protestant princes as to retard for some time the progress of the Reformation.[39] In his other great war he, as the champion of Christianity against Mohammedanism, consummated what his grandfather Ferdinand had begun. Charles defeated and dislodged the Mohammedans in the East, just as Ferdinand had done in the West; the repulse of the Turks before Vienna being to the sixteenth century what the conquest of the Arabs of Granada was to the fifteenth.[40] It was therefore with reason that Charles, at the close of his career, could boast that he had always preferred his creed to his country, and that the first object of his ambition had been to maintain the interests of Christianity.[41]

be needlessly prolix. Historians, generally, are too apt to pay more attention to public transactions than to the opinions which those transactions evoke; though in point of fact the opinions form the most valuable part of history, since they are the result of more general causes, while political actions are often due to the peculiarities of powerful individuals.

Of the number of Jews actually expelled I can find no trustworthy account. They are differently estimated at from 160,000 to 800,000. *Prescott's History of Ferdinand and Isabella*, vol. ii. p. 148. *Mariana, Historia de España*, vol. vi. p. 304. *Ortiz, Compendio*, vol. v. p. 564. *Lafuente, Historia de España*, vol. ix. pp. 412, 413. *Llorente, Histoire de l'Inquisition*, Paris, 1817, vol. i. p. 261. *Mata, Dos Discursos*, Madrid, 1794, pp. 64, 65. *Castro, Decadencia de España*, Cadiz, 1852, p. 19.

[38] It had been introduced into Aragon in 1242; but, according to M. Tapia, "sin embargo, la persecucion se limitó entonces á la secta de los albigenses; y como de ellos hubo tan pocos en Castilla, no se consideró sin duda necesario en ella el establecimiento de aquel tribunal." *Tapia, Historia de la Civilizacion Española*, Madrid, 1840, vol. ii. p. 302. Indeed, Llorente says (*Histoire de l'Inquisition d'Espagne*, Paris, 1817, vol. i. p. 88), "Il est incertain si au commencement du 15e siècle l'Inquisition existait en Castille." In the recent work by M. Lafuente, 1232 is given as its earliest date; but "á fines del siglo xiv. y principios del xv. apenas puede saberse si existia tribunal de Inquisicion en Castilla." *Lafuente, Historia de España*, vol. ix. pp. 204–206, Madrid, 1852. It seems therefore with good reason that Mariana (*Historia*, vol. vi. p. 171) terms the Inquisition of Ferdinand and Isabella "un *nuevo* y santo tribunal." See also *Florez, Memorias de las Reynas Catholicas*, vol. ii. p. 799. [This virtually concedes the proposition of McCrie, scouted above in *note* 21.—Ed.]

[39] *Prescott's History of Philip II.*, vol. i. p. 23, London, 1857. *Davies' History of Holland*, vol. i. p. 447, London, 1841. On the religious character of his German policy, compare *Mariana, Historia de España*, vol. vii. p. 330; *Ortiz, Compendio*, vol. vi. pp. 195, 196. [Charles's anti-Lutheran policy was certainly ruled by political no less than by religious motives, as was that of Francis I.—Ed.]

[40] *Prescott's Philip II.*, vol. i. p. 3; and the continuation of *Fleury, Histoire Ecclésiastique*, vol. xxvii. p. 280. Robertson, though praising Charles V. for this achievement, seems rather inclined to underrate its magnitude; *History of Charles V.*, p. 246.

[41] In the speech he made at his abdication, he said that "he had been ever mindful of the interests of the dear land of his birth, but above all of the great interests of Christianity. His first object had been to maintain these inviolate against the infidel." *Prescott's*

[* Charles, be it observed, was a *Teuton* by descent, by education, and by physiological type; and as emperor of Germany he lay open to Teutonic as well as to Spanish influences. The argument as to Spanish bias is thus not made out.—Ed.]

The zeal with which he struggled for the faith also appears in his exertions against heresy in the Low Countries. According to contemporary and competent authorities, from fifty thousand to a hundred thousand persons were put to death in the Netherlands during his reign on account of their religious opinions.[42] Later inquirers have doubted the accuracy of this statement,[43] which is probably exaggerated; but we know that between 1520 and 1550 he published a series of laws to the effect that those who were convicted of heresy should be beheaded, or burned alive, or buried alive. The penalties were thus various, to meet the circumstances of each case. Capital punishment, however, was always to be inflicted on whoever bought an heretical book, or sold it, or even copied it for his own use.[44] His last advice to his son well accorded with these measures. Only a few days before his death he signed a codicil to his will, recommending that no favour should ever be shown to heretics; that they should all be put to death; and that care should be taken to uphold the Inquisition, as the best means of accomplishing so desirable an end.[45]

Philip II., vol. i. p. 8. Miñana boasts that "el César con piadoso y noble ánimo exponia su vida á los peligros para extender los limites del Imperio Christiano." *Continuacion de Mariana*, vol. viii. p. 352. Compare the continuation of *Fleury, Histoire Ecclésiastique*, vol. xxxi. p. 19. [Charles's claim at the close of his life, when he retired to the cloister, is not good evidence for his real motives in earlier life. His sack of Rome cannot possibly be reconciled with his final pretences. And Motley includes "fanaticism for the faith" among the qualities which Charles "not only lacked but despised" (*Rise of the Dutch Republic*, 1–vol. ed. 1863, p. 63). Compare Prescott, *Philip II.*, Kirk's ed. 1894, p. 124. —Ed.]

[42] Grotius says 100,000; Bor, Meteren, and Paul say 50,000. *Watson's History of Philip II.*, London, 1839, pp. 45, 51. *Davies' History of Holland*, London, 1841, vol. i. pp. 498, 499. *Motley's Dutch Republic*, London, 1858, vol. i. pp. 103, 104.

[43] It is doubted, if I rightly remember, by Mr. Prescott. But the opinion of that able historian is entitled to less weight from his want of acquaintance with Dutch literature, where the principal evidence must be sought for. On this, as on many other matters, the valuable work of Mr. Motley leaves little to desire. [Motley not only gives no new evidence whatever from Dutch literature for the statement in question, but admits that the figures of the Venetian Navigero, who estimated the victims at thirty thousand in 1546, are "doubtless inaccurate." As Buckle admits the common statement to be "probably exaggerated," his remark on Prescott is beside the case. The latter had good grounds for his doubt, for which he gives his reasons (*Hist. of Philip II.*, Kirk's ed. 1894 pp. 149–50.—Ed.]

[44] *Prescott's Philip II.*, vol. i. pp. 196, 197. In 1523 the first persons were burned. *Motley's Dutch Republic*, vol. i. p. 69. The mode of burying alive is described in *Davies' History of Holland*, vol. i. p. 383, vol. ii. pp. 311, 312.

[45] He died on the 21st September; and on the 9th he signed a codicil, in which he "enjoined upon his son to follow up and bring to justice every heretic in his dominions, and this without exception, and without favour or mercy to any one. He conjured Philip to cherish the holy Inquisition as the best means of accomplishing this good work." *Prescott's Additions to Robertson's Charles V.*, p. 576. See also his instructions to Philip in *Raumer's History of the Sixteenth and Seventeenth Centuries*, vol. i. p. 91; and on his opinion of the Inquisition, see his conversation with Sir Thomas Wyatt, printed from the State Papers in *Froude's History of England*, vol. iii. p. 456, London, 1858. This may have been mere declamation; but in *Tapia's Civilizacion Española*, Madrid, 1840, vol. iii. pp. 76, 77, will be found a deliberate and official letter, in which Charles does not hesitate to say, "La santa inquisicion como oficio santo y puesto por los reyes católicos nuestros señores y abuelos á honra de Dios nuestro senor y de nuestra santa fé católica, tengo firme é entrañablemente asentado y fijado en mi corazon, para la mandar favorecer y honrar, como principe justo y temeroso de Dios es obligado y debe hacer."

The codicil to the will of Charles still exists, or did very recently, among the archives at Simancas. *Ford's Spain*, 1847, p. 334. In M. Lafuente's great work, *Historia de España*, vol. xii. pp. 494, 495, Madrid, 1853, it is referred to in language which, in more

This barbarous policy is to be ascribed not to the vices nor to the temperament of the individual ruler, but to the operation of large general causes, which acted upon the individual and impelled him to the course he pursued. Charles was by no means a vindictive man ; his natural disposition was to mercy rather than to rigour ; his sincerity is unquestionable ; he performed what he believed to be his duty ; and he was so kind a friend that those who knew him best were precisely those who loved him most.[46] Little, however, could all that avail in shaping his public conduct. He was obliged to obey the tendencies of the age and country in which he lived.* And what those tendencies were, appeared still more clearly after his death, when the throne of Spain was occupied upwards of forty years by a prince who inherited it in the prime of life, and whose reign is particularly interesting as a symptom and a consequence of the disposition of the people over whom he ruled.

Philip II., who succeeded Charles V. in 1555, was indeed eminently a creature of the time, and the ablest of his biographers aptly terms him the most perfect type of the national character.[47] His favourite maxim, which forms the key to his policy, was, " That it is better not to reign at all than to reign over heretics." [48] Armed with supreme power, he bent all his energies towards carrying this principle

senses than one, is perfectly Spanish : " Su testamento y codicilo respiran las ideas cristiansa y religiosas en que habia vivido y la piedad que señaló su muerte." . . . " Es muy de notar su primera cláusula [i.e. of the codicil] por la cual deja muy encarecidamente recomendado al rey don Felipe que use de todo rigor en el castigo de los hereges luteranos que habian sido presos y se hubieren de prender en España." . . . " ' Sin escepcion de persona alguna, ni admitir ruegos, ni tener respeto á persona alguna ; porque para el efecto de ello favorezca y mande favorecer al Santo Oficio de la Inquisicion,' " etc.

[46] Native testimony may perhaps be accused of being partial ; but on the other hand Raumer, in his valuable *History of the Sixteenth and Seventeenth Centuries*, vol. i. p. 22, justly observes that his character has been misrepresented " by reason that historians have availed themselves by preference of the inimical narratives of French and Protestant writers." To steer between these extremes, I will transcribe the summing up of Charles's reign as it is given by a learned and singularly unprejudiced writer. " Tortuous as was sometimes the policy of the emperor, he never, like Francis, acted with treachery ; his mind had too much of native grandeur for such baseness. Sincere in religion and friendship, faithful to his word, clement beyond example, liberal towards his servants, indefatigable in his regal duties, anxious for the welfare of his subjects, and generally blameless in private life, his character will not suffer by a comparison with that of any monarch of his times." *Dunham's History of Spain*, vol. v. p. 41. " Clemency was the basis of his character," p. 30. [After praising Motley as in note 43, Buckle should here have noted *his* opinion on Charles: " He was as false as water " (*Rise of the Dutch Republic*, 1-vol. ed. 1863, p. 63). The same authority pronounces Charles grossly niggardly towards his servants, treacherous, fraudulent, and regardless of the welfare of his subjects ; and as to his private habits says : " He was addicted to vulgar and miscellaneous incontinence " (p. 64). What Dunham meant by his eulogy on that score it is hard to guess. Motley founds on a *Spanish* authority.—Ed.]

[47] " The Spaniards, as he grew in years, beheld with pride and satisfaction, in their future sovereign, the most perfect type of the national character." *Prescott's History of Philip II.*, vol. i. p. 39. So, too, in *Motley's Dutch Republic*, vol. i. p. 128, " he was entirely a Spaniard ; " and in *Lafuente, Historia de España*, vol. i. p. 155, " pero el reinado de Felipe fué todo Español." [Buckle omits to note that Motley tells (1-vol. ed. 1863, p. 76) how " many good Catholics thought Philip much more religious than was becoming to his rank and age." Cp. Prescott, *Philip II.*, Kirk's ed. p. 656.—Ed.]

[48] *Prescott's Philip II.*, vol. i. pp. 68, 210, vol. ii. p. 26. *Watson's Philip II.*, p. 55. Compare *Fleury, Histoire Ecclésiastique*, vol. xxxiv. p. 273.

[* In the time of Charles, Henry VIII. of England overthrew the Catholic hierarchy in defiance of his " age " and of the bias of his people. The formula " obliged to obey " will not bear examination, nor will the account of Charles' character given in the text.—Ed.]

into effect. Directly that he heard that the Protestants were making converts in Spain, he strained every nerve to stifle the heresy ;[49] and so admirably was he seconded by the general temper of the people * that he was able without risk to suppress opinions which convulsed every other part of Europe. In Spain, the Reformation, after a short struggle, died completely away, and in about ten years the last vestige of it disappeared.[50] The Dutch † wished to adopt, and in many instances did adopt, the reformed doctrine ; therefore Philip waged against them a cruel war, which lasted thirty years, and which he continued till his death, because he was resolved to extirpate the new creed.[51] He ordered that every heretic who refused to recant should be burned. If the heretic did recant, some indulgence was granted ; but having once been tainted, he must die. Instead of being burned, he was therefore to be executed.[52] Of the number of those who actually suffered in the Low Countries we have no precise information ;[53] but Alva triumphantly boasted that, in the five or six years of his administration, he had put to death in cold blood more than eighteen thousand, besides a still greater number whom he had slain on the field of battle.[54] This, even during

[49] " Como era tan zeloso en la extirpacion de la heregía, uno de sus primeros cuidados fué el castigo de los Luteranos ; y á presencia suya, se executó en Valladolid el dia ocho de Octubre el suplicio de muchos reos de este delito." *Miñana, Continuacion de Mariana*, vol. ix. p. 212.

[50] " The contest with Protestantism in Spain, under such auspices, was short. It began in earnest and in blood about 1559, and was substantially ended in 1570." *Ticknor's History of Spanish Literature*, vol. i. p. 425. See also *M'Crie's History of the Reformation in Spain*, pp. 336, 346. Thus it was that " España se preservó del contagio. Hízolo con las armas Carlos V., y con las hogueras los inquisidores. España se aislo del movimiento europeo." *Lafuente, Historia de España*, vol. i. p. 144, Madrid, 1850. M. Lafuente adds that in his opinion all Christendom is about to follow the good example set by Spain of rejecting Protestantism. " Si no nos equivocamos, en nuestra misma edad se notan síntomas de ir marchando este problema hácia su resolucion. El catolicismo gana prosélitos ; los protestantes de hoy no son lo que antes fueron, y creemos que la unidad católica se realizará."

[51] Before the arrival of Alva, " Philip's commands to Margaret were imperative, to use her utmost efforts to extirpate the heretics." *Davies' History of Holland*, vol. i. p. 551; and in 1563 he wrote, " The example and calamities of France prove how wholesome it is to punish heretics with rigour." *Raumer's History of the Sixteenth and Seventeenth Centuries*, vol. i. p. 171. The Spaniards deemed the Dutch guilty of a double crime ; being rebels against God and the king : " Rebeldes á Dios por la heregía, y á su Principe á quien debian obedecer." *Mariana, Historia de España*, vol. vii. p. 410. " Tratauan de secreto de quitar la obediencia á Dios y á su Principe." *Vanderhammen's Don Filipe el Prudente Segundo deste Nombre*, Madrid, 1632, p. 44 rev. Or, as Miñana phrases it, Philip " tenia los mismos enemigos que Dios." *Continuacion de Mariana*, vol. x. p. 139.

[52] *Motley's Dutch Republic*, vol. i. p. 229. *Watson's Philip II.*, pp. 51, 52, 177.

[53] Mr. Motley, under the year 1566, says, " The Prince of Orange estimated that up to this period fifty thousand persons in the provinces had been put to death in obedience to the edicts. He was a moderate man, and accustomed to weigh his words." *Motley's Dutch Republic*, vol. i. pp. 424, 425.

[54] *Watson's Philip II.*, pp. 248, 249. Tapia (*Civilizacion Española*, vol. iii. p. 95) says,

[* It should be remembered that the persecution and expulsion of Protestants in Spain under Philip was on all fours with the procedure of his wife in England, where also the " general temper of the people " was clearly in favour of Catholicism. Thousands of Protestants left Spain; and many left England; but under Elizabeth they were able to return. That was the determining difference.—Ed.]

[† This loose phrasing obscures the facts. Protestant heresy in Holland was long confined to the " lower orders," and was cruelly persecuted with the full acquiescence of the upper for a whole generation before the nobles, become impoverished and seeing a chance of retrieving their fortunes by getting the Church lands, began a movement of armed resistance. See the editor's *Introd. to English Politics*, pp. 307 seq.—Ed.]

his short tenure of power, would make about forty thousand victims ; an estimate probably not far from the truth, since we know from other sources that in one year more than eight thousand were either executed or burned.[55] Such measures were the result of instructions issued by Philip, and formed a necessary part of his general scheme.[56] The desire paramount in his mind, and to which he sacrificed all other considerations, was to put down the new creed, and to re-instate the old one. To this, even his immense ambition and his inordinate love of power were subordinate. He aimed at the empire of Europe, because he longed to restore the authority of the Church.[57] All his policy, all his negotiations, all his wars, pointed to this one end. Soon after his accession he concluded an ignominious treaty with the Pope, that it might not be said that he bore arms against the head of the Christian world.[58] And his last great enterprise, in some respects the most important of all, was to fit out, at an incredible cost, that famous Armada with which he hoped to humble England, and to nip the heresy of Europe in its bud, by depriving the Protestants of their principal support, and of the only asylum where they were sure to find safe and honourable refuge.[59]

" quitó la vida á mas de diez y ocho mil protestantes con diversos géneros de suplicios." Compare *Motley's Dutch Republic.* vol. ii. p. 423, and *Davies' History of Holland,* vol. i. p. 608.

[55] *Davies' History of Holland,* vol. i. p. 567. Vanderhammen (*Don Filipe el Prudente,* Madrid, 1632, p. 52 rev.), with tranquil pleasure, assures us that " muriessen mil y setecientas personas en pocos dias con fuego, cordel y cuchillo en diuersos lugares."

[56] " El duque de Alba, obrando en conformidad á las instrucciones de su soberano, y apoyado en la aprobacion que merecian al rey todas sus medidas." *Lafuente, Historia de España,* vol. xiii. p. 221.

[57] " It was to restore the Catholic Church that he desired to obtain the empire of Europe." *Davies' History of Holland,* vol. ii. p. 329. " El protestó siempre ' que sus desinios en la guerra, y sus exercitos no se encaminauan á otra cosa, que al ensalçamiento de la Religion Christiana.' " *Vanderhammen's Don Filipe el Prudente,* p. 125. " El que aspiraba á someter todas las naciones de la tierra á su credo religioso." *Lafuente, Historia de España,* vol. xv. p. 203. The Bishop of Salamanca in 1563 openly boasted " que son roi ne s'étoit marié avec la reine d'Angleterre que pour ramener cette isle à l'obéissance de l'église." *Continuation de Fleury, Histoire Ecclésiastique,* vol. xxxiii. p. 331. Compare *Ortiz, Compendio,* vol. vi. p. 204. " Este casamiento no debió de tener otras miras que el de la religion."

[58] On this treaty, the only humiliating one which he ever concluded, see *Prescott's Philip II.*, vol. i. p. 104. His dying advice to his son was, " Siempre estareis en la obediencia de la Santa Iglesia Romana, y del Sumo Pontifice, teniendole por vuestro Padre espiritual." *Davila, Historia de la Vida de Felipe Tercero,* Madrid, 1771, folio, lib. i. p. 29. According to another writer, " La ultima palabra que le salió con el espiritu, fue : ' Yo muero como Catolico Christiano en la Fe y obediencia de la Iglesia Romana, y respeto al Papa, como á quien trae en sus manos las llaues del Cielo, como á Principe de la Iglesia, y Teniente de Dios sobre el imperio de las almas.' " *Vanderhammen, Don Filipe el Prudente,* p. 124.

[59] Elizabeth, uniting the three terrible qualities of heresy, power, and ability, was obnoxious to the Spaniards to an almost incredible degree, and there never was a more thoroughly national enterprise than the fitting out of the Armada against her. One or two passages from a grave historian will illustrate the feelings with which she was regarded even after her death, and will assist the reader in forming an opinion respecting the state of the Spanish mind. " Isabel, ó Jezabel, Reyna de Inglaterra, heretica Calvinista, y la mayor perseguidora que ha tenido la sangre de Jesu-Christo y los hijos de la Iglesia." *Davila, Historia de Felipe Tercero,* p. 74. " Los sucesos de fuera causaron admiracion ; y el mayor y muy esperado de toda la Christiandad fue la muerte de Isabela, Reyna de Inglaterra, heretica Calvinista, que hizo su nombre famoso con la infamia de su vida, y perseguir á la Iglesia, derramando la sangre de los Santos, que defendian la verdadera Religion Catolica, dexando registradas sus maldades en las historias públicas del mundo, pasando su alma á coger el desdichado fruto de su obstinada soberbia en las penas del Infierno, donde conoce con el castigo perpetuo el engaño de su vida," pp. 83, 84.

While Philip, following the course of his predecessors, was wasting the blood and treasure of Spain in order to propagate religious opinions,[60] the people, instead of rebelling against so monstrous a system, acquiesced in it, and cordially sanctioned it. Indeed, they not only sanctioned it, but they almost worshipped the man by whom it was enforced. There probably never lived a prince who, during so long a period, and amid so many vicissitudes of fortune, was adored by his subjects as Philip II. was. In evil report and in good report, the Spaniards clung to him with unshaken loyalty.* Their affection was not lessened, either by his reverses, or by his forbidding deportment, or by his cruelty, or by his grievous exactions. In spite of all, they loved him to the last. Such was his absurd arrogance, that he allowed none, not even the most powerful nobles, to address him except on their knees, and in return he only spoke in half sentences, leaving them to guess the rest, and to fulfil his commands as best they might.[61] And ready enough they were to obey his slightest wishes. A contemporary of Philip, struck by the universal homage which he received, says that the Spanish did "not merely love, not merely reverence, but absolutely adore him, and deem his commands so sacred, that they could not be violated without offence to God."[62]

That a man like Philip II., who never possessed a friend, and whose usual

[60] One of the most eminent of living historians well says, "It was Philip's enthusiasm to embody the wrath of God against heretics." *Motley's Dutch Republic*, vol. ii. p. 155. "Philip lived but to enforce what he chose to consider the will of God." p. 285.

[61] "Personne vivante ne parloit à lui qu'à genoux, et disoit pour son excuse à cela qu'estant petit de corps, chacun eust paru plus eslevé que lui, outre qu'il sçavoit que les Espagnols estoient d'humeur si altiere et hautaine, qu'il estoit besoin qu'il les traittast de cette façon ; et pour ce mesme ne se laissoit voir que peu souvent du peuple, n'y mesme des grands, sinon aux jours solemnels, et action necessaire, en cette façon ; il faisoit ses commandemens à demy mot, et falloit que l'on devinast le reste, et que l'on ne manquast à bien accomplir toutes ses intentions ; mesmes les gentilshommes de sa chambre, et autres qui approchoient plus près de sa personne, n'eussent osé parler devant luy s'il en leur eust commandé, se tenant un tout seul à la fois près de la porte du lieu où il estoit, et demeurant nud teste incessamment, et appuyé contre une tapisserie, pour attendre et recevoir ses commandemens." *Mémoires de Cheverny*, pp. 352, 353, in *Petitot's Collection des Mémoires*, vol. xxxvi. Paris, 1823.

[62] These are the words of Contarini, as given in *Ranke's Ottoman and Spanish Empires*, London, 1843, p. 33. Sismondi, though unacquainted with this passage, observes in his *Literature of the South of Europe*, vol. ii. p. 273, London, 1846, that Philip, though "little entitled to praise, has yet been always regarded with enthusiasm by the Spaniards." About half a century after his death, Sommerdyck visited Spain, and in his curious account of that country he tells us that Philip was called "le Salomon de son siècle." *Aarsens de Sommerdyck, Voyage d'Espagne*, Paris, 1665, 4to, pp. 63, 95. See also *Yañez, Memorias para la Historia de Felipe III.*, Madrid, 1723, p. 294. "El gran Felipe, aquel Sabio Salomon." Another writer likens him to Numa. "Hacia grandes progresos la piedad, á la qual se dedicaba tanto el Rey Don Felipe, que parecia su reynado en España lo que en Roma el de Numa, despues de Rómulo." *Miñana, Continuacion de Mariana*, vol. ix. p. 241. When he died, "celebradas sus exêquias entre lágrimas y gemidos." vol. x. pp. 259, 260. We further learn from *Vanderhammen's Filipe Segundo*, Madrid, 1632, p. 120 rev., that the people ascribed to him "una grandeza adorable, y alguna cosa mas que las ordinarias á los demas hombres." [We have already seen that "the French mind" was similarly prostrated before Louis XIV. a century later ; and the dedication of the authorised version of the English Bible remains to show the tone towards the crown even in England, a few years after Philip's death. It is necessary to realise how far Spanish practice was on normal European lines.—Ed.]

[* Buckle has omitted to note the violent and repeated resistance of the Aragonese to Philip's illegal treatment of Antonio Perez (Dunham, v. 84–85). The habit of regarding the Spaniards as one homogeneous community, with one opinion, obscures many facts in Spanish history.—Ed.]

demeanour was of the most repulsive kind, a harsh master, a brutal parent, a bloody and remorseless ruler,—that he should be thus reverenced by a nation among whom he lived, and who had their eyes constantly on his actions ; that this should have happened is surely one of the most surprising and, at first sight, one of the most inexplicable facts in modern history. Here we have a king who though afflicted by every quality most calculated to excite terror and disgust, is loved far more than he is feared, and is the idol of a very great people during a very long reign. This is so remarkable as to deserve our serious attention ; and in order to clear up the difficulty, it will be necessary to inquire into the causes of that spirit of loyalty which, during several centuries, has distinguished the Spaniards above every other European people.

One of the leading causes was undoubtedly the immense influence possessed by the clergy. For the maxims inculcated by that powerful body have a natural tendency to make the people reverence their princes more than they would otherwise do. And that there is a real and practical connexion between loyalty and superstition, appears from the historical fact that the two feelings have nearly always flourished together and decayed together. Indeed, this is what we should expect on mere speculative grounds, seeing that both feelings are the product of those habits of veneration which make men submissive in their conduct and credulous in their belief.[63] Experience, therefore, as well as reason, points to this as a general law of the mind, which in its operation may be occasionally disturbed, but which holds good in a large majority of cases. Probably the only instance in which the principle fails is when a despotic government so misunderstands its own interests as to offend the clergy, and separate itself from them. Whenever this is done, a struggle will arise between loyalty and superstition ; the first being upheld by the political classes, the other by the spiritual classes. Such a warfare was exhibited in Scotland ; but history does not afford many examples of it, and certainly it never took place in Spain, where, on the contrary, several circumstances occurred to cement the union between the Crown and the Church, and to accustom the people to look up to both with almost equal reverence.

By far the most important of these circumstances was the great Arab invasion, which drove the Christians into a corner of Spain, and reduced them to such extremities that nothing but the strictest discipline and the most unhesitating obedience to their leaders could have enabled them to make head against their enemies. Loyalty to their princes became not merely expedient but necessary ; for if the Spaniards had been disunited, they would, in the face of the fearful odds against which they fought, have had no chance of preserving their national existence.* The long war which ensued, being both political and religious, caused an intimate alliance between the political and religious classes, since the kings and the clergy had an equal interest in driving the Mohammedans from Spain. During nearly eight centuries this compact between Church and State was a necessity forced upon the Spaniards by the peculiarities of their position ; and after the necessity had subsided, it naturally happened that the association of ideas survived the original danger, and that an impression had been made upon the popular mind which it was hardly possible to efface.

Evidence of this impression, and of the unrivalled loyalty it produced, crowds

[63] " Habits of reverence which, if carried into religion, cause superstition, and if carried into politics, cause despotism." Above, p. 384.

[* The Spaniards in this period *were* often disunited, as were the Moors ; and on neither side was loyalty prevalent. In describing the attempt to depose Henry IV. in 1465, U. R. Burke remarks (Hume's ed. ii. 28) on the " rich store of precedents " for such procedure in the history of Spain. For details see his first vol. pp. 153, 157, 160, 162, 178 (referring to " the usual rebellion "), 179, 181, 182, 184, 185, 186, 195, 214, 218, 233, 236, 237, 256, 258, 259, 266, 267, 369, etc. Compare Prescott, *Philip II.*, Kirk's ed. 1894, p. 658, as to the nobles' " privilege, so highly prized, of renouncing their allegiance and declaring war upon their sovereign."—Ed.]

upon us at every turn. In no other country are the old ballads so numerous and so intimately connected with the national history. It has however been observed that their leading characteristic is the zeal with which they inculcate obedience and devotion to princes, and that from this source, even more than from military achievements, they draw their most favourite examples of virtue.[64] In literature the first great manifestation of the Spanish mind was the poem of *The Cid*, written at the end of the twelfth century, in which we find fresh proof of that extraordinary loyalty which circumstances had forced upon the people.[65] The ecclesiastical councils display a similar tendency; for, notwithstanding a few exceptions, no other church has been equally eager in upholding the rights of kings.[66] In civil legislation we see the same principle at work; it being asserted, on high authority, that in no system of laws is loyalty carried to such extreme height as in the Spanish codes.[67] Even their dramatic writers were unwilling to represent

[64] "More ballads are connected with Spanish history than with any other, and in general they are better. The most striking peculiarity of the whole mass is perhaps to be found in the degree in which it expresses the national character. Loyalty is constantly prominent. The Lord of Butrago sacrifices his own life to save that of his sovereign," &c. *Ticknor's History of Spanish Literature*, vol. i. p. 133. "In the implicit obedience of the old Spanish knight, the order of the king was paramount to every consideration, even in the case of friendship and love. This code of obedience has passed into a proverb—'mas pesa el Rey que la sangre.'" *Ford's Spain*, p. 183. Compare the admirable little work of Mr. Lewes, *The Spanish Drama*, London, 1846, p. 120, "ballads full of war, loyalty, and love."

[65] See some interesting remarks in M. Tapia's *Civilizacion Española*, vol. i. He observes that, though cruelly persecuted by Alfonso, the first thing done by the Cid, after gaining a great victory, was to order one of his captains "para que lleve al rey Alfonso treinta caballos árabes bien ensillados, con sendas espadas pendientes de los arzones en señal de homenage, á *pesar del agravio que habia recibido*." p. 274. And at p. 280, "comedido y obediente subdito á un rey que tan mal le habia tratado." Southey (*Chronicle of the Cid*, p. 268) notices with surprise that the Cid is represented in the old chronicles as "offering to kiss the feet of the king." [The view here given of the character of the Cid is unduly restricted. When exiled by Alfonso, he fought against him on the Moslem side. The old poem, which probably belongs to the first half of the thirteenth century (Cp. H. Lucas, *Documents relatifs à l'hist. du Cid*, 1860, p. 4; Ormsby, *The Poem of the Cid*, 1879, Introd. pp. 7–11), is not a trustworthy narrative; and the story of the Cid's giving his daughters to the Infantes of Carrion, whereat is given the detail of the offer to kiss the king's feet (Lucas, p. 13), is "undoubtedly an invention of the Castilian minstrels" (Burke, *Hist. of Spain*, Major Hume's ed. i. 193). For the rest, many of the ballads characterized by Ticknor as full of loyalty are late: for instance, the great majority of the Cid ballads are held by Huber and Dozy to be no older than the sixteenth century (Burke, as cited, p. 197). On the other hand, as Mr. Ormsby has noted, there is a considerable *anti*-royalist element in many of them. They have even been described as "a pæan of triumphant democracy." (Burke, p. 195; Ormsby, p. 41).—Ed.]

[66] "Le xvi^e^ Concile de Tolède appelait les rois 'vicaires de Dieu et du Christ;' et rien n'est plus fréquent dans les conciles de cette époque que leurs exhortations aux peuples pour l'observation du serment de fidélité à leur roi, et leurs anathèmes contre les séditieux." *Sempere, Monarchie Espagnole*, vol. i. p. 41. "Aparte de los asuntos de derecho civil y canonico y de otros varios que dicen relacion al gobierno de la iglesia, sobre los cuales se contienen en todos ellos disposicoines muy útiles y acertadas, la mayor parte de las leyes dictadas en estas asambleas tuvieron por objeto dar fuerza y estabilidad al poder real, proclamando su inviolabilidad y estableciendo graves penas contra los infractores; condenar las heregías," &c. *Antequera, Historia de la Legislacion Española*, p. 47. [This alliance of church and crown was normal in Christendom in the Middle Ages, and prevailed in France and England as well as in Spain in the eighteenth century.—Ed.]

[67] "Loyalty to a superior is carried to a more atrocious length by the Spanish law than I have seen it elsewhere." . . . "The *Partidas* (P. 2, T. 13, L. 1) speaks of an old law whereby any man who openly wished to see the King dead, was condemned to death, and the loss of all that he had. The utmost mercy to be shown him was to spare his life

an act of rebellion on the stage, lest they should appear to countenance what in the eyes of every good Spaniard was one of the most heinous of all offences.[68] Whatever the king came in contact with was in some degree hallowed by his touch. No one might mount a horse which he had ridden ;[69] no one might marry a mistress whom he had deserted.[70] Horse and mistress alike were sacred, and it would have been impious for any subject to meddle with what had been honoured by the Lord's anointed. Nor were such rules confined to the prince actually reigning. On the contrary, they survived him, and, working with a sort of posthumous force, forbade any woman whom he had taken as a wife, to marry, even after he was dead. She had been chosen by the king ; such choice had already raised her above the rest of mortals ; and the least she could do was to retire to a convent and spend her life mourning over her irreparable loss. These regulations were enforced by custom rather than by law.[71] They were upheld by the popular will,

and pluck out his eyes, that he might never see with them what he had desired. To defame the King is declared as great a crime as to kill him, and in like manner to be punished. The utmost mercy that could be allowed was to cut out the offender's tongue. P. 2, T. 13. L. 4." *Southey's Chronicle of the Cid*, p. 442. Compare *Johnston's Civil Law of Spain*, London, 1825, p. 269, on " Blasphemers of the King."

[68] Thus Montalvan, the eminent poet and dramatist, who was born in 1602, avoided, we are told, representing rebellion on the stage, lest he should seem to encourage it. *Ticknor's History of Spanish Literature*, vol. ii. p. 283. A similar spirit is exhibited in the plays of Calderon and of Lope de Vega. On the " Castilian loyalty " evinced in one of Calderon's comedies, see *Hallam's Literature of Europe*, 2nd edit. London, 1843, vol. iii. p. 63 ; and as to Lope, see *Lewes on the Spanish Drama*, p. 78. [The exhibition of rebellion on the stage under Elizabeth in 1601, in a revival of Shakespeare's *Richard II.*, excited the royal displeasure. *Lee's Life of Shakespeare*, pp. 175–6.—Ed.]

[69] " His Majesty's horses could never be used by any other person. One day, while Philip IV. was going in procession to the church of Our Lady of Atocha, the Duke of Medina-de-las-Torres offered to present him with a beautiful steed which belonged to him, and which was accounted the finest in Madrid ; but the King declined the gift, because he should regret to render so noble an animal ever after useless." *Dunlop's Memoirs*, vol. ii. p. 372. Madame d'Aulnoy, who travelled in Spain in 1679, and who, from her position, had access to the best sources of information, was told of this piece of etiquette. " L'on m'a dit que lors que le Roy s'est servy d'un cheval, personne par respect ne le monte jamais." *D'Aulnoy, Relation du Voyage d'Espagne*, Lyon, 1693, vol. ii. p. 40. In the middle of the eighteenth century, I find another notice of this loyal custom, which, likely enough, is still a tradition in the Spanish stables. " If the king has once honoured a Pad so much as to cross his back, it is never to be used again by anybody else." *A Tour through Spain, by Udal ap Rhys*, 2nd edit. London, 1760, p. 15.

[70] Madame d'Aulnoy, who was very inquisitive respecting these matters, says (*Relation du Voyage d'Espagne*, vol. ii. p. 411), " Il y a une autre étiquette, c'est qu'après que le Roi a eu une Maitresse, s'il vient à la quitter, il faut qu'elle se fasse Religieuse, comme je vous l'ai déja écrit ; et l'on m'a conté que le feu Roi s'estant amoureux d'une Dame du Palais, il fut un soir fraper doucement à la porte de sa chambre. Comme elle comprit que c'estoit lui, elle ne voulut pas lui ouvrir, et elle se contenta de lui dire au travers de la porte, *Baya, baya, con Dios, no quiero ser monja* ; c'est à dire, 'Allez, allez, Dieu vous conduise, je n'ai pas envie d'estre Religieuse.' " So too Henry IV. of Castile, who came to the throne in the year 1454, made one of his mistresses "abbess of a convent in Toledo ; " in this case to the general scandal, because, says Mr. Prescott, he first expelled " her predecessor, a lady of noble rank and irreproachable character." *Prescott's Ferdinand and Isabella*, vol. i. p. 68.

[71] There is, however, one very remarkable old law, in the form of a canon enacted by the third Council of Saragossa, which orders that the royal widows " seront obligées à prendre l'habit de religieuses, et à s'enfermer dans un monastère pour le reste de leur vie." *Fleury, Histoire Ecclésiastique*, vol. ix. p. 104. In 1065 Ferdinand I. died ; and, says the biographer of the Spanish Queens, " La Reyna sobrevivió : y parece, que muerto su marido entró en algun Monasterio ; lo que expressamos no tanto por *la costumbre antigua*, quanto por constar en la Memoria referida de la Iglesia de Leon, el dictado d 'Consagrada

and were the result of the excessive loyalty of the Spanish nation. Of that loyalty their writers often boast, and with good reason, since it was certainly matchless, and nothing seemed able to shake it. To bad kings and to good kings it equally applied. It was in full strength amid the glory of Spain in the sixteenth century; it was conspicuous when the nation was decaying in the seventeenth century; and it survived the shock of civil wars early in the eighteenth.[72] Indeed, the feeling had so worked itself into the traditions of the country as to become not only a national passion but almost an article of national faith. Clarendon, in his History of that great English Rebellion, the like of which, as he well knew, could never have happened in Spain, makes on this subject a just and pertinent remark. He says that a want of respect for kings is regarded by the Spaniards as a "monstrous crime;" "submissive reverence to their princes being a vital part of their religion."[73]

These, then, were the two great elements of which the Spanish character was compounded. Loyalty and superstition; reverence for their kings and reverence for their clergy were the leading principles which influenced the Spanish mind, and governed the march of Spanish history.* The peculiar and unexampled

a Dios,' frasse que denota estado Religioso." *Florez, Memorias de las Reynas Catholicas*, Madrid, 1761, 4to, vol. i. p. 148. In 1667 it was a settled principle that "les reines d'Espagne n'en sortent point. Le couvent de *las Señoras descalças reales* est fondé afin que les reines veuves s'y enferment." *Discours du Comte de Castrillo à la Reine d'Espagne*, in *Mignet's Négociations relatives à la Succession d'Espagne*, vol. ii. p. 604, Paris, 1835, 4to. This valuable work consists for the most part of documents previously unpublished, many of which are taken from the Archives at Simancas. To the critical historian it would have been more useful if the original Spanish had been given.

[72] See some good remarks on San Phelipe, in *Ticknor's History of Spanish Literature*, vol. iii. pp. 213, 214, which might easily be corroborated by other testimony; as, for instance, Lafuente, under the year 1710: "Ni el abandono de la Francia, ni la prolongacion y los azares de la guerra, ni los sacrificios pecuniarios y personales de tantos años, nada bastaba á entibiar el amor de los castellanos á su rey Felipe V." (*Historia de España* vol. xviii. p. 258); and Berwick (*Mémoires*, vol. ii. p. 114, edit. Paris, 1778): "La fidélité inouie des Espagnols;" and, nine years earlier, a letter from Louville to Torcy: "Le mot révolte, pris dans une acception rigoureuse, n'a pas de sens en Espagne." *Louville, Mémoires sur l'établissement de la Maison de Bourbon en Espagne*, edit. Paris,, 1818, vol. i. p. 128. See also *Memoirs of Ripperda*, London, 1740, p. 58; and *Mémoires de Gramont*, vol. ii. p. 77, edit. Petitot, Paris, 1827. All these passages illustrate Spanish loyalty in the eighteenth century, except the reference to Gramont, which concerns the seventeenth, and which should be compared with the following observations of Madame d'Aulnoy, who writes from Madrid in 1679: "Quelques richesses qu'ayent les grands Seigneurs, quelque grande que soit leur fierté ou leur présomption, ils obéïssent aux moindres ordres du Roy, avec une exactitude et un respect que l'on ne peut assez loüer. Sur le premier ordre ils partent, ils reviennent, ils vont en prison, ou en exil, sans se plaindre. Il ne se peut trouver une soûmission, et une obéïssance plus parfaite, ni un amour plus sincère, que celui des Espagnols pour leur Roi. Ce nom leur est sacré, et pour réduire le peuple à tout ce que l'on souhaite, il suffit de dire, 'Le Roi le veut.'" *D'Aulnoy, Voyage*, vol. ii. pp. 256, 257.

[73] "And Olivarez had been heard to censure very severely the duke's (Buckingham's)

[* Once more this generalization must be qualified. The instances given belong to the period when the Inquisition and despotism had eliminated all the independent minds from Spain. Ferdinand, as an Aragonese, was disrespectfully treated by the Castilians; Charles V. was slighted after his retirement; and even in the reign of Philip II. the Cortes petitioned against the Burgundian and un-Spanish mode of the upbringing of Don Carlos (*M.A.S. Hume's Spain, 1479-1788*, p. 127; *Armstrong's* introd. thereto, pp. 5, 31; *Robertson's Charles V.* B. xii. [Works, edit. 1821, v. 417]; and Burke, *History*, as cited, ii. 45, 238). In the words of Bishop Stubbs: "To a German race of sovereigns Spain finally owed the subversion of her national system and ancient freedom" (*Const. Hist.* 4th ed. i. 5).—Ed.]

circumstances under which they arose have been just indicated; and having seen their origin, we will now endeavour to trace their consequences. Such an examination of results will be the more important, not only because nowhere else in Europe have these feelings been so strong, so permanent, and so unmixed, but also because Spain, being seated at the further extremity of the Continent, from which it is cut off by the Pyrenees, has from physical causes as well as from moral ones, come little into contact with other nations.[74] The course of affairs being therefore undisturbed by foreign habits, it becomes easier to discover the pure and natural consequences of superstition and loyalty, two of the most powerful and disinterested feelings which have ever occupied the human heart, and to whose united action we may clearly trace the leading events in the history of Spain.

The results of this combination were, during a considerable period, apparently beneficial, and certainly magnificent. For the church and the crown making common cause with each other, and being inspirited by the cordial support of the people, threw their whole soul into their enterprises, and displayed an ardour which could hardly fail to insure success. Gradually advancing from the north of Spain, the Christians, fighting their way inch by inch, pressed on till they reached the southern extremity, completely subdued the Mohammedans, and brought the whole country under one rule and one creed. This great result was achieved late in the fifteenth century, and it cast an extraordinary lustre on the Spanish name.[75] Spain, long occupied by her own religious wars, had hitherto been little noticed by foreign powers, and had possessed little leisure to notice them. Now, however, she formed a compact and undivided monarchy, and at once assumed an important position in European affairs.[76] During the next hundred years, her power advanced with a speed of which the world had seen no example since the days of the Roman Empire. So late as 1478 Spain was still

familiarity and want of respect towards the prince, a crime monstrous to the Spaniard." . . . "Their submissive reverence to their princes being a vital part of their religion." *Clarendon's History of the Rebellion*, ed. Oxford, 1843, p. 15. For the religion of loyalty, in an earlier period, see *Florez, Reynas Catholicas*, vol. i. p. 421: "La persona del Rey fue mirada de sus fieles vassallos con respeto tan sagrado," that resistance was "una especie de sacrilegio."

[74] These impediments to intercourse were once deemed almost invincible. Fontenay-Mareuil, who visited Spain in 1612, and was not a little proud of the achievement, says, "Au reste, parcequ'on ne va pas aussy ordinairement en Espagne qu'en France, en Italie et ailleurs; et qu'estant comme en un coin, et séparée du reste du monde par la mer ou par les Pyrénées, on n'en a, ce me semble, guere de connoissance, j'ay pensé que je devois faire icy une petite digression pour dire ce que j'en ay appris dans ce voyage et despuis." *Mémoires de Fontenay-Mareuil*, in *Collection des Mémoires par Petitot*, vol L. p. 169, 1e Série, Paris, 1826. Seventy years later, another writer on Spain says of the Pyrenees, "Ces montagnes sont à nos voyageurs modernes, ce qu'étoit aux anciens mariniers le *Non plus ultra* et les colomnes du grand Hercule." *L'Estat de l'Espagne*, Geneve, 1681, Epistre, p. ii. This work, little known, and not much worth knowing, forms the third volume of *Le Prudent Voyageur*.

[75] "Con razon se miró la conquista de Granada, no como un acontecimiento puramente español, sino como un suceso que interesaba al mundo. Con razon tambien se regocijó toda la cristiandad. Hacia medio siglo que otros mahometanos se habian apoderado de Constantinopla; la caida de la capital y del imperio bizantino en poder de los turcos habia llenado de terror á la Europa; pero la Europa se consoló al saber que en España habia concluido la dominacion de los musulmanes." *Lafuente, Historia de España*, vol. xi. p. 15.

[76] "L'Espagne, long-temps partagée en plusieurs états, et comme étrangère au reste de l'Europe, devint tout-á-coup une puissance redoutable, faisant pencher pour elle la balance de la politique." *Koch, Tableau des Révolutions de l'Europe*, Paris, 1823, vol. i. p. 362. On the relation between this and some changes in literature which corresponded to it, see *Bouterwek's History of Spanish Literature*, vol. i. pp. 148–152, where there are some ingenious, though perhaps scarcely tenable, speculations.

broken up into independent and often hostile states ; Granada was possessed by the Mohammedans ; the throne of Castile was occupied by one prince, the throne of Aragon by another. Before the year 1590 not only were these fragments firmly consolidated into one kingdom, but acquisitions were made abroad so rapidly as to endanger the independence of Europe. The history of Spain during this period is the history of one long and uninterrupted success. That country, recently torn by civil wars, and distracted by hostile creeds, was able in three generations to annex to her territory the whole of Portugal, Navarre, and Roussillon. By diplomacy, or by force of arms, she acquired Artois and Franche Comté, and the Netherlands * ; also the Milanese, Naples, Sicily, Sardinia, the Balearic Islands, and the Canaries. One of her kings was emperor of Germany ; while his son influenced the councils of England, whose queen he married. The Turkish power, then one of the most formidable in the world, was broken and beaten back on every side. The French monarchy was humbled. French armies were constantly worsted ; Paris was once in imminent jeopardy ; and a king of France, after being defeated on the field, was taken captive, and led prisoner to Madrid. Out of Europe, the deeds of Spain were equally wonderful. In America the Spaniards became possessed of territories which covered sixty degrees of latitude, and included both the tropics. Besides Mexico, Central America, Venezuela, New Granada, Peru, and Chili, they conquered Cuba, San Domingo, Jamaica, and other islands. In Africa, they obtained Ceuta, Melilla, Oran, Bougiah, and Tunis, and overawed the whole coast of Barbary. In Asia, they had settlements on each side of the Deccan ; they held part of Malacca ; and they established themselves in the Spice Islands. Finally, by the conquest of the noble archipelago of the Philippines they connected their most distant acquisitions, and secured a communication between every part of that enormous empire which girdled the world.

In connexion with this a great military spirit arose, such as no other modern nation has ever exhibited. All the intellect of the country which was not employed in the service of the Church was devoted to the profession of arms. Indeed, the two pursuits were often united ; and it is said that the custom of ecclesiastics going to war was practised in Spain long after it was abandoned in other parts of Europe.[77] At all events, the general tendency is obvious. A mere list of successful battles and sieges in the sixteenth and part of the fifteenth century would prove the vast superiority of the Spaniards in this respect over their contemporaries, and would show how much genius they had expended in maturing the arts of destruction. Another illustration, if another were required, might be drawn from the singular fact that since the time of ancient Greece, no country has produced so many eminent literary men who were also soldiers. Calderon, Cervantes, and Lope de Vega risked their lives in fighting for their country. The military profession was also adopted by many other celebrated authors, among whom may be mentioned Argote de Molina, Acuña, Bernal Diaz del Castillo, Boscan, Carrillo, Cetina, Ercilla, Espinel, Francisco de Figueroa, Garcilasso de la Vega, Guillen de Castro, Hita, Hurtado de Mendoza, Marmol Carvajal, Perez de Guzman, Pulgar, Rebolledo, Roxas, and Virues ; all of whom bore, in this manner, unconscious testimony to the spirit by which Spain was universally pervaded.

Here, then, we have a combination which many readers will still consider with

[77] "The holy war with the infidels" (Mohammedans) "perpetuated the unbecoming spectacle of militant ecclesiastics among the Spaniards to a still later period, and long after it had disappeared from the rest of civilized Europe." *Prescott's History of Ferdinand and Isabella*, vol. i. p. 162.

* "Diplomacy" must here be defined as including royal marriages. Franche Comté and the Netherlands were joined to Spain through the marriage of Philip (son of the Austrian archduke Maximilian and Mary of Burgundy) to Joanna, daughter of Ferdinand and Isabella. One emperor, Charles V., was their son, and succeeded to the Spanish throne.—Ed.]

favour, and which, at the time it occurred, excited the admiration, albeit the terror, of Europe. We have a great people glowing with military, patriotic, and religious ardour, whose fiery zeal was heightened, rather than softened, by a respectful obedience to their clergy, and by a chivalrous devotion to their kings. The energy of Spain, being thus both animated and controlled, became wary as well as eager; and to this rare union of conflicting qualities we must ascribe the great deeds which have just been related. But the unsound part of a progress of this sort is that it depends too much upon individuals, and therefore cannot be permanent. Such a movement can only last as long as it is headed by able men. When, however, competent leaders are succeeded by incompetent ones, the system immediately falls to the ground, simply because the people have been accustomed to supply to every undertaking the necessary zeal, but have not been accustomed to supply the skill by which the zeal is guided. A country in this state, if governed by hereditary princes, is sure to decay; inasmuch as, in the ordinary course of affairs, incapable rulers must sometimes arise. Directly this happens the deterioration begins; for the people, habituated to indiscriminate loyalty, will follow wherever they are led, and will yield to foolish counsels the same obedience that they had before paid to wise ones. This leads us to perceive the essential difference between the civilization of Spain and the civilization of England. We in England are a critical, dissatisfied, and captious people, constantly complaining of our rulers, suspecting their schemes, discussing their measures in a hostile spirit, allowing very little power either to the Church or to the Crown, managing our own affairs in our own way, and ready, on the slightest provocation, to renounce that conventional, lip-deep loyalty which, having never really touched our hearts, is a habit lying on the surface, but not a passion rooted in the mind. The loyalty of Englishmen is not of that sort which would induce them to sacrifice their liberties to please their prince, nor does it ever for a moment blind them to a keen sense of their own interests. The consequence is that our progress is uninterrupted, whether our kings are good or whether they are bad. Under either condition the great movement goes on. Our sovereigns have had their full share of imbecility and of crime. Still, even men like Henry III. and Charles II. were unable to do us harm. In the same way, during the eighteenth and many years of the nineteenth century, when our improvement was very conspicuous, our rulers were very incompetent. Anne and the first two Georges were grossly ignorant; they were wretchedly educated, and nature had made them at once weak and obstinate. Their united reigns lasted nearly sixty years; and after they had passed away we, for another period of sixty years, were governed by a prince who was long incapacitated by disease, but of whom we must honestly say that, looking at his general policy, he was least mischievous when he was most incapable. This is not the place to expose the monstrous principles advocated by George III., and to which posterity will do that justice from which contemporary writers are apt to shrink; but it is certain that neither his contracted understanding, nor his despotic temper, nor his miserable superstition, nor the incredible baseness of that ignoble voluptuary who succeeded him on the throne, could do aught to stop the march of English civilization, or to stem the tide of English prosperity. We went on our way rejoicing, caring for none of these things. We were not to be turned aside from our path by the folly of our rulers, because we know full well that we hold our own fate in our own hands, and that the English people possess within themselves those resources and that fertility of contrivance by which alone men can be made great, and happy, and wise.*

[* It is hard to know what Buckle meant by the "we" of this declamatory passage. Thus to speak of a nation which has always contained many reactionaries, and undergone many reactions, is to darken the facts of social evolution and to reduce sociology to rhetoric. The "tide of English prosperity" has been "stemmed" a score of times, sometimes by the acts of kings, as in the case of the American policy of George III.; sometimes by the policy of both kings and statesmen, as when extreme misery followed the victory of Waterloo, and when the Corn Laws created artificial famine. If Buckle's picture in the above passage be true, there can be no need for any struggle towards any

In Spain, however, directly the government slackened its hold, the nation fell to pieces.[78] During that prosperous career which has just been noticed, the Spanish throne was invariably filled by very able and intelligent princes. Ferdinand and Isabella, Charles V. and Philip II., formed a line of sovereigns not to be matched in any other country for a period of equal length. By them the great things were effected, and by their care Spain apparently flourished. But what followed when they were withdrawn from the scene showed how artificial all this was, and how rotten, even to the core, is that system of government which must be fostered before it can thrive, and which, being based on the loyalty and reverence of the people, depends for success not on the ability of the nation, but on the skill of those to whom the interests of the nation are intrusted.*

[78] A learned Spanish lawyer has made some remarks which are worth quoting, and which contain a curious mixture of truth and error : " Comment la monarchie espagnole

reform, inasmuch as " we " are all wise to political salvation. But what he describes in the next paragraph as a " falling to pieces " of Spain was only an unchecked continuance of such mismanagement as permitted the Dutch to enter the Medway under Charles II., and lost the American colonies in the next century. He has thus partly missed setting forth the main cause of Spanish decadence, which was the acquisition of " empire " in both the New World and the Old.—Ed.]

[* In thus crediting despots with the power of making as well as marring the fortunes of a nation, Buckle seems to have forgotten his earlier arguments as to their impotence, and as to the utter nullity of " protection." In point of fact, he has given undue credit for " success " to both Charles V. and Philip II. Industrial decadence began on one side as soon as the bullion delusion was enthroned by the possession of the mines of the New World, though the connexion with the Low-Countries set up a healthy commerce under Charles V. (Armstrong's Introd. to M. A. S. Hume's *Spain*, 1898, pp. 83–4 ; Grattan, *The Netherlands*, 1830, pp. 66, 88.) But the policy of Charles depended largely on his northern possessions, the whole Low Countries yielding him two-fifths of his revenues ; Spain and the Indies only another fifth between them ; and Milan and Sicily the rest (Motley, 1 vol. ed. p. 59). Of Charles as a ruler the best English authority writes :—" He was not great enough to give unity to circumstances of extraordinary perplexity. Far from taking the lead, he was from first to last put upon the defensive " (E. Armstrong, *The Emperor Charles V.*, 1902, pref.). When Philip succeeded " Spain was already wellnigh ruined by the drain of the Emperor's wars " (M. A. S. Hume, *Spain*, p. 194). Thus even in 1561 his revenues were mortgaged past recovery, and his deficits irremediable (Motley, p. 149 ; Hume, p. 195), so that at length, in 1597, he had to get from the Pope an absolution from payment of the interest he owed to Spanish and Genoese merchants, thus ruining his credit (Davies, *History of Holland*, 1841, ii. 304; cp. Watson, *Hist. of the Reign of Philip II.*, ed. 1839, p. 527). The loss of his first Armada, in 1588, was the greatest naval and financial disaster that had ever befallen any modern power, and when that was followed by the loss of the second, the finances of Spain must have been hopelessly crippled. As Buckle admits, further, there is no reason to doubt that Philip had been in favour of the fatal project of expelling the Moriscoes, carried out by his successor (See below, *note* 132). But in his own day ruin was in sight. When, not long before his death, he asked the Cortès for a vote of five hundred million maravedis, they answered : " No one has either money or credit ; and the country is utterly ruined. Commerce is killed by the *alcabala*. Where 30,000 *arrobas* of wool were manufactured, there are not now 5,000 ; and in the principal cities most of the houses are closed and deserted " (M. A. S. Hume's *Spain*, pp. 198–9). In short, " Philip II. had nearly ruined Spain " (*Id.* p. 196. See p. 195 as to his fiscal methods, and compare Prescott, *Hist. of Philip II.* Kirk's ed. 1894, p. 659, and M. A. S. Hume's *The Spanish People*, 1901, pp. 350-403, and *Philip II.*, 1897, pp. 252, 256-7). As Montesquieu said of him (*Esprit des Lois*, xxi. 22), " no prince suffered more than he from the insolence and mutiny of his troops, always ill-paid." Buckle relied unduly, at this stage, on the inadequate History of Dunham, which he over praises, and on the uncritical Spanish writers he quotes. His account of the reign of Louis XIV. should have suggested to him the probability of a parallel development in Spain.—Ed.]

Philip II., the last of the great kings of Spain, died in 1598, and after his death the decline was portentously rapid.[79] From 1598 to 1700 the throne was occupied by Philip III., Philip IV., and Charles II. The contrast between them and their predecessors was most striking.[80] Philip III. and Philip IV. were idle, ignorant, infirm of purpose, and passed their lives in the lowest and most sordid pleasures. Charles II., the last of that Austrian dynasty which had formerly been so distinguished, possessed nearly every defect which can make a man ridiculous and contemptible. His mind and his person were such as, in any nation less loyal than Spain, would have exposed him to universal derision. Although his death took place while he was still in the prime of life, he looked like an old and worn-out debauchee. At the age of thirty-five he was completely bald; he had lost his eyebrows; he was paralyzed; he was epileptic;

fut-elle déchue de tant de grandeur et de gloire? Comment perdit-elle les Pays-Bas et le Portugal dans le dix-septième siècle, et s'y trouva-t-elle réduite à n'être qu'un squelette de ce qu'elle avait été auparavant? Comment vit-elle disparaître plus d'une moitié de sa population? Comment, possédant les mines inépuisables du Nouveau Monde, les revenus de l'état n'étaient à peine que de six millions de ducats sous le règne de Philippe III? Comment son agriculture et son industrie furent-elles ruinées? et comment presque tout son commerce passa-t-il dans les mains de ses plus grands ennemis? Ce n'est point ici le lieu d'examiner les véritables causes d'une métamorphose si triste; il suffira d'indiquer *que tous les grands empires contiennent en eux-memes le germe de leur dissolution*," &c. "D'ailleurs les successeurs de ces deux Monarques" (Charles V. and Philip II.) "n'eurent point les mêmes talens, ni les ducs de Lerme et d'Olivarès, leurs ministres, ceux du cardinal Cisneros; et il est difficile de calculer l'influence de la bonne ou de la mauvaise direction des affaires sur la prospérité ou les malheurs des nations. Sous une même forme de gouvernement, quel qu'il puisse être, *elles tombent ou se relèvent suivant la capacité des hommes qui les dirigent*, et d'après les circonstances où ils agissent." *Sempere, Histoire des Cortès*, Bordeaux, 1815, pp. 265–267. Of the two passages which I have marked with italics, the first is a clumsy, though common, attempt to explain complicated phenomena by a metaphor which saves the trouble of generalizing their laws. The other passage, though perfectly true as regards Spain, does not admit of that universal application which M. Sempere supposes; inasmuch as in England, and in the United States of America, national prosperity has steadily advanced, even when the rulers have been very incapable men. [If this were true, it would be hard to show why rulers are ever to be denounced. But English prosperity has *not* steadily advanced irrespective of the wisdom of rulers. *E.g.* the effect of the Corn Laws.—Ed.]

[79] "With Philip II. ends the greatness of the kingdom, which from that period declined with fearful rapidity." *Dunham's History of Spain*, vol. v. p. 87. And Ortiz (*Compendio*, vol. vii., Prologo, p. 6) classes together "la muerte de Felipe II. y principios de nuestra decadencia." The same judicious historian elsewhere observes (vol. vi. p. 211), that if Philip III. had been equal to his father, Spain would have continued to flourish. Several of the more recent Spanish writers, looking at the heavy expenses caused by the policy of Philip II., and at the debts which he incurred, have supposed that the decline of the country began in the latter years of his reign. But the truth is, that no great nation ever was, or ever will be, ruined by the prodigality of its government. Such extravagance causes general discomfort, and therefore ought not to be tolerated; but, if this were the place for so long an argument, I could easily show that its other and more permanent inconveniences are nothing like what they are commonly supposed to be. [The leap in the second last sentence from the proposition "the decline *began*" to "no nation was ever *ruined*" amounts to an *ignoratio elenchi*. Philip lost the Netherlands, and had to let Flanders pass from Spain. This was part of the decadence as commonly regarded. But when Buckle asserts that the system was "rotten to the core" even when "prosperous," it is hard to check his reasoning. Enough to say that under Philip commerce and industry were already disappearing.—Ed.]

[80] "Abstraido Felipe III. en devociones, amante Felipe IV. de regocijos, mortificado Carlos II. por padecimientos, cuidáronse poco ó nada de la gobernacion del Estado, y confiáronla á validos altaneros, codiciosos, incapaces, y de muy funesta memoria." *Rio, Historia del Reinado de Carlos III.*, Madrid, 1856, vol. i. p. 33.

and he was notoriously impotent.[81] His general appearance was absolutely revolting, and was that of a drivelling idiot. To an enormous mouth, he added a nether jaw protruding so hideously that his teeth could never meet, and he was unable to masticate his food.[82] His ignorance would be incredible, if it were not substantiated by unimpeachable evidence. He did not know the names of the large towns, or even of the provinces, in his dominions ; and during the war with France he was heard to pity England for losing cities which in fact formed part of his own territory.[83] Finally, he was immersed in the most grovelling superstition ; he believed himself to be constantly tempted by the devil ; he allowed himself to be exorcised as one possessed by evil spirits ; and he would not retire to rest except with his confessor and two friars, who had to lie by his side during the night.[84]

Now it was that men might clearly see on how sandy a foundation the grandeur of Spain was built. When there were able sovereigns the country prospered ; when there were weak ones it declined. Nearly everything that had been done by the great princes of the sixteenth century was undone by the little princes of the seventeenth. So rapid was the fall of Spain, that in only three reigns after the death of Philip II. the most powerful monarchy existing in the world was depressed to the lowest point of debasement, was insulted with impunity

[81] "Sans espérance de posterité." *Millot, Mémoires de Noailles*, vol. i. p. 419. "Incapaz de tener hijos." *Ortiz, Compendio*, vol. vi. p. 560. See also *Mémoires de Louville*, vol. i. p. 82 ; and the allusions in *Lettres de Madame de Villars*, edit. Amsterdam, 1759, pp. 53, 120, 164. She was ambassadress in Spain in the reign of Charles II. M. Lafuente, who, if I rightly remember, never quotes these interesting letters, and who, indeed, with very few exceptions, has used none but Spanish authorities, ventures nevertheless to observe that "La circunstancia de no haber tenido sucesion, falta que en general se achabaca mas al rey que á la reina," &c. *Historia de España*, vol. xvii. pp. 198, 199, Madrid, 1856. According to the biographer of the Spanish Queens, some persons imputed this to sorcery, "y aun se dijo si intervenia maleficio." *Florez, Memorias de las Reynas Catholicas*, vol. ii. p. 973, Madrid, 1761, 4to.

[82] In 1696, Stanhope, the English minister at Madrid, writes : "He has a ravenous stomach, and swallows all he eats whole, for his nether jaw stands so much out, that his two rows of teeth cannot meet ; to compensate which he has a prodigious wide throat, so that a gizzard or liver of a hen passes down whole, and, his weak stomach not being able to digest it, he voids it in the same manner." *Mahon's Spain under Charles II.*, London, 1840, p. 79 ; a very valuable collection of original documents, utterly unknown to any Spanish historian I have met with. Some curious notices of the appearance of Charles II. in his childhood may be seen, published for the first time, in *Mignet's Négociations relatives à la Succession d'Espagne*, Paris, 1835–1842, 4to, vol. i. pp. 294, 295, 310, 396, 404, 410, vol. ii. p. 130, vol. iii. pp. 418, 419, 423. See also vol. iv. p. 636, for an instance of his taciturnity, which was almost the only mark of sense he ever gave. "Le roi l'écouta, et ne lui répondit rien."

[83] "Le Roy demeuroit dans une profonde ignorance et de ses affaires, et même des Etats de sa couronne ; à peine connoissoit-il quelles étoient les places qui lui appartenoient hors du continent d'Espagne." . . . "La perte de Barcelone lui fut plus sensible qu'aucune autre, parce que cette ville, capitale de la Catalogne, et située dans le continent de l'Espagne, lui étoit plus connue que les villes de Flandre, dont il ignoroit l'importance au point de croire que Mons appartenoit au roi d'Angleterre, et de le plaindre lorsque le Roi fit la conquête de cette province." *Mémoires du Marquis de Torcy*, vol. i. pp. 19, 23, edit. Petitot, Paris, 1828.

[84] "Fancying everything that is said or done to be a temptation of the devil, and never thinking himself safe but with his confessor and two friars by his side, whom he makes lie in his chamber every night." *Mahon's Spain under Charles II.*, p. 102. On account, no doubt, of this affection for monks, he is declared by a Spanish historian to have possessed a "corazon pio y religioso." *Bacallar, Comentarios de la Guerra de España*, vol. i. p. 20. The best notice of the exorcism will be found in *Lafuente's Historia de España*, vol. xvii. pp. 294–309, where there is an entire chapter, headed "Los Hechizos del Rey."

by foreign nations, was reduced more than once to bankruptcy, was stripped of her fairest possessions,* was held up to public opprobrium, was made a theme on which schoolboys and moralists loved to declaim respecting the uncertainty of human affairs, and at length was exposed to the bitter humiliation of seeing her territories mapped out and divided by a treaty in which she took no share, but the provisions of which she was unable to resent.[85] Then truly did she drink to the dregs the cup of her own shame. Her glory had departed from her, she was smitten down and humbled. Well might a Spaniard of that time who compared the present with the past, mourn over his country, the chosen abode of chivalry and romance, of valour and of loyalty. The mistress of the world, the queen of the ocean, the terror of nations, was gone ; her power was gone, no more to return. To her might be applied that bitter lamentation, which, on a much slighter occasion, the greatest of the sons of men has put into the mouth of a dying statesman. Good reason, indeed, had the sorrowing patriot to weep, as one who refused to be comforted, for the fate of his earth, his realm, his land of dear souls, his dear, dear land, long dear for her reputation through the world, but now leased out like to a tenement or pelting farm.[86]

It would be a weary and unprofitable task to relate the losses and disasters of Spain during the seventeenth century. The immediate cause of them was undoubtedly bad government and unskilful rulers ; but the real and overriding cause, which determined the whole march and tone of affairs, was the existence of that loyal and reverential spirit which made the people submit to what any other country would have spurned, and, by accustoming them to place extreme confidence in individual men, reduced the nation to that precarious position in which a succession of incompetent princes was sure to overthrow the edifice which competent ones had built up.[87]

[85] " La foiblesse de l'Espagne ne permettoit pas à son roi de se ressentir du traitement dont il croyoit à propos de se plaindre." *Mémoires de Torcy*, vol. i. p. 81. Or, as an eminent native writer bitterly says, " Las naciones estrangeras disponiendo de la monarquia española como de bienes sin dueño." *Tapia, Civilizacion Española*, vol. iii. p. 167.

[86] " This royal throne of kings, this scepter'd isle,
This earth of majesty, this seat of Mars,
This other Eden, demi-paradise ;
This fortress, built by nature for herself
Against infection and the hand of war ;
This happy breed of men, this little world,
This precious stone set in the silver sea,
Which serves it in the office of a wall,
Or as a moat defensive to a house,
Against the envy of less happier lands ;
This blessed plot, this earth, this realm, this England,
This nurse, this teeming womb of royal kings,
Fear'd by their breed, and famous by their birth,
Renowned for their deeds as far from home,
For Christian service and true chivalry,
As is the sepulchre in stubborn Jewry
Of the world's ransom, blessed Mary's son :
This land of such dear souls, this dear, dear land,
Dear for her reputation through the world,
Is now leas'd out, I die pronouncing it,
Like to a tenement or pelting farm."

[87] The Spanish theory of government is well stated in the following passage in Davila's

[* *Before* the death of Philip II., as already noted, Spain was bankrupt, had lost Holland and given up Flanders, and was insulted with impunity by England. The two Armadas were undertaken to punish insults, and both failed. Finally, the English fleet under Essex sacked Cadiz for fifteen days, unmolested. " This was the last blow to the naval supremacy of Spain, and showed to the whole world that, under Philip's system, his country had become effete " (*M. A. S. Hume's Spain*, p. 193).—Ed.]

The increasing influence of the Spanish Church was the first and most conspicuous consequence of the declining energy of the Spanish government. For, loyalty and superstition being the main ingredients of the national character,* and both of them being the result of habits of reverence, it was to be expected that, unless the reverence could be weakened, what was taken from one ingredient would be given to the other. As, therefore, the Spanish government during the seventeenth century did, owing to its extreme imbecility, undoubtedly lose some part of the hold it possessed over the affections of the people, it naturally happened that the Church stepped in, and, occupying the vacant place, received what the crown had forfeited. Besides this, the weakness of the executive government encouraged the pretensions of the priesthood, and emboldened the clergy to acts of usurpation which the Spanish sovereigns of the sixteenth century, superstitious though they were, would not have allowed for a single moment.[88] Hence the very striking fact that while in every other great country, Scotland alone excepted, the power of the Church diminished during the seventeenth century, it in Spain actually increased. The results of this are well worth the attention not only of philosophic students of history, but also of every one who cares for the welfare of his own country, or feels an interest in the practical management of public affairs.

For twenty-three years after the death of Philip II. the throne was occupied by Philip III., a prince as distinguished by his weakness as his predecessors had been by their ability. During more than a century the Spaniards had been accustomed to be entirely ruled by their kings, who, with indefatigable industry, personally superintended the most important transactions, and in other matters exercised the strictest supervision over their ministers. But Philip III., whose listlessness almost amounted to fatuity, was unequal to such labour, and delegated the powers of government to Lerma, who wielded supreme authority for twenty years.[89] Among a people so loyal as the Spaniards this unusual proceeding

Life of Philip III. The remarks apply to Philip II. "Que solo havia gobernado sin Validos ni Privados, tomando para sí solo, como primera causa de su gobierno, el mandar, prohibir, premiar, castigar, hacer mercedes, conocer sugetos, elegir Ministros, dar oficios, y tener como espiritu, que andaba sobre las aguas, ciencia y providencia de todo, para que nada se hiciese sin su saber y querer; no sirviendo los Ministros mas que de poner por obra (obedeciendo) lo que su Señor mandaba, velando sobre cada uno, como pastor de sus ovejas, para ver la verdad con que executan sus Mandamientos y Acuerdos." *Davila, Historia de Felipe Tercero*, lib. i. pp. 22, 23.

[88] Even Philip II. always retained a certain ascendency over the ecclesiastical hierarchy, though he was completely subjugated by ecclesiastical prejudices. "While Philip was thus willing to exalt the religious order, already far too powerful, he was careful that it should never gain such a height as would enable it to overtop the royal authority." *Prescott's History of Philip II.*, vol. iii. p. 235. "Pero este monarca tan afecto á la Inquisicion mientras le servia para sus fines sabía bien tener á raya al Santo Oficio cuando intentaba invadir o usurpar las preeminencias de la autoridad real, ó arrogarse un poder desmedido." *Lafuente, Historia de España*, vol. xv. p. 114.

[89] "Por cuyo absoluto poderio se executaba todo." *Yañez, Memorias para la Historia de Felipe III.*, Prologo, p. 150. "An absoluteness in power over king and kingdom." Letter from Sir Charles Cornwallis to the Lords of the Council in England, dated Valladolid, May 31, 1605, in *Winwood's Memorials*, vol. ii. p. 73, London, 1725, folio. "Porque no era fácil imaginar entonces, ni por fortuna se ha repetido el ejemplo después, que hubiera un monarca tan pródigo de autoridad, y al propio tiempo tan indolente, que por no tomarse siquiera el trabajo de firmar los documentos de Estado, quisiera dar á la firma de un vasallo suyo la misma autoridad que á la suya propia, y que advirtiera y ordenára, como ordenó Felipe III. á todos sus consejos, tribunales, y súbditos, que dieran a los despachos firmados por el duque de Lerma el mismo cumplimiento y obediencia, y los ejecutáran y guardáran con el mismo respeto que si fueran firmados

[* Both are broadly forms of opinion, and results of education, not parts of "character."—Ed.]

could not fail to weaken the executive ; since in their eyes the immediate and irresistible interference of the sovereign was essential to the management of affairs, and to the well-being of the nation. Lerma, well aware of this feeling, and conscious that his own position was very precarious, naturally desired to strengthen himself by additional support, so that he might not entirely depend on the favour of the king. He therefore formed a strict alliance with the clergy, and from the beginning to the end of his long administration did everything in his power to increase their authority.[90] Thus the influence lost by the crown was gained by the Church, to whose advice a deference was paid even greater than had been accorded by the superstitious princes of the sixteenth century. In this arrangement the interests of the people were of course unheeded. Their welfare formed no part of the general scheme. On the contrary, the clergy, grateful to a government so sensible of their merits, and so religiously disposed, used all their influence in its favour ; and the yoke of a double despotism was rivetted more firmly than ever upon the neck of that miserable nation, which was now about to reap the bitter fruit of a long and ignominious submission.[91]

The increasing power of the Spanish Church during the seventeenth century may be proved by nearly every description of evidence. The convents and churches multiplied with such alarming speed, and their wealth became so prodigious, that even the Cortes, broken and humbled though they were, ventured on a public remonstrance. In 1626, only five years after the death of Philip III., they requested that some means might be taken to prevent what they described as a constant invasion on the part of the Church. In this remarkable document, the Cortes, assembled at Madrid, declared that never a day passed in which laymen were not deprived of their property to enrich ecclesiastics ; and the evil, they said, had grown to such a height that there were then in Spain upwards of nine

por él." *Lafuente, Historia de España*, vol. xv. pp. 449, 450. " El duque de Lerma, su valido, era el que gobernaba el reino solo." vol. xvii. p. 332. His power lasted from 1598 to 1618. *Ortiz, Compendio*, vol. vi. pp. 290, 325.

[90] Davila (*Historia de Felipe Tercero*, lib. ii. p. 41), after eulogizing the personal qualities of Lerma, adds, " Y sin estas grandes partes tuvo demostraciones christianas, manifestandolo en los conventos, iglesias, colegiatas, hospitales, ermitas y catedras, que dejo fundadas, en que gastó, como me consta de los libros de su Contaduría, un millon ciento cincuenta y dos mil doscientos ochenta y tres ducados." After such monstrous prodigality, Watson might well say, in his rather superficial but on the whole well-executed History, that Lerma showed " the most devoted attachment to the church," and " conciliated the favour of ecclesiastics." *Watson's History of Philip III.*, London, 1839, pp. 4, 8, 46, 224.

[91] The only energy Philip III. ever displayed was in seconding the efforts of his minister to extend the influence of the Church ; and hence, according to a Spanish historian, he was " monarque le plus pieux parmi tous ceux qui ont occupé le trône d'Espagne depuis saint Ferdinand." *Sempere, Monarchie Espagnole*, vol. i. p. 245. " El principal cuidado de nuestro Rey era tener á Dios por amigo, grangear y beneficiar su gracia, para que le asistiese propicio en quanto obrase y dixese. De aqui tuvieron principio tantos dones ofrecidos á Dios, tanta fundacion de Conventos, y favores hechos á Iglesias y Religiones." *Davila, Historia de Felipe Tercero*, lib. ii. p. 170. His wife, Margaret, was equally active. See *Florez, Reynas Catholicas*, vol. ii. pp. 915, 916. " Demas de los frutos que dió para el Cielo y para la tierra nuestra Reyna, tuvo otros de ambas lineas en fundaciones de Templos y obras de piedad para bien del Reyno y de la Iglesia. En Valladolid fundó el Convento de las Franciscas Descalzas. En Madrid trasladó á las Agustinas Recoletas de Santa Isabel desde la calle del Principe al sitio en que hoy estan. Protegió con sus limosnas la fundacion de la Iglesia de Carmelitas Descalzas de Santa Ana ; y empezó á fundar el Real Convento de las Agustinas Recoletas con titulo de la Encarnacion en este misma Corte, cuya primera piedra se puso á 10 de Junio del 1611. En la parroquia de S. Gil junto al Palacio introdujo los Religiosos Franciscos, cuyo Convento persevera hoy con la misma advocacion." How the country fared, while all this was going on, we shall presently see.

thousand monasteries, besides nunneries.[92] This extraordinary statement has, I believe, never been contradicted, and its probability is enhanced by several other circumstances. Davila, who lived in the reign of Philip III., affirms that in 1623 the two orders of Dominicans and Franciscans alone amounted to thirty-two thousand.[93] The other clergy increased in proportion. Before the death of Philip III. the number of ministers performing in the Cathedral of Seville had swelled to one hundred ; and in the diocese of Seville there were fourteen thousand chaplains ; in the diocese of Calahorra, eighteen thousand.[94] Nor did there seem any prospect of remedying this frightful condition. The richer the Church became the greater was the inducement for laymen to enter it ; so that there appeared to be no limit to the extent to which the sacrifice of temporal interests might be carried.[95] Indeed, the movement, notwithstanding its sudden-

[92] The burden of the petition was, "Que se tratasse con mas veras de poner limite á los bienes, que se sacauan cada dia del braço Seglar al Eclesiastico, enflaqueciendo no tan solo el patrimonio Real, mas el comun, pues siendo aquel libre de pechos, contribuciones, y gauelas, alojamientos, huespedes, y otros grauamenes mayores, presidios, guerras, y soldados." . . . "Que las Religiones eran muchas, las Mendicantes en excesso, y el Clero en grande multitud. Que auia en España 9088 monasterios, aun no cõtando los de Monjas. Que yuan metiẽdo poco á poco, con dotaciones, cofradias, capellanias, o con cõpras, á todo el Reyno en su poder. Que se atajasse tanto mal. Que huuiesse numero en los frayles, moderacion en los Cõuentos, y aun en los Clerigos seglares." *Cespedes. Historia de Don Felipe IV.*, Barcelona, 1634, folio, lib. vii. cap. 9, p. 272 rev. This is the only noticeable passage in an unusually dull chronicle, which, though professing to be a history of Philip IV., is confined to the first few years of his reign.

[93] "En este año, que iba escribiendo esta Historia, tenian las Ordenes de Santo Domingo, y S. Francisco en España, treinta y dos mil Religiosos, y los Obispados de Calahorra y Pamplona veinte y quatro mil clerigos: pues qué tendran las demas Religiones, y los demas Obispados ?" *Davila, Historia de Felipe Tercero*, lib. ii. p. 215. See also cap. xcvii. pp. 248, 249 ; and, on the increase of convents, see *Yañez, Memorias para la Historia de Felipe III.*, pp. 240, 268, 304, 305.

[94] "The reign of Philip III., surnamed from his piety the Good, was the golden age of Churchmen. Though religious foundations were already too numerous, great additions were made to them ; and in those which already existed, new altars or chancels were erected. Thus the Duke of Lerma founded seven monasteries and two collegiate churches ; thus, also, the diocese of Calahorra numbered 18,000 chaplains, Seville 14,000. How uselessly the ministers of religion were multiplied, will appear still more clearly from the fact that the cathedral of Seville alone had a hundred when half-a-dozen would assuredly have been sufficient for the public offices of devotion." *Dunham's History of Spain*, vol. v. p. 274. According to the passage quoted in note 93, from Davila, there were twenty-four thousand "clerigos" in the two dioceses of Calahorra and Pamplona.

[95] "Entre tanto crecia por instantes y se aumentaba prodigiosamente el poder y la autoridad de la iglesia. Sus pingües riquezas desmembraban de una manera considerable las rentas de la corona ; y el estado eclesiástico, que muchos abrazaron en un principio á consecuencia de las desgracias y calamidades de la época, fué despues el mas solicitado por las inmensas ventajas que ofrecia su condicion comparada con la de las clases restantes." *Antequera, Historia de la Legislacion*, pp. 223, 224. See also in *Campomanes, Apéndice á la Educacion*, Madrid, 1775–1777, vol. i. p. 465, and vol. iv. p. 219, a statement made by the University of Toledo in 1619 or 1620, that "hay doblados religiosos, clerigos y estudiantes ; porque ya *no hallan otro modo de vivir, ni de poder sustentarse.*" If the eye of M. Lafuente had lighted upon this and other passages, which I shall shortly quote from contemporary observers, he would, I think, have expressed himself much more strongly than he has done respecting this period, in his recent brilliant but unsatisfactory History of Spain. On the great wealth of the convents in 1679, when the rest of the country was steeped in poverty, see a letter dated Madrid, July 25, 1679, in *D'Aulnoy, Relation du Voyage d'Espagne*, Lyon, 1693, vol. ii. p. 251. But the earliest evidence I have met with is in a letter written in 1609 to Prince Henry of England, by Sir Charles Cornwallis, the English ambassador at Madrid. "The furniture of their churches here, and the riches and lustre of their sepulchures made in every monasterie (the general

ness, was perfectly regular, and was facilitated by a long train of preceding circumstances. Since the fifth century the course of events, as we have already seen, invariably tended in this direction, and insured to the clergy a dominion which no other nation would have tolerated. The minds of the people being thus prepared, the people themselves looked on in silence at what it would have been impious to oppose ; for, as a Spanish historian observes, every proposition was deemed heretical which tended to lessen the amount, or even to check the growth of that enormous wealth which was now possessed by the Spanish Church.[96]

How natural all this was appears also from another fact of considerable interest. In Europe generally the seventeenth century was distinguished by the rise of a secular literature in which ecclesiastical theories were disregarded ; the most influential writers, such as Bacon and Descartes, being laymen, rather hostile to the Church than friendly to it, and composing their works with views purely temporal. But in Spain no change of this sort occurred.[97] In that country the Church retained her hold over the highest as well as over the lowest intellects. Such was the pressure of public opinion, that authors of every grade were proud to count themselves members of the ecclesiastical profession, the interests of which they advocated with a zeal worthy of the Dark Ages. Cervantes, three years before his death, became a Franciscan monk.[98] Lope de

povertye of this kingdome considered), are almost incredible. The laity of this nation may say with Davyde (though in another sense), 'Zelus domus tuæ comedit me' : for, assuredly, the riches of the Temporall hath in a manner all fallen into the mouthes and devouring throates of the Spiritual." *Winwood's Memorials of Affairs of State*, vol. iii. p. 10, London, 1725, folio.

[96] "Deux millions de ducats, que le clergé possédait sous le règne de Charles V., étaient réputés comme un revenu exorbitant ; et, un demi-siècle plus tard, lorsque ces revenus s'élevaient à huit millions, on qualifiait d'hérétique toute proposition tendante à opérer quelque modification dans leur accroissement." *Sempere, Monarchie Espagnole*, vol. ii. p. 16.

[97] In a work on Spanish literature which was published about seventy years ago, and which at the time of its appearance made considerable noise, this peculiarity is frankly admitted, but is deemed rather an honour to Spain than otherwise, inasmuch as that country, we are told, has produced philosophers who have gone much deeper into things than Bacon, Descartes, and Newton, who, no doubt, were clever men, but were nowise comparable to the great thinkers of the Peninsula. Such assertions, proceeding, not from some ignorant despiser of physical science, who contemns what he has never been at the pains to study, but from a really able and in some respects competent judge, are important for the history of opinion ; and as the book is not very common, I will give two or three extracts. "Confiesan los Franceses con ingenuidad que Descartes fué un novelista ; y con todo eso quieren hacerle pasar por el promotor de la filosofía en Europa, como si su filosofía se desemejase mucho de la que dominaba en las sectas de la antigüedad. Su tratado 'Del método' es nada en comparacion de los libros 'De la corrupcion de las artes' de Juan Luis Vives, que le antecedió buen número de años." *Oracion Apologética por la España y su Mérito Literario por D. J. P. Forner*, Madrid, 1786, p. xi. "No hemos tenido en los efectos un Cartesio, no un Neuton : démoslo de barato : pero hemos tenido justísimos legisladores y excelentes filósofos prácticos, que han preferido el inefable gusto de trabajar en beneficio de la humanidad á la ociosa ocupacion de edificar mundos imaginarios en la soledad y silencio de un gabinete." p. 12. "Nada se disputaba en España." p. 61. At p. 143 a comparison between Bacon and Vives ; and the final decision, p. 146, that Vives enjoys "una gloriosa superioridad sobre todos los sabios de todos los siglos."

[98] The final profession was not made till 1616 ; but he began to wear the clothes in 1613. "Tal era su situacion el sábado santo 2 de abril" [1616] "que por no poder salir de su casa hubieron de darle en ella la profesion de la venerable órden tercera de San Francisco, cuyo hábito habia tomado en Alcalá, el dia 2 de julio de 1613." *Navarrete, Vida de Cervantes*, p. cii., prefixed to *Don Quijote*, Barcelona, 1839. Even in 1609, says Navarrete (p. lxii.), "Se ha creido que entonces se incorporó tambien Cervantes, como lo

Vega was a priest; he was an officer of the Inquisition; and in 1623 he assisted at an auto da fé, in which, amid an immense concourse of people, a heretic was burned outside the gate of Alcalá at Madrid.[99] Moreto, one of the three greatest dramatists Spain has produced, assumed the monastic habit during the last twelve years of his life.[100] Montalvan, whose plays are still remembered, was a priest, and held office in the Inquisition.[101] Tarrega, Mira de Mescua, and Tirso de Molina were all successful writers for the stage, and were all clergymen.[102] Solis, the celebrated historian of Mexico, was also a clergyman.[103] Sandoval, whom Philip III. appointed historiographer, and who is the principal authority for the reign of Charles V., was at first a Benedictine monk, afterwards became Bishop of Tuy, and later still was raised to the see of Pampeluna.[104] Davila, the biographer of Philip III., was a priest.[105] Mariana was a Jesuit;[106] and Miñana, who continued his History, was superior of a convent in Valencia.[107] Martin Carrillo was a jurisconsult as well as an historian, but, not satisfied with his double employment, he too entered the Church, and became canon of Saragossa.[108] Antonio, the most learned bibliographer Spain ever possessed, was a canon of Seville.[109] Gracian, whose prose works have been much read, and who was formerly deemed a great writer, was a Jesuit.[110] Among the poets the same tendency was exhibited. Paravicino was for sixteen years a popular preacher at the courts of Philip III. and Philip IV.[111] Zamora was a monk.[112] Argensola was a canon of Saragossa.[113] Gongora was a priest;[114] and Rioja received a high post in the Inquisition.[115] Calderon was chaplain to Philip IV.;[116] and so fanatical are the sentiments which tarnish his brilliant genius that he has been termed the poet of the Inquisition.[117] His love for the Church was a passion, and he scrupled at nothing which could advance its interests. In Spain such

hizo Lope de Vega, en la congregacion del oratorio del Caballero de Gracia, mientras que su muger y su hermana doña Andréa se dedicaban á semejantes ejercicios de piedad en la venerable órden tercera de San Francisco, cuyo hábito recibieron en 8 de junio del mismo año."

117 "Calderon is in fact the true poet of the Inquisition. Animated by a religious feeling which is too visible in all his pieces, he inspires me only with horror for the faith which he professes." *Sismondi's Literature of the South of Europe*, vol. ii. p. 379. Compare *Lewes on the Spanish Drama*, pp. 176–179.

feelings were natural; though to other nations they seem so strange that an eminent critic has declared that it is hardly possible to read his works without indignation.[118] If this be so, the indignation should be extended to nearly all his contemporary countrymen, great or small. There was hardly a Spaniard of that period who did not entertain similar sentiments. Even Villaviciosa, author of one of the very best mock-heroic poems Spain has produced, was not only an officer in the Inquisition, but, in his last will, he strongly urged upon his family and all his descendants, that they too should, if possible, enter the service of that noble institution, taking whatever place in it they could obtain, since all its offices were, he said, worthy of veneration.[119] In such a state of society anything approaching to a secular or scientific spirit was, of course, impossible. Every one believed; no one inquired. Among the better classes all were engaged in war or theology, and most were occupied with both. Those who made literature a profession ministered, as professional men too often do, to the prevailing prejudice. Whatever concerned the Church was treated not only with respect, but with timid veneration. Skill and industry worthy of a far better cause were expended in eulogizing every folly which superstition had invented. The more cruel and preposterous a custom was the greater the number of persons who wrote in its favour, albeit no one had ventured to assail it. The quantity of Spanish works to prove the necessity of religious persecution is incalculable; and this took place in a country where not one man in a thousand doubted the propriety of burning heretics. As to miracles, which form the other capital resource of theologians, they, in the seventeenth century, were constantly happening, and as constantly being recorded. All literary men were anxious to say something on that important subject. Saints, too, being in great repute, their biographies were written in profusion, and with an indifference to truth which usually characterizes that species of composition. With these and kindred topics the mind of Spain was chiefly busied. Monasteries, nunneries, religious orders, and cathedrals received equal attention, and huge books were written about them, in order that every particular might be preserved. Indeed, it often happened that a single convent, or a single cathedral, would have more than one historian, each seeking to distance his immediate competitor, and all striving which could do most to honour the Church and to uphold the interests of which the Church was the guardian.[120]

Such was the preponderance of the ecclesiastical profession, and such was the homage paid to ecclesiastical interests by the Spaniards during the seventeenth

[118] Salfi says, "Calderon de la Barca excite encore plus une sorte d'indignation, malgré son génie dramatique, qui le mit au-dessus de Vega, son prédécesseur. En lisant ses drames sans prévention, vous diriez qu'il a voulu faire servir son talent uniquement à confirmer les préjugés et les superstitions les plus ridicules de sa nation." *Ginguené, Histoire Littéraire d'Italie*, vol. xii. p. 499, Paris, 1834.

[119] "Entró en el año de 1622 á ser *Relator del Consejo de la General Inquisicion*, cuyo empleo sirvió y desempeñó con todo honor muchos años." And he declared, "en esta clausula de su Testamento: 'Y por quanto yo y mis hermanos y toda nuestra familia nos hemos sustentado, autorizado y puesto en estado con las honras y mercedes, que nos ha hecho el santo Oficio de la Inquisicion, á quien hemos servido como nuestros antepassados; encargo afectuosissimamente á todos mis sucessores le sean para siempre los mas respetuosos servidores y criados, viviendo en ocupacion de su santo servicio, procurando adelantarse y señalarse en él, quanto les fuere possible, en qualquiera de sus ministerios; pues todos son tan dignos de estimacion y veneracion.'" *La Mosquea, por Villaviciosa*, Prólogo, pp. x.-xii., edit. Madrid, 1777.

[120] "Hardly a convent or a saint of any note in Spain, during the sixteenth and seventeenth centuries, failed of especial commemoration; and each of the religious orders and great cathedrals had at least one historian, and most of them several. The number of books on Spanish ecclesiastical history is therefore one that may well be called enormous." *Ticknor's History of Spanish Literature*, vol. iii. p. 132. Forner assures us, somewhat needlessly, of what no one ever doubted, that "los estudios sagrados jamas decayéron en España." *Forner, Oracion Apologética*, Madrid, 1786, p. 141.

century.[121] They did everything to strengthen the Church in that very age when other nations first set themselves in earnest to weaken it. This unhappy peculiarity was undoubtedly the effect of preceding events; but it was the immediate cause of the decline of Spain, since, whatever may have been the case in former periods, it is certain that in modern times the prosperity of nations depends on principles to which the clergy as a body are invariably opposed. Under Philip III. they gained an immense accession of strength; and in that very reign they signalized this new epoch of their power by obtaining, with circumstances of horrible barbarity, the expulsion of the whole Moorish nation. This was an act so atrocious in itself,[122] and so terrible in its consequences, that some writers have ascribed to it alone the subsequent ruin of Spain; forgetting that other causes, far more potent, were also at work, and that this stupendous crime* could never have been perpetrated except in a country which, being long accustomed to regard heresy as the most heinous of all offences, was ready, at any cost, to purge the land and to free itself from men whose mere presence was regarded as an insult to the Christian faith.

After the reduction, late in the fifteenth century, of the last Mohammedan kingdom in Spain, the great object of the Spaniards became to convert those whom they had conquered.[123] They believed that the future welfare of a whole people was at stake; and finding that the exhortations of their clergy had no effect, they had recourse to other means, and persecuted the men they were unable to persuade. By torturing some, by burning others, and by threatening all, they at length succeeded; and we are assured that after the year 1526 there was no Mohammedan in Spain who had not been converted to Christianity.[124] Immense numbers of them were baptized by force; but being

[121] In 1623, Howell writes from Madrid: "Such is the reverence they bear to the church here, and so holy a conceit they have of all ecclesiastics, that the greatest Don in Spain will tremble to offer the meanest of them any outrage or affront." *Howell's Letters*, edit. London, 1754, p. 138. "The reverence they show to the holy function of the church is wonderful; Princes and Queens will not disdain to kiss a Capuchin's sleeve, or the surplice of a priest." . . . "There are no such sceptics and cavillers there, as in other places." p. 496. In 1669, another observer writes: "En Espagne les Religieux sont les maîtres, et l'emportent par tout où ils se trouvent." *Voyages faits en divers Temps en Espagne*, Amsterdam, 1700, p. 35. And, to quote one more authority, the following picture is given of Spanish society in the reign of Philip IV: "No habia familia con quien no estuvieran entroncados los frailes por amistad ó parentesco; ni casa que les cerrara sus puertas; ni conversacion en que no se les cediera la palabra; ni mesa en que no se les obligara á ocupar la primera silla; ni resolucion grave entre ricos ó pobres que se adoptara sin su consejo; y si no tomaban parte en elles, las satisfacciones domésticas no eran cabales." *Rio, Historia del Reinado de Carlos III.*, vol. i. p. 94.

[122] "Le cardinal de Richelieu, qui n'étoit pas très susceptible de pitié, l'appelle 'le plus hardi et le plus barbare conseil dont l'histoire de tous les siècles précédens fasse mention.'" *Sismondi, Histoire des Français*, vol. xxii. p. 163, Paris, 1839.

[123] "Porque los Reyes queriendo, que en todo el Reino fuesen Christianos, embiaron á Frai Francisco Ximenez, que fue Arzobispo de Toledo i Cardenal, para que los persuadiese. Mas ellos, gente dura, pertinaz, nuevamente conquistada, estuvier onrecios." *Mendoza, Guerra de Granada que hizo Felipe II. contra los Moriscos*, Valencia, 1776, 4to, p. 10. The author of this book was born early in the sixteenth century, at Granada, where he lived for a considerable period.

[124] "L'année 1526 vit donc disparaître dans toutes les parties de l'Espagne les signes extérieurs de l'islamisme." *Circourt, Histoire des Arabes d'Espagne*, Paris, 1846, vol. ii. p. 220. M. Lafuente (*Historia de España*, vol. x. p. 132) says of 1502, that "desde entonces, por primera vez al cabo de ocho siglos, no quedó un solo habitante en España

[* Causes "far more potent" than a "stupendous" act must have been potent indeed. As is fully shown below, the expulsion of the Moriscoes did for the industrial life of Spain what the other work of the Inquisition had done for the intellectual. It was thus a main factor in the decay of Spain.—ED.]

baptized, it was held that they belonged to the Church, and were amenable to her discipline.[125] That discipline was administered by the Inquisition, which, during the rest of the sixteenth century, subjected these new Christians, or Moriscoes, as they were now called,[126] to the most barbarous treatment. The genuineness of their forced conversion was doubted ; it therefore became the business of the Church to inquire into their sincerity.[127] The civil government lent its aid ; and among other enactments an edict was issued by Philip II. in 1566, ordering the Moriscoes to abandon everything which by the slightest possibility could remind them of their former religion. They were commanded, under severe penalties, to learn Spanish, and to give up all their Arabic books. They were forbidden to read their native language, or to write it, or even to speak it in their own houses. Their ceremonies and their very games were strictly prohibited. They were to indulge in no amusements which had been practised by their fathers ; neither were they to wear such clothes as they had been accustomed to. Their women were to go unveiled ; and as bathing was a heathenish custom, all public baths were to be destroyed, and even all baths in private houses.[128]

By these and similar measures[129] these unhappy people were at length goaded

que esteriormente diera culto á Mahoma : " but in vol. xi. p. 447, he says that, in 1524, " volvieron inmediatamente á sus ritos y ceremonias muslímicas." As M. de Circourt was well acquainted with all the materials used by M. Lafuente, and is, moreover, a much more critical writer, it seems likely that his statement is the correct one.

[125] " Ces malheureux auraient tous été exterminés, s'ils n'avaient consenti à recevoir le baptême. Au milieu des décombres de leurs maisons, sur les cadavres fumans de leurs femmes, ils s'agenouillèrent. Les germanos, ivres de sang, firent l'office de prêtres ; l'un d'eux prit un balai, aspergea la foule des musulmans, en prononçant les paroles sacramentelles, et crut avoir fait des chrétiens. L'armée des germanos se répandit ensuite dans le pays environnant, saccageant d'abord, baptisant après." *Circourt, Histoire des Arabes d'Espagne*, vol. ii. p. 175. See also p. 202.

[126] That was their general name ; but, in Aragon, they were termed " ' tornadizos,' en lenguage insultante." *Janer, Condicion de los Moriscos de España*, Madrid, 1857, p. 26.

[127] " Recibieron el Sacramento por comodidad, no de voluntad, y asi encubrian todo lo possible el viuir y morir en la secta de Mahoma, siendo infieles apostatas." *Vanderhammen's Filipe Segundo*, p. 12. " Porque la Inquisicion los comenzó á apretar mas de lo ordinario." *Mendoza, Guerra de Granada*, p. 20. " Poner nuevo cuidado i diligencia en descubrir los motivos destos hombres." p. 26. And yet this very writer has the impudence to declaim against Mohammedanism as a cruel religion. " Cruel i abominable religion aplacar á Dios con vida i sangre inocente ! " pp. 107, 108.

[128] Vanderhammen (*Filipe Segundo*, p. 12, Madrid, 1632) merely tells us that " Por cedula el año sesenta y seis les mandó dexassen el habito, lengua y costumbres de Moros, y fuessen Christianos y lo pareciessen." But the exact provisions were, "Que dentro de tres años aprendiesen los moriscos á hablar la lengua castellana, ye de allí adelante ninguno pudiese hablar, leer ni escribir arábigo en publico ni en secreto: que todos los contratos que se hiciesen en arábigo fuesen nulos : que todos los libros así escritos los llevasen en término de treinta dias al presidente de la audiencia de Granada para que los mandase examinar, devolviendoseles aquellos queno ofriecieran inconveniente para que los pudiesen guardar solo durante los tres años : que no se hicieran de nuevo marlotas, almalafas, calzas ni otra suerte de vestidos de los que se usaban en tiempos de moros ; que durante este tiempo, las mujeres vestidas á la morisca llevarian la cara descubier ta ; que no usasen de las ceremonias ni de los regocijos moros en las bodas, sino conforme al uso de la Santa Madre Iglesia, abriendo las puertas de sus casas en tales dias, y tambien en los de fiesta, no haciendo zambras ni leylas con instrumentos ni cantares moriscos, aunque no dijesen en ellos cosas contraria á la religion cristiana," &c. *Janer, Condicion de los Moriscos*, pp. 31, 32, where other particulars will be found, which should be compared with *Circourt, Histoire des Arabes d'Espagne*, vol. ii. pp. 278, 283, 459-463.

[129] Some of the other steps which were taken before 1566 to affront the Moriscoes are enumerated in *Prescott's History of Philip II.*, vol. iii. p. 10, and elsewhere. In the reign of Charles V. there were many acts of local tyranny which escape the general his-

into rebellion ; and in 1568 they took the desperate step of measuring their force against that of the whole Spanish monarchy. The result could hardly be doubted ; but the Moriscoes, maddened by their sufferings, and fighting for their all, protracted the contest till 1571, when the insurrection was finally put down.[130] By this unsuccessful effort they were greatly reduced in numbers and in strength ; and during the remaining twenty-seven years of the reign of Philip II. we hear comparatively little of them. Notwithstanding an occasional outbreak, the old animosities were subsiding, and in the course of time would probably have disappeared. At all events, there was no pretence for violence on the part of the Spaniards, since it was absurd to suppose that the Moriscoes, weakened in every way, humbled, broken, and scattered through the kingdom, could, even if they desired it, effect anything against the resources of the executive government.

But after the death of Philip II. that movement began which I have just described, and which, contrary to the course of affairs in other nations, secured to the Spanish clergy in the seventeenth century more power than they had possessed in the sixteenth. The consequences of this were immediately apparent. The clergy did not think that the steps taken by Philip II. against the Moriscoes were sufficiently decisive ; and even during his lifetime they looked forward to a new reign, in which these Christians of doubtful sincerity should be either destroyed or driven from Spain.[131] While he was on the throne the prudence of the government restrained in some degree the eagerness of the Church ; and the king, following the advice of his ablest ministers, refused to adopt the measures to which he was urged, and to which his own disposition prompted him.[132] But under his successor the clergy, as we have already seen, gained fresh

torian. One of them, on the part of the Bishop of Guadix, is worth quoting. "On le vit pousser l'intolérance jusqu'à faire raser les femmes et les obliger à racler leurs ongles pour en faire disparaître les traces du henné, cosmétique inoffensif dont il abhorrait l'usage, en raison de ce que les Arabes l'avaient introduit." *Circourt, Histoire des Arabes d'Espagne*, vol. ii. p. 226.

130 Its concluding scene, in March, 1571, is skilfully depicted in *Prescott's History of Philip III.*, vol. iii. pp. 148–151. The splendid courage of the Moriscoes is attested by Mendoza in his contemporary history of the war ; but, in narrating the horrible outrages which they undoubtedly committed, he makes no allowance for the long-continued and insufferable provocations which they had received from the Spanish Christians. What he mentions of one of the battles is curious, and I do not remember to have seen it elsewhere recorded. "Fue porfiado por ambas partes el combate hasta venir á las espadas, de que los Moros se aprovechan menos que nosotros, por tener las suyas un filo i no herir ellos de punta." *Mendoza, Guerra de Granada*, edit. 4to, Valencia, 1776, p. 168.

131 An instance of this was exhibited in 1578, on the very day in which Philip III. was born. "Predicando en un lugar de Aragon, todo de Moriscos, llamado Ricla, ó Torrellas, un religioso, llamado Vargas, el mismo dia que nació su Magestad, viendo el poco fruto que hacia con sus sermones, dixo, como en Profecia, á aquella gente rebelde : Pues no quereis despedir de vuestros pechos esta infernal secta, sabed, que ha nacido en Castilla vn Principe que os ha de echar de España." *Porreño, Dichos y Hechos de Phelipe III.*, in *Yañez, Memorias*, Madrid, 1723, p. 224 : and nearly the same words in *Janer, Condicion de los Moriscos*, p. 60. Mr. Prescott, in his *History of Philip II.*, vol. iii. p. 139, quotes a MS. letter from Don John of Austria to Philip II., written in 1570, and stating that the Spanish monks were openly preaching against the leniency with which the king treated the Moriscoes. "Predicando en los pulpitos publicamente contra la benignidad y clemencia que V. M. ha mandado usar con esta gente."

132 In a recent work of considerable authority, it is denied that Philip II. entertained the desire of expelling the Moriscoes. "El cáracter austero y la severidad de Felipe II. redundaban en favor de los moriscos, porque no daba oidos á las instigaciones de algunos personajes que señalaban la expulsion general como único remedio eficaz para los males que ofrecia al pais aquella desventurada raza. Acababa el monarca de tocar los tristes resultados de una emigracion por las funestas consecuencias de la despoblacion del reino granadino, y preferia continuar en la *senda de la conciliacion*, procurando de nuevo la

strength, and they soon felt themselves sufficiently powerful to begin another and final crusade against the miserable remains of the Moorish nation.[133]

The Archbishop of Valencia was the first to take the field. In 1602 this eminent prelate presented a memorial to Philip III. against the Moriscoes; and finding that his views were cordially supported by the clergy, and not discouraged by the crown, he followed up the blow by another memorial having the same object.[134] The Archbishop, who spoke as one having authority, and who from his rank and position was a natural representative of the Spanish Church, assured the king that all the disasters which had befallen the monarchy had been caused by the presence of these unbelievers, whom it was now necessary to root out, even as David had done to the Philistines, and Saul to the Amalekites.[135] He declared that the Armada which Philip II. sent against England in

enseñanza de los conversos." *Janer, Condicion de los Moriscos*, Madrid, 1857, p. 59. But, to say nothing of the fact that this is contrary to all we know of the character of Philip, we have on the other side of the question the testimony of Archbishop Ribera, who had often communicated with the king on the subject, and who distinctly states that Philip desired the expulsion of the Moors from Spain. "El hechar los Moros deste Reyno, ha sido cosa muy desseada, y procurada por los Reyes Predecessores del Rey nuestro Señor, aunque no executada." . . . "El Rey Don Felipe Segundo, nuestro Señor, despues de suceder en estos Reynos, *tuvo el mismo desseo*; y assi mandó, que se juntassen los Prelados deste Reyno para buscar remedio el año de 1568; siendo Arçobispo desta Metropoli el Reverendissimo Don Hernando de Lloazes. Hizieronse en aquella Junta álgunas Constituciones de consideracion. Visto que no aprovechaban, mando el año 1587 que se hiziesse ortra Junta, *en la qual me hallé yo*: añadimos tambien algunas nuevas Constituciones. Y constando á su Magestad que no eran bastantes las diligencias passadas, y que siempre perseveraban en su heregia, se resolvió de mandarlos hechar del Reyno, ó por lo menos meterlos dentro de la tierra." *Ximenez, Vida de Ribera*, Roma, 1734, 4to, pp. 419, 420. This important passage is decisive as to the real feelings of Philip, unless we assume that Ribera has stated a deliberate falsehood. But, strange to say, even the book in which so remarkable a passage is contained appears to be unknown either to M. Janer or to M. Lafuente.

133 "El rey Felipe III., hombre de rudo ingenio, se dejaba gobernar con facilidad por aquellos que sabiendo los temores de su conciencia, se aprovechaban de su imbecilidad para conseguir cuanto querian. Muchos eclesiásticos, recordando las espulsiones de judios y moros ejecutadas de órden de Fernando é Isabel, y conociendo que á Felipe III. seria agradable imitar á estos monarcas, le aconsejaron que condenase al destierro á todos los moriscos que vivian en sus reynos; pues no solo se obstinaban en seguir la ley mahometana, sino que tenian tratos con los turcos y entre sí para buscar suslibertades por medio del rigor de las armas." *Castro, Decadencia de España*, Cadiz, 1852, pp. 101, 102.

134 These memorials are printed in the Appendix to his Life by Ximenez. See the very curious book entitled *Vida y Virtudes del Venerable Siervo de Dios D. Juan de Ribera, por el R. P. Fr. Juan Ximenez*, Roma, 1734, 4to, pp. 367–374, 376–393. This work is, I believe, extremely rare; at all events I endeavoured in vain to obtain a copy from Spain or Italy, and after some years' unsuccessful search I met with the one I now have, on a London book-stall. M. de Circourt, in his learned History of the Spanish Arabs, does not appear to have been aware of its existence, and he complains that he could not procure the works of Ribera, whose Memorials he consequently quotes second-hand. *Circourt, Histoire des Arabes d'Espagne*, Paris, 1846, vol. iii. pp. 168, 351. Nor does Watson seem to have known it: though both he and M. de Circourt refer to Escriva's Life of Ribera. *Watson's Philip III.*, London, 1839, pp. 214–221. An abstract of these Memorials is given by Geddes, who, though a learned and accurate writer, had the mischievous habit of not indicating the sources of his information. *Geddes' Tracts*, London, 1730, vol. i. pp. 60–71.

135 "Por lo qual se puede creer, que nuestro Señor ha querido reservar esta obra tan digna de pecho Real para Vuestra Magestad, como reservó la libertad de su pueblo para Moyses, la entrada de la Tierra de Promission para Josue, la vengança de la injuria antigua de los Amalequitas para Saul, y la victoria de los Filisteos para David."

1588 had been destroyed because God would not allow even that pious enterprise to succeed while those who undertook it left heretics undisturbed at home. For the same reason the late expedition to Algiers had failed; it being evidently the will of Heaven that nothing should prosper while Spain was inhabited by apostates.[136] He, therefore, exhorted the king to exile all the Moriscoes, except some whom he might condemn to work in the galleys, and others who could become slaves, and labour in the mines of America.[137] This, he added, would make the reign of Philip glorious to all posterity, and would raise his fame far above that of his predecessors, who in this matter had neglected their obvious duty.[138]

These remonstrances, besides being in accordance with the known views of

Ximenez, Vida de Ribera, p. 370. Again, p. 377: "Y al primer Rey que tuvo el Mundo, en siendo elegido por Dios, y confirmado en su Reyno, le embia á mandar por un Propheta que destruya á los Amalequitas, sin dexar hombres, ni mugeres, ni niños, aunque sean de leche, en fin que no quede rastro de ellos, ni de sus haziendas. Y porque no cumplio exactamente su mandamiento, cayó en indignacion de Dios, y fue privado del Reyno. Al segundo Rey, que fue David, le mandó Dios en siendo jurado, que destruyesse los Philisteos, como lo hizo."

[136] "El año quando se perdio la poderosa Armada, que iba á Inglaterra, confiado de la benignidad del Rey nuestro Señor, que está en el Cielo, me atrevi con el zelo de fiel vassallo y Capellan, á dezir á Su Magestad; que aviendo gastado mucho tiempo en discurrir, que causa podia aver para que Dios, nuestro Señor, permitiesse aquel mal sucesso, se me havia ofrecido una cosa de mucha consideracion, y era, querer dezir la Magestad Divina á Su Magestad Catolica; que mientras no ponia remedio en estas Heregias de España, cuyos Reynos le avia encomendado, no se debia ocupar en remediar las de los Reynos agenos. Y ahora confiando en la misma benignidad, y clemencia de Vuestra Magestad, me atrevo tambien á dezir, que aviendo considerado la causa, porque Dios nos ha quitado de las manos la toma de Argel, aviendose dispuesto todas las prevenciones para ella con la mayor prudencia, y sagacidad, que hemos visto en nuestros tiempos, y sirviendonos el mar, y los ayres, y las ocasiones, de la manera, que podiamos dessear, tengo por sin duda, que ha sido, querer nuestro Señor dar á Vuestra Magestad el ultimo recuerdo de la obligacion, que tiene, de resolver esta platica." *Ximenez, Vida de Ribera*, p. 373. It would be a pity if such admirable specimens of theological reasoning were to remain buried in an old Roman quarto. I congratulate myself and the reader on my acquisition of this volume, which is a vast repertory of powerful though obsolete weapons.

[137] "Todas estas cosas, y otras muchas, que dexo de dezir, por no ser prolixo, me hazen evidencia, de que conviene para el servicio de Dios nuestro Señor, y que Vuestra Magestad está obligado en conciencia, como Rey, y Supremo Señor, á quien toca de justicia defender, y conservar sus Reynos, mandar desterrar de España todos estos Moriscos, sin que quede hombre, ni muger grande, ni pequeño; reservando tan solamente los niños, y niñas, que no llegaren á siete años, para que se guarden entre nosotros, repartiendolos por las casas particulares de Christianos viejos. Y aun hay opinion de personas doctas, que estos tales niños y niñas, los puede Vuestra Magestad dar por esclavos, y lo fundan con razones probables." *Ximenez, Vida de Ribera*, pp. 379, 380. "Destos que se han de desterrar, podrá Vuestra Magestad tomarlos que fuere servido por esclavos, para proveer sus Galeras, ó para embiar á las minas de las Indias, sin escrupulo alguno de conciencia, lo que tambien será de no poca utilidad." p. 384. To do this was to be merciful; for they all deserved capital punishment, "merecian pena capital." p. 381.

[138] "Aora, Catolica Magestad, vemos que Dios nuestro Señor ha reservado para Vuestra Magestad, y para su Real Corona, el nombre, y hechos de Rey Catholico: permitiendo por sus secretos juizios, que los que han sido siempre enemigos de su Iglesia se conserven, y que los que antes eran Catholicos, ayan degenerado, y apostatado de su santa ley y assi va la honra de Dios nuestro Señor, y el exemplo, y confusion de los otros Reyes, en que Vuestra Magestad tenga sus Reynos limpios de Hereges, y principalmente á España. Y quando esto huviesse de costar grandes trabajos, y todo el oro, y plata, que hay en las Indias, estaria muy bien empleado: pues se atraviessa la honra de Dios, la de su Santa Iglesia, el antiguo renombre desta Corona," &c. *Ximenez, Vida de Ribera*, p. 382. And on the neglect of duty by Charles V. and Philip II., see p. 370.

the Spanish Church, were warmly supported by the personal influence of the Archbishop of Toledo, the primate of Spain. In only one respect did he differ from the views advocated by the Archbishop of Valencia. The Archbishop of Valencia thought that children under seven years of age need not share in the general banishment, but might, without danger to the faith, be separated from their parents, and kept in Spain. To this the Archbishop of Toledo strongly objected. He was unwilling, he said, to run the risk of pure Christian blood being polluted by infidels ; and he declared that sooner than leave one of these unbelievers to corrupt the land, he would have the whole of them, men, women, and children, at once put to the sword.[139]

That they should all be slain, instead of being banished, was the desire of a powerful party in the Church, who thought that such signal punishment would work good by striking terror into the heretics of every nation. Bleda, the celebrated Dominican, one of the most influential men of his time, wished this to be done, and to be done thoroughly. He said that for the sake of example every Morisco in Spain should have his throat cut, because it was impossible to tell which of them were Christians at heart, and it was enough to leave the matter to God, who knew his own, and who would reward in the next world those who were really Catholics.[140]

It was evident that the fate of the wretched remnant of a once splendid nation was now sealed. The religious scruples of Philip III. forbade him to struggle with the Church ; and his minister Lerma would not risk his own authority by even the show of opposition. In 1609 he announced to the king that the expulsion of the Moriscoes had become necessary. "The resolution," replied Philip, "is a great one ; let it be executed."[141] And executed it was, with unflinching barbarity. About one million of the most industrious inhabitants of Spain were hunted out like wild beasts, because the sincerity of their religious

[139] "The most powerful promoter of their expulsion was Don Bernardo de Roias y Sandoval, Cardinal Archbishop of Toledo, and Inquisitor-General and Chancellor of Spain. This great prelate, who was brother to the Duke of Lerma, by whom the king for some years before and for some years after the expulsion was absolutely governed, was so zealous to have the whole race of the Moriscoes extinguished, that he opposed the detaining of their children who were under seven years of age ; affirming that of the two he judged it more advisable to cut the throats of all the Moriscoes, men, women, and children, than to have any of their children left in Spain, to defile the true Spanish blood with a mixture of the Moorish." *Geddes' Tracts*, vol. i. pp. 85, 86. Navarrete has pronounced a glowing eulogy upon the piety and other noble qualities of this prelate ; and says that "llenando de esplendor con su virtud tres sillas episcopales, mereció que Clemente VIII. le honrase con el capelo, y fué elevado á la primada de Toledo, y al empleo de inquisidor general." *Vida de Cervantes*, pp. xcvii. xcviii., Barcelona, 1839.

[140] "He did assure all the old Christian laity that whenever the king should give the word, they might, without any scruple of conscience, cut the throats of all the Moriscoes, and not spare any of them upon their professing themselves Christians ; but to follow the holy and laudable example of the Croisado that was raised against the Albigenses, who, upon their having made themselves masters of the city of Bezeir, wherein were two hundred thousand Catholics and hereticks, did ask Father Arnold, a Cistercian monk, who was their chief preacher, 'Whether they should put any to the sword that pretended to be Catholics ;' and were answered by the holy Abbot, 'That they should kill all without distinction, and leave it to God, who knew his own, to reward them for being true Catholicks in the next world ;' which was accordingly executed." *Geddes*, vol. i. p. 84.

[141] "'Grande resolucion !' contesto el débil monarca al ministro favorito : 'hacedlo vos, duque.'" *Lafuente, Historia de España*, vol. xv. p. 375. But this reply, so far from being a mark of weakness on the part of Philip, was a strictly logical application of the principles which he entertained, and which indeed were almost universal in Spain. We know from his contemporary biographer that "Determinó el Rey en los principios de su Reynado, como Rey tan poderoso y Catolico, de consagrar y dedicar á Dios la potencia de sus Consejos y Armas para extinguir y acabar los enemigos de la Iglesia Santa." *Davila, Historia de la Vida de Felipe Tercero*, lib. i. p. 44.

opinions was doubtful.[142] Many were slain as they approached the coast; others were beaten and plundered; and the majority, in the most wretched plight, sailed for Africa. During the passage, the crew, in many of the ships, rose upon them, butchered the men, ravished the women, and threw the children into the sea. Those who escaped this fate landed on the coast of Barbary, where they were attacked by the Bedouins and many of them put to the sword. Others made their way into the desert, and perished from famine. Of the number of lives actually sacrificed we have no authentic account; but it is said, on very good authority, that in one expedition, in which 140,000 were carried to Africa, upwards of 100,000 suffered death in its most frightful forms within a few months after their expulsion from Spain.[143]

Now, for the first time, the Church was really triumphant.[144] For the first time there was not a heretic to be seen between the Pyrenees and the Straits of Gibraltar. All were orthodox, and all were loyal. Every inhabitant of that great country obeyed the Church, and feared the king. And from this happy combination it was believed that the prosperity and grandeur of Spain were sure to follow. The name of Philip III. was to be immortal, and posterity would never weary of admiring that heroic act by which the last remains of an infidel race were cast out from the land. Those who had even remotely participated in the glorious consummation were to be rewarded by the choicest blessings. Themselves and their families were under the immediate protection of Heaven. The earth should bear more fruit, and the trees should clap their hands. Instead of the thorn should come up the fir-tree, and instead of the brier, the myrtle. A new era was now inaugurated, in which Spain, purged of her heresy, was to be at ease, and men, living in safety, were to sleep under the shade of their own

[142] This is the average estimate. Some authors make it less, and some more; while one writer says, "The numbers expelled have been estimated at four hundred thousand families, or two millions of souls." *Clarke's Internal State of Spain*, London, 1818, p. 33. But this is incredible. M. Castro (*Decadencia de España*, Cadiz, 1852, p. 105) says, "España perdió en los moriscos un millon de habitantes;" and M. Janer (*Condicion de los Moriscos*, Madrid, 1857, p. 93), "Sin entrar en cálculos sobre los que habia cuando se expidió el edicto de Valencia en 1609, ni sobre los que fenecieron en las rebeliones, de mano armada, de sed, de hambre ó ahogados, creemos poder fijar, aproximadamente, en novecientos mil los que llegaron á poner el pie fuera de la península, despidiéndose para siempre de las costas y fronteras de España, cuya cifra deducimos del exámen y contexto de unos y otros escritores, de las listas que nos han quedado de los expulsos, de los datos de diversas relaciones, estados y documentos examinados con este solo intento;" and further on, p. 105, "la expulsion de un millon, ó novecientos mil de sus habitantes." Llorente (*Histoire de l'Inquisition*, vol. iii. p. 430, Paris, 1818) says, "un million d'habitans utiles et laborieux;" Ximenez (*Vida de Ribera*, Roma, 1734, 4to, p. 70), "novecientos mil;" and Boisel, who was in Spain fifty years after the expulsion, and collected the traditionary evidence, says, "Il sortit neuf cens tant de mille hommes de compte fait, de Valence, d'Andalousie, et de Castille." *Boisel, Journal du Voyage d'Espagne*, Paris, 1669, 4to, p. 275.

[143] *Watson's Philip III.*, pp. 234, 235. *Davila, Vida de Felipe III.*, p. 146. *Yanez, Memorias para la Historia de Felipe III.*, pp. 281, 290. *Janer, Condicion de los Moriscos*, pp. 83, 84, 90. Some particulars respecting their expulsion may also be seen in Cottington's Letters from Madrid, which were written in 1609, but are of very little value. *Winwood's Memorials of Affairs of State*, vol. iii. pp. 73, 91, 103, 118, London, folio, 1725.

[144] In a contemporary sermon in commemoration of their expulsion, the preacher joyfully exclaims, "Pues, que mayor honra podemos tener en este Reyno, que ser todos los que vivimos en el, fieles á Dios, y al Rey, sin compañia de estos Hereges y traydores?" *Ximenez, Vida de Ribera*, p. 423. Another clergyman cries out, "Al fin salieron estos, y quedó la tierra libre de la infamia de esta gente." *Davila, Vida de Felipe Tercero*, p. 149. See also p. 151. "Y es digno de poner en consideracion el zelo que los Reyes de España tuvieron en todo tiempo de sustentar la Fé Catolica; pues en diferentes expulsiones que han hecho, han sacado de sus Reynos tres millones de Moros, y dos millones de Judios, enemigos de nuestra Iglesia."

vineyards, sow their gardens in peace, and eat of the fruit of the trees they had planted.[145]

These were the promises held out by the Church, and believed by the people. It is our business to inquire how far the expectations were fulfilled, and what the consequences were of an act which was instigated by the clergy, welcomed by the nation, and eagerly applauded by some of the greatest men of genius Spain has produced.[146]

[145] See the sermon by the Archbishop of Valencia, printed at length in the Appendix to *Ximenez, Vida de Ribera*, pp. 411–428. I would fain quote it all; but the reader must be content with part of the peroration, pp. 426, 427. "Entre las felizidades, que cuenta el Espiritu Santo que tuvieron los hijos de Israel en el govierno del Rey Salomon, es una; que vivian los hombres seguros, durmiendo á la sombra de su parra, y de su higuera, sin tener de quien temer. *Assi estarémos en este Reyno de aqui adelante*, por la misericordia de nuestro Señor, y paternal providencia de Su Magestad, todo nos sobrará, y la misma tierra se fertilizará y dará fruto de bendicion. Brocardico es, de que todos usabades, diziendo que despues, que estos se bautizaron, no se avia visto un año fertil; *aora todos lo seran*, porque las heregias y blasfemias de estos tenian esterilizada, abrasada, y inficionada la tierra, como dixo el Real Propheta David, con tantos pecados y abominaciones." . . . "Y edificarán en las tierras, que antes eran desiertas, plantando viñas, y bebiendo el vino de ellas, y sembrarán huertas, y comeran del fruto de los arboles, que han plantado, y nunca seran hechados de sus casas, dize Dios. Todo esto promete nuestro Señor por dos Prophetas suyos. *Todo (digo otra vez) nos sobrará.*" All this was to happen to the people; while, as to the king, he, in the same sermon, p. 416, is likened to David; and it was declared by another high authority that his expulsion of the Moriscoes was so great an exploit ("hazaña"), that "durára su memoria por los venideros siglos." *Porreño*, in *Yanez, Memorias para Felipe III.*, p. 281.

[146] "Amidst the devout exultation of the whole kingdom,—Cervantes, Lope de Vega, and others of the principal men of genius then alive, joining in the general jubilee." *Ticknor's History of Spanish Literature*, vol. i, pp. 428, 429. Compare *Dunlop's Memoirs*, vol. i. p. 16. Porreño says that it may be placed among the seven wonders of the world; "la podemos poner entre las siete maravillas del mundo." *Yañez, Memorias*, p. 297: and Davila (*Vida de Felipe Tercero*, lib. ii. cap. 41, p. 139) pronounces it to be the most glorious achievement which had been seen since the days of Pelayo. All this is natural enough; but what is really curious is to trace the modern remains of this feeling. Campomanes (*Apendice á la Educacion Popular*, vol. iv. p. 130, Madrid, 1777), a very able man, and far more liberal than most of his countrymen, is not ashamed to speak of "la justa expulsion de los moriscos desde 1610 á 1613." Ortiz, in 1801, expresses himself with more hesitation, but is evidently in favour of a measure which liberated Spain from "la perniciosa semilla de Mahoma que restaba en ella." *Compendio de la Historia de España*, vol. vi. pp. 304, 305. Nay, even in 1856, the great modern historian of Spain, while admitting the serious material injury which this horrible crime inflicted on the country, assures us that it had the "immense advantage" of producing religious unity; unable to perceive that the very unity of which he boasts, generates an acquiescence and stagnation of mind fatal to all real improvement, because it prevents that play and collision of opinions by which the wits of men are sharpened and made ready for use. "Con la expulsion se completó el principio de la unidad religiosa en España, que fué un bien inmenso, pero se consumó la ruina de la agricultura, que fué un inmenso mal." *Lafuente, Historia de España*, vol. xvii. p. 340, Madrid, 1856. And, the year after this sagacious sentiment had been given to the world, another eminent Spaniard, in a work crowned by the Royal Academy of History, went still further, and declared, that not only did the expulsion of the Moriscoes cause great benefit by securing unity of creed, but that such unity was "necessary on the Spanish soil." "Y si bajo el aspecto económico reprobamos semejante medida por la influencia perniciosa que tuvo desde el momento de dictarse, la imparcialidad de historiadores nos obliga á respetarla por los inmensos bienes que produjo en el órden religioso y en el órden político." . . . "La unidad religiosa era necesaria en el suelo español." *Janer, Condicion Social de los Moriscos de España*, Madrid, 1857, pp. 110, 114. What are we to think of a country in which these opinions are expressed, not by some obscure fanatic, from the platform or

The effects upon the material prosperity of Spain may be stated in a few words. From nearly every part of the country large bodies of industrious agriculturists and expert artificers were suddenly withdrawn. The best systems of husbandry then known were practised by the Moriscoes, who tilled and irrigated with indefatigable labour.[147] The cultivation of rice, cotton, and sugar, and the manufacture of silk and paper, were almost confined to them.[148] By their expulsion all this was destroyed at a blow, and most of it was destroyed for ever. For the Spanish Christians considered such pursuits beneath their dignity. In their judgment war and religion were the only two avocations worthy of being followed. To fight for the king, or to enter the Church, was honourable; but everything else was mean and sordid.[149] When, therefore, the Moriscoes were thrust out of Spain there was no one else to fill their place; arts and manufactures either degenerated or were entirely lost, and immense regions of arable land were left uncultivated. Some of the richest parts of Valencia and Granada were so neglected that means were wanting to feed even the scanty population which remained there.[150] Whole districts were suddenly deserted, and down to the present day have never been repeopled. These

the pulpit, but by able and learned men, who promulgate them with all the authority of their position, being themselves deemed, if anything, rather too bold and too liberal for the people to whom they address their works?

[147] "Los moros eran muy diestros en todo lo que mira á obras de agua." *Campomanes, Apendice á la Educacion Popular*, vol. iii. p. cvii. "The Moors were the most intelligent agriculturists Spain ever had." *Laborde's Spain*, vol. ii. p. 216. Even Jovellános admits that "except in the parts occupied by the Moors, the Spaniards were almost totally unacquainted with the art of irrigation." *Clarke's Internal State of Spain*, p. 116. See also *Circourt, Arabes d'Espagne*, vol. i. p. 255, vol. ii. p. 12, vol. iii. pp. 162, 222; *Bourgoing, Tableau de l'Espagne*, vol. ii. pp. 170, 171; and *Townsend's Spain*, vol. iii. p. 74. Remains of their splendid aqueducts still exist. *Hoskins' Spain*, vol. i. pp. 120, 125, 291, 292. Compare *Spain by an American*, vol. ii. p. 112, with *L'Estat de l'Espagne*, Geneve, 1681, p. 399.

[148] Compare *Janer, Condicion de los Moriscos*, pp. 47, 48, with *Campomanes, Apendice á la Educacion Popular*, vol. iii. p. xxii., and *Dunlop's Memoirs*, vol. i. p. 13.

[149] The more sensible among the Spaniards notice, with regret, this national contempt for every form of useful industry. See *Campomanes, Educacion Popular*, p. 128, and *Sempere, Monarchie Espagnole*, vol. ii. pp. 277, 278. A traveller in Spain in 1669, says of the people, "ils méprisent tellement le travail, que la plûpart des artisans sont étrangers." *Voyages faits en divers Temps par M. M*****, Amsterdam, 1700, p. 80. Another traveller, between 1693 and 1695, says, they "think it below the dignity of a Spaniard to labour and provide for the future." *Travels by a Gentleman* (by Bromley?), London, 1702, p. 35. A third observer, in 1679, assures us that "ils souffrent plus aisément la faim et les autres necessitez de la vie, que de travailler, disent-ils, comme des mercenaires, ce qui n'appartient qu'à des Esclaves." *D'Aulnoy, Relation du Voyage d'Espagne*, Lyon, 1693, vol. ii. pp. 369, 370. For further illustrations of this, see *Labat, Voyages en Espagne*, Paris, 1730, vol. i. pp. 285, 286. *Capmany, Qüestiones Criticas*, pp. 43, 49, 50. *Laborde's Spain*, vol. i. p. l. *Ranke's Spanish Empire*, p. 103. *Townsend's Journey through Spain*, vol. ii. pp. 240, 241.

[150] "Pudo, pues, decirse con razon de nuestra patria, que de Arabia Felíz se habia convertido en Arabia Desierta, y de Valencia en particular, que el bello jardin de España se habia convertido en páramo seco y deslucido. Dejóse en breve sentir en todas partes el azote del hambre; y al alegre bullicio de las poblaciones sucedio el melancolico silencio de los despoblados, y al frecuente cruzar de los labradores y trajineros por los caminos siguió el peligroso encuentro de los salteadores que los infestaban, abrigándose en las ruinas de los pueblos desiertos." *Janer, Condicion de los Moriscos*, p. 100. See also *Dunlop's Memoirs*, vol. i. p. 16. Campomanes says, "El gran número de artesanos, que salieron con la expulsion de los moriscos, causó un golpe mortal á las manufacturas, y á la labranza." *Apendice a la Educacion Popular*, vol. i. p. 13. And p. 268, "El punto de decadencia de nuestras manufacturas, puede fixarse desde el año de 1609, en que tubo principio la expulsion de los Moriscos."

solitudes gave refuge to smugglers and brigands, who succeeded the industrious inhabitants formerly occupying them; and it is said that from the expulsion of the Moriscoes is to be dated the existence of those organized bands of robbers which after this period became the scourge of Spain, and which no subsequent government has been able entirely to extirpate.[151]

To these disastrous consequences others were added, of a different, and if possible of a still more serious kind. The victory gained by the Church increased both her power and her reputation. During the rest of the seventeenth century, not only were the interests of the clergy deemed superior to the interests of laymen, but the interests of laymen were scarcely thought of. The greatest men, with hardly an exception, became ecclesiastics, and all temporal considerations, all views of earthly policy, were despised and set at nought. No one inquired; no one doubted; no one presumed to ask if all this was right. The minds of men succumbed and were prostrate. While every other country was advancing, Spain alone was receding.* Every other country was making some addition to knowledge, creating some art, or enlarging some science. Spain, numbed into a death-like torpor, spell-bound and entranced by the accursed superstition which preyed on her strength, presented to Europe a solitary instance of constant decay. For her no hope remained; and before the close of the seventeenth century the only question was by whose hands the blow should be struck which would dismember that once mighty empire, whose shadow had covered the world, and whose vast remains were imposing even in their ruin.

To indicate the different steps which mark the decline of Spain would be hardly possible, since even the Spaniards, who, when it was too late, were stung with shame, have abstained from writing what would only be the history of their own humiliation; so that there is no detailed account of the wretched reigns of Philip IV. and Charles II., which together comprise a period of nearly eighty years.[152] Some facts, however, I have been able to collect, and they

[151] "Sur la carte d'Espagne, en mille endroits est inscrit ce funeste mot, *despoblado*; en mille endroits la nature sauvage a repris la place des cultures. Etudiez la direction des despoblados, et consultez les registres des commissaires de l'expulsion, vous verrez presque toujours que les familles morisques couvraient ces solitudes. Leur patrimoine abandonné forma le domaine des voleurs, qui établirent avec une sorte de sécurité leurs correspondances effrontées à travers toute l'Espagne. Le brigandage s'organisa comme une profession ordinaire; et la contrebande, sa compagne, leva le front avec autant d'audace, autant de succès." *Circourt, Histoire des Arabes d'Espagne*, vol. iii. pp. 227, 228.

[152] "Declinó pues muy sensiblemente la vasta monarquía, y callaron atonitos los historiadores, como huyendo la necesidad de traer á la memoria lo que veian y apenas creian. Enmudeció pues la historia de España en los dos reynados de Felipe IV. y Carlos II. viendo continuaba nuestra decadencia, hasta quedar España al nivel de los menos poderosos Estados de Europa. Este silencio nos ha privado de saber no solo las causas de nuestra decadencia, sino tambien de los acontecimientos civiles y militares del siglo xvii." *Ortiz, Compendio de la Historia de España*, vol. vi., Prologo, p. i. No attempt was made to supply the deficiency complained of by Ortiz until 1856, when M. Lafuente published, in Madrid, the sixteenth and seventeenth volumes of his History of Spain, which contain the reigns of Philip IV. and Charles II. Of this work I have no desire to speak disrespectfully; on the contrary, it is impossible to read it without interest, on account of the admirable clearness with which the different topics are arranged, and also on account of its beautiful style, which reminds us of the best days of Castilian prose. But I feel constrained to say that as a history, and especially as a history which undertakes to investigate the causes of the decline of Spain, it is a complete failure. In the first place, M. Lafuente has not emancipated himself from those very prejudices to which the decline of his country is owing. And in the second place he has, particularly in the reigns of Philip IV. and Charles II., not used sufficient diligence

[* This is contradicted by the account previously given of the state of France under Louis XIV. And Germany, of course, "receded" in the Thirty Years' War.—Ed.]

are very significant. At the beginning of the seventeenth century the population of Madrid was estimated to be 400,000 ; at the beginning of the eighteenth century less than 200,000.[153] Seville, one of the richest cities in Spain, possessed in the sixteenth century upwards of sixteen thousand looms, which gave employment to a hundred and thirty thousand persons.[154] By the reign of Philip V. these sixteen thousand looms had dwindled away to less than three hundred ; [155] and in a report which the Cortes made to Philip IV., in 1662, it is stated that the city contained only a quarter of its former number of inhabitants, and that even the vines and olives cultivated in its neighbourhood, and which comprised a considerable part of its wealth, were almost entirely neglected.[156] Toledo, in the middle of the sixteenth century, had upwards of fifty woollen manufactories ; in 1665 it had only thirteen, almost the whole of the trade having been carried away by the Moriscoes, and established at Tunis.[157] Owing to the same cause the art of manufacturing silk, for which Toledo was celebrated, was entirely lost, and nearly forty thousand persons who depended on it were deprived of their means of support.[158] Other branches

in searching for materials for studying the economical changes through which Spain has passed. Looking too intently at the surface, he mistakes symptoms for causes ; so that the real history of the Spanish people everywhere escapes his grasp. As the object to which my studies are directed compels me to contemplate affairs from a larger and more general point of view than he has done, it naturally happens that the conclusions at which we arrive are very different ; but I wish to bear my testimony, whatever it may be worth, to the great merit of his book as a work of art, though as a work of science it appears to me that he has effected nothing, and has thrown no new light on the real history of that unfortunate albeit once splendid nation, of which his eloquence, his learning, and his taste, make him one of the chiefest ornaments.

153 See *Dunlop's Memoirs*, vol. ii. p. 320; and the interesting calculations in *Uztariz, Theorica y Practica de Comercio*, Madrid, 1757, folio, pp. 35, 36. Owing to the ignorance which formerly prevailed respecting statistics, such estimates are necessarily imperfect ; but after the desolation of Spain in the seventeenth century, an extraordinary diminution in the population of the capital was inevitable. Indeed, a contemporary of Charles II. states that in 1699, Madrid had only 150,000 inhabitants. *Mémoires de Louville*, Paris, 1818, vol. i. p. 72. This account is taken from "un mémoire manuscrit, en langue espagnole, trouvé dans les papiers du marquis de Louville," p. 67.

154 Capmany (*Qüestiones Criticas*, p. 30), who seems to have written his able but not very accurate work for the express purpose of concealing the decline of his country, has given these figures erroneously. My information is derived from an official report made in 1701 by the trade-corporations ("gremios") of Seville. "Fijan la época de la ruina de nuestras fábricas desde el reynado de Felipe II. y añaden 'haber llegado á tener solo en esta ciudad el arte mayor, y menor de la sede, el número de mas de diez y seis mil telares, ye s ocupaban en los exercicios adherentes á él, mas de ciento treinta mil personas de ambos sexos.'" *Campomanes, Apendice á la Educacion Popular*, vol. i. p. 473, Madrid, 1775. See also *Uztariz, Theorica y Practica de Comercio*, p. 14, "diez y seis mil telares ;" where, however, no authority is quoted.

155 "El principal origen y causa de que los 16,000 telares de seda, lana, oro y plata, que se contaban en Sevilla, se hallen oy reducidos á menos de 300." *Uztariz, Theorica de Comercio*, p. 243.

156 *Sempere, Monarchie Espagnole*, vol. ii. p. 52, who refers to the report of the Cortes published by Alonso Nunez de Castro.

157 *Laborde's Spain*, vol. iv. p. 338, where it is also said that Tunis became, in consequence of the expulsion of the Moriscoes, famous for the manufacture of caps, which "were subsequently imitated at Orleans." Compare, on the cap-manufactories of Tunis, a note in *Campomanes, Apendice á la Educacion Popular*, vol. iv. p. 249.

158 "Tolède où se mettaient en œuvre 435,000 livres de soie, avait déjà perdu ce travail, qui suffisait autrefois à l'existence de 38,484 personnes. La population de cette ville avait éprouvé un tiers de diminution, et vingt-cinq maisons de ses familles les plus illustres étaient passées dans le domaine de divers couvens." *Sempere, Monarchie Espagnole*, vol. ii. p. 50.

of industry shared the same fate. In the sixteenth century, and early in the seventeenth, Spain enjoyed great repute for the manufacture of gloves, which were made in enormous quantities, and shipped to many parts, being particularly valued in England and France, and being also exported to the Indies. But Martinez de Mata, who wrote in the year 1655, assures us that at that time this source of wealth had disappeared; the manufacture of gloves having quite ceased, though formerly, he says, it had existed in every city in Spain.[159] In the once-flourishing province of Castile everything was going to ruin. Even Segovia lost its manufactures, and retained nothing but the memory of its former wealth.[160] The decay of Burgos was equally rapid; the trade of that famous city perished; and the deserted streets and empty houses formed such a picture of desolation, that a contemporary, struck by the havoc, emphatically declared that Burgos had lost everything except its name.[161] In other districts the results were equally fatal. The beautiful provinces of the south, richly endowed by nature, had formerly been so wealthy that their contributions alone sufficed, in time of need, to replenish the imperial treasury; but they now deteriorated with such rapidity, that, by the year 1640, it was found hardly possible to impose a tax on them which would be productive.[162] During the latter half of the

[159] See his interesting essay, reprinted in the appendix to *Campomanes*, vol. iv. p. 251. He says, "La fábrica de los guantes, que tenian pocos años ha todas las ciudades de estos reynos para el consumo de Espana y las Indias, era muy considerable; y se ha destruido, despues que se dió entrada al consumo de guantes estrangeros." Such a statement, made by a contemporary, is unimpeachable; but the reason he assigns is inadequate.

[160] Segovia, as it appeared in 1659, is thus described in *Boisel, Journal du Voyage d'Espagne*, Paris, 1669, 4to, p. 186: "Autresfois, cette ville qui paroist assez grande, estoit fort riche, tant à cause que les rois de Castille y demeuroient, qu'à cause du grand commerce des laines et des beaux draps qui s'y faisoient; mais à present le trafic n'y est plus, et on n'y fait plus que fort peu de draps, de sorte que la ville est presque desert et fort pauvre. Une marque de sa pauvreté, du mauvais ordre d'Espagne, et du peu de prévoyance des Espagnols (quoy qu'on dise de leur flegme) c'est que le jour que j'y arrivay jusques à deux heures après midy il n'y avoit point eu de pain en toute la ville, et ils ne s'en étonnoient point." The decline of the silk and wool manufactures of Segovia is also noticed by Martinez de la Mata, who wrote in 1650. See his *Dos Discursos*, edited by Canga, Madrid, 1794, p. 8. Saint Simon, who was there in 1722 says, "A l'égard de leurs laines, j'en vis les manufactures à Ségovie qui me parurent peu de chose et fort tombées de leur ancienne réputation." *Mémoires du Duc de Saint Simon*, vol. xxxvii. p. 230, Paris, 1841. Segovia used to be famous for the beautiful colour of its cloth, the dye of which was taken from a shell-fish found in the West Indies, and is supposed to be the same as the purpura of the ancients. See a note in *Dillon's Spain*, Dublin, 1781, pp. 19, 20.

[161] Such is the language of a Spaniard in the middle of the seventeenth century. "Porque á la ciudad de Burgos, cabeza de Castilla, no le ha quedado sino el nombre, ni aun vestigios de sus ruinas; reducida la grandeza de sus tratos, Prior, y Cónsules, y ordenanzas para la conservacion de ellos, á 600 vecinos, que conservan el nombre, y lustre de aquella antigua y noble ciudad, que encerró en sí mas de seis mil, sin la gente suelta, natural, y forastera." *Campomanes, Apendice a la Educacion*, vol. i. p. 453, Madrid, 1775. An intelligent Dutchman, who visited Spain in 1655, says of Burgos, "elle a esté autrefois fort marchande, mais depuis peu, elle a presque perdu tout son commerce." *Aarsens de Sommerdyck, Voyage d'Espagne*, Paris, 1665, 4to, p. 16. To me it certainly appears that facts of this sort have more to do with the real history of Spain than the details of kings, and treaties, and battles, which the Spanish historians love to accumulate.

[162] "Could contribute little to the exigencies of the state." *Dunlop's Memoirs*, vol. i. p. 285. Compare *Lamentos Apologéticos*, in *Dos Discursos*, edit. Canga, Madrid, 1794, p. 82, on the state of things in "lo mas fértil de Andalucía." The government first became alive to all this when it found that no more money could be wrung from the people. In May, 1667, a council of state, convoked by the queen, reported that "quant aux ressources qu'on voudrait tirer de l'Espagne, sous forme de dons volontaires ou

seventeenth century matters became still worse, and the poverty and wretchedness of the people surpass all description. In the villages near Madrid the inhabitants were literally famishing; and those farmers who had a stock of food refused to sell it, because, much as they needed money, they were apprehensive of seeing their families perish around them. The consequence was that the capital was in danger of being starved; and ordinary threats producing no effect, it was found necessary in 1664 that the President of Castile, with an armed force, and accompanied by the public executioner, should visit the adjacent villages, and compel the inhabitants to bring their supplies to the markets of Madrid.[163] All over Spain the same destitution prevailed. That once rich and prosperous country was covered with a rabble of monks and clergy, whose insatiate rapacity absorbed the little wealth yet to be found. Hence it happened that the government, though almost penniless, could obtain no supplies. The tax-gatherers, urged to make up the deficiency, adopted the most desperate expedients. They not only seized the beds and all the furniture, but they unroofed the houses, and sold the materials of the roof for whatever they would fetch. The inhabitants were forced to fly; the fields were left uncultivated; vast multitudes died from want and exposure; entire villages were deserted; and in many of the towns upwards of two-thirds of the houses were, by the end of the seventeenth century, utterly destroyed.[164]

autrement, le conseil estime qu'il est bien difficile d'imposer aux peuples des charges nouvelles;" and in November of that same year, at another meeting of the council, a memoir was drawn up stating that "depuis le règne de Don Ferdinand le Catholique jusqu'à ce jour, la monarchie d'Espagne ne s'est pas encore vue si près de sa ruine, si épuisée, si dénuée des ressources nécessaires pour faire face à un grand péril." See extracts from the proceedings of the Councils, published for, I believe, the first time, by M. Mignet, in his *Négociations relatives à la Succession d'Espagne*, vol. ii. pp. 124, 601, Paris, 1835, 4to. See also, in the same valuable work, vol. ii. p. 127, a letter to Louis XIV. from his ambassador at Madrid, dated 2nd June, 1667, and stating that "l'extrémité est ici si grande qu'il se fait une contribution volontaire de tous les particuliers que l'on appelle *donativo*, pour fournir quelque argent présent pour les nécessités publiques."

[163] In 1664, Sir Richard Fanshawe writes from Madrid to Secretary Bennet, "Since my last to you, of yesterday, the President of Castile, having, by the king's special and angry command, gone forth to the neighbouring villages, attended with the hangman, and whatsoever else of terror incident to his place and derogatory to his person, the markets in this town begin to be furnished again plentifully enough." *Memoirs of Lady Fanshawe, written by herself*, edit. London, 1830, p. 291.

[164] Nothing but the precise and uncontradicted evidence of a contemporary witness could make such things credible. In 1686, Alvarez Osorio y Redin wrote his *Discursos*. They were published in 1687 and 1688; they were reprinted at Madrid in 1775; and from the reprint, pp. 345–348, I extract the following particulars: "Es preciso decir con la mayor brevedad, que pide el asunto, en la forma que los comisionantes continuamente están saqueando todos los lugares, con capa de servir á V. M. Entran en ellos, intiman sus comisiones á las justicias, y ellas les suplican, tengan misericordia de los moradores, que están con mucha necesidad. Y luego que toman el uso, dicen: que á ellos no les toca dispensar en hacer gracias: que traen orden de cobrar con todo rigor las cantidades, que deben los lugares; y tambien dicen han de cobrar sus salarios. Y se van entrando por las casas de los pobres labradores, y demás vecinos; y con mucha cuenta y razon, les quitan el poco dinero, que tienen: y á los que no tienen, les sacan prendas: y donde no las hallan, les quitan las pobres camas, en que duermen: y se detienen en vender las prendas, todo el tiempo que pueden." . . . "Los saquéos referidos van continuando, obligando á los mas vecinos de los lugares, á que se vayan huyendo de sus casas, dexando baldías sus haciendas de campo; y los cobradores no tienen lástima de todas estas miserias, y asolaciones, como si entráran en lugares de enemigos. Las casas, que hallan vacías, si hay quien se las compre, las venden: y quando no pueden venderlas, las quitan los texados; y venden la texa, y madera por qualquier dinero. Con esta destruicion general, no han quedado en pie en los lugares la tercera parte de casas, y se han muerto de necesidad gran multitud de personas. Con lo qual los lugares

In the midst of these calamities the spirit and energy of Spain were extinguished. In every department all power and life disappeared. The Spanish troops were defeated at Rocroy in 1643, and several writers ascribe to that battle the destruction of the military reputation of Spain.[165] This, however, was only one of many symptoms.[166] In 1656 it was proposed to fit out a small fleet; but the fisheries on the coast had so declined that it was found impossible to procure sailors enough to man even the few ships which were required.[167]

no tienen la mitad de familias, que antiguamente habia en España. Y si no se pone remedio á todo referido, será preciso, que la vengan á poblar de otros Reynos."

[165] "Allí acabó aquella antigua milicia española que desde el tiempo de los reyes catolicos habia ganadó tan gloriosos triunfos, siendo el terror de sus enemigos." *Tapia, Civilizacion Espanola*, vol. iii. p. 150, Madrid, 1840. "La batalla de Rocroy, en que el jóven Condé recogió los laureles con que engalanó la dorada cuna del niño Luis XIV., acabó con la reputacion que aun habian podido ir conservando los viejos tercios españoles de Flandres." *Lafuente, Historia de España*, vol. xvii. p. 368, Madrid, 1856.

[166] In the *Clarendon State Papers*, vol. i. p. 275, Oxford, 1767, folio, I find a letter written by Hopton to Secretary Windebank, dated Madrid, 31st May, 1635. The author of this official communication gives an account of the Spanish troops just raised, and says, "I have observed these levies, and I find the horses are so weak, as the most of them will never be able to go to the rendezvous, and those very hardly gotten, the infantry so unwilling to serve, as they are carried, like galley-slaves, in chains, which serves not the turn, and so far short of the number that was proposed, as they come not to one of three." This was eight years before the battle of Rocroy; after it matters became rapidly worse. A letter from Sir Edward Hyde to Secretary Nicholas, dated Madrid, 18th March, 1649–50, states, that Spanish "affairs are really in huge disorder, and capable of being rendered almost desperate;" and another letter, on 14th April, 1650, "if some miracle do not preserve them, this crown must be speedily destroyed." *Clarendon State Papers*, vol. iii. pp. 13, 17, Oxford, 1786. An official Report on the Netherlands presented to Louis XIV. in 1655, declares that the Dutch "considered Spain so weakened as to be out of condition to renew the war within the next one hundred years." *Raumer's History of the Sixteenth and Seventeenth Centuries, illustrated by Original Documents*, London, 1835, vol. i. p. 237. See also *Mignet, Négociations Relatives à la Succession d'Espagne*, Paris, 1835–1842, 4to, vol. i. pp. 37, 38, 314, 315, vol. iii. p. 684, vol. iv. p. 218; and *L'Estat de l'Espagne*, Geneve, 1681, pp. 83, 271. "L'Espagne faisant en nos jours plus de pitié que de peur à ceux qu'elle a tenus long-tems dans une crainte perpetuelle, et dans une respectueuse veneration." . . . "Aussi peut-on dire que les Espagnols qui étoient autrefois des lions, ou des véritables hommes et incomparables en valeur, sont maintenant des cerfs, ou des femmes, et enfin des personnes peu propres à la guerre." And finally, the Spanish explanation of all this in *Yañez, Memorias*, Prologo, pp. 148, 149, Madrid, 1723. "La Monarquia de España, cuya decadencia la avia yá Dios decretado desde el año de 1621," etc.; blasphemously ascribing to the Almighty what was the result of their own folly, and obstinately shutting their eyes to the real cause of their ruin.

[167] "A century ago Spain had been as supreme at sea as on land; her ordinary nava force was 140 gallies, which were the terror both of the Mediterranean and Atlantic. But now" (1656), "in consequence of the decline of commerce and fisheries on the coast, instead of the numerous squadrons of the Dorias and Mendozas, which were wont to attend the movements of the first great John of Austria and the Emperor Charles, the present High-Admiral of Spain, and favourite son of its monarch, put to sea with three wretched gallies, which with difficulty escaped from some Algerine corsairs, and were afterwards nearly shipwrecked on the coast of Africa." *Dunlop's Memoirs*, vol. i. p. 549. In 1663, "Il n'y avait à Cadix ni vaisseaux ni galères en état d'aller en mer. Les Maures insultaient audacieusement les côtes de l'Andalousie, et prenaient impunément les barques qui se hasardaient à une lieue de la rade. Le duc d'Albuquerque, qui commandait les forces navales, se plaignait hautement de la position humiliante dans laquelle on le laissait. Il avait demandé avec instance qu'on lui donnât des matelots et des soldats pour mettre sur les vaisseaux; mais le Comte de Castrillo, président du

The charts which had been made were either lost or neglected ; and the ignorance of the Spanish pilots became so notorious that no one was willing to trust them.[168] As to the military service, it is stated, in an account of Spain late in the seventeenth century, that most of the troops had deserted their colours, and that the few who were faithful were clothed in rags, received no pay, and were dying of hunger.[169] Another account describes this once mighty kingdom as utterly unprotected ; the frontier towns ungarrisoned ; the fortifications dilapidated and crumbling away ; the magazines without ammunition ; the arsenals empty ; the workshops unemployed ; and even the art of building ships entirely lost.[170]

While the country at large was thus languishing, as if it had been stricken by some mortal distemper, the most horrible scenes were occurring in the capital, under the eyes of the sovereign. The inhabitants of Madrid were starving, and the arbitrary measures which had been adopted to supply them with food could only produce temporary relief. Many persons fell down in the streets exhausted, and died where they fell ; others were seen in the public highway evidently dying, but no one had wherewithal to feed them. At length the people became desperate, and threw off all control. In 1680, not only the workmen of Madrid, but large numbers of the tradesmen, organized themselves

conseil de finances (de la *hacienda*) avait déclaré qu'il n'avait ni argent, ni la possibilité d'en trouver, et conseillait de renoncer à l'armée navale." *Mignet, Négociations relatives à la Succession d'Espagne*, vol. i. pp. 315, 316, Paris, 1835, 4to, from contemporary manuscripts. Even in 1648, Spain had "become so feeble in point of naval affairs as to be obliged to hire Dutch vessels for carrying on her American commerce." *Macpherson's Annals of Commerce*, vol. ii. p. 435, London, 1805, 4to. And, to complete the chain of evidence, there is a letter in the *Clarendon State Papers*, vol. ii. p. 86, Oxford, 1773, folio, written from Madrid in June, 1640, stating that "for ships they have few, mariners fewer, landmen not so many as they need, and, by all signs, money not at all that can be spared." The history of Spain during this period never having been written, I am compelled, in my own justification, to give these and similar passages with a fulness which I fear will weary some readers.

[168] And when they did, it was to their own cost, as Stanhope found, at the beginning of his career as British minister to the court of Madrid, in 1690. See his letter to Lord Shrewsbury, in *Mahon's Spain under Charles II.*, London, 1840, p. 3. "We were forced into a small port, called Ferrol, three leagues short of the Groyne, and by the ignorance of a Spanish pilot our ships fell foul one with another, and the admiral's ship was on ground for some hours, but got off clear without any damage." Indeed, the Spanish seamen, once the boldest and most skilful navigators in the world, so degenerated that early in the eighteenth century we find it stated as a matter of course that "to form the Spaniard to marine affairs is transporting them into unknown countries." *The History of Cardinal Alberoni*, London, 1719, p. 257.

[169] "Le peu de soldats qui résistaient à la désertion, étaient vêtus de haillons, sans solde, sans pain." *Mémoires de Louville*, edit. Paris, 1818, vol. i. p. 72. "Dans l'état le plus misérable." p. 43. Compare Lafuente, in the reign of Philip IV. (*Historia*, vol. xvi. p. 519), "los soldados peleaban andrajosos y medio desnudos ;" and D'Aulnoy, in 1679 (*Relation du Voyage d'Espagne*, vol. i. p. 168), "Il est rare que dans tout un regiment il se trouve deux soldats qui ayent plus d'une chemise."

[170] "Ruinosos los muros de sus fortalezas, aun tenía Barcelona abiertas las brechas, que hizo el duque de Vendoma ; y desde Rosas hasta Cadiz, no habia Alcazar, ni Castillo, no solo presidiado, pero ni montada su artillería. La misma negligencia se admiraba en los puertos de Vizcaya, y Galicia ; no tenian los almazenes sus provisiones, faltaban fundidores de armas, y las que habia, eran de ningun uso. Vacios los arsenales y astilleros, se habia olvidado el arte de construir naves, y no tenia el Rey mas que las destinadas al comercio de Indias, y algunos galeones ; seis galeras, consumidas del tiempo, y del ocio, se ancoraban en Cartagena." *Bacallar, Comentarios de la Guerra de España*, vol. i. p. 43. Another eye-witness describes "the best fortresses consisting of ruined walls, mounted with here and there a rusty cannon, and the man thought an able engineer who knew how to fire them." *Ripperda's Memoirs*, second edition, London, 1740, p. 227.

into bands, broke open private houses, and robbed and murdered the inhabitants in the face of day.[171] During the remaining twenty years of the seventeenth century the capital was in a state, not of insurrection, but of anarchy. Society was loosened, and seemed to be resolving itself into its elements. To use the emphatic language of a contemporary, liberty and restraint were equally unknown.[172] The ordinary functions of the executive government were suspended. The police of Madrid, unable to obtain the arrears of their pay, disbanded, and gave themselves up to rapine. Nor did there seem any means of remedying these evils. The exchequer was empty, and it was impossible to replenish it. Such was the poverty of the court that money was wanting to pay the wages of the king's private servants, and to meet the daily expenses of his household.[173] In 1693 payment was suspended of every life-pension ; and all officers and ministers of the crown were mulcted of one-third of their salaries.[174] Nothing, however, could arrest the mischief. Famine and poverty continued to increase ;[175]

[171] *Dunlop's Memoirs*, vol. ii. pp. 224, 225. In 1680 Madame de Villars, the wife of the French ambassador, writes from Madrid that such was the state of affairs there that her husband thought it advisable that she should return home. *Lettres de Madame de Villars*, Amsterdam, 1759, p. 169. A letter written by the Danish ambassador in 1677 describes every house in Madrid as regularly armed from top to bottom ; " de haut en bas." *Mignet, Négociations relatives à la Succession*, vol. iv. p. 638, Paris, 1842, 4to. The deaths from starvation are said to have been particularly numerous in Andalusia. See *Tapia, Civilizacion Española*, vol. iii. p. 167. " En Andalucia especialmente moria mucha gente de hambre, y el consulado de Sevilla envió una diputacion para representar que aquella ciudad habia quedado reducida á la cuarta parte de la poblacion que habia tenido cincuenta años antes." On the state of the people generally, in 1680, compare *Lettres de Villars*, pp. 145, 152, 161.

[172] " Point de libertés et point de frein." *Mém. de Louville*, vol. i. p. 68.

[173] In 1681 the French ambassadress writes from Madrid, " Je ne vous parle point de la misère de ce royaume. La faim est jusques dans le palais. J'étois hier avec huit ou dix camaristes, et la Moline, qui disoient qu'il y avoit fort longtems qu'on ne leur donnoit plus ni pain ni viande. Aux écuries du roi et de la reine, de même." *Lettres de Madame la Marquise de Villars*, Amsterdam, 1759, pp. 216, 217. The year after Charles II. died : " Il n'y avoit pas de fonds pour les choses les plus nécessaires, pour la cuisine, l'écurie, les valets de pied," etc. *Millot, Mémoires du Duc de Noailles*, vol. ii. p. 26, ed. Petitot, Paris, 1828. Among other reckless expedients, the currency was so depreciated that in a letter from Martin to Dr. Fraser, dated Madrid, March 6th, 1680, we hear of " the fall of money to one fourth part of its former value." *Miscellany of the Spalding Club*, vol. v. p. 187, Aberdeen, 4to, 1852.

[174] " The king has taken away, by a late decree, a third part of all wages and salaries of all officers and ministers without exception, and suspended for the ensuing year, 1694, all pensions for life granted either by himself or his father." Letter from the English ambassador, dated Madrid, November 18th, 1693, in *Mahon's Spain under Charles II.*, London, 1840 p. 40. This is also stated in *Millot, Mémoires de Noailles*, vol. i. p. 359, Paris, 1828 ; " retranchant le tiers des dépenses de sa maison, et des appointemens de ses officiers tant militaires que civils." In the preceding reign the pensions had been stopped, at all events for a time. In 1650 Sir Edward Hyde writes from Madrid, " There is an universal stop of all pensions which have been granted formerly." *Clarendon State Papers*, vol. ii. p. 538, Oxford, 1773. The next step which was taken was a proposal, in 1667, to tax the salaries of the members of the Councils of Castile, Arragon, etc. ; but this idea was abandoned, until at length they, like all other public servants, came under the comprehensive edict of 1693. See the letter from the French ambassador to Louis XIV., dated Madrid, June 2nd, 1667, in *Mignet, Négociations*, vol. ii. p. 128, Paris, 1835, 4to. The only chance of recovering the history of Spain in the seventeenth century is by collating these and similar documents with the meagre notices to be found in Spanish writers.

[175] In 1695, " the miserable poverty in this country." *Travels through Spain, performed by a Gentleman*, London, 1702, p. 62. And, in the same year, " L'Espagne, manquant de tout, d'hommes et d'argent." *Mémoires de Noailles*, vol. i. p. 402. " L'Espagne, presque anéantie." p. 424.

and in 1699 Stanhope, the British minister then residing in Madrid, writes that never a day passed in which people were not killed in the streets scuffling for bread ; that his own secretary had seen five women stifled to death by the crowd before a bakehouse ; and that, to swell the catalogue of misery, upwards of twenty thousand additional beggars from the country had recently flocked into the capital.[176]

If this state of things had continued for another generation, the wildest anarchy must have ensued, and the whole frame of society been broken up.[177] The only chance of saving Spain from a relapse into barbarism was that it should fall, and fall quickly, under foreign dominion. Such a change was indispensable ; and there was reason to fear that it might come in a form which would have been inexpressibly odious to the nation. For, late in the seventeenth century, Ceuta was besieged by the Mohammedans, and as the Spanish government had neither troops nor ships, the greatest apprehensions were entertained respecting the fate of this important fortress ; there being little doubt that if it fell, Spain would be again overrun by the infidels, who this time, at least, would have found little difficulty in dealing with a people weakened by suffering half famished, and almost worn out.[178]

Fortunately, in the year 1700, when affairs were at their worst, Charles II., the idiot king, died, and Spain fell into the hands of Philip V., the grandson of Louis XIV. This change from the Austrian dynasty to the Bourbon[179] brought with it many other changes. Philip, who reigned from 1700 to 1746,[180]

[176] See the letters in *Mahon's Spain under Charles II.*, pp. 138–140. On the 21st of May, " We have an addition of above 20,000 beggars, flocked from the country around, to share in that little here is, who were starving at home, and look like ghosts." On the 27th of May, " The scarcity of bread is growing on apace towards a famine, which increases by vast multitudes of poor that swarm in upon us from the countries round about. I shifted the best I could till this day, but the difficulty of getting any without authority has made me recur to the Corregidor, as most of the foreign ministers had done before ; he very courteously, after inquiring what my family was, gave me an order for twenty loaves every day ; but I must send two leagues, to Vallejas, to fetch it, as I have done this night, and my servants with long guns to secure it when they have it, otherwise it would be taken from them, for several people are killed every day in the streets in scuffles for bread, all being lawful prize that anybody can catch." . . . " My secretary, Don Francisco, saw yesterday five poor women stifled to death by the crowd before a bakehouse."

[177] Even M. Lafuente, who, having used scarcely any of the authorities which I have quoted in the last few pages, can have no adequate idea of the utter wretchedness of Spain, confesses that " Jamás monarca ni pueblo alguno se vieron en tan lastimosa situacion y en tan mísero trance como se hallaron en este tiempo " (1699) " Cárlos II. y la España." *Lafuente, Historia de España*, vol. xvii. p. 426, Madrid, 1856.

[178] " Les Maures d'Afrique assiégeoient Ceuta. Le roi d'Espagne manquait non-seulement de troupes, mais de vaisseaux pour transporter le peu de secours qu'il pouvoit y envoyer : Louis XIV. lui fit offrir les troupes et les vaisseaux dont il auroit besoin. Il s'agissoit non-seulement de conserver Ceuta, mais de plus Oran ; par conséquent d'empêcher la prise de deux places dont la conquête facilitoit aux Maures un retour en Espagne." *Mémoires du Marquis de Torcy*, vol. i. p. 46, ed. Paris, 1828. Respecting the attacks made on Ceuta, from 1696 to 1698, see *Ortiz, Compendio de la Historia de España*, vol. vi. pp. 556, 557, 561.

[179] A celebrated modern writer has made some remarks upon this, which are too apposite to be omitted. " Con el siglo xvii. acabó tambien la dinastía austriaca en España, dejando á esta nacion pobre, despoblada, sin fuerzas marítimas ni terrestres, y por consiguiente á merced de las demas potencias que intentaron repartir entre sí sus colonias y provincias. Así habia desparecido en poco mas de un siglo aquella grandeza y poderío, aquella fuerza y heroismo, aquella cultura é ilustracion con que habia descollado entre todas las naciones." *Biografía de Ensenada*, in *Navarrete, Opúsculos*, vol. ii. p. 5, Madrid, 1848.

[180] Except during the short interregnum of Louis, in 1724, which only lasted a few

was a Frenchman, not only by birth and education, but also in feelings and habits.[181] Just before he entered Spain, Louis charged him never to forget that he was a native of France, the throne of which he might some day ascend.[182] After he became king he neglected the Spaniards, despised their advice, and threw all the power he could command into the hands of his own countrymen.[183] The affairs of Spain were now administered by subjects of Louis XIV., whose ambassador at Madrid frequently performed the functions of prime minister.[184] What had once been the most powerful monarchy in the world became little else than a province of France, all important matters being decided in Paris, from whence Philip himself received his instructions.[185]

The truth is that Spain, broken and prostrate, was unable to supply ability of any kind ; and if the government of the country was to be carried on, it was absolutely necessary that foreigners should be called in.[186] Even in 1682 that

months, and during which the boy, though called king, exercised no real power, and Philip remained the actual ruler. " Aun el nuevo rey no resolvia negocio de consideracion sin asenso de su padre." *Ortiz, Compendio*, vol. vii. p. 374.

[181] Saint Simon, who knew Philip well, and who was in Spain in 1721 and 1722, says of him, " L'amour de la France lui sortait de partout." *Mémoires du Duc de Saint Simon*, vol. xxxvii. p. 3, Paris, 1841. And, in 1746, shortly before his death, Noailles writes from Aranjuez, " Ce prince a le cœur tout français." *Millot, Mémoires de Noailles*, vol. iv. p. 191, Paris, 1829.

[182] " N'oubliez jamais que vous êtes Français, et ce qui peut vous arriver." *Millot, Mémoires de Noailles*, vol. ii. p. 6. Compare *Coxe's Memoirs of the Bourbon Kings of Spain*, London, 1815, vol. i. p. 103.

[183] In 1702, Philip " parlait moins que jamais, et seulement aux Français, comme s'ils eussent été les seuls êtres de son espèce." *Mémoires de Louville*, vol. i. p. 276. " Le dégoût que Philippe laissait voir pour sa cour espagnole." p. 333. A Spanish statesman, celebrated, or, I would rather say, notorious, at the close of the century, indignantly exclaims, " It was on the accession of the Bourbon dynasty that foreigners came to govern us on our native soil." *Godoy's Memoirs*, ed. London, 1836, vol. ii. p. 271.

[184] In 1701 it was the duty of the French ambassador, " qu'il pût au besoin être premier ministre d'Espagne." *Millot, Mémoires de Noailles*, vol. ii. p. 31 ; " que l'ambassadeur de sa Majesté soit ministre du roi Catholique ; que, sans en avoir le titre, il en exerce les fonctions ; qu'il aide au roi d'Espagne à connoître l'état de ses affaires, et à gouverner par lui-même." p. 55. In 1702 Marsin writes to Louis XIV., " Comme il est absolument nécessaire que l'ambassadeur de Votre Majesté en Espagne ait un crédit sans bornes auprès du Roy son petit-fils." p. 183. In 1705 Amelot, the French ambassador, " décidoit de tout en Espagne." *Mémoires de Louville*, vol. ii. p. 165 ; and, in 1706, " étant à la tête des affaires, et joignant presque les fonctions de premier ministre à celles d'ambassadeur." *Noailles*, vol. ii. p. 398.

[185] In 1703, " Il est clair que l'embarras de Philippe venoit surtout de la crainte que ses décisions ne fussent point approuvées en France, où toutes les affaires importantes se décidoient." *Millot, Mémoires de Noailles*, vol. ii. p. 244. " The King of France had always certain persons at Madrid, which compos'd a Council, of which that of Versailles was the soul ; and whose members were all creatures of the French Court, and sent to Madrid from time to time to direct all affairs there, according to the views of the Most Christian King, and to give him an account of everything that pass'd in the Councils of the Escurial. Alberoni got to be initiated in the mysteries of this cabal." *History of Cardinal Alberoni*, London, 1719, p. 70.

The Spanish historians are not very fond of admitting this unquestionable fact ; but Bacallar, after mentioning the influence of the French ambassador, frankly adds : " Desde entonces tomaron tanta mano sobre los de España los ministros Franceses, que dieron mas zelos á los Principes, viendo estrechar la union á un grado, que todo se ponía al arbitrio de Luis XIV." *Bacallar, Comentarios de la Guerra de España*, vol. i. p. 33.

[186] Even the veteran diplomatist Torcy was so struck by the escape of Spain from complete ruin, that he ascribes its change of masters to the direct interference of the Deity. " Sa seule puissance avait placé Philippe V sur le trône d'Espagne ; elle seule

is, eighteen years before the accession of Philip V., there was not to be found a single native well acquainted with the art of war; so that Charles II. was obliged to intrust the military defence of the Spanish Netherlands to De Grana, the Austrian ambassador at Madrid.[187] When, therefore, the War of the Succession broke out, in 1702, even the Spaniards themselves desired that their troops should be commanded by a foreigner.[188] In 1704 the extraordinary spectacle was exhibited of the Duke of Berwick, an Englishman, leading Spanish soldiers against the enemy, and being in fact generalissimo of the Spanish army.[189] The King of Spain, dissatisfied with his proceedings, determined to remove him; but instead of filling his place with a native he applied to Louis XIV. for another general, and this important post was confided to Marshal Tessé, a Frenchman.[190] A little later, Berwick was again summoned to Madrid, and ordered to put himself at the head of the Spanish troops, and defend Estremadura and Castile.[191] This he effected with complete success; and, in the

pouvoit l'y maintenir; les hommes n'avaient pas conduit ce grand événement." *Mémoires de Torcy*, vol. i. p. 333. "Le trône où Dieu l'avait placé," p. 401. See also vol. ii. pp. 3, 227. "The Spanish people received him with unhesitating obedience to the deceased king's will, and rejoiced at the prospect of a rule that would at least have the merit of being different from that under which they had so long withered." *Memoirs of Peterborough*, London, 1853, vol. i. p. 102. "Muchos españoles recibieron por su soberano á Felipe V., cansados de la dominacion de la casa de Austria. Esperaban de la mudanza de la dinastia la felicidad y el buen gobierno." *Castro, Decadencia de España*, Cadiz, 1852, p. 131. To the same effect, *Millot, Mémoires de Noailles*, vol. i. pp. 420, 426, vol. ii. p. 9.

[187] He "committed the military defence of these provinces to the Marquis of Grana, the Austrian ambassador at Madrid, from the want of any Spanish commander whose courage or military endowments qualified him to repel such an enemy as the King of France." *Dunlop's Memoirs*, vol. ii. p. 232. Compare, on the want of Spanish generals, *Mémoires du Maréchal de Gramont*, vol. ii. p. 82, edit. Paris, 1827. The opinion which Grana himself formed of the Spanish government may be learned from a conversation which he held at Madrid, in 1680, with the French ambassadress, and which is preserved in her correspondence. *Lettres de Madame la Marquise de Villars*, Amsterdam, 1759, pp. 118, 119.

[188] See the letter of Philip V. to Louis XIV., dated June 22, 1703, in *Mémoires de Noailles*, vol. ii. pp. 256, 257, Paris, 1828, edit. Petitot.

[189] See *Bacallar, Comentarios de la Guerra de España*, vol. i. pp. 137, 166, where he is called "el Duque de Bervich." His own account is, "J'arrivai à Madrid le 15 février" (1704), "où d'abord S. M. Catholique me fit Capitaine Général de ses armées." *Mémoires de Berwick*, Paris, 1778, vol. i. p. 227; and see p. xxv. No one would suppose this from the observations of M. Lafuente, in his *Historia de España*, vol. xviii. p. 80, Madrid, 1857.

[190] "Philippe n'étoit pas content de Berwick, ou plutôt il témoigna ne le pas être, et il demanda un autre général à Louis XIV. On lui envoya le maréchal de Tessé, pour qui il avoit montré du penchant." *Millot, Mémoires de Noailles*, vol. ii. p. 331. Berwick himself ascribes his dismissal to the influence of Gramont and of the Queen of Spain. *Mémoires de Berwick*, vol. i. pp. 269–273. At all events, the new general became supreme. In December, 1705, the Princess des Ursins writes from Madrid to Madame de Maintenon, "M. le maréchal de Tessé, quand il est à Madrid, est consulté, et décide sur toutes les affaires, *autant, pour le moins, que M. l'ambassadeur*; et lorsqu'il est à l'armée, il est le maître absolu non seulement des troupes de France, mais encore de celles d'Espagne, commandant aux capitaines-généraux, ses anciens, contre l'usage du pays." *Lettres inédites de Madame de Maintenon et de Madame la Princesse des Ursins*, vol. iii. p. 259, Paris, 1826.

[191] In 1706 "Le duc de Berwick, redemandé par Philippe V., arrivé à Madrid le 11 mars, avec le titre de maréchal de France, pour défendre l'Estramadure et la Castille, ayant rassemblé ce qu'il peut de troupes espagnoles, empêcha les ennemis d'entreprendre le siège de Badajoz." *Millot, Mémoires de Noailles*, vol. ii. p. 387. Philip "pria le Roi, son grand-père, d'envoyer un général pour commander sur les frontières de Portugal. Ce fut donc sur moi que le choix tomba." *Mémoires de Berwick*, vol. i. p. 305.

battle of Almansa, which he fought in 1707, he overthrew the invaders, ruined the party of the pretender Charles,[192] and secured the seat of Philip on the throne.[193] As the war, however, still continued, Philip in 1710 wrote to Paris for another general, and requested that the Duke de Vendôme might be sent to him.[194] This able commander, on his arrival, infused new vigour into the Spanish counsels, and utterly defeated the allies;[195] so that the war by which the independence of Spain was established owed its success to the ability of foreigners, and to the fact that the campaigns were planned and conducted not by natives, but by French and English generals.

In the same way, the finances were by the end of the seventeenth century in such deplorable confusion, that Portocarrero, who at the accession of Philip V. was the nominal minister of Spain, expressed a desire that they should be administered by some one sent from Paris, who could restore them.[196] He felt that

[192] In a recently published work (*Memoirs of Peterborough*, London, 1853, vol. i. pp. 148, 155, 161, 206, 210, vol. ii. pp. 34, 93), Charles is not only called King of Spain, which he never was, as Spain always refused to accept him, but, in the teeth of all history, he is actually termed Charles III.; while Philip V. is merely "Philip of Anjou." If this were allowed, the consequence would be that the king whom the Spaniards now call Charles III. would have to change his appellation, and become Charles IV.; and Charles IV. would be changed into Charles V. It is really too much when mere biographers obtrude in this way their own little prepossessions into the vast field of history, and seek to efface its established nomenclature, because they are enamoured of the hero whose life they write.

[193] "This victory established the throne of Philip." *Dunham's History of Spain*, vol. v. p. 136. "A victory which may be justly said to have saved Spain." *Coxe's Bourbon Kings of Spain*, vol. i. p. 408. Even Ortiz allows that if Berwick had failed, Philip would have been ruined. "Esta batalla de Almansa, que las circunstancias hicieron ruidosa, comenzó á poner mejor la corona de España en la cabeza de Felipe V.; y se tuvo por indubitable que si la hubiera perdido, tambien hubiera perdido la corona." *Ortiz, Compendio*, vol. vii. p. 116. See also *Lafuente, Historia de España*, vol. xviii. p. 185. "Berwick, á quien, sin duda, debió su salvacion la España."

[194] "Sa réputation étoit grande et bien établie; le roi d'Espagne avoit été témoin de sa conduite en Lombardie; il demanda au Roi un général si capable de commander ses armées." *Mémoires de Torcy*, vol. i. p. 386. See also *History of Alberoni*, London, 1719, p. 45. "Le duc de Vendôme alloit enfin commander les troupes d'Espagne." *Mémoires de Noailles*, vol. iii. p. 12. According to Berwick, the offer was first made to himself. *Mémoires de Berwick*, vol. ii. pp. 106, 109. M. Lafuente, without quoting any authority, says (*Historia de España*, vol. xviii. p. 279), "Luego que se perdió la batalla de Zaragoza escribio Felipe al rey Cristianísimo, su abuelo, rogándole que, ya que no pudiera socorrerle con tropas, le enviára al menos *al duque de Berwick ó al de Vendome*." But as Berwick must have had the means of knowing the real state of the case, he is probably correct in saying that the first application was in his own favour.

[195] "Vendôme arrived at this moment to call into action the spirit of the monarch and the zeal of his subjects." *Coxe's Bourbon Kings of Spain*, vol. ii. p. 41. "The arrival of the Duke de Vendôme again changed the fate of Spain." *Memoirs of Peterborough*, vol. ii. p. 130.

[196] "Portocarrero, abrumado con las dificultades de la gobernacion, que excedian en mucho á sus escasas luces, no contento con haber inducido al rey á que aumentára su consejo de gabinete con dos ministros más, que fueron el marqués de Mancera, presidente del de Aragon, y el duque de Montalto, del de Italia, pidió á Luis XIV. le enviára una persona que pudiera establecer un plan de hacienda en España, y corregir y reformar los abusos de la administracion." *Lafuente, Historia de España*, vol. xviii. p. 15. On 22nd June, 1701, Louis XIV. writes to the Duc d'Harcourt, "Qu'enfin le cardinal Porto-Carrero m'a fait demander quelqu'un intelligent en matière de finances pour voir et connoître l'état de celles du roi d'Espagne, pour examiner les moyens les plus propres de soulager ses sujets, et de pourvoir aux plus pressans besoins du public; qu'il m'assure que *toute l'Espagne le désire en général*: toutes ces raisons m'ont déterminé à choisir le sieur Orry, pour l'envoyer à Madrid." *Millot, Mémoires de Noailles*, vol. ii. p. 44.

no one in Spain was equal to the task, and he was by no means singular in this opinion. In 1701 Louville wrote to Torcy that if a financier did not soon arrive from France there would shortly be no finances to administer.[197] The choice fell upon Orry, who reached Madrid in the summer of 1701.[198] He found everything in the most miserable condition; and the incompetence of the Spaniards was so obvious that he was soon forced to undertake the management not only of the finances but also of the war department. To save appearances, Canalez became the ostensible minister at war; but he, being completely ignorant of affairs, merely performed the drudgery of that office, the real duties of which were fulfilled by Orry himself.[199]

This dominion of the French continued without interruption until the second marriage of Philip V. in 1714, and the death of Louis XIV. in 1715, both of which events weakened their influence, and for a time almost destroyed it. The authority, however, which they lost was transferred not to Spaniards but to other foreigners. Between 1714 and 1726, the two most powerful and conspicuous men in Spain were Alberoni, an Italian, and Ripperda, a Dutchman. Ripperda was dismissed in 1726;[200] and after his fall the affairs of Spain were controlled by Konigseg, who was a German, and who indeed was the Austrian ambassador residing at Madrid.[201] Even Grimaldo, who held office before and after the dismissal of Ripperda, was a disciple of the French school, and had been brought up under Orry.[202] All this was not the result of accident, nor is it to be

[197] "Il faudra que l'homme que vous enverrez pour les finances (car vous aurez la bonté d'en envoyer un, ou bien nous n'aurons plus de finances)." *Mémoires de Louville*, vol. i. p. 149.

[198] *Ibid.* vol. i. p. 181.

[199] "Canalez, qu'on a substitué à Rivas pour le département de la guerre, n'a aucun talent pour cet emploi, selon l'instruction: et toute l'Espagne voit clairement qu'Orry ne le lui a procuré qu'afin d'en exercer les fonctions sous le nom d'un Espagnol." *Millot, Mémoires de Noailles*, vol. ii. p. 305; under the year 1704. See also, on the power of Orry in the war department, *Mémoires de Berwick*, vol. i. pp. 226, 227, 306, 316, vol. ii. p. 166. Berwick, who hated Orry, says of him (vol. i. p. 232), "il se mêloit de tout et faisoit tout." But there can be no doubt of his being a man of very considerable ability; and M. Lafuente (*Historia de España*, vol. xix. p. 253, Madrid, 1857) candidly says, "Es lo cierto que hizo abrir mucho los ojos de los españoles en materia de administracion. Compare vol. xviii. p. 369; *Mémoires du Duc de Saint Simon*, vol. vii. pp. 102, 195, Paris, 1842; and *Bacallar, Comentarios de la Guerra de España*, vol. i. pp. 82, 83, 99, 168, vol. ii. pp. 95, 107. Bacallar treats him harshly.

[200] *Ripperda's Memoirs*, London, 1740, second edition, pp. 117, 118. Saint Simon (*Mémoires*, vol. xxxvi. p. 246) says that Ripperda was "premier ministre aussi absolu que le fut jamais son prédécesseur, Alberoni." The English pamphleteers and politicians of the last century were very unjust to Alberoni, who, notwithstanding the dangerous boldness of his nature, was one of the best ministers who ever governed Spain. M. Lafuente, while admitting his faults, says (*Historia de España*, vol. xix. pp. 437, 438), "Negarle gran capacidad seria una gran injusticia. Tampoco puede desconocerse que reanimó y regeneró la España, levantándola á un grado de esplendor y de grandeza en que nunca se habia vuelto á ver desde los mejores tiempos de Felipe II." See also a good summary of what he did for Spain, in *Tapia, Historia de la Civilizacion Española*, Madrid, 1840, vol. iv. pp. 50, 51.

[201] "The all-powerful Konigseg." *Coxe's Bourbon Kings of Spain*, vol. iii. p. 154; "the prime mover of the Spanish counsels." p. 159; in 1727–8, "Konigseg usurped the control over every operation of government," p. 190; and see p. 235. His great power is likewise noticed in *Lafuente, Historia de España*, vol xix. p. 71: "el hombre de mas influjo y valimiento en la córte."

[202] "Originally a clerk under Orri, he gained the favour of his employer," &c. *Coxe's Bourbon Kings of Spain*, vol. iii. p. 39. Coxe had access to a large mass of letters which were written in the eighteenth century by persons connected with Spain, and many of which are still unpublished. This makes his book very valuable; and as a recital of political events it is superior to anything the Spaniards have produced, though the

ascribed to the caprice of the court. In Spain the national spirit had so died away that none but foreigners, or men imbued with foreign ideas, were equal to the duties of government. To the evidence already quoted on this point I will add two other testimonies. Noailles, a very fair judge, and by no means prejudiced against the Spaniards, emphatically stated in 1710 that notwithstanding their loyalty, they were incapable of ruling, inasmuch as they were ignorant both of war and of politics.[203] In 1711 Bonnac mentions that a resolution had been formed to place no Spaniard at the head of affairs, because those hitherto employed had proved to be either unfortunate or unfaithful.[204]

The government of Spain, being taken from the Spaniards, now began to show some signs of vigour. The change was slight, but it was in the right direction, though, as we shall presently see, it could not regenerate Spain, owing to the unfavourable operation of general causes. Still, the intention was good. For the first time, attempts mere made to vindicate the rights of laymen, and to diminish the authority of ecclesiastics. Scarcely had the French established their dominion when they suggested that it might be advisable to relieve the necessities of the state by compelling the clergy to give up some of the wealth which they had accumulated in their churches.[205] Even Louis XIV. insisted that the important office of President of Castile should not be conferred on an ecclesiastic, because, he said, in Spain the priests and monks had already too much power.[206] Orry, who for several years possessed immense influence, exerted it in the same direction. He endeavoured to lessen the immunities possessed by the clergy in regard to taxation, and also in regard to their exemption from lay jurisdiction. He opposed the privilege of sanctuary ; he sought to deprive churches of their right of asylum. He even attacked the Inquisition, and worked so powerfully on the mind of the king that Philip at one time determined to suspend that dreadful tribunal, and abolish the office of grand inquisitor.[207] This intention was very properly abandoned ; for there can be no doubt that if it had been enforced it would have caused a revolution, in which Philip would probably have lost his crown.[208] In such case, a reaction would have set in which would have left the

author is, I need hardly say, far inferior to M. Lafuente as a writer, and also as an artistic arranger of facts.

[203] " Que les Espagnols depuis longtemps ignoroient la guerre et la politique ; qu'on devoit être sensible à leurs démonstrations d'attachement et de zèle, sans les croire suffisantes pour soutenir un Etat " . . ." l'incapacité des sujets pour le gouvernement." *Millot, Mémoires de Noailles*, vol. iii. pp. 24, 25.

[204] " C'étoit un parti pris, comme l'observe Bonnac, de ne plus mettre le gouvernement entre leurs mains. On avoit trouvé parmi eux peu d'hommes capables des grands emplois : ceux à qui on les avoit confiés, malheureux ou infidèles, avoient inspiré de l'éloignement pour les autres." *Millot, Mémoires de Noailles*, vol. iii. p. 81.

[205] In 1701, " Les églises d'Espagne ont des richesses immenses en or et en argenterie, qui augmentent tous les jours par le crédit des religieux ; et cela rend l'espèce très rare dans le commerce. On propose d'obliger le clergé à vendre une partie de cette argenterie. Avant que de prendre ce parti, il en faudroit bien examiner non-seulement l'utilité, que l'on connoit, mais aussi les inconvéniens qu'un pareil ordre pourroit produire." *Millot, Mémoires de Noailles*, vol. ii. p. 60.

[206] " Il insistoit sur la nécessité de ne pas donner à un ecclésiastique, ni à une créature du cardinal, la présidence de Castille, quand on rempliroit cette importante place ; les prêtres et les moines n'avoient déjà que trop de pouvoir." *Millot, Mémoires de Noailles*, vol. ii. p. 77. Compare pp. 71, 72 ; a letter from Louville to Torcy, dated August 5th, 1701.

[207] *Coxe's Bourbon Kings of Spain*, vol. ii. pp. 163–165. *Mémoires de Noailles*, vol. iii p. 143.

[208] In 1714 it was thought necessary that Philip V., not having had the benefit of a Spanish education, should be enlightened on the subject of the Inquisition. He was, therefore, informed, " que la pureza de la religion Catolica en estos reynos se debia á la vigilancia de la Inquisicion y sus ministros, todos justos, clementes y circunspectos, no rigidos, violentos ni crueles, como por error ó malicia los pintan comunmente los Franceses. Y que *la*

Church stronger than ever. Many things, however, were done for Spain in spite of the Spaniards.[209] In 1707 the clergy were forced to contribute to the state a small part of their enormous wealth ; the tax being disguised under the name of a loan.[210] Ten years later, during the administration of Alberoni, this disguise was thrown off ; and not only did government exact what was now called " the ecclesiastical tax," but it imprisoned or exiled those priests who, refusing to pay, stood up for the privileges of their order.[211] This was a bold step to be taken in Spain, and it was one on which, at that time, no Spaniard would have ventured. Alberoni, however, as a foreigner, was unversed in the traditions of the country, which indeed, on another memorable occasion, he set at defiance. The government of Madrid, acting in complete unison with public opinion, had always been unwilling to negotiate with infidels ; meaning by infidels, every people whose religious notions differed from their own. Sometimes such negotiations were unavoidable, but they were entered into with fear and trembling, lest the pure Spanish faith should be tainted by too close a contact with unbelievers. Even in 1698, when it was evident that the monarchy was at its last gasp, and that nothing could save it from the hands of the spoiler, the prejudice was so strong that the Spaniards refused to receive aid from the Dutch, because the Dutch were heretics. At that time, Holland was in the most intimate relation with England, whose interest it was to secure the independence of Spain against the machinations of France. Obvious however as this was, the Spanish theologians, being consulted respecting the proposal, declared that it was inadmissible, since it would enable the Dutch to propagate their religious opinions ; so that, according to this view, it was better to be subjugated by a Catholic enemy than to be assisted by a Protestant friend.[212]

Still, much as the Spaniards hated Protestants, they hated Mohammedans yet

conservacion de la Monarquia dependia en gran parte de mantener ilibata la religion Catolica." *Ortiz, Compendio*, vol. vii. p. 286. Bacallar (*Comentarios*, vol. ii. pp. 122–125) gives an interesting account of the attacks made on the rights of the Church, and which, he says, p. 122, were " poco ajustados á la doctrina de los Santos Padres, á la Inmunidad de la Iglesia, y que sonaban á heregía." He significantly adds, p. 125, " Los pueblos de España, que son tan religiosos, y professan la mayor veneracion á la Iglesia, creían, que esta se atropellaba. *y huvo alguna interna inquietud, no sin fomento de los adversos al Rey, cuyo puro y sincero corazon podia ser engañado ;* pero no inducido á un evidente error contra los Sagrados Canones," &c. Such passages, proceeding, in the eighteenth century, from a man like the Marquis de San Phelipe, are of no slight importance in the history of the Spanish mind.

[209] So early as May, 1702, Philip V., in a letter to Louis XIV., complained that the Spaniards opposed him in everything. " Je crois être obligé de vous dire que je m'aperçois de plus en plus du peu de zèle que les Espagnols ont pour mon service, dans les petites choses comme dans les grandes, et qu'ils s'opposent à tout ce que je désire." *Millot, Mémoires de Noailles*, vol. ii. p. 136. The dislike which the Spaniards felt for the liberal reforms advocated by the French went on increasing until, in 1709, " se renovaron los antiguos odios entre las dos naciones, con tanto ardor, que deseaban las tropas Españolas el haber de combatir con los Franceses." *Bacallar, Comentarios*, vol. i. p. 360.

[210] " L'opulence de l'Église devoit évidemment fournir des secours à la patrie. Un emprunt de quatre millions, fait sur le clergé l'année précédente, 1707, avoit cependant fort déplu au Pape ou à ses ministres." *Millot, Mémoires de Noailles*, vol. ii. p. 412.

[211] " He " (Alberoni) " continued also the exaction of the ecclesiastical tax, in spite of the papal prohibitions, imprisoning or banishing the refractory priests who defended the privileges of their order." *Coxe's Bourbon Kings of Spain*, vol. ii. p. 288.

[212] On January 2nd, 1698, Stanhope, the British Minister at Madrid, writes from that capital : " This Court is not at all inclined to admit the offer of the Dutch troops to garrison their places in Flanders. They have consulted their theologians, who declare against it as a matter of conscience, since it would give great opportunities to the spreading of heresy. They have not yet sent their answer ; but it is believed it will be in the negative, and that they will rather choose to lie at the mercy of the French, as being Catholics." *Mahon's Spain under Charles II.*, pp. 98, 99.

more.[213] They could never forget how the followers of that creed had once conquered nearly the whole of Spain, and had during several centuries possessed the fairest portion of it. The remembrance of this strengthened their religious animosity, and caused them to be the chief supporters of nearly every war which was waged against the Mohammedans, both of Turkey and of Africa.[214] But Alberoni, being a foreigner, was unmoved by these considerations, and, to the astonishment of all Spain, he on the mere ground of political expediency set at naught the principles of the Church, and not only concluded an alliance with the Mohammedans, but supplied them with arms and with money.[215] It is indeed true that in these and similar measures Alberoni opposed himself to the national will, and that he lived to repent of his boldness. It is however also true that his policy was part of a great secular and anti-theological movement, which during the eighteenth century was felt all over Europe. The effects of that movement were seen in the government of Spain, but not in the people. This was because the government for many years was wielded by foreigners, or by natives imbued with a foreign spirit. Hence we find that during the greater part of the eighteenth century the politicians of Spain formed a class more isolated, and, if I may so say, more living on their own intellectual resources, than the politicians of any other country during the same period. That this indicated a state of disease, and that no political improvement can produce real good unless it is desired by the people before being conferred on them, will be admitted by whoever has mastered the lessons which history contains. The results actually produced in Spain we shall presently see. But it will first be advisable that I should give some further evidence of the extent to which the influence of the Church had prostrated the national intellect, and by discouraging all inquiry, and fettering

[213] " Entre el catolicismo y las diferentes sectas que brotaron en las imaginaciones de Calvino y de Lutero podia mediar tolerancia, y aun transaccion, si bien, como dice un escritor político, cuando se comienza á transigir sobre un principio, ese principio comienza á perder su imperio sobre las sociedades humanas. Pero entre el cristianismo de los españoles y el mahometismo de los moriscos era imposible todo avenimiento." *Janer, Condicion Social de los Moriscos*, Madrid, 1857, p. 112.

[214] The Marquis of San Phelipe, who wrote in 1725, says, " Es ley fundamental de los Reyes Catholicos, nunca hacer la paz con los Mahometanos ; y esta guerra permanece desde el Rey Don Pelayo, por mas de siete siglos, sin hacer jamás paces, ni treguas con ellos, como cada dia las hacen el Emperador, y otros Principes Catholicos." *Bacallar, Comentarios de la Guerra de España*, vol. ii. p. 169. And in the most influential work on commerce which the reign of Philip V. produced, I find the following instructive passage : " Aunque en los Puertos de las dilatadas Costas, que de Europa, Asia y Africa baña el Mediterraneo, se hace comercio muy considerable, y util por diversas naciones, no podrá España tener gran parte en él, mientras se observare la maxima de hacer continua guerra á todos los Moros y Turcos, en cuyo dominio se hallan la mayor parte de aquellas Provincias ; sin embargo de ser constante, que *en esta guerra, aunque procedida de zelo Christiano, es mayor el daño que recibimos, que el que ocasionamos á los Infieles* " (the way the mercantile spirit peeps out here is extremely curious) " á lo menos de muchos años á esta parte, como lo he explicado en diversos capitulos." *Uztariz, Theorica y Practica de Comercio*, Madrid, 1757, p. 399. This is the third edition of a book which, considering the circumstances under which it was written, is a very remarkable production.

[215] Compare *Coxe's Bourbon Kings of Spain*, London, 1815, vol. ii. p. 314, with *The History of Alberoni*, London, 1719, pp. 119, 253 ; and *Bacallar, Comentarios de la Guerra de España*, vol. ii. pp. 168, 169. The outcry which this caused may be easily imagined ; and Alberoni, finding himself in great peril, took advantage of the secrecy of the negotiations to deny part, at least, of the charges made against him. See his indignant but yet cautious letter to the Pope, in *History of Alberoni*, 1719, p. 124. Ortiz, who had evidently not looked into the evidence, is so ill-informed as to suppose that this was a calumnious accusation brought against Alberoni after his fall. " Caido ya por entonces Alberoni de su grandeza, expelido ignominiosamente de España, y aun perseguido por el Rey en Italia, preso en Roma por orden del Papa, etc. no era dificil atribuirle culpas agenas ó no cometidas." *Note in Ortiz, Compendio*, vol. vii. p. 321.

all freedom of thought, had at length reduced the country to such a plight that the faculties of men, rusted by disuse, were no longer equal to fulfil the functions required from them; so that in every department, whether of political life or of speculative philosophy, or even of mechanical industry, it was necessary that foreigners should be called in to do that work which the natives had become unable to perform.

The ignorance in which the force of adverse circumstances had sunk the Spaniards, and their inactivity, both bodily and mental, would be utterly incredible, if it were not attested by every variety of evidence. Gramont, writing from personal knowledge of the state of Spain during the latter half of the seventeenth century, describes the upper classes as not only unacquainted with science or literature, but as knowing scarcely any thing even of the commonest events which occurred out of their own country. The lower ranks, he adds, are equally idle, and rely upon foreigners to reap their wheat, to cut their hay, and to build their houses.[216] Another observer of society, as it existed in Madrid in 1679, assures us that men even of the highest position never thought it necessary that their sons should study; and that those who were destined for the army could not learn mathematics if they desired to do so, inasmuch as there were neither schools nor masters to teach them.[217] Books, unless they were books of devotion, were deemed utterly useless; no one consulted them; no one collected them; and until the eighteenth century Madrid did not possess a single public library.[218] In other cities professedly devoted to purposes of education, similar ignorance prevailed. Salamanca was the seat of the most ancient and most famous university in Spain, and there if anywhere we might look for the en-

[216] "Leur paresse, et l'ignorance non seulement des sciences et des arts, mais quasi généralement de tout ce qui se passe hors de l'Espagne, et on peut dire même hors du lieu où ils habitent, vont presque de pair, et sont inconcevables. La pauvreté est grande parmi eux, ce qui provient de leur extrême paresse; car si nombre de nos Français n'alloient faucher leurs foins, couper leurs blés et faire leurs briques, je crois qu'ils courroient fortune de se laisser mourir de faim, et de se tenir sous des tentes pour ne se pas donner la peine de bâtir des maisons." . . . "L'éducation de leurs enfans est semblable à celle qu'ils ont eu de leurs pères, c'est-à-dire sans qu'ils apprennent ni sciences ni exercices; et je ne crois pas que parmi tous les grands que j'ay pratiqués, il s'en trouvât un seul qui sût décliner son nom." . . . "Ils n'ont nulle curiosité de voir les pays étrangers, et encore moins de s'enquérir de ce qui s'y passe." *Mémoires du Maréchal de Gramont*, vol. ii. pp. 77, 78, 82, 83, in *Collection des Mémoires par Petitot et Monmerqué*, vol. lvii. See also *Aarsens de Sommerdyck, Voyage d'Espagne*, Paris, 1665, 4to, p. 124. "La terre mesme n'y est pas toute cultiuée par des gens du pays: au temps du labourage, des semailles et de la recolte, il leur vient quantité de paysans du Bearn et d'autres endroits de France, qui gagnent beaucoup d'argent, pour leur mettre leurs bleds en terre et pour les recueillir. Les architectes et charpentiers y sont aussi pour la plûpart estrangers, qui se font payer au triple de ce qu'ils gagneroient en leur pays. Dans Madrid on ne voit pas un porteur d'eau qui ne soit estranger, et la plûpart des cordonniers et tailleurs le sont aussi."

[217] "Mais aussi de quelle manière les éleve-t-on? Ils n'étudient point; on néglige de leur donner d'habiles precepteurs; dès qu'on les destine à l'épée, on ne se soucie plus qu'ils apprennent le latin ni l'histoire. On devroit au moins leur enseigner ce qui est de leur mestier, les mathematiques, à faire des armes et à monter à cheval. Ils n'y pensent seulement pas. Il n'y a point ici d'Academie ni de maîtres qui montrent ces sortes de choses. Les jeunes hommes passent le tems qu'ils devroient emploïer à s'instruire dans un oisiveté pitoïable." Letter from Madrid, dated 27th June, 1679, in *D'Aulnoy, Relation du Voyage d'Espagne*, Lyon, 1693, vol. ii. pp. 232, 233.

[218] "Madrid étant la capitale d'une monarchie aussi vaste, il n'y eut dans cette ville jusqu'à l'époque du règne de Philippe V. aucune bibliothèque publique." *Sempere, De la Monarchie Espagnole*, Paris, 1826, vol. ii. p. 79. [Buckle had previously pointed out (above, ch. vii. *note* 221) that in 1725 there was not a single public library in *London*. The argument is thus partly invalid.—Ed.]

couragement of science.[219] But De Torres, who was himself a Spaniard, and was educated at Salamanca early in the eighteenth century, declares that he had studied at that university for five years before he had heard that such things as the mathematical sciences existed.[220] So late as the year 1771, the same university publicly refused to allow the discoveries of Newton to be taught; and assigned as a reason that the system of Newton was not so consonant with revealed religion as the system of Aristotle.[221] All over Spain a similar plan was adopted. Everywhere knowledge was spurned, and inquiry discouraged. Feijoo, who, notwithstanding his superstition, and a certain slavishness of mind, from which no Spaniard of that age could escape, did on matters of science seek to enlighten his countrymen, has left upon record his deliberate opinion that whoever had acquired all that was taught in his time under the name of philosophy would as the reward of his labour be more ignorant than he was before he began.[222] And there can be no doubt that he was right. There can be no

[219] The university was transferred from Palencia to Salamanca, early in the thirteenth century. *Forner, Oracion Apologética por la España*, Madrid, 1786, p. 170. By the beginning of the fifteenth century it had become very prosperous (*Sempere, De la Monarchie Espagnole*, vol i. p. 65); and in 1535 it is described as "a great Universitie, conteyning seven or eight thowsand students." See a letter from John Mason, dated Valladolid, 3rd July, 1535, in *Ellis' Original Letters*, second series, vol. ii. p. 56, London, 1827. But, like everything else which was valuable in Spain, it declined in the seventeenth century; and Monconys, who carefully examined it in 1628, and praises some of its arrangements which were still in force, adds, "Mais je suis aussi contraint de dire après tant de loüanges, que les écoliers qui étudient dans cette université sont des vrais ignorans." *Les Voyages de Monsieur de Monconys*, Quatrième Partie, vol. v. p. 22, Paris, 1695. However, their ignorance, of which Monconys gives some curious instances, did not prevent Spanish writers, then and long afterwards, from deeming the University of Salamanca to be the greatest institution of its kind in the world. "La mayor del orbe, madre gloriosísima de todas las ciencias y de los mas vehementes ingenios, que han ilustrado las edades." *Vida de Calderon de la Barca*, pp. iii. iv., reprinted in Keil's edition of *Calderon*, Leipsique, 1827. Compare Davila (*Felipe Tercero*, p. 81), "Salamanca, madre de ciencias y letras;" Yañez (*Memorias*, p. 228), "Universidad insigne, y Oficina de las buenas Letras de España;" Bacallar (*Comentarios*, vol. i. p. 238), "El emporio de las ciencias;" and Ximenez (*Vida de Ribera*, p. 6), "Salamanca, cathedra universal de las artes, y emporio de todas ciencias."

[220] "Says that, after he had been five years in one of the schools of the university there, it was by accident he learned the existence of the mathematical sciences." *Ticknor's History of Spanish Literature*, vol. iii. p. 223. A celebrated Spanish writer of the eighteenth century actually boasts of the ignorance of his countrymen concerning mathematics, and discerns, in their neglect of that foolish pursuit, a decisive proof of their superiority over other nations. "No se dexe deslumbrar con los ásperos calculos é intrincadas demostraciones geométricas, con que, astuto el entendimiento, disimula el engaño con los disfraces de la verdad. El uso de las matemáticas es la alquimia en la fisica, que da apariencias de oro á lo que no lo es." *Forner, Oracion Apologética por la España y su Mérito Literario*, Madrid, 1786, p. 38. Compare his contemptuous notice (p. 66) of those insignificant persons who "con título de filósofos han dado algun aumento á las matemáticas;" and his comparison (p. 222) of Mercado with Newton.

[221] "L'université de Salamanque, excitée par le Conseil, à réformer ses études, en l'année 1771, lui répondit 'qu'elle ne pouvait se séparer du péripatétisme, parce que les systèmes de Newton, Gassendi et Descartes, ne concordent pas autant avec les vérités révélées que ceux d'Aristote.'" *Sempere, Monarchie Espagnole*, vol. ii. p. 152. This reply, says M. Sempere, p. 153, may be found "dans la collection des ordonnances royales." In *Letters from Spain by an English Officer*, London, 1788, vol. ii. p. 256, it is stated that, in all the Spanish universities, "Newton, and modern philosophy, is still prohibited. Nothing can supplant Aristotle, and the superstitious fathers and doctors of the church."

[222] Or, as he in one place expresses himself, would know "very little more than nothing." "El que estudió Logica, y Metaphysica, con lo demás que, debaxo del nombre

doubt that in Spain the more a man was taught, the less he would know. For he was taught that inquiry was sinful, that intellect must be repressed, and that credulity and submission were the first of human attributes. The Duke de Saint Simon, who, in 1721 and 1722, was the French ambassador at Madrid, sums up his observations by the remark that in Spain science is a crime, and ignorance a virtue.[223] Fifty years later, another shrewd observer, struck with amazement at the condition of the national mind, expresses his opinion in a sentence equally pithy and almost equally severe. Searching for an illustration to convey his sense of the general darkness, he emphatically says that the common education of an English gentleman would in Spain constitute a man of learning.[224]

Those who know what the common education of an English gentleman was eighty years ago will appreciate the force of this comparison, and will understand how benighted a country must have been to which such a taunt was applicable. To expect that under such a state of things the Spaniards should make any of the discoveries which accelerate the march of nations, would be idle indeed; for they would not even receive the discoveries which other nations had made for them, and had cast into the common lap. So loyal and orthodox a people had nothing to do with novelties, which, being innovations on ancient opinions, were fraught with danger. The Spaniards desired to walk in the ways of their ancestors, and not have their faith in the past rudely disturbed. In the inorganic world the magnificent discoveries of Newton were contumeliously rejected; and in the organic world the circulation of the blood was denied, more than a hundred and fifty years after Harvey had proved it.[225] These things were new, and it was better to pause a little, and not receive them too hastily. On the same principle, when in the year 1760 some bold men in the government proposed that the streets of Madrid should be cleansed, so daring a suggestion excited general anger. Not only the vulgar, but even those who were called educated, were loud in their censure. The medical profession, as the guardians of the public health, were desired by the government to give their opinion.

de Philosofia, se enseña en las Escuelas, por bien que sepa todo, sabe muy poco mas que nada; pero suena mucho. Dicese, que es un gran Philosofo; y no es Philosofo grande, ni chico." *Feijoo, Theatro Critico Universal*, vol. ii. p. 187, quinta impression, Madrid, 1741.

223 "La science est un crime, l'ignorance et la stupidité la première vertu." *Mémoires du Duc de Saint Simon*, vol. xxxv. p. 209, Paris, 1840. Elsewhere (vol. xxxvi. p. 252) he says, "Les jésuites savants partout et en tout genre de science, ce qui ne leur est pas même disputé par leurs ennemis, les jésuites, dis-je, sont ignorants en Espagne, mais d'une ignorance à surprendre."

224 "The common education of an English gentleman would constitute a man of learning here; and should he understand Greek, he would be quite a phenomenon." *Swinburne's Travels through Spain in 1775 and 1776*, vol. ii. pp. 212, 213, 2nd edit., London, 1787.

225 So late as 1787, Townsend, a very accomplished man, who travelled through Spain with the express object of noting the state of knowledge, as well as the economical condition of the country, and who by previous study had well qualified himself for such an undertaking, says, "I have observed in general that the physicians with whom I have had occasion to converse are disciples of their favourite doctor Piquer, who denied, or at least doubted of, the circulation of the blood." *Townsend's Journey through Spain*, 2nd ed., London, 1792, vol. iii. p. 281. At that time the Spanish physicians were however beginning to read Hoffmann, Cullen, and other heretical speculators, in whose works they would find, to their astonishment, that the circulation of the blood was assumed, and was not even treated as a debatable question. But the students were obliged to take such matters on trust; for, adds Townsend, p. 282, "In their medical classes they had no dissections." Compare *Laborde's Spain*, vol. i. p. 76, vol. iii. p. 315, London, 1809, and *Godoy's Memoirs*, London, 1836, vol. ii. p. 157. Godoy, speaking of the three colleges of surgery at Madrid, Barcelona, and Cadiz, says that until his administration in 1793, "In the capital, even that of San Carlos had not a lecture-room for practical instruction."

This they had no difficulty in doing. They had no doubt that the dirt ought to remain. To remove it was a new experiment; and of new experiments it was impossible to foresee the issue. Their fathers having lived in the midst of it, why should not they do the same? Their fathers were wise men, and must have had good reasons for their conduct. Even the smell, of which some persons complained, was most likely wholesome. For the air being sharp and piercing, it was extremely probable that bad smells made the atmosphere heavy, and in that way deprived it of some of its injurious properties. The physicians of Madrid were therefore of opinion that matters had better remain as their ancestors had left them, and that no attempts should be made to purify the capital by removing the filth which lay scattered on every side.[226]

While such notions prevailed respecting the preservation of health,[227] it is hardly to be supposed that the treatment of disease should be very successful. To bleed and to purge were the only remedies prescribed by the Spanish physicians.[228] Their ignorance of the commonest functions of the human body was

[226] This little episode is noticed by Cabarrus, in his *Elogio de Carlos III.*, Madrid, 1789, 4to, p. xiv. "La salubridad del ayre, la limpieza y seguridad de las calles." . . . "Pero ¿quién creerá que este noble empeño produxo las mas vivas quejas: que se conmovió el vulgo de todas clases; y que tuvo varias autoridades á su favor la extraña doctrina de que los vapores mefíticos eran un correctivo saludable de la rigidez del clima?" But the fullest details will be found in the recently published and very elaborate History of Charles III., by M. Rio, from which I will give one or two extracts. "Para la limpieza de las calles poseia mayores ó menores fondos el ayuntamiento, y cuando el Rey quiso poner la mano en este ramo de policía, le presentaron dictámenes de médicos en que se defendia el absurdo de ser elemento de salubridad la basura." *Rio, Historia del Reinado de Carlos III.*, Madrid, 1856, vol. iv. p. 54. See also vol. i. pp. 267, 268, where it is mentioned that when the minister Esquilache persevered in his attempts to have the streets of Madrid cleansed, the opponents of the scheme made inquiries into the opinions of their fathers on that subject; and the result was, "que le presentaron cierta originalísima consulta hecha por los médicos bajo el reinado de uno de los Felipes de Austria, y reducida á demostrar que, siendo sumamente sutil el aire de la poblacion á causá de estar próxima la sierra de Guadarrama, ocasionaria los mayores estragos si no se impregnara en los vapores de las inmundicias desparramadas por las calles." That this idea had long been entertained by the physicians of Madrid we also know from another testimony, with which none of the Spanish historians are acquainted. Sir Richard Wynne, who visited that capital in 1623, describes a disgusting practice of the inhabitants, and adds, "Being desirous to know why so beastly a custom is suffered, they say it's a thing prescribed by their physicians; for they hold the air to be so piercing and subtle, that this kind of corrupting it with these ill vapours keeps it in good temper." *The Autobiography and Correspondence of Sir Simonds D'Ewes*, edited by J. O. Halliwell, London, 1845, vol ii. p. 446.

[227] Even thirty years later, it was said with good reason that "es menester *deshacer todo lo que se ha hecho*," and "confiar exclusivamente el precioso depósito de la sanidad pública á las manos capaces de conservarlo y mejorarlo." *Cartas por el Conde de Cabarrus*, Madrid, 1813, p. 280. These letters, which, though little known, contain some interesting statements, were written in 1792 and 1793. See p. 34, and Prologo, p. i.

[228] Bleeding, however, had the preference. See the curious evidence in *Townsend's Journey through Spain in 1786 and 1787*, vol. ii. pp. 37–39. Townsend, who had some knowledge of medicine, was amazed at the ignorance and recklessness of the Spanish physicians. He says, "The science and practice of medicine are at the lowest ebb in Spain, but more especially in the Asturias." Compare *Sprengel, Histoire de la Médecine*, vol. iii. p. 217, Paris, 1815, with *Winwood's Memorials*, London, 1725, folio, vol. ii. p. 219. The last reference shows the terrible "purging and letting blood," to which the unfortunate Spaniards were exposed in the reign of Philip III. Another observer, much later, states that "La saignée leur est assez familière. Ils se la font faire hors du lit tant que leurs forces le permettent, et *lorsqu' ils en usent par précaution, ils se font tirer du sang deux jours de suite du bras droit et du gauche, disant qu'il faut égaliser le sang.* On peut juger de là, si la circulation leur est connue." *Voyages faits en Espagne, par Monsieur M*****

altogether surprising, and can only be explained on the supposition, that in medicine as in other departments the Spaniards of the eighteenth century knew no more than their progenitors of the sixteenth. Indeed, in some respects they appeared to know less. For their treatment was so violent that it was almost certain death to submit to it for any length of time.[229] Their own king, Philip V., did not dare to trust himself in their hands, but preferred having an Irishman for his physician.[230] Though the Irish had no great medical reputation, anything was better than a Spanish doctor.[231] The arts incidental to medicine and surgery were equally backward. The instruments were rudely made, and the drugs badly prepared. Pharmacy being unknown, the apothecaries' shops in the largest towns were entirely supplied from abroad; while in the smaller towns, and in districts remote from the capital, the medicines were of such a quality, that the best which could be hoped of them was that they might be innocuous. For in the middle of the eighteenth century Spain did not possess one practical chemist. Indeed, we are assured by Campomanes himself that so late as the year 1776 there was not to be found in the whole country a single man who knew how to make the commonest drugs, such as magnesia, Glauber's salts, and the ordinary preparations of mercury and antimony. This eminent statesman adds, however, that a chemical laboratory was about to be established in Madrid; and although the enterprise, being without a precedent, would surely be regarded as a portentous novelty, he expresses a confident expectation that by its aid the universal ignorance of his countrymen would in time be remedied.[232]

Amsterdam, 1700, p. 112. See further *Clarke's Letters concerning the Spanish Nation*, London, 4to, 1763, p. 55, and *Spain by an American*, London, 1831, vol. ii. p. 321.

[229] In 1780 poor Cumberland, when in Madrid, was as nearly as possible murdered by three of their surgeons in a very few days; the most dangerous of his assailants being no less a man than the "chief surgeon of the Gardes de Corps," who, says the unfortunate sufferer, was "sent to me by authority." See *Memoirs of Richard Cumberland, written by Himself*, London, 1807, vol. ii. pp. 67, 68.

[230] Duclos says of Philip V., "Il étoit fort attentif sur sa santé; son médecin, s'il eût été intriguant, auroit pu jouer un grand rôle. Hyghins, Irlandois, qui occupoit cette première place, fort eloigné de l'intrigue et de la cupidité, instruit dans son art, s'en occupoit uniquement. Après sa mort, la reine fit donner la place à Servi, son médecin particulier." *Mémoires par Duclos*, 2e édit. Paris, 1791, vol. ii. pp. 200, 201. "Hyghens, premier médecin, était Irlandais." *Mémoires du Duc de Saint Simon*, vol. xxxvi. p. 215, ed. Paris, 1841.

[231] In the eighteenth century, the Spaniards, generally, began to admit this; since they could not shut their eyes to the fact that their friends and relations succumbed so rapidly under professional treatment that sickness and death were almost synonymous. Hence, notwithstanding their hatred of the French nation, they availed themselves of the services of French physicians and French surgeons, whenever they had an opportunity of doing so. In 1707 the Princess des Ursins writes from Madrid to Madame de Maintenon, "Les chirurgiens espagnols sont mésestimés même de ceux de leur nation;" and in another letter, "Les Espagnols conviennent que les médecins français sont beaucoup plus savants que les leurs; ils s'en servent même très-volontiers, mais ils sont persuadés que ceux de la faculté de Montpellier l'emportent sur les autres." *Lettres inédites de Madame de Maintenon et de la Princesse des Ursins*, vol. iii. p. 412, vol. iv. p. 90.

[232] Campomanes (*Apéndice á la Educacion Popular*, Madrid, 1776, vol. iii. pp. 74, 75), speaking of a work on distillation, says, "La tercera (parte) describe la preparacion de los productos químicos sólidos: esto es la preparacion de varias sustancias terreas, como argamasa, magnesia blanca, ojos de cangrejo etc., la de varios sales, como sal de glaubero, amoniaco, cristal mineral, borax refinado etc., y la del antimonio, mercurio, plomo, litargirio etc., comunicando sobre todo lo expresado varias noticias, que demuestran lo mucho que conducen á los progresos del arte, las observaciones del fisico reflexîvo: unidas á la práctica de un profesor experimentado. *Este arte en toda su extension falta en España.* Solo le tenemos para aguardientes, rosolis, y mistelas. *La salud pública es demasiado importante, para depender de los estraños en cosas esenciales*; quando no estimulase nuestra industria la manutencion de muchas familias." . . . "Gran parte de estas cosas se introducen de fuera, por no conocerse bien las operaciones qu micas. No

Whatever was useful in practice, or whatever subserved the purposes of knowledge, had to come from abroad. Ensenada, the well-known minister of Ferdinand VI., was appalled by the darkness and apathy of the nation, which he tried, but tried in vain, to remove. When he was at the head of affairs, in the middle of the eighteenth century, he publicly declared that in Spain there was no professorship of public law, or of physics, or of anatomy, or of botany. He further added that there were no good maps of Spain, and that there was no person who knew how to construct them. All the maps which they had came from France and Holland. They were, he said, very inaccurate; but the Spaniards, being unable to make any, had nothing else to rely on. Such a state of things he pronounced to be shameful. For, as he bitterly complained, if it were not for the exertions of Frenchmen and Dutchmen it would be impossible for any Spaniard to know either the position of his own town, or the distance from one place to another.[233]

The only remedy for all this seemed to be foreign aid; and Spain being now ruled by a foreign dynasty, that aid was called in. Cervi established the Medical Societies of Madrid and of Seville; Virgili founded the College of Surgery at Cadiz; and Bowles endeavoured to promote among the Spaniards the study of mineralogy.[234] Professors were sought for far and wide; and application was made to Linnæus to send a person from Sweden who could impart some idea of botany to physiological students.[235] Many other and similar steps were taken by the government, whose indefatigable exertions would deserve our warmest praise, if we did not know how impossible it is for any government to enlighten a nation, and how absolutely essential it is that the desire for improvement should in the first place proceed from the people themselves.* No progress is real unless

son dificultosas en la execucion; pero *es necesario enseñarlas, y conocer los instrumentos que son aproposito.* Un laboratorio químico, que *se va á establecer en Madrid*, producirá maestros para las capitales del reyno."

[233] "Su ministro el célebre Ensenada, que tenia grandes miras en todos los ramos de la administracion pública, deseaba ardientemente mejorar la enseñanza, lamentándose del atraso en que esta se hallaba. 'Es menester, decia hablando de las universidades, reglar sus cátedras, reformar las superfluas y establecer las que faltan con nuevas ordenanzas para asegurar el mejor método de estudios. No sé que haya cátedra alguna de derecho público, de física esperimental, de anatomia y botánica. No hay puntuales cartas geográficas del reino y de sus provincias, *ni quien las sepa grabar, ni tenemos otras que las imperfectas que vienen de Francia y Holanda.* De esto proviene que ignoramos la verdadera situacion de los pueblos y sus distancias, que es una vergüenza.'" *Tapia, Civilizacion Española*, Madrid, 1840, vol. iv. pp. 268, 269. See also *Biografia de Ensenada*, in *Navarrete, Coleccion de Opusculos*, Madrid, 1848, vol. ii. pp. 21, 22. "Le parecia vergonzoso que para conocer la situacion y distancias respectivas de nuestros mismos pueblos y lagures, dependiésemos de los franceses y holandeses, quienes por sus mapas imperfectas de la península extraian de ella sumas considerables." Eighty years after this complaint was made by Ensenada, we find a traveller in Spain stating that "a decent map of any part, even of the country round the gates of the capital, cannot be found." *Cook's Spain from 1829 to 1832*, London, 1834, vol. i. p. 322. Compare *Notices of Geological Memoirs*, p. 1, at the end of the *Quarterly Journal of the Geological Society*, vol. vi., London, 1850; "even a good geographical map of the Peninsula does not exist."

[234] M. Rio (*Historia del Reinado de Carlos III.*, vol. i. p. 185) mentions this in a very characteristic manner. "Varios extranjeros distinguidos *hallaron fraternidad entre los españoles, y correspondieron hidalgamente al hospedaje*: Cervi dió vida á las sociedades médicas de Madrid y Sevilla; Virgili al colegio de cirugía de Cádiz; Quer trabajó sin descanso para que el jardin Botánico no fuera un simple lugar de recreo, sino principalmente de estudio; Bowles comunicó grande impulso á la mineralogía," etc.

[235] I have mislaid the evidence of this fact; but the reader may rely on its accuracy.

[* See notes above, pp. 155, 163, 346, 354, 372. In thus calling for an absolutely spontaneous—i.e. uncaused—change of mind on the part of a nation, Buckle departs from his primary principles. His words as to "general causes" in this passage carry a quite fallacious implication. Schools *are* "general causes."—Ed.]

it is spontaneous. The movement, to be effective, must emanate from within, and not from without; it must be due to general causes acting on the whole country, and not to the mere will of a few powerful individuals. During the eighteenth century all the means of improvement were lavishly supplied to the Spaniards; but the Spaniards did not want to improve. They were satisfied with themselves; they were sure of the accuracy of their own opinions; they were proud of the notions which they inherited, and which they did not wish either to increase or to diminish. Being unable to doubt, they were, therefore, unwilling to inquire. New and beautiful truths, conveyed in the clearest and most attractive language, could produce no effect upon men whose minds were thus hardened and enslaved.[236] An unhappy combination of events, working without interruption since the fifth century, had predetermined the national character in a particular direction, and neither statesmen, nor kings, nor legislators, could effect aught against it. The seventeenth century was, however, the climax of all. In that age the Spanish nation fell into a sleep from which, as a nation, it has never since awakened.* It was a sleep not of repose, but of death. It was a sleep in which the faculties, instead of being rested, were paralyzed, and in which a cold and universal torpor succeeded that glorious though partial activity which, while it made the name of Spain terrible in the world, had insured the respect even of her bitterest enemies.

Even the fine arts, in which the Spaniards had formerly excelled, partook of the general degeneracy, and, according to the confession of their own writers, had by the beginning of the eighteenth century fallen into complete decay.[237] The arts which secure national safety were in the same predicament as those which minister to national pleasure. There was no one in Spain who could build a ship; there was no one who knew how to rig it after it was built. The consequence was that by the close of the seventeenth century the few ships which Spain possessed were so rotten that, says an historian, they could hardly support the fire of their own guns.[238] In 1752 the government, being determined to restore the navy, found it necessary to send to England for shipwrights; and they were also obliged to apply to the same quarter for persons who could make ropes and canvas; the skill of the natives being unequal to such arduous achievements.[239] In this way the ministers of the Crown, whose ability and vigour, considering the difficult circumstances in which the incapacity of the people placed them, were extremely remarkable, contrived to raise a fleet superior to any which had

[236] Townsend (*Journey through Spain in* 1786 *and* 1787, vol. ii. p. 275) says, "Don Antonio Solano, professor of experimental philosophy, merits attention for the clearness and precision of his demonstrations; but, unfortunately, although his lectures are delivered gratis, such is the want of taste for science in Madrid, that nobody attends them."

[237] "La ignorancia reinante en los últimos años del siglo xvii depravó en tal manera el buen gusto, que á principios del xviii las artes se hallaban en la mas lastimosa decadencia." *Tapia, Civilizacion Española*, Madrid, 1840, vol. iv. p. 346. See also, on this decline, or rather destruction, of taste, *Velazquez, Orígenes de la Poesia Castellana*, Malaga, 1754, 4to. "Un siglo corrompido, en que las letras estaban abandonadas, y el buen gusto casi desterrado de toda la nacion." p. 70. "Al passo que la nacion perdia el buen gusto, y las letras iban caminando á su total decadencia." p. 107. "Los caminos por donde nuestros poetas en el siglo passado se apartaron del buen gusto en esta parte." p. 170.

[238] "Solo cuatro navíos de línea y seis de poco porte dejaron los reyes de origen austriaco, y todos tan podridos que apenas podian aguantar el fuego de sus propias baterías." *Rio, Historia del Reinado de Carlos III.*, Madrid, 1856, vol. i. p. 184.

[239] "Se mandaron construir 12 navíos á la vez, y se contrataron otros. Por medio de D. Jorge Juan se trajeron de Inglaterra los mas hábiles constructores y maestros para las fábricas de jarcia, lona y otras." *Biografia de Ensenada*, in *Navarrete, Coleccion de Opusculos*, Madrid, 1848, vol. ii. p. 18. M. Rio, taking all this as a matter of course, quietly says, "D. Jorge Juan fue á Lóndres para estudiar la construccion de navios." *Historia del Reinado de Carlos III.*, Madrid, 1856, vol. iv. p. 485.

[* This is clearly an exaggeration.—Ed.]

been seen in Spain for more than a century.[240] They also took many other steps towards putting the national defences into a satisfactory condition; though in every instance they were forced to rely on the aid of foreigners. Both the military and the naval service were in utter confusion, and had to be organized afresh. The discipline of the infantry was re-modelled by O'Reilly, an Irishman, to whose superintendence the military schools of Spain were intrusted.[241] At Cadiz a great naval academy was formed, but the head of it was Colonel Godin, a French officer.[242] The artillery, which like everything else had become almost useless, was improved by Maritz, the Frenchman; while the same service was rendered to the arsenals by Gazola, the Italian.[243]

The mines, which form one of the greatest natural sources of the wealth of Spain, had likewise suffered from that ignorance and apathy into which the force of circumstances had plunged the country. They were either completely neglected, or if worked, they were worked by other nations. The celebrated cobalt-mine, situated in the valley of Gistau in Aragon, was entirely in the hands of the Germans, who, during the first half of the eighteenth century, derived immense profit from it.[244] In the same way, the silver-mines of Guadalcanal, the richest in Spain, were undertaken not by natives but by foreigners. Though they had been discovered in the sixteenth century, they, as well as other matters of importance, had been forgotten in the seventeenth, and were re-opened in 1728 by English adventurers; the enterprise, the tools, the capital, and even the miners, all coming from England.[245] Another and still more famous mine is that of Almaden in La Mancha, which produces mercury of the finest quality, and in great profusion. This metal, besides being indispensable for many of the commonest arts, was of peculiar value to Spain, because without it the gold and silver of the New World could not be extracted from their ores. From Almaden, where every natural facility exists for collecting it, and where the cinnabar in which it is found is unusually rich, vast supplies had formerly been drawn; but they had for some time been diminishing, although the demand, especially from foreign countries, was on the increase. Under these circum-

[240] M. Lafuente says that Ensenada was the restorer, and almost the creator, of the Spanish navy; "de la cual fué el restaurador, y casi pudiera decirse el creador." *Lafuente, Historia de España*, vol. xix. p. 344, Madrid, 1857.

[241] "C'est par un Irlandais aussi, Oreilly, que la discipline de l'infanterie est réformée." *Bourgoing, Tableau de l'Espagne Moderne*, Paris, 1808, vol. ii. p. 142. "Las escuelas militares del puerto de Sta. Maria para la infanteria, que dirigió con tanto acierto el general Ofarril bajo las ordenes del conde de O'Reilly." *Tapia, Civilizacion Española*, vol. iv. p. 128.

[242] "Vino á dirigir la academia de guardias marinas de Cadiz." *Tapia, Civilizacion Española*, vol. iv. p. 79. "Godin figuró como director del colegio de guardias marinas." *Rio, Historia de Carlos III.*, vol. i. p. 186. Compare *Biographie Universelle*, vol. xvii. p. 564, Paris, 1816.

[243] See the interesting remarks in *Bourgoing, Tableau de l'Espagne Moderne*, Paris, 1808, vol. ii. pp. 96, 142. With good reason therefore was it stated, some years afterwards, that "c'est à des étrangers que l'Espagne doit presque tous les plans, les réformes utiles et les connoissances dont elle a eu besoin." *Voyage en Espagne par le Marquis de Langle*, 1785, vol. ii. p. 159.

[244] "Como los del pais entendian poco de trabajar minas, vinieron de Alemania algunos prácticos para enseñarlos." . . . "Los Alemanes sacaron de dicha mina por largo tiempo cosa de 500 á 600 quintales de cobalto al año." *Bowles, Historia Natural de España*, Madrid, 1789, 4to, pp. 418, 419. See also *Dillon's Spain*, Dublin, 1781, pp. 227–229.

[245] "In 1728 a new adventurer undertook the work of opening the mines of Guadalcanal. This was Lady Mary Herbert, daughter of the Marquis of Powis." . . . "Lady Mary departed from Madrid for Guadalcanal, to which miners and engines had been sent from England at her expense, and at that of her relation, Mr. Gage, who accompanied her, and of her father, the marquis." *Jacob's Historical Inquiry into the Production and Consumption of the Precious Metals*, London, 1831, vol. i. pp. 278, 279.

stances the Spanish government, fearing that so important a source of wealth might altogether perish, determined to institute an inquiry into the manner in which the mine was worked. As, however, no Spaniard possessed the knowledge requisite for such an investigation, the advisers of the Crown were obliged to call on foreigners to help them. In 1752 an Irish naturalist named Bowles was commissioned to visit Almaden, and ascertain the cause of the failure. He found that the miners had acquired a habit of sinking their shafts perpendicularly, instead of following the direction of the vein.[246] So absurd a process was quite sufficient to account for their want of success; and Bowles reported to the government, that if a shaft were to be sunk obliquely, the mine would no doubt again be productive. The government approved of the suggestion, and ordered it to be carried into effect. But the Spanish miners were too tenacious of their old customs to give way. They sank their shafts in the same manner as their fathers had done; and what their fathers had done, must be right. The result was that the mine had to be taken out of their hands; but as Spain could supply no other labourers, it was necessary to send to Germany for fresh ones.[247] After their arrival matters rapidly improved. The mine, being superintended by an Irishman and worked by Germans, assumed quite a different appearance; and notwithstanding the disadvantages with which new comers always have to contend, the immediate consequence of the change was that the yield of mercury was doubled, and its cost to the consumer correspondingly lowered.[248]

Such ignorance, pervading the whole nation, and extending to every department of life, is hardly conceivable, considering the immense advantages which the Spaniards had formerly enjoyed. It is particularly striking when contrasted with the ability of the government, which for more than eighty years constantly laboured to improve the condition of the country. Early in the eighteenth century, Ripperda, in the hopes of stimulating Spanish industry, established a large woollen manufactory at Segovia, which had once been a busy and prosperous city. But the commonest processes had now been forgotten; and he was obliged to import manufacturers from Holland to teach the Spaniards how to make up the wool, though that was an art for which in better days they had been especially famous.[249] In 1757 Wall, who was then minister, constructed upon a still larger scale a similar manufactory at Guadalajara in New Castile. Soon, however, something went wrong with the machinery; and as the Spaniards neither knew nor cared anything about these matters, it was necessary to send

[246] "Los mineros de Almaden nunca hicieron los socavones siguiendo la inclinacion de las betas, sino perpendiculares, y baxaban á ellos puestos en una especie de cubos atados desde arriba con cuerdas. De este mal método se originó todo el desórden de la mina, porque al paso que los operarios penetraban dentro de tierra, era forzoso que se apartasen de las betas y las perdiesen." *Bowles, Historia Natural de España*, Madrid, 1789, 4to, p. 14.

[247] "Fue mi proyecto bien recibido del Ministerio, y *habiendo hecho venir mineros Alemanes*, le han executado en gran parte con mucha habilidad. Los mineros Españoles de Almaden son atrevidos y tienen robustez, maña y penetracion quanta es menester, de suerte que *con el tiempo serán excelentes mineros, pues no les falta otra cosa que la verdadera ciencia de las minas*." *Historia Natural de España*, p. 16. The latter part of this sentence is an evident struggle between the interests of truth and the exigencies of a book printed at the Royal Press of Madrid, and licensed by the Spanish authorities.

[248] "Encargado por el gobierno el laborioso extrangero Bowles de proponer los medios convenientes para beneficiar con mas acierto las famosas minas de azogue del Almaden, descubrió algunos nuevos procedimientos por medio de los cuales casi se duplicaron los productos de aquellas, y bajó una mitad el precio de los azogues." *Tapia, Civilizacion Española*, vol. iv. p. 117.

[249] *Memoirs of Ripperda*, 2nd ed., London, 1740, pp. 23, 62, 91, 104. "A ship arrived at Cadiz with fifty manufacturers on board, whom the Baron de Ripperda had drawn together in Holland." . . . "The new manufactures at Segovia, which, though at this time wholly managed by foreigners, he wished in the next age might be carried on by the Spaniards themselves, and by them only."

to England for a workman to put it right.[250] At length the advisers of Charles III., despairing of rousing the people by ordinary means, devised a more comprehensive scheme, and invited thousands of foreign artizans to settle in Spain; trusting that their example, and the suddenness of their influx, might invigorate this jaded nation.[251] All was in vain. The spirit of the country was broken, and nothing could retrieve it.* Among other attempts which were made, the formation of a National Bank was a favourite idea of politicians, who expected great things from an institution which was to extend credit and make advances to persons engaged in business. But though the design was executed, it entirely failed in effecting its purpose. When the people are not enterprising, no effort of government can make them so. In a country like Spain a great bank was an exotic, which might live with art, but could never thrive by nature. Indeed, both in its origin and in its completion, it was altogether foreign, having been first proposed by the Dutchman Ripperda,[252] and owing its final organization to the Frenchman Cabarrus.[253]

In everything the same law prevailed. In diplomacy the ablest men were not Spaniards, but foreigners; and during the eighteenth century the strange spectacle was frequently exhibited of Spain being represented by French, Italian, and even Irish ambassadors.[254] Nothing was indigenous; nothing was

[250] "The minister, Wall, an Irishman, contrived to decoy over one Thomas Bevan, from Melksham, in Wiltshire, to set the machinery and matters to rights." *Ford's Spain*, London, 1847, p. 525.

[251] "Ademas de la invitacion que se hizo á millares de operarios extrangeros para venir á establecerse en España," &c. *Tapia, Civilizacion Española*, vol. iv. pp. 112, 113. In 1768, Harris, who travelled from Pampeluna to Madrid, writes, "I did not observe a dozen men either at plough or any other kind of labour, on the road." *Diaries and Correspondence of James Harris, Earl of Malmesbury*, London, 1844, vol. i. p. 38.

[252] "A national bank, a design originally suggested by Ripperda." *Coxe's Bourbon Kings of Spain*, vol. v. p. 202.

[253] Bourgoing, not aware of Ripperda's priority, says (*Tableau de l'Espagne Moderne*, vol. ii. p. 49), "L'idée de la banque nationale fut donnée au gouvernement par un banquier r ançais, M. Cabarrus." Compare *Rio, Historia del Reinado de Carlos III.*, vol. iv. pp. 122, 123: "Banco nacional de San Cárlos; propúsolo Cabarrús, apoyólo Floridablanca, y sancionólo el Soberano por Real cedula de 2 de junio de 1782." This sounds well; but the inevitable catastrophe soon came. "Charles IV.," says the Prince of the Peace, "had just ascended the throne; the bank of St. Carlos was rapidly falling, and on the verge of bankruptcy." *Godoy's Memoirs*, London, 1836, vol. i. p. 124.

[254] "A Londres, à Stockholm, à Paris, à Vienne et à Venise, le souverain est représenté par des étrangers. Le prince de Masserano, Italien, ambassadeur en Angleterre; le comte de Lacy, Irlandais, ministre à Stockholm; le marquis de Grimaldi, ambassadeur en France, avant de parvenir au ministère; le comte de Mahoni, Irlandais, ambassadeur à Vienne; le marquis de Squilaci, ambassadeur à Venise, après sa retraite du ministère." *Bourgoing, Tableau de l'Espagne*, vol. ii. pp. 142, 143. To this I may add that, in the reign of Philip V., an Italian, the Marquis de Beretti Landi, was the representative of Spain in Switzerland, and afterwards at the Hague (*Ripperda's Memoirs*, 1740, pp. 37, 38); and that in, or just before, 1779, Lacy filled the same post at St. Petersburg. *Malmesbury's Diaries and Correspondence*, 1844, vol. i. p. 261. So, too, M. Rio (*Historia de Carlos III.*, vol. i. pp. 288, 289) says of the important negotiations which took place in 1761, between Spain, England, and France, "Y así de las negociaciones en que Luis XV. trataba de enredarlá Carlos III., quedaron absolutamente excluidos los españoles, como que por una parte las iban á seguir el duque de Choiseul y el marques de Ossun, franceses, y por otra el irlandés D. Ricardo Wall, y el genovés marques de Grimaldi." About the same time, Clarke writes (in his *Letters concerning the Spanish Nation*, London, 1763, 4to, p. 331), "Spain has, for many years past, been under the direction of foreign ministers. Whether this hath been owing to want of capacity in the natives, or disinclination in the sovereign, I will not take upon me to say; such as it is, the native nobility lament it as a great calamity."

[* This is inconsistent with the statements made below, at note 279.—Ed.

done by Spain herself. Philip V., who reigned from 1700 to 1746, and possessed immense power, always clung to the ideas of his own country, and was a Frenchman to the last. For thirty years after his death the three most prominent names in Spanish politics were: Wall, who was born in France, of Irish parents;[255] Grimaldi, who was a native of Genoa;[256] and Esquilache, who was a native of Sicily.[257] Esquilache administered the finances for several years; and after enjoying the confidence of Charles III. to an extent rarely possessed by any minister, was only dismissed, in 1766, in consequence of the discontent of the people at the innovations introduced by this bold foreigner.[258] Wall, a much more remarkable man, was, in the absence of any good Spanish diplomatist, sent envoy to London in 1747; and after exercising great influence in matters of state, he was placed at the head of affairs in 1754, and remained supreme till 1763.[259] When this eminent Irishman relinquished office, he was succeeded by the Genoese, Grimaldi, who ruled Spain from 1763 to 1777, and was entirely devoted to the French views of policy.[260] His principal patron was Choiseul, who had imbued him with his own notions, and by whose advice he was chiefly guided.[261] Indeed, Choiseul, who was then the first minister in France, used to boast, with exaggeration but not without a considerable amount of truth, that his influence in Madrid was even greater than it was in Versailles.[262]

However this may be, it is certain that four years after Grimaldi took office, the ascendency of France was exhibited in a remarkable way. Choiseul, who hated the Jesuits, and had just expelled them from France, endeavoured also to expel them from Spain.[263] The execution of the plan was confided to Aranda,

[255] Lord Stanhope, generally well informed on Spanish affairs, says that Wall was "a native of Ireland." *Mahon's History of England*, vol. iv. p. 182, 3rd edit., London, 1853; but in *Mémoires de Noailles*, vol. iv. p. 47, edit. Paris, 1829, he is called "irlandais d'origine, né en France." See also *Biografía de Ensenada*, in *Navarrete, Opúsculos*, Madrid, 1848, vol. ii. p. 26, "D. Ricardo Wall, irlandés de orígen, nacido en Francia." Swinburne, who knew him personally, and has given some account of him, does not mention where he was born. *Swinburne's Travels through Spain*, second edition, London, 1787, vol. i. pp. 314–318.

[256] "A Genoese, and a creature of France." *Dunham's History of Spain*, vol. v. p. 170.

[257] "Era siciliano." *Rio, Historia del Reinado de Carlos III.*, vol. i. p. 244.

[258] The fullest account of his dismissal is given by M. Rio, in the first chapter of the second volume of his *Historia del Reinado de Carlos III.*, which should, however, be compared with *Coxe's Bourbon Kings of Spain*, vol. iv. pp. 340–346. Coxe terms him Squilaci; but I follow the orthography of the Spanish writers, who always call him Esquilache. Such was his influence over the King that, according to Coxe (vol. iv. p. 347), Charles III. "publicly said that 'if he was reduced to a morsel of bread, he would divide it with Squilaci.'"

[259] *Coxe's Kings of Spain*, vol. iv. pp. 15, 135. *Rio, Historia de Carlos III.*, vol. i. pp. 246, 247, 400, 401. *Navarrete, Biografía de Ensenada*, pp. 26–28.

[260] He resigned in 1776, but held office till the arrival of his successor, Florida Blanca, in 1777. *Rio, Historia de Carlos III.*, vol. iii. pp. 171, 174. In reference to his appointment in 1763, M. Rio observes (vol. i. p. 402), "De que Grimaldi creciera en fortuna se pudo congratular no Roma, sino Francia." In 1770, Harris, the diplomatist, who was then in Spain, writes, "His doctrine is absolutely French; guided in everything by the French closet," &c. *Malmesbury's Diaries and Correspondence*, vol. i. p. 56, London, 1844.

[261] "Guided in his operations by the counsels of Choiseul." *Coxe's Bourbon Kings of Spain*, vol. iv. p. 339. "The prosecution of the schemes which he had concerted with Choiseul." p. 373. "His friend and patron." p. 391, and vol. v. p. 6.

[262] "Personne n'ignoroit le crédit prodigieux que M. de Choiseul avoit sur le roi d'Espagne, dont il se vantoit lui-même, au point que je lui ai ouï dire, qu'il étoit plus sûr de sa prépondérance dans le cabinet de Madrid que dans celui de Versailles.' *Mémoires du Baron de Besenval, écrits par lui-même*, vol. ii. pp. 14, 15, Paris, 1805.

[263] M. Muriel (*Gobierno del Rey Don Carlos III.*, Madrid, 1830, pp. 44, 45) terms their

who, though a Spaniard by birth, derived his intellectual culture from France, and had contracted in the society of Paris an intense hatred of every form of ecclesiastical power.[264] The scheme, secretly prepared, was skilfully accomplished.[265] In 1767 the Spanish government, without hearing what the Jesuits had to say in their defence and indeed without giving them the least notice, suddenly ordered their expulsion; and with such animosity were they driven from the country in which they sprung up, and had long been cherished, that not only was their wealth confiscated, and they themselves reduced to a wretched pittance, but even that was directed to be taken from them if they published anything in their own vindication; while it was also declared that whoever ventured to write respecting them, should, if he were a subject of Spain, be put to death as one guilty of high treason.[266]

Such boldness on the part of the government [267] caused even the Inquisition to tremble. That once omnipotent tribunal, threatened and suspected by the civil authorities, became more wary in its proceedings, and more tender in its treatment of heretics. Instead of extirpating unbelievers by hundreds or by thousands, it was reduced to such pitiful straits that between 1746 and 1759 it was only able to burn ten persons, and between 1759 and 1788 only four persons.[268] The extraordinary diminution during the latter period was partly owing to the great authority wielded by Aranda, the friend of the encyclopædists and of other French sceptics. This remarkable

expulsion from Spain "este acto de violencia hecho meramente por complacer al duque de Choiseul, ministro de Francia y protector del partido filosófico." See also *Crétineau-Joly, Histoire de la Compagnie de Jésus*, vol. v. p. 291, Paris, 1845; and *Georgel, Mémoires pour servir à l'Histoire des Evénemens depuis* 1760, vol. i. p. 95, Paris, 1817.

[264] Archdeacon Coxe, in a somewhat professional tone, says of Aranda, "In France he had acquired the graces of polished society, and *imbibed that freedom of sentiment* which then began to be fashionable, and *has since been carried to such a dangerous excess*." *Coxe's Bourbon Kings of Spain*, vol. iv. p. 402. His great enemy, the Prince of the Peace, wishing to be severe, unintentionally praises him; and observes that he was "connected with the most distinguished literary Frenchmen of the middle of the last century," and that he was "divested of religious prejudices, though swayed by philosophical enthusiasm." *Godoy's Memoirs*, London, 1836, vol. i. p. 319. The hostility of some men is extremely valuable. The Prince further adds that Aranda "could only lay claim to the inferior merit of a sectarian attachment;" forgetting that in a country like Spain every enlightened person must belong to a miserably small sect.

[265] Cabarrus (*Elogio de Carlos III.*, Madrid, 1789, 4to, p. xxiv.) says, rather magniloquently, "El acierto de la execucion que correspondió al pulso y prudencia con que se habia deliberado esta providencia importante, pasará á la última posteridad."

[266] *Coxe's Bourbon Kings of Spain*, vol. iv. p. 362. M. Rio, in the second volume of his *History of Charles III.*, Madrid, 1856, has given a long, but not very philosophical nor very accurate account of the expulsion of the Jesuits, which he considers solely from the Spanish point of view; overlooking the fact that it was part of an European movement headed by France. He denies the influence of Choiseul, p. 125; censures the perfectly correct statement of Coxe, p. 123; and finally ascribes this great event to the operation of causes confined to the Peninsula. "De ser los jesuitas adversarios del regalismo emanó su ruina en España, cuando triunfaban las opiniones sostenidas con heróico teson desde mucho ántes por doctísimos jurisconsultos." p. 519.

[267] One of the most recent historians of the Jesuits indignantly observes, "Depuis deux cent vingt ans les Jésuites vivent et prêchent en Espagne. Ils sont comblés de bienfaits par des monarques dont ils étendent la souveraineté. Le clergé et les masses acceptent avec bonheur leur intervention. Tout à coup l'Ordre se voit déclaré coupable d'un crime de lèse-majesté, d'un attentat public que personne ne peut spécifier. La sentence prononce la peine sans énoncer le délit." *Crétineau-Joly, Histoire de la Compagnie de Jésus*, vol. v. p. 295, Paris, 1845.

[268] *Dunham's History of Spain*, vol. v. p. 285, where the facts are well brought together. The valuable *History of the Inquisition*, by Llorente, is not quite precise enough in these matters; though it is a very accurate, and, what is still more surprising, a very honest book.

man was President of Castile till 1773,[269] and he issued an order forbidding the Inquisition to interfere with the civil courts.[270] He also formed a scheme for entirely abolishing it; but his plan was frustrated owing to its premature announcement by his friends in Paris, to whom it had been confided.[271] His views, however, were so far successful that after 1781 there is no instance in Spain of a heretic being burned; the Inquisition being too terrified by the proceedings of government to do anything which might compromise the safety of the Holy Institution.[272]

In 1777 Grimaldi, one of the chief supporters of that anti-theological policy which France introduced into Spain, ceased to be minister; but he was succeeded by Florida Blanca, who was his creature, and to whom he transmitted his policy as well as his power.[273] The progress therefore of political affairs continued in the same direction. Under the new minister, as under his immediate predecessors, a determination was shown to abridge the authority of the Church and to vindicate the rights of laymen. In everything the ecclesiastical interests were treated as subordinate to the secular. Of this many instances might be given; but one is too important to be omitted. We have seen that early in the eighteenth century Alberoni, when at the head of affairs, was guilty of what in Spain was deemed the enormous offence of contracting an alliance with Mohammedans; and there can be no doubt that this was one of the chief causes of his fall, since it was held that no prospect of mere temporal advantages could justify an union, or even a peace, between a Christian nation and a nation of unbelievers.[274] But the Spanish government, which, owing to the causes I have related, was far in advance of Spain itself, was gradually becoming bolder, and growing more and more disposed to force upon the country views which, abstractedly considered,

[269] *Rio, Historia de Carlos III.*, vol. iii. pp. 103–107, which must be compared with the account of Coxe, who derived some of his information from a friend of Aranda's. *Coxe's Bourbon Kings of Spain*, vol. iv. pp. 401–415. A good life of Aranda would be very interesting. That contained in the *Biographie Universelle* is extremely meagre, and carelessly written.

[270] *Coxe's Bourbon Kings of Spain*, vol. iv. p. 407.

[271] "When at Paris, in 1786, I received the following anecdote from a person connected with the encyclopedists. During his residence in that capital, D'Aranda had frequently testified to the literati with whom he associated, his resolution to obtain the abolition of the Inquisition, should he ever be called to power. His appointment was, therefore, exultingly hailed by the party, particularly by D'Alembert; and he had scarcely begun his reforms before an article was inserted in the Encyclopædia, then printing, in which this event was confidently anticipated, from the liberal principles of the minister. D'Aranda was struck on reading this article, and said, 'This imprudent disclosure will raise such a ferment against me, that my plans will be foiled.' He was not mistaken in his conjecture." *Coxe's Bourbon Kings of Spain*, vol. iv. p. 408.

[272] Even the case in 1781 appears to have been for witchcraft rather than for heresy. "La dernière victime qui périt dans les flammes fut une *béate:* on la brûla à Séville, le 7 novembre 1781, comme ayant fait un pacte, et entretenu un commerce charnel avec le Démon, et pour avoir été impénitente négative. Elle eût pu éviter la mort en s'avouant coupable du crime dont on l'accusait." *Llorente, Histoire de l'Inquisition d'Espagne*, Paris, 1818, vol. iv. p. 270. About this time torture began to be disused in Spain. See an interesting note in *Johnston's Institutes of the Civil Law of Spain*, London, 1825, p. 263.

[273] "Menester es decir que el marqués de Grimaldi cayó venciendo á sus enemigos, pues, léjos de legarles el poder, á que aspiraban con anhelo, trasmitiólo á una de sus más legítimas hechuras; que tal era y por tal se reconocia el conde de Floridablanca." *Rio, Historia del Reinado de Carlos III.*, vol. iii. pp. 151, 152.

[274] In 1690 it was stated that "since the expulsion of the Moors" there was no precedent for the King of Spain ever sending an envoy to a Mohammedan prince. See *Mahon's Spain under Charles II.*, p. 5. In that year an envoy was sent to Morocco; but this was merely concerning the redemption of prisoners, and certainly without the remotest intention of concluding a peace.

were extremely enlightened, but which the popular mind was unable to receive. The result was that in 1782 Florida Blanca concluded a treaty with Turkey, which put an end to the war of religious opinions ; to the astonishment, as we are told, of the other European powers, who could hardly believe that the Spaniards would thus abandon their long-continued efforts to destroy the infidels.[275] Before, however, Europe had time to recover from its amazement, other and similar events occurred, equally startling. In 1784 Spain signed a peace with Tripoli ; and in 1785 one with Algiers.[276] And scarcely had these been ratified when in 1786 a treaty was also concluded with Tunis.[277] So that the Spanish people, to their no small surprise, found themselves on terms of amity with nations whom for more than ten centuries they had been taught to abhor, and whom, in the opinion of the Spanish Church, it was the first duty of a Christian government to make war upon, and if possible to extirpate.

Putting aside for a moment the remote and intellectual consequences of these transactions, there can be no doubt that the immediate and material consequences were very salutary ; though, as we shall presently see, they produced no lasting benefit, because they were opposed by the unfavourable operation of more powerful and more general causes. Still it must be confessed that the direct results were extremely advantageous ; and to those who take only a short view of human affairs, it might well appear that the advantages would be permanent. The immense line of coast from the kingdoms of Fez and Morocco to the furthest extremity of the Turkish empire was no longer allowed to pour forth those innumerable pirates who, heretofore, swept the seas, captured Spanish ships, and made slaves of Spanish subjects. Formerly, vast sums of money were annually consumed in ransoming these unhappy prisoners ;[278] but now all such evils were ended. At the same time, great impetus was given to the commerce of Spain ; a new trade was thrown open, and her ships could safely appear in the rich countries of the Levant. This increased her wealth ; which was moreover aided by another circumstance growing out of these events. For the most fertile parts of Spain are those which are washed by the Mediterranean, and which had for centuries been the prey of Mohammedan corsairs, who, frequently landing by surprise, had at length caused such constant fear that the

[275] "The other European courts, with surprise and regret, witnessed the conclusion of a treaty which terminated the political and religious rivalry so long subsisting between Spain and the Porte." *Coxe's Bourbon Kings of Spain*, vol. v. pp. 152, 153. "Une des maximes de la politique espagnole avait été celle de maintenir une guerre perpétuelle contre les mahométans, même après la conquête de Grenade. Ni les pertes incalculables éprouvées par suite de ce système, ni l'exemple de la France et d'autres puissances catholiques qui ne se faisaient point scruple d'être en paix avec les Turcs, n'avaient suffi pour détromper l'Espagne sur l'inconvenance d'une telle politique. Le génie éclairé de Charles III. corrigea un préjugé aussi dangereux ; dicta la paix avec les empereurs de Turquie et d'autres potentats mahométans ; delivra ses sujets de la terrible piraterie des corsaires, et ouvrit à leur commerce de nouvelles voies pour spéculer avec de plus grands avantages." *Sempere, La Monarchie Espagnole*, vol. ii. p. 160.

[276] *Rio, Historia del Reinado de Carlos III.*, vol. iv. pp. 11–13.

[277] *Ibid.*, vol. iv. pp. 16, 17.

[278] "Ha sido notable el número de cautivos, que los piratas de Berbería han hecho sobre nuestras costas por tres centurias. En el siglo pasado se solian calcular exístentes á la vez en nuestras Argel, treinta mil personas españolas. Su rescate á razon de mil pesos por cada persona á lo menos, ascendia á 30 millones de pesos." *Campomanes, Apéndice á la Educacion Popular*, vol. i. p. 373, Madrid, 1775. On the precautions which had to be used to guard the coasts of Spain against the Mohammedan corsairs, see *Uztariz, Theorica y Practica de Comercio*, Madrid, 1757, folio, pp. 172, 173, 222–226 ; and *Lafuente, Historia de España*, vol. xv. p. 476, Madrid, 1855. In the middle of the eighteenth century a regular watch had to be kept along the Mediterranean coast of Spain, "in order to give the alarm upon the appearance of the enemy." See *A Tour Through Spain by Udal ap Rhys*, 2nd edit., London, 1760, p. 170. As to the state of things in the seventeenth century, see *Janer, Condicion de los Moriscos*, Madrid, 1857, p. 63.

inhabitants gradually retired towards the interior, and abstained from cultivating the richest soil in their country. But by the treaties just concluded such dangers were at once removed; the people returned to their former abodes; the earth again gave forth its fruits; regular industry reappeared; villages sprung up; even manufactures were established; and the foundation seemed to be laid for a prosperity the like of which had not been known since the Mohammedans were driven out of Granada.[279]

I have now laid before the reader a view of the most important steps which were taken by those able and vigorous politicians who ruled Spain during the greater part of the eighteenth century. In considering how these reforms were effected, we must not forget the personal character of Charles III., who occupied the throne from 1759 to 1788.[280] He was a man of great energy, and though born in Spain had little in common with it. When he became king he had been long absent from his native country, and had contracted a taste for customs, and above all for opinions, totally dissimilar to those natural to the Spaniards.[281] Comparing him with his subjects, he was enlightened indeed. They cherished in their hearts the most complete, and therefore the worst, form of spiritual power which has ever been exhibited in Europe. That very power he made it his business to restrain. In this as in other respects he far surpassed Ferdinand VI. and Philip V., though they, under the influence of French ideas, had proceeded to what was deemed a dangerous length.[282] The clergy, indignant at such proceedings, murmured, and even threatened.[283] They declared that

[279] "De esta suerte quedaron los mares limpios de piratas desde los reinos de Fez y Marruecos hasta los últimos dominios del emperador Turco, por el Mediterráneo todo; vióse á menudo la bandera española en Levante, y las mismas naciones mercantiles que la persiguieron indirectamente, preferíanla ahora, resultando el aumento del comercio y de la Real marina, y la pericia de sus tripulaciones, y el mayor brillo de España y de su augusto Soberano: termino hubo la esclavitud de tantos millares de infelices con abandono de sus familias é indelebles perjuicios de la religion y el Estado, cesando tambien la contínua extraccion de enormes sumas para los rescates que, al paso que nos empobrecian, pasaban á enriquecer á nuestros contrarios, y á facilitar sus armamentos para ofendernos; y se empezaban á cultivar rápidamente en las costas del Mediterráneo leguas de terrenos los más fertiles, del mundo desamparados y eriales hasta entónces por miedo á los piratas, y donde se formaban ya pueblos enteros para dar salida á los frutos y las manufacturas." *Rio, Historia del Reinado de Carlos III.*, vol. iv. pp. 17, 18.

[280] M. Rio, whose voluminous History of the Reign of Charles III. is, notwithstanding its numerous omissions, a work of considerable value, has appreciated the personal influence of the king more justly than any previous writer; he having had access to unpublished papers, which show the great energy and activity of Charles. "Entre sus mas notables figuras ninguna aventaja á la de Cárlos III.; y no por el lugar jerárquico que ocupa, sino por el brillante papel que representa, ora tome la iniciativa, ora el consejo, para efectuar las innumerables reformas que le valieron inextinguible fama. Ya sé que algunos tachan á este Monarca de cortedad de luces y de estrechez de miras; y que algunos otros suponen que sus ministros le engañaron ó sorprendieron para dictar ciertas providencias. Cuarenta y ocho tomos de cartas semanales y escritas de su puño desde octubre de 1759 hasta marzo de 1783 al marques de Tanucci, existentes en el archivo de Simancas, por mí leidas hoja tras hoja, sacando de ellas largos apuntes, sirven á maravilla para pintarle tal como era, y penetrar hasta sus más recónditos pensamientos, y contradecir á los que le juzgan á bulto." *Rio, Historia del Reinado de Carlos III.*, Madrid, 1856, vol. i. pp. xxii. xxiii.

[281] "Although born and educated in Spain, Charles had quitted the country at too early an age to retain a partiality to its customs, laws, manners, and language; while, from his residence abroad, and his intercourse with France, he had formed a natural predilection for the French character and institutions." *Coxe's Bourbon Kings of Spain*, vol. iv. p. 337.

[282] He "far surpassed his two predecessors in his exertions to reform the morals and restrain the power of the clergy." *Ibid.*, vol. v. p. 215.

[283] His measures "alarmaron al clero en general, que empezó á murmurar con

Charles was despoiling the Church, taking away her rights, insulting her ministers, and thus ruining Spain beyond human remedy.[284] The king, however, whose disposition was firm and somewhat obstinate, persevered in his policy; and as he and his ministers were men of undoubted ability, they, notwithstanding the opposition they encountered, succeeded in accomplishing most of their plans. Mistaken and short-sighted though they were, it is impossible to refrain from admiring the honesty, the courage, and the disinterestedness which they displayed in endeavouring to alter the destiny of that superstitious and half-barbarous country over which they ruled. We must not however conceal from ourselves that in this, as in all similar cases, they, by attacking evils which the people were resolved to love, increased the affection which the evils inspired. To seek to change opinions by laws is worse than futile. It not only fails, but it causes a reaction which leaves the opinions stronger than ever. First alter the opinion, and then you may alter the law. As soon as you have convinced men that superstition is mischievous, you may with advantage take active steps against those classes who promote superstition and live by it. But however pernicious any interest or any great body may be, beware of using force against it, unless the progress of knowledge has previously sapped it at its base, and loosened its hold over the national mind. This has always been the error of the most ardent reformers, who, in their eagerness to effect their purpose, let the political movement outstrip the intellectual one, and, thus inverting the natural order, secure misery either to themselves or to their descendants. They touch the altar, and fire springs forth to consume them. Then comes another period of superstition and of despotism; another dark epoch in the annals of the human race. And this happens merely because men will not bide their time, but will insist on precipitating the march of affairs. Thus, for instance, in France and Germany it is the friends of freedom who have strengthened tyranny; it is the enemies of superstition who have made superstition more permanent. In those countries it is still believed that government can regenerate society; and therefore, directly they who hold liberal opinions get possession of the government, they use their power too lavishly, thinking that by doing so they will best secure the end at which they aim. In England, the same delusion, though less general, is far too prevalent; but as with us public opinion controls politicians, we escape from evils which have happened abroad because we will not allow any government to enact laws which the nation disapproves. In Spain, however, the habits of the people were so slavish, and their necks had so long been bowed under the yoke, that though the government in the eighteenth century opposed their dearest prejudices, they rarely ventured to resist, and they had no legal means of making their voice heard. But not the less did they feel. The materials for reaction were silently accumulating; and before that century had passed away the reaction itself was manifest. As long as Charles III. lived it was kept under; and this was owing partly to the fear which his active and vigorous government inspired, and partly to the fact that many of the reforms which he introduced were so obviously beneficial as to shed a lustre on his reign, which all classes could perceive. Besides the exemption which his policy insured from the incessant ravages of pirates, he also succeeded in obtaining for Spain the most honourable peace which any Spanish government had signed for two centuries; thus recalling to the popular mind the brightest and

impaciencia, y aun algunos de sus individuos se propasaron á violentos actos." *Tapia, Civilizacion Española*, vol. iv. p. 98.

[284] A popular charge against the government was, "que se despojara á la Iglesia de sus inmunidades." *Rio, Historia del Reinado de Carlos III.*, vol. ii. p. 54. See also at pp. 201, 202, a letter, in 1766, from the Bishop of Cuenca to the King's confessor, in which that prelate stated, "que España corria á su ruina, que ya no corria, sino que volaba, y que ya estaba perdida sin remedio humano;" and that the cause of this was the persecution of the poor Church, which was "saqueada en sus bienes, ultrajada en sus ministros, y atropellada en su inmunidad."

most glorious days of Philip II.[285] When Charles came to the throne Spain was hardly a third-rate power ; when he died she might fairly claim to be a first-rate one, since she had for some years negotiated on equal terms with France, England, and Austria, and had taken a leading part in the councils of Europe. To this the personal character of Charles greatly contributed ; he being respected for his honesty, as well as feared for his vigour.[286] Merely as a man, he bore high repute ; while as a sovereign none of his contemporaries were in any way equal to him, except Frederick of Prussia, whose vast abilities were however tarnished by a base rapacity, and by an incessant desire to overreach his neighbours. Charles III. had nothing of this ; but he carefully increased the defences of Spain, and, raising her establishments to a war-footing, he made her more formidable than she had been since the sixteenth century. Instead of being liable to insult from every petty potentate who chose to triumph over her weakness, the country had now the means of resisting, and if need be of attacking. While the army was greatly improved in the quality of the troops, in their discipline, and in the attention paid to their comforts, the navy was nearly doubled in number, and more than doubled in efficiency.[287] And this was done without imposing fresh burdens on the people. Indeed, the national resources were becoming so developed, that in the reign of Charles III. a large amount of taxation could have been easier paid than a small one under his predecessors. A regularity hitherto unknown was introduced into the method both of assessing imposts and of collecting them.[288] The laws of mortmain were relaxed, and steps were taken towards diminishing the rigidity of entails.[289] The industry of the country was liberated from many of the trammels which had long been imposed upon it, and the principles of free trade were so far recognized that in 1765 the old laws respecting corn were repealed ; its exportation was allowed, and also its transit from one part of Spain to another, uninterrupted by those absurd precautions which preceding governments had thought it advisable to invent.[290]

[285] Coxe (*Bourbon Kings of Spain*, vol. v. p. 144) calls the peace of 1783 "the most honourable and advantageous ever concluded by the crown of Spain since the peace of St. Quinton." Similarly, M. Rio (*Historia del Reinado de Carlos III.*, vol. iii. p. 397), "Siglos habian pasado para España de continuas y porfiadas contiendas, sin llegar nunca, desde la famosa jornada de San Quintin y al alborear el reinado de Felipe II., tan gloriosamente al reposo."

[286] Towards the close of his reign we find a contemporary observer, who was anything but prejudiced in his favour, bearing testimony to "the honest and obstinate adherence of his present Catholic Majesty to all his treaties, principles, and engagements." *Letters by an English Officer*, London, 1788, vol. ii. p. 329. Compare Muriel (*Gobierno del Rey Don Carlos III.*, Madrid, 1839, p. 34), "Tan conocido llegó á ser Cárlos III. en los reinos estraños por la rectitud de su carácter, que en las desavenencias que ocurrian entre los gobiernos, todos consentian en tomarle por árbitro, y se sometian á sus decisiones ; " and Cabarrus (*Elogio de Carlos III.*, Madrid, 1789, 4to, p. xl.), "Esta probidad llega á ser el resorte político de la Europa ; todas las córtes penetradas de respeto á sus virtudes le buscan por árbitro y mediador." Evidence of the great respect paid to Charles III. by foreign powers will also be found in *Rio, Historia del Reinado de Carlos III.*, vol. iv. pp. 41–43, 253.

[287] On the increase of the navy, compare *Tapia, Civilizacion Española*, vol. iv. p. 127 with *Muriel, Gobierno del Rey Carlos III.*, pp. 73, 82.

[288] These financial improvements were due, in a great measure, to the Frenchman, Cabarrus. See *Rio, Historia del Reinado de Carlos III.*, vol. iv. pp. 122, 123.

[289] Rio, *ibid.*, vol. iv. pp. 164–166, and *Tapia, Civilizacion Española*, vol. iv. pp. 96, 97.

[290] "La providencia mas ascertada para el fomento de nuestra agricultura fué sin duda la real pragmática de 11 de julio de 1765, por la cual se abolió la tasa de los granos, y se permitió el libre comercio de ellos." *Tapia, Civilizacion Española*, vol. iv. p. 105. See also *Dillon's Spain*, p. 69, and *Townsend's Spain*, vol. ii. p. 230. The first step towards this great reform was taken in 1752. See the edict issued in that year, "Libertase de Derechos el trigo, cebada, centeno y maiz que por mar se transportáre de unas

It was also in the reign of Charles III. that the American Colonies were for the first time treated according to the maxims of a wise and liberal policy. The behaviour of the Spanish government in this respect contrasts most favourably with the conduct pursued at the same time towards our great Colonies by that narrow and incompetent man who then filled the English throne. While the violence of George III. was fomenting rebellion in the British Colonies, Charles III. was busily engaged in conciliating the Spanish ones. Towards this end, and with the object of giving fair play to the growth of their wealth, he did everything which the knowledge and resources of that age allowed him to do. In 1764 he accomplished what was then considered the great feat of establishing every month a regular communication with America, in order that the reforms which he projected might be more easily introduced, and the grievances of the Colonies attended to.[291] In the very next year, free trade was conceded to the West Indian Islands, whose abundant commodities were now for the first time allowed to circulate, to their own benefit as well as to the benefit of their neighbours.[292] Into the Colonies generally vast improvements were introduced, many oppressions were removed, the tyranny of officials was checked, and the burdens of the people were lightened.[293] Finally, in 1778, the principles of free trade, having been successfully tried in the American Islands, were now extended to the American Continent ; the ports of Peru and of New Spain were thrown open ; and by this means an immense impetus was given to the prosperity of those magnificent colonies which nature intended to be rich, but which the meddling folly of man had forced to be poor.[294]

All this reacted upon the mother country with such rapidity, that scarcely was the old system of monopoly broken up when the trade of Spain began to advance, and continued to improve, until the exports and imports had reached a height that even the authors of the reform could hardly have expected ; it being said that the export of foreign commodities was tripled, that the export of home-produce was multiplied fivefold, and the returns from America ninefold.[295]

provincias á otras de estos dominios." This document, which is important for the history of political economy, is printed in the Appendix to *Campomanes, Educacion Popular*, vol. ii. pp. 16, 17, Madrid, 1775.

[291] " Pronto se establecieron los correos marítimos y se comunicaron con regularidad y frecuencia no vistas hasta entónces la metrópoli y las colonias. Por efecto del importante decreto de 24 de agosto de 1764, salia el primero de cada mes un paquebot de la Coruña con toda la correspondencia de las Indias ; desembarcábala en la Habana, y desde allí se distribuia en balandras y otros bajeles á propósito para puntear los vientos escasos, á Veracruz, Portobelo, Cartagena, islas de Barlovento y provincias de la Plata ; y aquellos ligeros buques volvian á la Habana, de donde zarpaba mensualmente y en dia fijo otro paquebot para la Coruña." *Rio, Historia del Reinado de Carlos III.*, vol. i. p. 452. That part of the plan, however, which aimed at making Coruña a rival of Cadiz appears to have been unsuccessful. See a letter from Coruña, written in 1774, in *Dalrymple's Travels through Spain*, London, 1777, 4to, p. 99.

[292] See the edicts in *Campomanes, Apéndice*, vol. ii. pp. 37–47, Madrid, 1775. They are both dated October 16th, 1765.

[293] It was said with reason, by Alaman, " Que el gobierno de América llegó al colmo de su perfeccion en tiempo de Carlos III." *Rio, Historia del Reinado de Carlos III.*, vol. iv. p. 141. And Humboldt observes (*Essai Politique sur le Royaume de la Nouvelle-Espagne*, Paris, 1811, 4to, vol. i. p. 102), " C'est le roi Charles III surtout qui, par des mesures aussi sages qu'énergiques, est devenu le bienfaiteur des indigénes ; il a annulé les *Encomiendas* ; il a défendu les *Repartimientos*, par lesquels les corregidors se constituoient arbitrairement les créanciers, et par conséquent les maîtres du travail des natifs, en les pourvoyant, à des prix exagérés, de chevaux, de mulets et de vêtemens (*ropa*)."

[294] *Cabarrus, Elogio de Carlos III.*, Madrid, 1789, p. xlii., and Canga's note in *Martinez de la Mata, Dos Discursos*, Madrid, 1794, p. 31. But these writers were not sufficiently familiar with political economy really to appreciate this measure.

[295] " Early in the reign of Charles steps had been taken towards the adoption of more

Many of the taxes which bore heavily on the lower ranks were repealed, and the industrious classes being relieved of their principal burdens, it was hoped that their condition would speedily improve.[296] And to benefit them still more, such alterations were effected in the administration of the law as might enable them to receive justice from the public tribunals when they had occasion to complain of their superiors. Hitherto, a poor man had not the least chance of succeeding against a rich one; but in the reign of Charles III. government introduced various regulations by which labourers and mechanics could obtain redress if their masters defrauded them of their wages, or broke the contracts made with them.[297]

Not only the labouring classes, but also the literary and scientific classes, were encouraged and protected. One source of danger, to which they had long been exposed, was considerably lessened by the steps which Charles took to curtail the power of the Inquisition. The king was moreover always ready to reward them; he was a man of cultivated tastes, and he delighted in being thought the patron of learning.[298] Soon after his accession, he issued an order exempting from military service all printers, and all persons immediately connected with printing, such as casters of type, and the like.[299] He also, as far as he was able, infused new life into the old universities, and did all that was possible towards restoring their discipline and reputation.[300] He founded schools, endowed colleges, rewarded professors, and granted pensions. In these matters his munificence seemed inexhaustible, and is of itself sufficient to account for the veneration with which literary Spaniards regard his memory. They have reason to regret that, instead of living now, they had not lived when he was king. In his reign it was supposed that their interests must be identical with the interests of knowledge; and these last were rated so highly that in 1771 it was laid down as a settled principle of government, that of all the branches of public policy the care of education is the most important.[301]

But this is not all. It is no exaggeration to say that in the reign of Charles III. the face of Spain underwent greater changes than it had done during the hundred and fifty years which had elapsed since the final expulsion of the Mohammedans. At his accession, in 1759, the wise and pacific policy of his predecessor, Ferdinand VI., had enabled that prince not only to pay many of the debts owed by the crown, but also to accumulate and leave behind him a considerable trea-

liberal principles in the commerce with America; but, in the year 1778, a complete and radical change was introduced. The establishment of a free trade rapidly produced the most beneficial consequences. The export of foreign goods was tripled, of home-produce quintupled; and the returns from America augmented in the astonishing proportion of nine to one. The produce of the customs increased with equal rapidity." *Clarke's Examination of the Internal State of Spain*, London, 1818, p. 72.

296 *Coxe's Bourbon Kings of Spain*, vol. v. pp. 197, 317, 318.

297 See Florida Blanca's statement in *Coxe's Bourbon Kings of Spain*, vol. v. p. 331; "To facilitate to artisans and journeymen the scanty payment of their labours, in spite of the privileges and interest of the powerful."

298 *Rio, Historia del Reinado de Carlos III.*, vol. iv. pp. 317, 318, and elsewhere.

299 " 'Desde mi feliz advenimiento al trono' (dijo el Rey en la ordenanza de reemplazos) 'ha merecido mi Real proteccion el arte de la imprenta, y, para que pueda arraigarse sólidamente en estos reinos, vengo en declarar la exencion del sorteo y servicio militar, no solo á los impresores, sino tambien á los fundidores que se empleen de continuo en este ejercicio, y á los abridores de punzones y matrices.'" *Rio, Historia del Reinado de Carlos III.*, vol. iii. p. 213.

300 On the steps taken to reform the universities between 1768 and 1774, see *Rio Historia del Reinado de Carlos III.*, vol. iii. pp. 185–210. Compare vol. iv. pp. 296–299.

301 " La educacion de la juventud por los maestros de primeras letras es uno y aun el más principal ramo de la policía y buen gobierno del Estado." *Real Provision de 11 de julio de* 1771. printed in Rio, vol. iii. p. 182.

sure.[302] Of this Charles availed himself, to begin those works of public splendour which, more than any other part of his administration, were sure to strike the senses, and to give popularity to his reign. And when, by the increase of wealth rather than by the imposition of fresh burdens, still larger resources were placed at his command, he devoted a considerable part of them to completing his designs. He so beautified Madrid that forty years after his death it was stated that, as it then stood, all its magnificence was owing to him. The public buildings and the public gardens, the beautiful walks round the capital, its noble gates, its institutions, and the very roads leading from it to the adjacent country, are all the work of Charles III., and are among the most conspicuous trophies which attest his genius and the sumptuousness of his taste.[303]

In other parts of the country roads were laid down, and canals were dug, with the view of increasing trade, by opening up communications through tracts previously impassable. At the accession of Charles III. the whole of the Sierra Morena was unoccupied, except by wild beasts and banditti, who took refuge there.[304] No peaceful traveller would venture into such a place ; and commerce was thus excluded from what nature had marked as one of the greatest highways in Spain, standing as it does between the basins of the Guadiana and Guadalquivir, and in the direct course between the ports on the Mediterranean and those on the Atlantic. The active government of Charles III. determined to remedy this evil ; but the Spanish people not having the energy to do what was required, six thousand Dutch and Flemish were in 1767 invited to settle in the Sierra Morena. On their arrival, lands were allotted to them, roads were cut through the whole of the district, villages were built ; and that which had just been an impervious desert was suddenly turned into a smiling and fruitful territory.[305]

[302] M. Lafuente, who has justly praised the love of peace displayed by Ferdinand VI. (*Historia de España*, vol. i. p. 202, vol. xix. pp. 286, 378), adds (vol. xix. p. 384), "De modo que con razon de admira, y es el testimonio mas honroso de la beuno administracion económica de este reinado, que al morir este buen monarca dejára, no diremos nosotros preletas y apuntaladas las arcas públicas, como hiperbólicamente suele decirse, pero sí con el considerable sobrante de trescientos millones de reales, despues de cubiertas todas las atenciones del Estado : fenómeno que puede decirse se veia por primera vez en España, y resultado satisfactorio, que aun supuesta una buena administracion, solo pudo obtenerse á favor de su prudente política de neutralidad y de paz."

[303] "But it is to Charles III. that Madrid owes all its present magnificence. Under his care, the royal palace was finished, the noble gates of Alcalá and San Vincente were raised ; the custom-house, the post-office, the museum, and royal printing-office were constructed ; the academy of the three noble arts improved ; the cabinet of natural history, the botanic garden, the national bank of San Carlos, and many gratuitous schools established ; while convenient roads leading from the city, and delightful walks planted within and without it, and adorned by statues and fountains, combine to announce the solicitude of this paternal king." *Spain by an American*, London, 1831, vol. i. p. 206 ; see also p. 297.

[304] The following passage describes its state so late as the year 1766 : "Por temor ó por connivencia de los venteros, dentro de sus casas concertaban frecuentemente los ladrones sus robos, y los ejecutaban á mansalva, ocultándose en guaridas de que ahuyentaban á las fieras. Acaso á muy largas distancias se descubrian entre contados caseríos algunos pastores como los que allí hizo encontrar el ilustre manco de Lepanto al ingenioso hidalgo de la Mancha. Parte de la Sierra estuvo poblada en tiempo de moros ; actualmente ya no habia más que espesos matorrales hasta en torno de la ermita de Santa Elena, donde resonaron cánticos de gracias al Cielo por el magnífico triunfo de las Navas." *Rio, Historia del Reinado de Carlos III.*, vol. iii. p. 9. On the condition of the Sierra Morena a hundred years before this, see *Boisel, Journal du Voyage d' Espagne*, Paris, 1669, 4to, pp. 62, 296, where it is termed "Le lieu le plus desert, et où il n'y a que quelques *ventas* sans villages."

[305] *Rio, Historia del Reinado de Carlos III.*, vol. iii. pp. 9–11, 35. By 1771, "sin auxilio de la Real hacienda pudieron mantenerse al fin los colonos." p. 42. See also vol. iv. pp. 114, 115. On the subsequent history of this settlement, see *Inglis'* Spain, vol. ii. pp. 29–31, London, 1831.

Nearly all over Spain the roads were repaired ; a fund having been, so early as 1760, specially set apart for that purpose.[306] Many new works were begun ; and such improvements were introduced, while at the same time such vigilance was employed to prevent peculation on the part of officials, that in a very few years the cost of making public highways was reduced to less than half of what it used to be.[307] Of the undertakings which were brought to a successful issue, the most important were a road now first constructed from Malaga to Antequera,[308] and another from Aquilas to Lorca.[309] In this way, means of intercourse were supplied between the Mediterranean and the interior of Andalusia and of Murcia. While these communications were established in the south and south-east of Spain, others were opened up in the north and north-west. In 1769 a road was begun between Bilbao and Osma ;[310] and soon after, one was completed between Galicia and Astorga.[311] These and similar works were so skilfully executed that the Spanish highways, formerly among the worst in Europe, were now classed among the best. Indeed a competent and by no means overfriendly judge gives it as his opinion that at the death of Charles III. better roads were to be found in Spain than in any other country.[312]

In the interior, rivers were made navigable, and canals were formed to connect them with each other. The Ebro runs through the heart of Aragon and part of Old Castile, and is available for purposes of traffic as high up as Logroño, and from thence down to Tudela. But between Tudela and Saragossa the navigation is interrupted by its great speed, and by the rocks in its bed. Consequently, Navarre is deprived of its natural communication with the Mediterranean. In the enterprizing reign of Charles V. an attempt was made to remedy this evil ; but the plan failed, was laid aside, and was forgotten, until it was revived, more than two hundred years later, by Charles III. Under his auspices the great canal of Aragon was projected, with the magnificent idea of uniting the Mediterranean and the Atlantic. This, however, was one of many instances in which the government of Spain was too far in advance of Spain itself ; and it was necessary to abandon a scheme to which the resources of the country were unequal. But what was really effected was of immense value. A canal was actually carried to Saragossa, and the waters of the Ebro were made available

306 "En 1760 se destinó por primera vez un fondo especial para la construccion de caminos." *Tapia, Civilizacion Española*, vol. iv. p. 123.

307 Indeed, M. Rio says that the expense was reduced by two-thirds, and, in some parts, by three-fourths. "Antes se regulaba en un millon de reales la construccion de cada legua ; ahora solo ascendia á la tercera ó cuarta parte de esta suma." *Rio, Historia del Reinado de Carlos III.*, vol. iv. p. 117.

308 A note in *Bowles, Historia Natural de España*, Madrid, 1789, 4to, p. 158, terms this "un camino alineado y sólido." In *Cook's Spain*, London, 1834, vol. i. p. 209, it is called "a magnificent road.'

309 "Para dar salida á los frutos, que regaban los pantanos de Lorca, ejecutóse una bien trazada via al puerto de las Aguilas." *Rio, Historia del Reinado de Carlos III.* vol. iv. pp. 115, 116.

310 In 1769 Baretti writes, in great surprise, "the Biscayans are actually making a noble road, which is to go from Bilbao to Osma." *Baretti's Journey through England, Portugal, Spain, and France*, London, 1770, vol. iv. p. 311.

311 "Otras diferentes carreteras, construidas de nuevo ó rehabilitadas, multiplicaron las comunicaciones durante los nueve primeros años de estar á cargo de Floridablanca la superintendencia general de caminos, haciéndose de fácil y cómodo tránsito puntos escabrosos como el del Puerto de la Cadena y los que médian entre Astorga y Galicia, y Málaga y Antequera." *Rio, Historia del Reinado de Carlos III.*, vol. iv. p. 115.

312 "The reigns of Ferdinand the Sixth and Charles the Third produced the most beneficial changes in this important branch of political economy. New roads were opened, which were carefully levelled, and constructed with solidity. There are at the present time in Spain several superb roads, such as may vie with the finest in Europe ; indeed they have been made with superior judgment, and upon a grander scale." *Laborde's Spain*, edit. London, 1809, vol. iv. p. 427.

not only for transport, but also for irrigating the soil. The means of a safe and profitable trade were now supplied even to the western extremity of Aragon. The old land, becoming more productive, rose in value, and new land was brought under the plough. From this other parts of Spain also benefited. Castile, for example, had in seasons of scarcity always depended for supplies on Aragon, though that province could under the former system only produce enough for its own consumption. But by this great canal, to which, about the same time, that of Tauste was also added,[313] the soil of Aragon became far more productive than it had ever yet been ; and the rich plains of the Ebro yielded so abundantly that they were able to supply wheat and other food to the Castilians as well as to the Aragonese.[314]

The government of Charles III., moreover, constructed a canal between Amposta and Altaques,[315] which irrigated the southern extremity of Catalonia, and brought into cultivation a large district which, from the constant lack of rain, had hitherto been untilled. Another and still greater enterprise belonging to the same reign was an attempt, only partly successful, to establish a water-communication between the capital and the Atlantic, by running a canal from Madrid to Toledo, whence the Tagus would have conveyed goods to Lisbon, and all the trade of the west would have been opened up.[316] But this and many other noble projects were nipped in the bud by the death of Charles III., with whom every thing vanished. When he passed away the country relapsed into its former inactivity, and it was clearly seen that these great works were not national, but political ; in other words, that they were due merely to individuals, whose most strenuous exertions always come to naught if they are opposed by the operation of those general causes which are often undiscerned, but to which even the strongest of us do, in our own despite, pay implicit obedience.

Still, for a time, much was done ; and Charles, reasoning according to the ordinary maxims of politicians, might well indulge the hope that what he had effected would permanently change the destiny of Spain. For these and other works which he not only planned but executed[317] were not paid for, as is too

[313] *Coxe's Bourbon Kings of Spain*, vol. v. p. 287.

[314] *Ibid.*, vol. v. pp. 198, 199, 286, 287. *Townsend's Spain*, vol. i. pp. 212–215. *Laborde's Spain*, vol. ii. p. 271. This canal, which was intended to establish a free communication between the Bay of Biscay and the Mediterranean, is slightly noticed in *Macpherson's Annals of Commerce*, vol. iv. pp. 95, 96 ; a learned and valuable work, but very imperfect as regards Spain. The economical value of this great enterprise, and the extent to which it succeeded, are seriously under-estimated in *Ford's Spain*, p. 587 ; a book which, notwithstanding the praise that has been conferred upon it, is carelessly composed, and is sure to mislead readers who have not the means of comparing it with other authorities. M. Rio's History of Charles III. contains some interesting information on the subject ; but unfortunately I omitted to mark the passages.

[315] *Coxe's Bourbon Kings of Spain*, vol. v. pp. 288, 289, on the authority of Florida Blanca himself.

[316] *Coxe's Bourbon Kings of Spain*, vol. v. p. 199. *Townsend's Spain*, vol. i. p. 304.

[317] See Florida Blanca's statement, in *Coxe's Bourbon Kings of Spain*, vol. v. p. 289. "In many other parts similar works have been promoted, for canals of irrigation, and for encouraging agriculture and traffic. The canals of Manzanares and Guadarrama are continued by means of the national bank, which has appropriated one-half of the profits derived from the export of silver to this end." . . . "The town of Almuradiel, formed in the middle of the *campo nuevo* of Andalusia, for the rugged pass of Despeña Perros, is another example of agriculture for the neighbouring places ; since, instead of woods and frightful deserts, we have seen in a few years public buildings, houses, plantations, and cultivated lands, producing every species of grain and fruits, which border the road, and banish the danger of robbers and banditti." See also *Muriel, Gobierno del Rey Don Carlos III.*, p. 5. "Habiendo sido el reinado de Carlos III. una serie continua de mejoras en todos ramos ;" and the striking picture (p. 15), "Agricultura, artes mecánicas, comercio, enseñanza, milicia, navegacion, ciencias,

often the case, by taxes which oppressed the people and trammelled their industry. At his side, and constantly advising him, there were men who really aimed at the public good, and who never would have committed so fatal an error. Under his rule the wealth of the country greatly increased, and the comforts of the lower classes, instead of being abridged, were multiplied. The imposts were more fairly assessed than they had ever been before. Taxes which in the seventeenth century all the power of the executive could not wring from the people, were now regularly paid, and, owing to the development of the national resources, they became at once more productive and less onerous. In the management of the public finances an economy was practised, the first example of which had been set in the preceding reign, when the cautious and pacific policy of Ferdinand VI. laid a foundation for many of the improvements just narrated. Ferdinand bequeathed to Charles III. a treasure which he had not extorted, but saved. Among the reforms which he introduced, and which an unwillingness to accumulate details has compelled me to omit, there is one very important and also very characteristic of his policy. Before his reign Spain had annually been drained of an immense amount of money, on account of the right which the Pope claimed of presenting to certain rich benefices, and of receiving part of their produce ; probably as a recompense for the trouble he had taken. Of this duty the Pope was relieved by Ferdinand VI., who secured to the Spanish crown the right of conferring such preferment, and thus saved to the country those enormous sums on which the Roman Court had been wont to revel.[318] This was just the sort of measure which would be hailed with delight by Charles III., as harmonizing with his own views ; and we accordingly find that in his reign it was not only acted upon but extended still further. For perceiving that, in spite of his efforts, the feeling of the Spaniards on these matters was so strong as to impel them to make offerings to him whom they venerated as the Head of the Church, the king determined to exercise control over even these voluntary gifts. To accomplish this end various devices were suggested ; and at length one was hit upon which was thought sure to be effectual. A royal order was issued, directing that no person should send money to Rome, but that if he had occasion to make remittances there, they should pass not through the ordinary channels, but through the ambassadors, ministers, or other agents of the Spanish Crown.[319]

If we now review the transactions which I have narrated, and consider them as a whole, extending from the accession of Philip V. to the death of Charles III., over a period of nearly ninety years, we shall be struck with wonder at their unity, at the regularity of their march, and at their apparent success. Looking at them merely in a political point of view, it may be doubted if such vast and uninterrupted progress has ever been seen in any country either before or since. For three generations there was no pause on the part of the government ; not one reaction, not one sign of halting. Improvement upon improvement, and reform upon reform, followed each other in swift succession. The power of the

letras, legislacion, en una palabra, todo cuanto puede influir en la prosperidad del Estado, todo llamó la atencion de los ministros, y en todo hicieron las mejoras que permitian las circunstancias." On the improvements in internal communications, see the same valuable work, pp. 187–192.

318 Respecting this step, which was effected in 1754, see *Tapia, Civilizacion Española*, Madrid, 1840, vol. iv. pp. 81, 82. " Fué este tratado utilísimo para la España, pues por él se libertó del pago de enormes sumas que hasta entonces habian pasado á los estados pontificos. En el informe canónico-legal escrito á virtud de real órden en 1746 por el fiscal de la cámara de Castilla Don Blas de Jover, se decia ; que segun el testimonio del historiador Cabrera, en el espacio de 30 años el solo renglon de las coadjutorias y dispensas habia hecho pasar á Roma de la corona de Castilla millon y medio de ducados romanos. Y añade el mismo Jover que á principios del siglo xviii. subia aun esta contribucion cada año en todos los estados de la monarquia española á 500,000 escudos romanos, que era *un tercio poco mas ó menos de lo que Roma percibia de toda la cristiandad.*"

319 See Appendix I. to *Coxe's Bourbon Kings of Spain*, vol. v. p. 334.

Church, which has always been the crying evil of Spain, and which hitherto none of the boldest politicians had dared to touch, was restricted in every possible way by a series of statesmen, from Orry to Florida Blanca, whose efforts were latterly, and for nearly thirty years, zealously aided by Charles III., the ablest monarch who has sat on the throne since the death of Philip II. Even the Inquisition was taught to tremble, and made to loosen its hold over its victims. The burning of heretics was stopped. Torture was disused. Prosecutions for heresy were discouraged. Instead of punishing men for imaginary offences, a disposition was shown to attend to their real interests, to alleviate their burdens, to increase their comforts, and to check the tyranny of those who were set over them. Attempts were made to restrain the cupidity of the clergy, and prevent them from preying at will upon the national wealth. With this view, the laws of mortmain were revised, and various measures taken to interpose obstacles in the way of persons who desired to waste their property by bequeathing it for ecclesiastical purposes. In this as in other matters the true interests of society were preferred to the fictitious ones. To raise the secular classes above the spiritual; to discountenance the exclusive attention hitherto paid to questions respecting which nothing is known, and which it is impossible to solve; to do this, and, in the place of such barren speculations, to substitute a taste for science or for literature, became the object of the Spanish government for the first time since Spain had possessed a government at all. As part of the same scheme, the Jesuits were expelled, the right of sanctuary was infringed, and the whole hierarchy, from the highest bishop down to the lowest monk, were taught to fear the law, to curb their passions, and to restrain the insolence with which they had formerly treated every rank except their own. These would have been great deeds in any country; in such a country as Spain they were marvellous. Of them I have given an abridged and therefore an imperfect account, but still sufficient to show how the government laboured to diminish superstition, to check bigotry, to stimulate intellect, to promote industry, and to rouse the people from their death-like slumber. I have omitted many measures of considerable interest, and which tended in the same direction; because here as elsewhere I seek to confine myself to those salient points which most distinctly mark the general movement. Whoever will minutely study the history of Spain during this period will find additional proof of the skill and vigour of those who were at the head of affairs, and who devoted their best energies to regenerating the country which they ruled. But for these special studies special men are required; and I shall be satisfied if I have firmly grasped the great march and outline of the whole. It is enough for my purpose if I have substantiated the general proposition, and have convinced the reader of the clearness with which the statesmen of Spain discerned the evils under which their country was groaning, and of the zeal with which they set themselves to remedy the mischief, and to resuscitate the fortunes of what had once not only been the chief of European monarchies, but had borne sway over the most splendid and extensive territory that had been united under a single rule since the fall of the Roman Empire.

They who believe that a government can civilize a nation, and that legislators are the cause of social progress, will naturally expect that Spain reaped permanent benefit from those liberal maxims which now, for the first time, were put into execution. The fact however is that such a policy, wise as it appeared, was of no avail, simply because it ran counter to the whole train of preceding circumstances. It was opposed to the habits of the national mind, and was introduced into a state of society not yet ripe for it. No reform can produce real good unless it is the work of public opinion, and unless the people themselves take the initiative. In Spain, during the eighteenth century, foreign influence, and the complications of foreign politics, bestowed enlightened rulers upon an unenlightened country.[320] The consequence was that for a time great things were done.

[320] It is important to observe that the Cortes, where alone the voice of the people had a chance of being heard, was assembled but three times during the whole of the

Evils were removed, grievances were redressed, many important improvements were introduced ; and a spirit of toleration was exhibited such as had never before been seen in that priest-ridden and superstitious land. But the mind of Spain was untouched. While the surface, and as it were the symptoms, of affairs were ameliorated, affairs themselves remained unchanged. Below that surface, and far out of reach of any political remedy, large general causes were at work which had been operating for many centuries, and which were sure, sooner or later, to force politicians to retrace their steps, and compel them to inaugurate a policy which would suit the traditions of the country, and harmonize with the circumstances under which those traditions had been formed.

At length the reaction came. In 1788 Charles III. died ; and was succeeded by Charles IV., a king of the true Spanish breed, devout, orthodox, and ignorant.[321] It was now seen how insecure everything was, and how little reliance can be placed on reforms which, instead of being suggested by the people, are bestowed on them by the political classes. Charles IV., though a weak and contemptible prince,[322] was so supported in his general views by the feelings of the Spanish nation that in less than five years he was able completely to reverse that liberal policy which it had taken three generations of statesmen to build up. In less than five years everything was changed. The power of the Church was restored ; the slightest approach towards free discussion was forbidden ; old and arbitrary principles, which had not been heard of since the seventeenth century, were revived ; the priests re-assumed their former importance ; literary men were intimidated, and literature was discouraged ; while the Inquisition, suddenly starting up afresh, displayed an energy which caused its enemies to tremble, and proved that all the attempts which had been made to weaken it had been unable to impair its vigour, or to daunt its ancient spirit.

The ministers of Charles III., and the authors of those great reforms which signalized his reign, were dismissed to make way for other advisers, better suited to this new state of things. Charles IV. loved the Church too well to tolerate the presence of enlightened statesmen. Aranda and Florida Blanca were both removed from office, and both were placed in confinement.[323] Jovellanos was banished from court, and Cabarrus was thrown into prison.[324] For now work had to be done to which these eminent men would not put their hands. A policy which had been followed with undeviating consistency for nearly ninety years was about to be rescinded, in order that the old empire of the seventeenth century, which was the empire of ignorance, of tyranny, and of superstition, might be resuscitated, and if possible restored to its pristine vigour.

Once more was Spain covered with darkness ; once more did the shadows of night overtake that wretched land. The worst forms of oppression, says a distinguished writer, seemed to be settling on the country with a new and porten-

eighteenth century, and then merely for the sake of form. " Les Cortès ne se réunirent que trois fois pendant le dix-huitième siècle, et plutôt encore comme des solennités formulaires pour la prestation du serment aux princes héritiers de la couronne, que comme étant nécessaires pour de nouvelles lois et des contributions." *Sempere, Histoire des Cortès d'Espagne*, Bordeaux, 1815, p. 270.

321 By combining these three qualities he has deserved and received the cordial approbation of the present Bishop of Barcelona, who, in his recent work on the Spanish Church, styles him " un monarca tan piadoso." *Observaciones sobre El Presente y El Porvenir de la Iglesia en España, por Domingo Costa y Borras*, Barcelona, 1857, p. 80.

322 Even in *Alison's History of Europe*, where men of his character are usually made much of, he is treated with moderate disdain. " Charles IV. was not destitute of good qualities, but he was a weak, incapable prince." Vol. viii. p. 382, Edinburgh, 1849.

323 *Sempere, Monarchie Espagnole*, vol. ii. p. 167. I need hardly say that not the slightest credit is to be attached to the account given in Godoy's Memoirs. Every one tolerably acquainted with Spanish history will see that his book is an attempt to raise his own reputation by defaming the character of some of the ablest and most high-minded of his contemporaries.

324 *Ticknor's History of Spanish Literature*, vol. iii. pp. 277, 278.

tous weight.[325] At the same time, and indeed as a natural part of the scheme, every investigation likely to stimulate the mind was prohibited, and an order was actually sent to all the universities, forbidding the study of moral philosophy; the minister who issued the order justly observing that the king did not want to have philosophers.[326] There was, however, little fear of Spain producing anything so dangerous. The nation not daring, and, what was still worse, not wishing to resist, gave way, and let the king do as he liked. Within a very few years he neutralized the most valuable reforms which his predecessors had introduced. Having discarded the able advisers of his father, he conferred the highest posts upon men as narrow and incompetent as himself; he reduced the country to the verge of bankruptcy; and, according to the remark of a Spanish historian, he exhausted all the resources of the state.[327]

Such was the condition of Spain late in the eighteenth century. The French invasion quickly followed; and that unhappy country underwent every form of calamity and of degradation. Herein, however, lies a difference. Calamities may be inflicted by others; but no people can be degraded except by their own acts. The foreign spoiler works mischief; he cannot cause shame. With nations, as with individuals, none are dishonoured if they are true to themselves. Spain, during the present century, has been plundered and oppressed, and the opprobrium lights on the robbers, not on the robbed. She has been overrun by a brutal and licentious soldiery; her fields laid waste, her towns sacked, her villages burned. It is to the criminal, rather than to the victim, that the ignominy of these acts must belong. And even in a material point of view such losses are sure to be retrieved, if the people who incur them are inured to those habits of self-government, and to that feeling of self-reliance, which are the spring and the source of all real greatness. With the aid of these every damage may be repaired, and every evil remedied. Without them the slightest blow may be fatal. In Spain they are unknown; and it seems impossible to establish them. In that country men have so long been accustomed to pay implicit deference to the Crown and the Church, that loyalty and superstition have usurped the place of those nobler emotions to which all freedom is owing, and in the absence of which the true idea of independence can never be attained.

More than once, indeed, during the nineteenth century, a spirit has appeared, from which better things might have been augured. In 1812, in 1820, and in 1836, a few ardent and enthusiastic reformers attempted to secure liberty to the Spanish people by endowing Spain with a free constitution. They succeeded for a moment, and that was all. The forms of constitutional government they could bestow; but they could not find the traditions and the habits by which the forms are worked. They mimicked the voice of liberty; they copied her institutions; they aped her very gestures. And what then? At the first stroke of adverse fortune their idol fell to pieces. Their constitutions were broken up, their assemblies dissolved, their enactments rescinded. The inevitable reaction quickly followed. After each disturbance the hands of the government were strengthened, the principles of despotism were confirmed, and the Spanish liberals were taught to rue the day in which they vainly endeavoured to impart freedom to their unhappy and ill-starred country.[328]

[325] "In all its worst forms, therefore, oppression, civil, political, and religious, appeared to be settling down, with a new and portentous weight, on the whole country." *Ticknor's History of Spanish Literature*, vol. iii. p. 318.

[326] "Caballero, fearing the progress of all learning which might disturb the peace of the Court, sent, not long since, a circular order to the universities, forbidding the study of moral philosophy. 'His Majesty,' it was said in the order, 'was not in want of philosophers, but of good and obedient subjects.'" *Doblado's Letters from Spain*, p. 358.

[327] "Le gouvernement de Charles IV avait épuisé toutes les ressources de l'état." *Sempere, Histoire des Cortès d'Espagne*, p. 323.

[328] In Spain, the voice of the people has always been opposed to the liberal party, as many writers have observed, without being aware of the reason. Mr. Walton (*Revolu-*

What makes these failures the more worthy of observation is that the Spaniards did possess, at a very early period, municipal privileges and franchises, similar to those which we had in England, and to which our greatness is often ascribed. But such institutions, though they preserve freedom, can never create it. Spain had the form of liberty without its spirit; hence the form, promising as it was, soon died away.* In England the spirit preceded the form, and therefore the form was durable. Thus it is that, though the Spaniards could boast of free institutions a century before ourselves, they were unable to retain them, simply because they had the institutions and nothing more. We had no popular representation till 1264;[329] but in Castile they had it in 1169,[330] and in Aragon in 1133.[331] So, too, while the earliest charter was granted to an English town in the twelfth century,[332] we find in Spain a charter conferred on Leon as early as 1020; and in the course of the eleventh century the enfranchisement of towns was as secure as laws could make it.[333]

The fact however is that in Spain these institutions, instead of growing out of the wants of the people, originated in a stroke of policy on the part of their rulers. They were conceded to the citizens, rather than desired by them.† For, during the war with the Mohammedans, the Christian kings of Spain, as they advanced southwards, were naturally anxious to induce their subjects to settle in the frontier towns, where they might face and repel the enemy. With this object, they granted charters to the towns, and privileges to the inhabitants.[334] And as the Mohammedans were gradually beaten back from the Asturias to Granada, the frontiers changed, and the franchises were extended

tions of Spain, London, 1837, vol. i. pp. 322, 323) says of the Cortes, "Public indignation hurled them from their seats in 1814; and in 1823 they were overpowered, not by the arms of France, but by the displeasure of their own countrymen," &c. See also p. 290; and *Quin's Memoirs of Ferdinand the Seventh*, London, 1824, p. 121, where it is mentioned that "in all the towns through which the King passed, the multitude, excited by the friars and clergy, overturned the constitutional stone, and uttered the most atrocious insults against the Constitution, the Cortes, and the Liberals." Compare *Sempere, Histoire des Cortès*, p. 335, and *Bacon's Six Years in Biscay*, p. 40. Indeed, a very intelligent writer on Spanish affairs in 1855 asserts, with, I believe, perfect truth, that Spain is "un pays où les populations sont toujours à coup sûr moins libérales que les gouvernemens." *Annuaire des Deux Mondes*, 1854, 1855, Paris, 1855, p. 266.

[331] *Ibid.*, vol. i. p. xcvi.

[332] *Hallam's Middle Ages*, ninth edition, London, 1846, vol. ii. pp. 153–157, which must be compared with *Hallam's Supplemental Notes*, London, 1848, pp. 323–327.

[333] *Ibid.*, vol. i. p. 373. *Prescott's Ferdinand and Isabella*, vol. i. pp. xlv. xlvi. [From these remarks it appears that Buckle had framed his earlier argument as to Spanish submissiveness before he had noted the details of the history of early Spanish constitutionalism. The facts here mentioned should have been dealt with in the survey of Spanish development during the Moorish period. They are now briefly noted and disposed of *à priori* in such a way as to save the preceding argument.—Ed.]

[334] "Ce fut alors que les successeurs de Pélage descendirent de leurs montagnes dans les plaines, de leurs forteresses perchées sur des rocs inaccessibles dans les villes populeuses, le long des fleuves, dans de fertiles vallées et sur les côtes de la mer; ce fut alors que la ville d'Astorgue revint du pouvoir des Arabes à celui des Asturiens et chassa toute

[* Here the formula is shaped by the supposed needs of the argument. In Old Spain there had been plenty of the "spirit" of freedom, otherwise the "forms" could not have existed. Spanish freedom was lost through causes which would have been equally efficient in any other country. Compare the relative "freedom" in England under Henry VIII. and in Spain before Ferdinand and Isabella.—Ed.]

[† The language here confutes itself. It is impossible to "concede" what is not desired. If, further, the people were attracted by the offer of privileges, they must have wanted them.—Ed.]

to the new conquests, in order that what was the post of danger might also be the place of reward. But meanwhile those general causes which I have indicated were predetermining the nation to habits of loyalty and of superstition, which grew to a height fatal to the spirit of liberty. That being the case, the institutions were of no avail. They took no root ; and as they were originated by one political combination, they were destroyed by another. Before the close of the fourteenth century the Spaniards were so firmly seated in the territories they had lately acquired, that there was little danger of their being again expelled ; [335] while on the other hand there was no immediate prospect of their being able to push their conquests further, and drive the Mohammedans from the strongholds of Granada. The circumstances, therefore, which gave rise to the municipal privileges had changed ; and as soon as this was apparent, the privileges began to perish. Being unsuited to the habits of the people, they were sure to fall on the first opportunity.[336] Late in the fourteenth century their decline was perceptible ; by the close of the fifteenth century they were almost extinct ; and early in the sixteenth century they were finally overthrown.[337]

la partie musulmane de ses habitants : ce fut alors, enfin, que commencèrent en Espagne ces concessions de franchises municipales par lesquelles les rois et les seigneurs chrétiens cherchèrent à attirer des populations chrétiennes dans les lieux d'où ils avaient chassé les Musulmans." *Fauriel, Histoire de la Gaule Méridionale*, Paris, 1836, vol. iii. p. 215. See also *Sempere, Monarchie Espagnole*, vol. ii. pp. 256, 257. [In similar ways were granted many municipal charters in England. Kings gave them in order to win support against the nobles. Cp. Adam Smith, *Wealth of Nations*, B. iii. ch. 3.—Ed.]

[335] On the increasing confidence of the Spaniards in the middle of the fourteenth century, see an interesting passage in *Mariana, Historia de España*, vol. iv. pp. 172, 173.

[336] The deputies of the towns did in fact eventually overthrow their own liberties, as a Spanish historian truly remarks. " Il n'est pas étonnant que les Monarques espagnols tâchassent d'affermir leur autorité autant que possible, et encore moins que leurs conseillers et leurs ministres coopérassent à leurs desseins. L'histoire de toutes les nations nous offre de nombreux exemples de cette politique ; mais *ce qu'il y a de plus remarquable dans celle d'Espagne, c'est que les députés des villes qui auraient dû être les plus zélés défenseurs de leurs droits, conspirèrent ouvertement contre le tiers-état*, et tentèrent d'anéantir les restes de l'ancienne représentation nationale." *Sempere, Histoire des Cortès d'Espagne*, p. 213. It strikes one as singular that M. Sempere should never have inquired why this happened in Spain, and not elsewhere. A later writer, reflecting on the destruction of the municipal element by the royal authority, gives a solution which, like many other so-called solutions, is merely a statement of the same fact in different words. " Al fin la autoridad real logró alcanzar un gran predominio en el gobierno municipal de los pueblos, *porque* los corregidores y alcaldes mayores llegaron á eclipsar la influencia de los adelantados y alcaldes elegidos por los pueblos." *Antequera, Historia de la Legislacion Española*, Madrid, 1849, p. 287. This, instead of explaining the event, is simply narrating it afresh. [The phrase " on the first opportunity " is confuted in the sentence which follows. See U. R. Burke's *History of Spain*, Hume's ed. i. 372–3, for an account of the process of decay. First the commons helped to put down the nobles ; then king and nobles put down the commons. But in the great revolt at the beginning of the reign of Charles V. the deputies who had truckled to him were hanged by their enraged constituents. Burke, ed. cited, ii. 291.—Ed.]

[337] The final destruction of popular liberty is ascribed by many writers to the battle of Villalar, in 1521 ; though it is quite certain that, if the royalists had lost that battle instead of gaining it, the ultimate result would have been the same. At one time I had purposed tracing the history of the municipal and representative elements during the fifteenth century ; and the materials which I then collected convinced me that the spirit of freedom never really existed in Spain, and that therefore the marks and forms of freedom were sure, sooner or later, to be effaced. [This summary solution is quite indefensible. It amounts to saying that the spirit of freedom has never existed where freedom is suppressed—an argument in a circle. The parliamentary liberties of England were often in great jeopardy up to the fifteenth century. See refs. in the editor's *Intro-*

It is thus that general causes eventually triumph over every obstacle. In the average of affairs, and on a comparison of long periods, they are irresistible. Their operation is often attacked, and occasionally, for a little time, stopped by politicians, who are always ready with their empirical and short-sighted remedies. But when the spirit of the age is against those remedies they can at best only succeed for a moment ; and after that moment has passed, a reaction sets in, and the penalty for violence has to be paid. Evidence of this will be found in the annals of every civilized country by whoever will confront the history of legislation with the history of opinion. The fate of the Spanish towns has afforded us one good proof ; the fate of the Spanish Church will supply us with another. For more than eighty years after the death of Charles II. the rulers of Spain attempted to weaken the ecclesiastical power * ; and the end of all their efforts was that even such an insignificant and incompetent king as Charles IV. was able, with the greatest ease, rapidly to undo what they had done. This is because, during the eighteenth century, while the clergy were assailed by law, they were favoured by opinion. The opinions of a people invariably depend on large general causes, which influence the whole country ; but their laws are too often the work of a few powerful individuals, in opposition to the national will.† When the legislators die or lose office, there is always a chance of their successors holding opposite views, and subverting their plans. In the midst, however, of this play and fluctuation of political life, the general causes remain steady, though they are often kept out of sight, and do not become visible until politicians, inclining to their side, bring them to the surface, and invest them with open and public authority.

This is what Charles IV. did in Spain ; and when he took measures to favour the Church, and to discourage free inquiry, he merely sanctioned those national habits which his predecessors had disregarded. The hold which the hierarchy of that country possess over public opinion has always been proverbial ; but it is even greater than is commonly supposed. What it was in the seventeenth century we have already seen ; and in the eighteenth century there were no signs of its diminution, except among a few bold men, who could effect nothing while the popular voice was so strong against them. Early in the reign of Philip V., Labat, who travelled in Spain, informs us that when a priest performed mass, nobles of the highest rank deemed it an honour to help him to dress, and that they would go down on their knees to him, and kiss his hands.[338] When this was

duction to English Politics, pp. 403, 409–10, 415. Broadly speaking, Castile succumbed to despotism after the suppression of the revolt of the communes in 1521 as France did after the suppression of the Fronde, and as England would have done after the reformation had Charles II. and James II. governed with the prudence of Charles V. and Louis XIV. As already noted, Buckle cannot have had the present problem before him when he wrote his account of the earlier political evolution of Spain.—Ed.]

[338] " Ceux qui servent la Messe en Espagne, soit Religieux, ou Seculiers, ne manquent jamais d'aider le Prêtre à s'habiller, et le font avec beaucoup de respect. Les plus grands Seigneurs s'en font honneur, et à mesure qu'ils présentent au Prêtre quelque partie des ornemens, ils lui baisent la main. On se met à genoux pour donner à laver au Prêtre pendant la Messe, et après qu'il a essuyé ses doigts, celui qui lui a donné l'eau demeurant à genoux lui présente le bassin retourné, sur lequel le Prêtre met sa main pour la lui laisser baiser. Au retour à la Sacristie, il ne manque pas d'aider le Prêtre à se déshabiller, après quoi il se met à genoux pour recevoir sa bénédiction, et baiser sa main." *Labat, Voyages en Espagne et en Italie*, Paris, 1730, vol. i. p. 36.

[* Not till Charles III., however, was popular education thought of—the one thing needful.—Ed.]

[† Precisely of this character were the laws which first set up the Inquisition under Ferdinand and Isabella. It was these laws, proximately, which wrought the growth of the " opinion " specified in the text. And if the successors of these monarchs, or of Charles V., had chanced to hold opposite views, Spanish history might have gone very differently.—Ed.]

done by the proudest aristocracy in Europe, we may suppose what the general feeling must have been. Indeed, Labat assures us that a Spaniard would hardly be considered of sound faith if he did not leave some portion of his property to the Church ; so completely had respect for the hierarchy become an essential part of the national character.[339]

A still more curious instance was exhibited on the occasion of the expulsion of the Jesuits. That once useful but now troublesome body was during the eighteenth century what it is in the nineteenth—the obstinate enemy of progress and of toleration. The rulers of Spain, observing that it opposed all their schemes of reform, resolved to get rid of an obstacle which met them at every turn. In France, the Jesuits had just been treated as a public nuisance, and suppressed at a blow, and without difficulty. The advisers of Charles III. saw no reason why so salutary a measure should not be imitated in their country ; and in 1767 they, following the example which had been set by the French in 1764, abolished this great mainstay of the Church.[340] Having done this, the government supposed that it had taken a decisive step towards weakening ecclesiastical power, particularly as the sovereign cordially approved of the proceeding. The year after this occurred, Charles III., according to his custom, appeared in the balcony of the palace, on the festival of Saint Charles, ready to grant any request which the people might make to him, and which usually consisted of a prayer for the dismissal of a minister, or for the repeal of a tax. On this occasion, however, the citizens of Madrid, instead of occupying themselves with such worldly matters, felt that still dearer interests were in peril ; and to the surprise and terror of the court they demanded with one voice that the Jesuits should be allowed to return and wear their usual dress, in order that Spain might be gladdened by the sight of these holy men.[341]

What can you do with a nation like this ? What is the use of laws when the current of public opinion thus sets in against them ? In the face of such

[339] " Telle est la coûtume du Païs, on s'exposeroit à laisser douter de sa foi, et passer au moins pour Maran, ou Chrétien nouveau, si on ne laissoit pas le tiers de ses biens mobiliers à l'Eglise." *Labat, Voyages en Espagne,* vol. i. p. 268.

[340] It was the opinion of the Pope that Charles by this act had endangered his own soul. " Dans un bref adressé à Charles III, il déclara : ' Que les actes du Roi contre es Jésuites mettaient évidemment son salut en danger.' " *Crétineau-Joly, Histoire de la Compagnie de Jésus,* Paris, 1845, vol. v. p. 302.

[341] As this circumstance, which is noticed by Crétineau-Joly (*Histoire de la Compagnie de Jésus,* vol. v. p. 311) and other writers (*Dunham's History of Spain,* vol. v. p. 180), has been much misrepresented, and has even been doubted by one author, I will transcribe the statement of Coxe, whose information respecting the reign of Charles III. was derived from eye-witnesses. " A remarkable and alarming proof of their influence was given at Madrid, the year after their expulsion. At the festival of St. Charles, when the monarch showed himself to the people from the balcony of the palace, and was accustomed to grant their general request ; to the surprise and confusion of the whole Court the voice of the immense multitude, with one accord, demanded the return of the Jesuits, and the permission for them to wear the habit of the secular clergy. This unexpected incident alarmed and mortified the King ; and, after a vigilant inquiry, he thought proper to banish the Cardinal Archbishop of Toledo, and his Grand Vicar, as the secret instigators of this tumultuary petition." *Coxe's Bourbon Kings of Spain,* 2nd edit., London, 1815, vol. iv. pp. 368, 369. The remarks made on this event by M. Rio (*Historia del Reinado de Carlos III.,* Madrid, 1856, vol. ii. pp. 197–199) are not very creditable either to his criticism or to his candour. It is uncritical to doubt the statement of a contemporary, when that statement relates what is probable in itself, and what those who lived nearest to the period never denied. Indeed, so far from denying it, M. Muriel, the learned translator of Coxe's work into Spanish, gave it the sanction of his name. And it is surely, to say the least, very uncandid on the part of M. Rio to impute to Coxe the error of placing this occurrence in 1767, and then proving that, owing to circumstances connected with the Archbishop of Toledo, it could not have happened in that year. For Coxe distinctly asserts that it was in 1768 ; " the year *after* their expulsion."

obstacles the government of Charles III., notwithstanding its good intentions, was powerless. Indeed it was worse than powerless: it did harm; for, by rousing popular sympathy in favour of the Church, it strengthened what it sought to weaken. On that cruel and persecuting Church, stained as it was with every sort of crime, the Spanish nation continued to bestow marks of affection which, instead of being diminished, were increased. Gifts and legacies flowed in freely and from every side; men being willing to beggar themselves and their families in order to swell the general contribution. And to such a height was this carried, that in 1788 Florida Blanca, minister of the crown, stated that within the last fifty years the ecclesiastical revenues had increased so rapidly that many of them had doubled in value.[342]

Even the Inquisition, the most barbarous institution which the wit of man has ever devised, was upheld by public opinion against the attacks of the crown. The Spanish government wished to overthrow it, and did everything to weaken it; but the Spanish people loved it as of old, and cherished it as their best protection against the inroads of heresy.[343] An illustration of this was exhibited in 1778, when, on occasion of a heretic being sentenced by the Inquisition, several of the leading nobles attended as servants, being glad to have an opportunity of publicly displaying their obedience and docility to the Church.[344]

All these things were natural and in order. They were the result of a long train of causes, the operation of which I have endeavoured to trace, during thirteen centuries, since the outbreak of the Arian war. Those causes forced the Spaniards to be superstitious, and it was idle mockery to seek to change their nature by legislation. The only remedy for superstition is knowledge. Nothing else can wipe out that plague spot of the human mind. Without it, the leper remains unwashed, and the slave unfreed. It is to a knowledge of

[342] See the statement of Florida Blanca, in Appendix I. to *Coxe's Bourbon Kings of Spain*, vol. v. p. 282. Another Spaniard, the Prince of the Peace, says that at the accession of Charles IV. in 1788 "the cloisters were encumbered with an ever-increasing number of monks of all orders and of all ages." *Godoy's Memoirs*, edit. London, 1836, vol. i. p. 126. See also, on the state of ecclesiastical establishments in the same year, some interesting remarks in the Letters of Cabarrus; "con qué horrible desproporcion superabundan los individuos estériles á los operarios útiles y preciosos." *Cartas escritas por el Conde de Cabarrus*, Madrid, 1813, p. 133.

[343] Of it, a celebrated writer in the reign of Philip V. boastfully says, "Su exacta vigilancia comprehende igualmente á Naturales y Estrangeros." *Uztariz, Theorica y Practica de Comercio*, tercera impression, Madrid, 1757, folio, p. 27. When such a man as Uztariz could pen a sentence like this, we may imagine what was felt by the people, who were far more ignorant than he, and far more orthodox. M. Tapia, in a remarkable and unusually bold passage, frankly admits that it was the pressure of public opinion which prevented Charles III. from abolishing the Inquisition. "Estraño pareceria que habiéndose hecho tanto en aquel reinado para limitar el poder escesivo del clero, y acabar con absurdas preocupaciones, no se suprimiese el monstruoso tribunal de la inquisicion; pero es necesario tener presente quel el rey despues del motin de Madrid procedia con timidez en toda providencia que pudiese contrariar la opinion pública: y él creia que los españoles querian la inquisicion, como se lo manifestó al ministro Roda y al conde de Aranda, añadiendo que en nada coartaba su autoridad." *Tapia, Civilizacion Española*, vol. iv. p. 98, Madrid, 1840. To us the Inquisition seems rather a singular object for men to set their affections on; but of the existence of the passion there can be no doubt. "L'Inquisition si révérée en Espagne." *Mémoires de Louville*, vol. i. p. 36. And Geddes (*Tracts*, London, 1730, vol. i. p. 400) tells us that "the Inquisition is not only established by law, but by a wonderful fascination is so fixed in the hearts and affections of the people, that one that should offer the least affront to another for having been an informer or witness in the Inquisition would be torn in a thousand pieces."

[344] "The familiars of the Inquisition, Abrantes, Mora, and others, grandees of Spain, attended as servants, without hats or swords." *Coxe's Bourbon Kings of Spain*, vol. iv. pp. 418, 419. This was in the great case of Olavide.

the laws and relations of things that European civilization is owing; but it is precisely this in which Spain has always been deficient. And until that deficiency is remedied, until science, with her bold and inquisitive spirit, has established her right to investigate all subjects, after her own fashion, and according to her own method, we may be assured that in Spain neither literature, nor universities, nor legislators, nor reformers of any kind, will ever be able to rescue the people from that helpless and benighted condition into which the course of affairs has plunged them.*

That no great political improvement, however plausible or attractive it may appear, can be productive of lasting benefit unless it is preceded by a change in public opinion, and that every change of public opinion is preceded by changes in knowledge, are propositions which all history verifies, but which are particularly obvious in the history of Spain. The Spaniards have had everything except knowledge. They have had immense wealth, and fertile and well-peopled territories, in all parts of the globe. Their own country, washed by the Atlantic and the Mediterranean, and possessed of excellent harbours, is admirably situated for the purposes of trade between Europe and America, being so placed as to command the commerce of both hemispheres.[345] They had, at a very early period, ample municipal privileges; they had independent parliaments; they had the right of choosing their own magistrates, and managing their own cities. They have had rich and flourishing towns, abundant manufactures, and skilful artizans, whose choice productions could secure a ready sale in every market in the world. They have cultivated the fine arts with eminent success; their noble and exquisite paintings, and their magnificent churches, being justly ranked among the most wonderful efforts of the human hand. They speak a beautiful, sonorous, and flexible language, and their literature is not unworthy of their language. Their soil yields treasures of every kind. It overflows with wine and oil, and produces the choicest fruits in an almost tropical exuberance.[346] It contains the most valuable minerals, in a profuse variety unexampled in any other part of Europe. Nowhere else do we find such rare and costly marbles, so easily accessible, and in such close communication with the sea, where they might safely be shipped, and sent to countries which require them.[347] As to the metals, there is hardly one which Spain does not possess in large quantities. Her mines of silver and of quicksilver are well known. She abounds in copper,[348] and her supply

[345] An accomplished modern geographer says: "From the extent of its coast-line, its numerous ports, its geographical position, and natural products, Spain possesses greater commercial advantages than any other country of Europe." *Johnston's Dictionary of Physical, Statistical, and Historical Geography*, London, 1850, p. 1213.

[346] "No quiero hablar de los frutos de España, no obstante que los produzca tan exquisitos de todas especies. Solo diré que sus naranjas dulces las traxeron de la China los Portugueses, y que de Portugal se ha difundido su planta por lo restante de Europa. En fin, España es celebrada entre otras cosas por sus limones, por la fragancia de sus cidras, por sus limas dulces, por sus granadas, por sus azeytunas, que merecieron ser alabadas hasta del gran Ciceron, y sus almendras, sus higos, sus uvas, etc." *Bowles, Historia Natural de España*, Madrid, 1789, 4to, p. 236.

[347] "The marbles of Spain are in greater variety and beauty than those of any country in Europe, and most valuable kinds of them are in situations of easy access and communication with the sea; but they have long been entirely neglected, the greater part being unknown, even to the more intelligent of the natives." *Cook's Spain*, London, 1834, vol. ii. p. 51. In the Cabinet of Natural History at Madrid, "the specimens of marbles are splendid, and show what treasures yet remain buried in the Peninsula." *Ford's Spain*, London, 1847, p. 413.

[348] "Hay infinitas minas de cobre en España las quales nunca se han tocado." *Bowles, Historia Natural de España*, Discurso Preliminar, p. 34.

[* Buckle here appears to say that until Spaniards are educated they cannot be educated. The rational proposition is that education must come gradually.—Ed.]

of lead is enormous.[349] Iron and coal, the two most useful of all the productions of the inorganic world,[350] are also abundant in that highly favoured country. Iron is said to exist in every part of Spain, and to be of the best quality;[351] while the coal-mines of Asturias are described as inexhaustible.[352] In short, nature has been so prodigal of her bounty, that it has been observed, with hardly an hyperbole, that the Spanish nation possesses within itself nearly every natural production which can satisfy either the necessity or the curiosity of mankind.[353]

These are splendid gifts; it is for the historian to tell how they have been used. Certainly the people who possess them have never been deficient in natural endowments. They have had their full share of great statesmen, great kings, great magistrates, and great legislators. They have had many able and vigorous rulers; and their history is ennobled by the frequent appearance of courageous and disinterested patriots, who have sacrificed their all that they might help their country. The bravery of the people has never been disputed; while, as to the upper classes, the punctilious honour of a Spanish gentleman has passed into a bye-word, and circulated through the world. Of the nation generally, the best observers pronounce them to be high-minded, generous, truthful, full of integrity, warm and zealous friends, affectionate in all the private relations of life, frank, charitable, and humane.[354] Their sincerity in religious matters is unquestionable;[355] they

[349] In 1832, Cook writes, "The lead-mines of the Sierra de Gador are in a state of repletion at present from the enormous quantity of the mineral, and the facility of raising it." . . . "Lead abounds in other parts of the same chain, nearer to Almeria." *Cook's Spain*, vol. ii. p. 75. "The most valuable of the existing Spanish mines are those of lead in Granada; and the supplies obtained from them during the last twenty years have been so large that they have occasioned the abandonment of several less productive mines in other countries, and a considerable fall in the price of lead." *M'Culloch's Geographical and Statistical Dictionary*, London, 1849, vol. ii. p. 705.

[350] I use the popular language in referring coal to the inorganic world, despite its cellular tissue and vegetable origin.

[351] "The most valuable of the whole mineral riches of Spain will be in all probability, in a few years, the iron, which is found everywhere, and of the best qualities." *Cook's Spain*, vol. ii. p. 78. See also *Bowles, Historia Natural de España*, pp. 56, 67, 106, 273, 346, 415, and *Ford's Spain*, pp. 565, 618.

[352] "The quantity is inexhaustible, the quality excellent, the working of extraordinary facility, and they possess an easy communication with the sea; yet they are practically useless, and afford only a miserable existence to a few labourers and mules used in conveying the mineral to Gijon." *Cook's Spain*, vol. ii. pp. 79, 80. "In the immediate neighbourhood of Oviedo are some of the largest coal-fields in Europe." *Ford's Spain*, p. 381; compare pp. 392, 606.

[353] "La nacion española posee casi quantas producciones naturales puede apetecer la necesidad, ó curiosidad de los hombres." *Campomanes, Apéndice á la Educacion Popular*, vol. iv. p. vi., Madrid, 1777.

[354] "Ils sont fort charitables, tant à cause du mérite que l'on s'acquiert par les aumônes, que par l'inclination naturelle qu'ils ont à donner, et la peine effective qu'ils souffirent lorsqu'ils sont obligés, soit par leur pauvreté, soit par quelqu'autre raison, de refuser ce qu'on leur demande. Ils ont encore la bonne qualité de ne point abandonner leurs amis pendant qu'ils sont malades." . . . "De manière que des personnes qui ne se voyent point quatre fois en un an, se voyent tous les jours deux ou trois fois, dès qu'ils souffrent." *D'Aulnoy, Relation du Voyage d'Espagne*, Lyon, 1693, vol. ii. p. 374. "They are grave, temperate, and sober; firm and warm in their friendships, though cautious and slow in contracting them." *A Tour through Spain by Udal ap Rhys*, second edition, London, 1760, p. 3. "When they have once professed it, none are more faithful friends." . . . "They have great probity and integrity of principle." *Clarke's Letters concerning the Spanish Nation*, London, 1763, 4to, p. 334. "To express all that I feel, on the recollection of their goodness, would appear like adulation; but I may venture at least to say that simplicity, sincerity, generosity, a high sense of

are moreover eminently temperate and frugal.[356] Yet, all these great qualities have availed them nothing, and will avail them nothing so long as they remain ignorant. What the end of all this will be, and whether in their unhappy country the right path will ever be taken, is impossible for any one to say.[357] But if it is not taken, no amelioration which can possibly be effected will penetrate below the surface. The sole course is to weaken the superstition of the people; and this can only be done by that march of physical science which, familiarizing men with conceptions of order and of regularity, gradually encroaches on the old notions of perturbation, of prodigy, and of miracle, and by this means accustoms the mind to explain the vicissitudes of affairs by natural considerations, instead of, as heretofore, by those which are purely supernatural.*

dignity, and strong principles of honour, are the most prominent and striking features of the Spanish character." *Townsend's Journey through Spain*, second edition, London, 1792, vol. iii. p. 353. "The Spaniards, though naturally deep and artful politicians, have still something so nobly frank and honest in their disposition." *Letters from Spain by an English Officer*, London, 1788, vol. ii. p. 171. "The Spaniards have fewer bad qualities than any other people that I have had the opportunity to know." *Croker's Travels through Spain*, London, 1799, pp. 237, 238. "Spanish probity is proverbial, and it conspicuously shines in commercial relations." *Laborde's Spain*, London, 1809, vol. iv. p. 423. "Certainly, if it be taken in the mass, no people are more humane than the Spaniards, or more compassionate and kind in their feelings to others. They probably excel other nations, rather than fall below them, in this respect." *Cook's Spain*, London, 1834, vol. i. p. 189. "The Spaniards are kind-hearted in all the relations of life." *Hoskins' Spain*, London, 1851, vol. ii. p. 58. Finally, I will adduce the testimony of two professional politicians, both of whom were well acquainted with the Spaniards. In 1770 Mr. Harris, afterwards Lord Malmesbury, writes, "They are brave, honest, and generous." *Diaries and Correspondence of the Earl of Malmesbury*, London, 1844, vol. i. p. 48. And Lord Holland, according to Moore, deemed "that the Spaniards altogether are amongst the best people of Europe." *Moore's Memoirs, edited by Lord John Russell*, vol. iii. p. 253, London, 1853.

[355] This their whole history decisively proves; and as to their more recent state, the author of *Revelations of Spain in* 1845, vol. i. p. 340, says: "But religion is so deeply rooted in the national character, that the most furious political storms, which prostrate everything else, blow over this and leave it unscathed. It is only amongst the educated male population that any lack of fervour is witnessed."

[356] "The habitual temperance of these people is really astonishing: I never saw a Spaniard drink a second glass of wine. With the lower order of people, a piece of bread with an apple, an onion, or pomegranate, is their usual repast." *Croker's Travels in Spain*, London, 1799, p. 116. "They are temperate, or rather abstemious, in their living to a great degree: *borracho* is the highest term of reproach; and it is rare to see a drunken man, except it be among the carriers or muleteers." *Dalrymple's Travels through Spain*, London, 1777, 4to, p. 174. "Drunkenness is a vice almost unknown in Spain among people of a respectable class, and very uncommon even among the lower orders." Esménard's note in *Godoy's Memoirs*, London, 1836, vol. ii. p. 321.

[357] "This is the most wonderful country under the sun; for here intellect wields no power." *Inglis' Spain*, London, 1831, vol. i. p. 101. "Tandis que l'activité publique, en Espagne, se porte depuis quelques années dans la sphère des intérêts pratiques et matériels, il semble, au contraire, qu'il y ait une sorte de ralentissement dans la vie intellectuelle." *Annuaire des Deux Mondes for* 1850, p. 410. "La vie intellectuelle n'est point malheureusement la sphère où se manifeste le plus d'activité en Espagne." *Ibid. for* 1856–1857, p. 356. Now, listen to the practical consequences of not giving free and fearless scope to the intellect. "It is singular, upon landing in the Peninsula, and making a short excursion for a few miles in any direction, to see reproduced the

[* Buckle would probably not have disputed, on challenge, that a knowledge of historical (including anthropological) science would avail for much, as well as that of physical science.—Ed.]

To this, in the most advanced countries of Europe, everything has been tending for nearly three centuries. But in Spain, unfortunately, education has always remained, and still remains, in the hands of the clergy, who steadily oppose that progress of knowledge which they are well aware would be fatal to their own power.[358] The people, therefore, resting ignorant, and the causes which kept them in ignorance continuing, it avails the country nothing that, from time to time, enlightened rulers have come forward, and liberal measures been adopted. The Spanish reformers have, with rare exceptions, eagerly attacked the Church, whose authority they clearly saw ought to be diminished. But what they did not see is that such diminution can be of no real use unless it is the result of public opinion urging on politicians to the work.* In Spain, politicians took the initiative, and the people lagged behind. Hence, in Spain, what was done at one time was sure to be undone at another. When the liberals were in power, they suppressed the Inquisition; but Ferdinand VII. easily restored it, because, though it had been destroyed by Spanish legislators, its existence was suited to the habits and traditions of the Spanish nation.[359]

manners of England *five centuries back*,—to find yourself thrown into the midst of a society which is a close counterpart of that *extinct semi-civilization* of which no trace is to be found in our history later than the close of the fourteenth century and the reign of Richard the Second." *Revelations of Spain in* 1845 *by an English Resident*, vol. ii. p. 1.

358 "That the Spaniards, as a people, are ignorant, supremely ignorant, it is impossible to dissemble; but this comes from the control of education being altogether in the hands of the clergy, who exert themselves to maintain that ignorance to which they are indebted for their power." *Spain by an American*, vol. ii. p. 360. "The schools in Madrid are all conducted by Jesuits; and the education received in them is such as might be expected from their heads." *Inglis' Spain*, vol. i. p. 156. "Private education here is almost entirely in the hands of the clergy." *Revelations of Spain in* 1845, vol. ii. p. 27. In Spain, as in all countries, Catholic or Protestant, the clergy, considered as a body, inculcate belief instead of inquiry, and by a sort of conservative instinct discourage that boldness of investigation without which there can be no real knowledge, although there may be much erudition and mere book-learning. In Spain the clergy are stronger than in any other country; therefore in Spain they display this tendency more fearlessly. A good instance of this may be seen in a work lately published by the Bishop of Barcelona, in which a violent attack upon all physical and philosophical knowledge is concluded in the following terms: "No intento recriminar á ningun católico de los que se asocian al nuevo sistema de filosofar y de extender indefinidamente el imperio de esta ciencia, pero deseo que fijen toda su atencion en los puntos que no haré sino indicar. Primero, que las escuelas de Holanda, Alemania, Inglaterra y Francia desafectas al Catolicismo, han iniciado y promovido con el mayor empeño ciertas discusiones filosóficas, presentándolas como un triunfo de la razon sobre la Religion, de la filosofía sobre la teología, del materialismo sobre el espiritualismo. Segundo, que sus máximas no son, en gran parte, mas que reproducciones ó nuevas evoluciones de errores mil veces refutados y condenados por la sana filosofía y por la Iglesia; bajo cuyo concepto no tienen por qué felicitarse en razon de su progreso, sino mas bien avergonzarse por su retroceso." *Costa y Borras. Iglesia en España*, Barcelona, 1857, p. 150.

359 "Immediately after his arrival in Madrid, Ferdinand re-established the Inquisition; and his decree for that purpose was hailed throughout all Spain with illuminations, thanksgivings, and other rejoicings." *Quin's Memoirs of Ferdinand VII.*, London, 1824, pp. 189, 190. This and similar acts gave such delight to the Church as well as to the people that, according to a great divine, the return of Ferdinand to Spain is to

[* This is one of too many passages in which Buckle lapses into something like fatalism. If the reformers are to wait till "public opinion" advances, there can be no advance whatever. Somebody must begin, and the beginner is a "reformer." The history of the Anti-Corn Law League in England gives the object lesson. The League had to *create* public opinion.—ED.]

Fresh changes occurring, this odious tribunal was in 1820 again abolished. Still, though its form is gone, its spirit lives.[360] The name, the body, and the visible appearance of the Inquisition are no more; but the spirit which generated the Inquisition is enshrined in the hearts of the people, and on slight provocation would burst forth and reinstate an institution which is the effect, far more than the cause, of the intolerant bigotry of the Spanish nation.

In the same way, other and more systematic attacks which were made on the Church during the present century succeeded at first, but were sure to be eventually baffled.[361] Under Joseph, in 1809, the monastic orders were suppressed, and their property was confiscated.[362] Little, however, did Spain gain by this. The nation was on their side; [363] and as soon as the storm passed away, they were restored. In 1836 there was another political movement, and the liberals being at the head of affairs, Mendizabal secularized all the Church property, and deprived the clergy of nearly the whole of their enormous and ill-gotten wealth.[364] He did not know how foolish it is to attack an institution, unless you can first lessen its influence. Overrating the power of legislation, he underrated the power of opinion. This the result clearly showed. Within a very few years the reaction began. In 1845 was enacted what was called the law of devolution, by which the first step was taken towards the re-endowment of the clergy.[365] In 1851 their position was still further improved by the celebrated Concordat, in which the right of acquiring as well

be deemed the immediate act of Divine Providence, watching over the interests of Spain. "La divina Providencia abrevió los dias de prueba, y la católica España respiró ceñida con los laureles del triunfo, recobrando luego á su tan deseado monarca, el señor rey don Fernando VII." *Costa y Borras, Observaciones sobre la Iglesia en España*, Barcelona, 1857, p. 91.

[360] "The spirit of the Inquisition is still alive; for no king, cortes, or constitution, ever permits in Spain any approach to any religious toleration." *Ford's Spain*, London, 1847, p. 60. "Les cortès auraient beau permettre l'exercice du culte protestant ou juif, il n'est point certain que cela ne suscitât de périlleux conflits." *Annuaire des Deux Mondes, ou Histoire Générale des Divers États*, 1854–1855, vol. v. p. 272, Paris, 1855; a work of considerable ability, planned on the same scheme as the *Annual Register*, but far superior to it. Respecting the chance of the Inquisition being again restored, compare two interesting passages in *Spain by an American*, 1831, vol. ii. p. 330, and *Inglis' Spain*, 1831, vol. i. p. 85. Since then the balance of affairs has on the whole been in favour of the Church, which received a further accession of strength by the success of the essentially religious war recently waged against the Moors. Hence, if any fresh political catastrophe were to occur in Spain, I should not be at all surprised to hear that the Inquisition was re-established.

[361] Compare some very sensible remarks in *Bacon's Six Years in Biscay*, London, 1838, pp. 40, 41, 50, with *Quin's Memoirs of Ferdinand the Seventh*, pp. 192, 193.

[362] *Walton's Revolutions of Spain*, London, 1837, vol. ii. p. 343.

[363] Very shortly before the suppression of the monastic orders, "Le respect pour le froc en général est poussé si loin, qu'on lui attribue une vertue préservative, même au-delà de la vie, quelque peu régulière qu'elle ait été. Aussi n'y a-t-il rien de si commun que de voir les morts ensevelis en robe de moines, et conduits ainsi à leur dernière demeure à visage découvert." . . . "De même que le froc accompagne les Espagnols au tombeau, de même il en saisit quelques-uns au sortir du berceau. Il n'est pas rare de rencontrer de petits moines de quatre à cinq ans polissonnant dans la rue." *Bourgoing, Tableau de l'Espagne*, Paris, 1808, vol. ii. pp. 330, 331.

[364] The confiscation took place at different periods between 1835 and 1841. Compare *Ford's Spain*, p. 48. *Revelations of Spain by an English Resident*, vol. i. p. 366. *Costa y Borras, Iglesia en España*, p. 95. *Annuaire des Deux Mondes for* 1850, Paris, 1851, p. 369. I have sought in vain for any detailed history of these transactions.

[365] "Dès 1845, une loi dite de *dévolution*, en attendant un règlement définitif, applique à la dotation du clergé une portion des biens ecclésiastiques non vendus." *Annuaire des Deux Mondes*, 1851–2, Paris, 1852, p. 318.

as of possessing was solemnly confirmed to them.[366] With all this the nation heartily concurred.[367] Such, however, was the madness of the liberal party that only four years afterwards, when they for a moment obtained power, they forcibly annulled these arrangements, and revoked concessions which had been made to the Church, and which, unhappily for Spain, public opinion had ratified.[368] The results might have been easily foreseen. In Aragon and in other parts of Spain the people flew to arms ; a Carlist insurrection broke out, and a cry ran through the country that religion was in danger. [369] It is impossible to benefit such a nation as this.* The reformers were of course overthrown, and by the autumn of 1856 their party was broken up. The political reaction now began, and advanced so rapidly that by the spring of 1857 the policy of the two preceding years was completely reversed. Those who idly thought that they could regenerate their country by laws, saw all their hopes confounded. A ministry was formed whose measures were more in accordance with the national mind. In May, 1857, Cortes assembled. The representatives of the people sanctioned the proceedings of the executive government, and by their united authority the worst provisions of the Concordat of 1851 were amply confirmed, the sale of Church property was forbidden, and all the limitations which had been set to the power of the bishops were at once removed.[370]

The reader will now be able to understand the real nature of Spanish civilization. He will see how, under the high-sounding names of loyalty and religion, lurk the deadly evils which those names have always concealed, but which it is the business of the historian to drag to light and expose. A blind spirit of reverence, taking the form of an unworthy and ignominious submission to the Crown and the Church, is the capital and essential vice of the Spanish people. It is their sole national vice, and it has sufficed to ruin them. From it all nations have grievously suffered, and many still suffer. But nowhere in

[366] " Il y a ici un règlement solennel, sous la forme d'un traité, de toutes les affaires relatives à l'église ; c'est le concordat de 1851. Le concordat reconnaît à l'église le droit d'acquérir et de posséder." *Ibid.*, 1854, 1855, p. 273, Paris, 1855.

[367] The very year in which the Concordat became law, Mr. Hoskins, the well-known traveller in Africa, a gentleman evidently of considerable intelligence, published, on his return from Spain, an account of that country. His work is valuable as showing the state of public feeling just before the Concordat, and while the Spanish clergy were still suffering from the well-intentioned but grossly injudicious acts of the liberal party. " We visited these churches on a Sunday, and were surprised to find them all crowded to excess. The incomes of the clergy are greatly reduced, but their fortunes are gradually reviving." *Hoskins' Spain*, London, 1851, vol. i. p. 25. " The priests are slowly re-establishing their power in Spain." vol. ii. p. 201. " The crowded churches, and, notwithstanding the appropriation of their revenues, the absence of all appearance of anything like poverty in the chapels and services, prove that the Spaniards are now as devout worshippers, and as zealous friends of the Church, as they were in her palmy days." vol. ii. p. 281.

[368] " La loi de désamortissement promulguée le 1er mai, 1855, ordonne, comme on sait, la mise en vente de tous les biens de main-morte, et en particulier des biens qui restent encore à l'église." *Annuaire des Deux Mondes*, 1855, 1856, p. 310. See also *Annuaire*, 1854, 1855, p. 274. For an account of other steps taken against the Church in the spring and summer of 1855, see *Costa y Borras, Observaciones sobre la Iglesia en España*, Barcelona, 1857, pp. 119, 286, 292 ; and respecting the law of the 1st of May, see p. 247.

[369] " Aussi le premier mot d'ordre de l'insurrection a été la défense de la religion." *Annuaire des Deux Mondes*, 1854, 1855, p. 275.

[370] *Annuaire des Deux Mondes*, 1856, 1857, pp. 315–317, 324–331, 336.

[* Here again the proposition lapses into fatalism. The Spanish people have fought for their Church as did the English under Henry VIII. and Edward VI., and as did the Vendeans in revolutionary France. But each struggle weakens the power of the Church, as the preceding note shows.—Ed.]

Europe has this principle been so long supreme as in Spain. Therefore, nowhere else in Europe are the consequences so manifest and so fatal. The idea of liberty is extinct, if, indeed, in the true sense of the word, it ever can be said to have existed. Outbreaks, no doubt, there have been, and will be; but they are bursts of lawlessness, rather than of liberty.* In the most civilized countries the tendency always is to obey even unjust laws, but while obeying them to insist on their repeal. This is because we perceive that it is better to remove grievances than to resist them. While we submit to the particular hardship, we assail the system from which the hardship flows. For a nation to take this view requires a certain reach of mind which in the darker periods of European history was unattainable. Hence we find that in the Middle Ages, though tumults were incessant, rebellions were rare. But since the sixteenth century, local insurrections, provoked by immediate injustice, are diminishing, and are being superseded by revolutions which strike at once at the source from whence the injustice proceeds. There can be no doubt that this change is beneficial; partly because it is always good to rise from effects to causes, and partly because, revolutions being less frequent than insurrections, the peace of society would be more rarely disturbed if men confined themselves entirely to the larger remedy. At the same time, insurrections are generally wrong; revolutions are always right. An insurrection is too often the mad and passionate effort of ignorant persons who are impatient under some immediate injury, and never stop to investigate its remote and general causes. But a revolution, when it is the work of the nation itself, is a splendid and imposing spectacle, because to the moral quality of indignation produced by the presence of evil it adds the intellectual qualities of foresight and combination; and, uniting in the same act some of the highest properties of our nature, it achieves a double purpose, not only punishing the oppressor but also relieving the oppressed.

In Spain, however, there never has been a revolution, properly so called; there never has even been one grand national rebellion. The people, though often lawless, are never free. Among them we find still preserved that peculiar taint of barbarism which makes men prefer occasional disobedience to systematic liberty. Certain feelings there are of our common nature which even their slavish loyalty cannot eradicate, and which, from time to time, urge them to resist injustice. Such instincts are happily the inalienable lot of humanity, which we cannot forfeit if we would, and which are too often the last resource against the extravagances of tyranny. And this is all that Spain now possesses. The Spaniards, therefore, resist, not because they are Spaniards, but because they are men. Still, even while they resist, they revere. While they will rise up against a vexatious impost, they crouch before a system of which the impost is the smallest evil. They smite the tax-gatherer, but fall prostrate at the feet of the contemptible prince for whom the tax-gatherer plies his craft. They will even revile the troublesome and importunate monk, or sometimes they will scoff at the sleek and arrogant priest; while such is their infatuation that they would risk their lives in defence of that cruel Church which has inflicted on them hideous calamities, but to which they still cling as if it were the dearest object of their affections.†

[* The same could more justly be said of the beginnings of the revolt of the Netherlands against Spain. Cp. Motley, *Rise of the Dutch Republic*, 1-vol. ed. 1863, pp. 462–7, 506, 527, 829; Prescott, *Hist. of Philip* II., Kirk's ed. 1894, pp. 249, 264–8, 335.—Ed.]

[† A few years after Buckle wrote, these words were disproved by the revolutions of 1868 and 1873, which proved that among the Spanish reformers were many republicans, and not a few freethinkers. In the past thirty years their numbers have been constantly growing. The whole of the concluding paragraph is thus an over-statement. The account of Spain as a homogeneous entity is substantially wrong. The priests are steadily losing power; and since the loss of Cuba and the Philippines the reform movement gains ground more rapidly than ever. Buckle failed to recognise the full value of time in evolution.—Ed.]

Connected with these habits of mind, and in sooth forming part of them, we find a reverence for antiquity, and an inordinate tenacity of old opinions, old beliefs, and old habits, which remind us of those tropical civilizations which formerly flourished. Such prejudices were once universal even in Europe; but they began to die out in the sixteenth century, and are now, comparatively speaking, extinct, except in Spain, where they have always been welcomed. In that country they retain their original force, and produce their natural results. By encouraging the notion that all the truths most important to know are already known, they repress those aspirations, and dull that generous confidence in the future, without which nothing really great can be achieved. A people who regard the past with too wistful an eye will never bestir themselves to help the onward progress; they will hardly believe that progress is possible. To them antiquity is synonymous with wisdom, and every improvement is a dangerous innovation. In this state Europe lingered for many centuries; in this state Spain still lingers. Hence the Spaniards are remarkable for an inertness, a want of buoyancy, and an absence of hope, which in our busy and enterprizing age isolate them from the rest of the civilized world. Believing that little can be done, they are in no hurry to do it. Believing that the knowledge they have inherited is far greater than any they can obtain, they wish to preserve their intellectual possessions whole and unimpaired; inasmuch as the least alteration in them might lessen their value. Content with what has been already bequeathed, they are excluded from that great European movement which first, clearly perceptible in the sixteenth century, has ever since been steadily advancing, unsettling old opinions, destroying old follies, reforming and improving on every side, influencing even such barbarous countries as Russia and Turkey; but leaving Spain unscathed. While the human intellect has been making the most prodigious and unheard-of strides, while discoveries in every quarter are simultaneously pressing upon us, and coming in such rapid and bewildering succession that the strongest sight, dazzled by the glare of their splendour, is unable to contemplate them as a whole; while other discoveries still more important, and still more remote from ordinary experience, are manifestly approaching, and may be seen looming in the distance, whence they are now obscurely working on the advanced thinkers who are nearest to them, filling their minds with those ill-defined, restless, and almost uneasy feelings which are the invariable harbingers of future triumph; while the veil is being rudely torn, and nature, violated at all points, is forced to disclose her secrets, and reveal her structure, her economy, and her laws, to the indomitable energy of man; while Europe is ringing with the noise of intellectual achievements, with which even despotic governments affect to sympathize, in order that they may divert them from their natural course and use them as new instruments whereby to oppress yet more the liberties of the people; while, amidst this general din and excitement, the public mind, swayed to and fro, is tossed and agitated,—Spain sleeps on, untroubled, unheeding, impassive, receiving no impressions from the rest of the world, and making no impressions upon it. There she lies, at the further extremity of the Continent, a huge and torpid mass, the sole representative now remaining of the feelings and knowledge of the Middle Ages.* And, what is the worst symptom of all, she is satisfied with her own condition. Though she is the most backward country in Europe, she believes herself to be the foremost. She is proud of everything of which she should be ashamed. She is proud of the antiquity of her opinions; proud of her orthodoxy; proud of the strength of her faith; proud of her immeasurable and childish credulity; proud of her unwillingness to amend either her creed or her customs; proud of her hatred of heretics, and proud of the undying vigilance with which she has baffled their efforts to obtain a full and legal establishment on her soil.

All these things conspiring together produce in their aggregate that melancholy exhibition to which we give the collective name of Spain. The history

[* Buckle is here echoing and developing a proposition of Prescott (*Hist. of Philip II.*, Kirk's ed. 1894, p. 181) which however Prescott's editor very properly rejects.—Ed.]

of that single word is the history of nearly every vicissitude of which the human species is capable. It comprises the extremes of strength and of weakness, of unbounded wealth and of abject poverty. It is the history of the mixture of different races, languages, and bloods. It includes almost every political combination which the wit of man can devise ; laws infinite in variety, as well as in number ; constitutions of all kinds, from the most stringent to the most liberal. Democracy, monarchy, government by priests, government by municipalities, government by nobles, government by representative bodies, government by natives, government by foreigners, have been tried, and tried in vain. Material appliances have been lavishly used ; arts, inventions, and machines introduced from abroad, manufactures set up, communications opened, roads made, canals dug, mines worked, harbours formed. In a word, there has been every sort of alteration except alterations of opinion ; there has been every possible change except changes in knowledge. And the result is that in spite of the efforts of successive governments, in spite of the influence of foreign customs, and in spite of those physical ameliorations which just touch the surface of society, but are unable to penetrate beneath, there are no signs of national progress ; the priests are rather gaining ground than losing it ; the slightest attack on the Church rouses the people ; while even the dissoluteness of the clergy, and the odious vices which in the present century have stained the throne, can do naught to lessen either the superstition or the loyalty which the accumulated force of many centuries has graven on the minds, and eaten into the hearts, of the Spanish nation.*

[* Mr. M. A. S. Hume, in his *Modern Spain* (1899, p.551), after practically bearing out all that Buckle has said as to the prematureness of the Spanish reforms in the past century, says : "It may now be safely asserted that during the last thirty years the people themselves have with much painful effort almost reached the level of their present political institutions" ; and in conclusion (p. 563) he pronounces that "absolutism . . . is past revival, and a popular constitutional government, republic or monarchy, is alone possible in Spain, *the most naturally democratic country in Europe.*"—Ed.]

CHAPTER XVI.

Condition of Scotland to the End of the Fourteenth Century.

In the preceding view of the rise and decay of Spain, I have sought to exhibit the successive steps by which what was formerly one of the greatest nations of the earth was broken, and cast down from its high estate. As we look back on that scene, the picture is indeed striking. A country rich in all natural productions, inhabited by a brave, a loyal, and a religious people, removed, too, by its geographical position from the hazards of European revolutions, did by the operation of those general causes which I have indicated, suddenly rise to unparalleled grandeur; and then, without the occurrence of any new combination, but by a mere continuance of the same causes, fall with an equal velocity. Yet these vicissitudes, strange and startling as they appear, were perfectly regular. They were the legitimate consequence of a state of society in which the spirit of protection had reached its highest point, and in which, everything being done for the people, nothing was done by the people. Whenever this happens, there may be great political progress, but there can be no really national progress. There may be accessions of territory, and vast increase of fame and of power. There may be improvements in the practice of administration, in the management of finances, in the organization of armies, in the art and theory of war, in the tricks of diplomacy, and in those various contrivances by which one nation is able to outwit and insult another. So far, however, from this benefiting the people, it will injure them in two different ways. In the first place, by increasing the reputation of the ruling classes, it encourages that blind and servile respect which men are too apt to feel for those who are above them, and which, wherever it has been generally practised, has been found fatal to the highest qualities of the citizen, and therefore to the permanent grandeur of the nation. And, in the second place, it multiplies the resources of the executive government, and thus renders the country unable as well as unwilling to correct the errors of those who are at the head of affairs. Hence, in Spain, as in all countries similarly circumstanced, it was at the very moment when things were most prosperous at the surface that they were most rotten at the foundation.* In presence of the most splendid political success, the nation hastened to its downfall, and the crisis was fast approaching in which, the whole edifice being overturned, nothing would be left except a memorable warning of the consequences which must ensue when the people, giving themselves up to the passions of superstition and loyalty, abdicate their own proper functions, forego their own responsibility, renounce their highest duties, and degrade themselves into passive instruments to serve the will of the Church and the throne.

Such is the great lesson taught by the history of Spain. From the history of Scotland we may gather another lesson, of a different and yet of a similar kind. In Scotland the progress of the nation has been very slow, but on the whole very sure. The country is extremely barren; the executive government has, with rare exceptions, been always weak; and the people have never been burdened with those feelings of loyalty which circumstances had forced upon the Spaniards. Certainly the last charge that will be brought against the Scotch is that of

[* As has been noted above, they were no more prosperous on the surface than anywhere else at the period specified. —Ed.]

superstitious attachment to their princes.[1] We in England have not always been very tender of the persons of our sovereigns, and we have occasionally punished them with what some consider excessive severity. With this we have been frequently taunted by the more loyal nations of the Continent; and in Spain in particular our conduct has excited the greatest abhorrence. But if we compare our history with that of our northern neighbours, we must pronounce ourselves a meek and submissive people.[2] There have been more rebellions in Scotland than in any other country; and the rebellions have been very sanguinary, as well as very numerous. The Scotch have made war upon most of their kings, and put to death many. To mention their treatment of a single dynasty, they * murdered James I. and James III. They rebelled against James II. and James VII. They laid hold of James V., and placed him in confinement. Mary they immured in a castle, and afterwards deposed. Her successor, James VI., they imprisoned; they led him captive about the country, and on one occasion attempted his life. Towards Charles I. they showed the greatest animosity, and they were the first to restrain his mad career. Three years before the English ventured to rise against that despotic prince, the Scotch boldly took up arms, and made war on him. The service which they then rendered to the cause of liberty it would be hard to overrate; but the singular part of the transaction was that having afterwards got possession of the person of Charles they sold him to the English for a large sum of money, of which they, being very poor, had pressing need. Such a sale is unparalleled in history; and although the Scotch might have plausibly alleged that this was the only gain they had derived, or ever could derive, from the existence of their hereditary prince, still the event is one which stands alone; it was unprecedented; it has never been imitated; and its occurrence is a striking symptom of the state of public opinion, and of the feelings of the country in which it was permitted.†

[1] One of their own historians complacently says, "but the Scots were seldom distinguished for loyalty." *Laing's History of Scotland*, vol. iii. p. 199, edit. 1819. See also p. 366. To the same effect, Brodie (*History of the British Empire*, Edinburgh, 1822, vol. i. p. 383): "The little respect paid to royalty is conspicuous in every page of Scottish history." Or, as Wilkes expressed himself in the House of Commons, "Scotland seems, indeed, the natural *foyer* of rebellion, as Egypt is of the plague." *Parliamentary History*, vol. xix. p. 810, London, 1814; and Nimmo (*History of Stirlingshire*, Edinburgh, 1777, p. 219): "Never was any race of monarchs more unfortunate than the Scottish. Their reigns were generally turbulent and disastrous, and their own end often tragical."

[2] Indeed, a well-known Scotchman of the seventeenth century scornfully says of the English, "such is the obsequiousness, and almost superstitious devotion of that nation

[* The use of "they" is somewhat indiscriminate. A few malcontents killed James I., and factions of nobles rebelled against his successors. In England there were rebellions against nearly every monarch from Richard II. to William III., and before Richard II. against Edward II., Henry III., John, and so on. The contrast thus breaks down.—ED.]

[† Seeing that the Scots Parliament denounced the execution of Charles I. as a crime, and took up at once the cause of his son, the inference in the text is clearly over-strained. The popular account of the "selling" of Charles, here followed by Buckle, is of course a myth. The Scots had an old-standing and long-admitted claim against the English Parliament, and having got the king they "held the king in pawn for their claim" (Burton, *History of Scotland*, vi. 408). But had there been no arrears due to them, the king would have been given up to the English much sooner. The Scots had offered to support and reinstate the king if he would sign their solemn League and Covenant, even after the English Parliament had threatened to make war on them if the king were not delivered up. Charles however refused to sign, preferring to take his risks in England. It was therefore a matter of course that he should be given up. And it was not by those English commissioners to whom he was surrendered that he was put to death, but by their opponents. Buckle gives a somewhat more accurate though still misleading account below (ch. xviii. at *note* 51); and after writing that should have altered the passage above. —ED.]

While, however, in regard to loyalty, the opposition between Scotland and Spain is complete, there is, strange to say, the most striking similarity between those countries in regard to superstition. Both nations have allowed their clergy to exercise immense sway, and both have submitted their actions, as well as their consciences, to the authority of the Church. As a natural consequence, in both countries intolerance has been and still is a crying evil; and in matters of religion a bigotry is habitually displayed, discreditable indeed to Spain, but far more discreditable to Scotland, which has produced many philosophers of the highest eminence, who would willingly have taught the people better things, but who have vainly attempted to remove from the national mind that serious blemish which mars its beauty, and tends to neutralize its many other admirable qualities.

Herein lies the apparent paradox, and the real difficulty, of Scotch history. That knowledge should not have produced the effects which have elsewhere followed it; that a bold and inquisitive literature should be found in a grossly superstitious country, without diminishing its superstition; that the people should constantly withstand their kings, and as constantly succumb to their clergy; that while they are liberal in politics they should be illiberal in religion; and that, as a natural consequence of all this, men who in the visible and external department of facts and of practical life display a shrewdness and a boldness rarely equalled, should nevertheless in speculative life and in matters of theory, tremble like sheep before their pastors, and yield assent to every absurdity they hear, provided their Church has sanctioned it; that these discrepancies should coexist, seems at first sight a strange contradiction, and is surely a phenomenon worthy of our careful study. To indicate the causes of this anomaly, and to trace the results to which the anomaly has led, will be the business of the remaining part of this volume; and although the investigation will be somewhat lengthy, it will not, I hope, be considered prolix by those who recognize the importance of the inquiry, and are aware how completely it has been neglected, even by those who have written most fully on the history of the Scottish nation

In Scotland as elsewhere, the course of events has been influenced by its physical geography; and by this I mean, not only its own immediate peculiarities, but also its relation to adjoining countries. It is close to Ireland; it touches England; and by the contiguity of the Orkney and Shetland Isles it was eminently exposed to the attacks of that great nation of pirates which for centuries inhabited the Scandinavian peninsula. Considered merely by itself, it is mountainous and sterile; nature has interposed such obstacles that it was long impossible to open regular communications between its different parts, which, indeed, in regard to the Highlands, was not effected till after the middle of the eighteenth century.[3] Finally—and this, as we shall presently see, was a matter

towards their prince." *Baillie's Letters*, vol. i. p. 204, edit. Laing, Edinburgh, 1841. [The same writer fiercely denounced the execution of Charles.—Ed.] This, however, was written in 1639, since which we have effectually wiped off that reproach. On the other hand, an English writer of the seventeenth century indignantly, though with evident exaggeration, imputes to the Scotch that "forty of their kings have been barbarously murdered by them; and half as many more have either made away with themselves, for fear of their torturing of them, or have died miserably in strait imprisonment." *Account of Scotland in* 1670, in *Harleian Miscellany*, vol. vi. p. 140, edit. Park, 4to, 1810. Compare two curious passages in *Shields' Hind Let Loose*, 1687, pp. 8, 9, 15.

[3] In England the travelling was bad enough; in Scotland it was far worse. Morer, stating what he saw in 1689, says, "Stage-coaches they have none; yet there are a few Hackney's at Edinburgh, which they may hire into the country upon urgent occasions. The truth is, the roads will hardly allow 'em those conveniences, which is the reason that their gentry, men and women, chuse rather to use their horses." *Morer's Account of Scotland*, London, 1702, p. 24.

As to the northern parts, we have the following account, written in Inverness, between 1726 and 1730. "The Highlands are but little known even to the inhabitants of the low country of Scotland, for they have ever dreaded the difficulties and dangers of travelling among the mountains; and when some extraordinary occasion has obliged any one of

of great importance, the most fertile land in Scotland is in the south, and was therefore constantly ravaged by the English borderers. Hence the accumulation of wealth was hindered, the growth of towns was discouraged by the serious hazards to which they were liable ; and it was impossible to develop that municipal spirit which might have existed if the districts most favoured by nature had been situated in the north of Scotland, instead of in the south. If the actual state of things had been reversed, so that the Highlands were in the south[4] and the Lowlands in the north, it can hardly be doubted that after the cessation in the thirteenth century of the great Scandinavian invasions the most fertile parts of Scotland, being comparatively secure, would have been the seat of towns which the active spirit of the people would have caused to prosper, and the prosperity of which would have introduced a new element into Scotch affairs, and changed the course of Scotch history. This, however, was not to be ; and, as we have to deal with events as they actually are, I will now endeavour to trace the consequences of the physical peculiarities which have just been noticed ; and by co-ordinating their results I will, so far as I am able, show their general meaning, and the way in which they have shaped the national character.

The earliest fact with which we are acquainted respecting the history of Scotland is the Roman invasion under Agricola, late in the first century. But neither his conquests nor those of his successors made any permanent impression. The country was never really subjugated, and nothing was effected except a military occupation, which, in spite of the erection of numerous forts, walls, and

them to such a progress, he has, generally speaking, made his testament before he set out, as though he were entering upon a long and dangerous sea-voyage, wherein it was very doubtful if he should ever return." *Letters from a Gentleman in the North of Scotland*, edit. London, 1815, vol. i. p. 4. Between 1720 and 1730, military roads were cut through parts of the Highlands, but they were "laid down by a practical soldier, and destined for warlike purposes, with scarcely any view towards the ends for which free and peaceful citizens open up a system of internal transit." *Burton's History of Scotland*, vol. ii. p. 255. See also *Chalmers' Caledonia*, vol. ii. p. 36. This is confirmed by the fact that, even between Inverness and Edinburgh, "until 1755, the mail was conveyed by men on foot." Account of Inverness-shire, in *M'Culloch's British Empire*, London, 1847, vol. i. p. 299 ; to which I may add that in *Anderson's Essay on the Highlands*, Edinburgh, 1827, pp. 119, 120, it is stated that "A postchaise was first seen in Inverness itself in 1760, and was for a considerable time the only four-wheeled carriage in the district." As to the communications in the country about Perth, see *Penny's Traditions of Perth*, pp. 131, 132, Perth, 1836 ; and as to those from Aberdeen to Inverness, and from Aberdeen to Edinburgh, see *Kennedy's Annals of Aberdeen*, vol. ii. pp. 269, 270, London, 4to, 1818.

The history of the improvement of the roads during the latter half of the eighteenth century has never been written ; but it is of the greatest importance for its intellectual results, in causing national fusion, as well as for its economical results, in helping trade. Some idea may be formed of the extraordinary energy displayed by Scotland in this matter, by comparing the following passages : *Chalmers' Caledonia*, vol. ii. pp. 494, 865, 939, vol. iii. pp. 599, 799 ; *Crawfurd's History of the Shire of Renfrew*, part ii. pp. 128, 160 ; *Irving's History of Dumbartonshire*, pp. 245, 246 ; *Sinclair's Statistical Account of Scotland*, vol. i. pp. 109, 210, 367, 430, 496 ; vol. ii. p. 498 ; vol. iii. pp. 331, 352, 353 ; vol. iv. p. 313 ; vol. v. pp. 128, 234, 235, 315, 364, 365 ; vol. vi. pp. 107, 154, 180, 458 ; vol. vii. pp. 135, 251, 275, 299, 417 ; vol. viii. pp. 81, 243, 344, 345, 541 ; vol. ix. pp. 414, 530 ; vol. x. pp. 221, 237, 238, 466, 618 ; vol. xi. pp. 127, 380, 418, 432, 522, 541 ; vol. xii. p. 59 ; vol. xiii. pp. 42, 141, 488, 542, 663 ; vol. xiv. pp. 217, 227, 413, 443, 466, 506 ; vol. xv. pp. 54, 88, 276 ; vol. xvi. p. 120 ; vol. xvii. pp. 5, 267, 297, 377, 533 ; vol. xviii. p. 309 ; vol. xx. p. 156.

[4] I use the word Highlands in the common though improper sense of including all Scotland from the Pentland Firth to the beginning of the mountains, a few miles north of Glasgow, Stirling, Perth, and Dundee. All such distinctions are necessarily somewhat vague, because the boundaries of nature are never clearly marked. Compare *Macky's Scotland*, p. 124, London, 1732, with *Anderson's Guide to the Highlands*. Edinburgh, 1847, pp. 17, 18.

ramparts,* left the spirit of the inhabitants unbroken. Even Severus, who in the year 209 undertook the last and most important expedition against Scotland, does not appear to have penetrated beyond the Firth of Moray ;[5] and directly he retired, the natives were again in arms, and again independent. After this, nothing was attempted upon a scale large enough to give a chance of success. Indeed the Romans, far from being equal to such an effort, were themselves deteriorating. In their best days their virtues were the virtues of barbarians, and even those they were now about to lose. From the beginning, their scheme of life was so one-sided and imperfect that the increase of wealth, which improves the civilization of really civilized countries, was to the Romans an irreparable mischief ; and they were corrupted by luxury, instead of being refined by it. In our time, if we compare the different nations of Europe, we find that the richest are also the most powerful, the most humane, and the most happy. We live in that advanced state of society in which wealth is both the cause and the effect of progress, while poverty is the fruitful parent of weakness, of misery, and of crime. But the Romans, when they ceased to be poor, began to be vicious. So unstable was the foundation of their greatness that the very results which their power produced were fatal to the power itself. Their empire gave them wealth, and their wealth overthrew their empire. Their national character, notwithstanding its apparent strength, was in truth of so frail a texture that it was ruined by its own development. As it grew, it dwarfed.† Hence it was that, in the third and fourth centuries, their hold on mankind visibly slackened. Their authority being undermined, other nations of course stepped in ; so that the inroads of those strange tribes which came pouring from the north, and to whose appearance the final catastrophe is often ascribed, were at best the occasion, but by no means the cause, of the fall of the Roman Empire. Towards that great and salutary event everything had long been pointing. The scourges and oppressors of the world, whom a false and ignorant sympathy has invested with noble qualities which they never possessed, had now to look to themselves ; and when, after receding on all sides, they in the middle of the fifth century withdrew their forces from the whole of Britain, they merely executed a movement which a train of circumstances, continued through several generations, had made inevitable.

It is at this point that we begin to discern the operation of those physical and geographical peculiarities which I have mentioned as influencing the fortunes of Scotland. The Romans gradually losing ground, the proximity of Ireland caused repeated attacks from that fertile island, whose rich soil and great natural advantages gave rise to an exuberant and therefore a restless population. An

[5] Browne (*History of the Highlands*, vol. i. p. 33) says that "he traversed the whole of North Britain, from the wall of Antoninus to the very extremity of the island." The same thing is stated in *Pennant's Scotland*, vol. i. p. 90. Neither of these writers quotes his authority for this ; but they probably relied on a passage in *Buchanan's Rerum Scoticarum Historia*, lib. iv. p. 94. "Neque tamen desideratis quinquaginta millibus (ut scribit Dion) prius ab incœpto destiterunt, quam ad finem insulæ penetrassent." I believe, however, that Scotch antiquaries are now agreed that this is wrong, as Chalmers was one of the first to perceive. See his *Caledonia*, vol. i. p. 187 ; a very valuable and learned but unhappily ill-arranged book, and written in a style which is absolutely afflicting. See also *Irving's History of Dumbartonshire*, 4to, 1860, p. 14.

[* There was only one "wall" or "rampart"—the vallum of Antonine. Recent research reduces the number of accredited Roman remains in Scotland. Compare the opening chapters in the Histories of Mr. Lang and Mr. Hume Brown.—Ed.]

[† Buckle has here failed to apply his own theories. He has previously treated wealth as a beneficent force, promoting knowledge. It is inconsistent with his doctrine to fall back on a bald proposition of "frailty" of character. He should have recognized that the *manner of acquisition* of wealth by a nation is all-important ; and further should have realized that deterioration of character resulting (not merely from wealth but) from despotism, was accompanied by an economic paralysis, and that the empire fell because of the exhaustion of its fiscal resources as well as of "national character."—Ed.]

overflow, which in civilized times is an emigration, is in barbarous times an invasion. Hence the Irish, or Scotti as they were termed, established themselves by force of arms in the west of Scotland, and came into collision with the Picts, who occupied the eastern part. A deadly struggle ensued, which lasted four centuries after the withdrawal of the Romans, and plunged the country into the greatest confusion. At length, in the middle of the ninth century, Kenneth M'Alpine, king of the Scotti, gained the upper hand, and reduced the Picts to complete submission.[6] The country was now united under one rule; and the conquerors, slowly absorbing the conquered, gave their name to the whole, which in the tenth century received the appellation of Scotland.[7]

But the kingdom was to have no rest. For, in the meantime, circumstances which it would be tedious to relate had raised the inhabitants of Norway to be the greatest maritime power in Europe. The use which that nation of pirates made of their strength forms another and very important link in the history of Scotland, and moreover illustrates the immense weight which, in an earlier period of society, should be assigned to mere geographical considerations. The nearest land to the centre of the long coast of Norway is the Shetland Isles, whence it is an easy sail to the Orkneys. The northern pirates naturally seized these small but to them most useful islands, and as naturally made them intermediate stations, from which they could conveniently pillage the coasts of Scotland. Being constantly reinforced from Norway, they in the ninth and tenth centuries advanced from the Orkneys, made permanent settlements in Scotland itself, and occupied not only Caithness, but also great part of Sutherland. Another body of them got possession of the Western Islands; and as Skye is only separated from the mainland by a very narrow channel, these pirates easily crossed over, and fixed themselves in Western Ross.[8] From their new abodes they waged incessant and destructive war against every district within their reach; and, keeping a large part of Scotland in constant alarm, they for about three centuries prevented the possibility of its social improvement.* Indeed, that unhappy country was never free from the dangers of Norwegian

[6] The history of Scotland in this period is in great confusion, and perhaps will never be recovered. For the statements made in the text I have chiefly used the following authorities: *Fordun's Scotichronicon*, vol. i.; *Buchanan's Rerum Scoticarum Historia*, lib. v. pp. 121–132, and the beginning of the sixth book. Also various parts of *Bede*; *Pinkerton's Enquiry into the Early History of Scotland*; *Chalmers' Caledonia*; the first volume of *Browne's History of the Highlands*; and, above all, Mr. Skene's acute and learned work on the Highlanders. In the last-named book, the western boundary of the Picts is traced with great ingenuity, though perhaps with some uncertainty. *Skene's Highlanders of Scotland*, vol. i. pp. 26–33, London, 1837.

[7] Here again we are involved in doubt; it being uncertain when the name Scotia was first applied to Scotland. The date therefore which I have given is only intended as an approximate truth. In arriving at it I have compared the following different and often conflicting passages: *Chalmers' Caledonia*, vol. i. p. 339. *Browne's History of the Highlands*, vol. i. p. 34. *Pinkerton's Enquiry into the Early History of Scotland*, vol. i. pp. 253, 254, vol. ii. pp. 151, 228, 237, 240. *Spottiswoode's History of the Church of Scotland*, edit. Russell, 1851, vol. i. p. 16, note, where, however, Pinkerton's authority is appealed to for an assertion which he did not make. *Skene's Highlanders*, vol. i. pp. 45, 61, 244. *Anderson's Prize Essay on the Highlands*, p. 34. [Pinkerton repeatedly insists, in the passages cited, that Scotland was not so called till the *eleventh* century. This is the correct view. Cp. *Hume Brown, History of Scotland*, 1896, i. 51.—Ed.]

[8] *Pinkerton's Enquiry into the Early History of Scotland*, vol. i. pp. 136, 317, vol. ii. pp. 179, 298. *Skene's Highlanders*, vol. i. pp. 90, 91, 94, 106, 114, 258, 259. *Chalmers' Caledonia*, vol. i. pp. 340–347.

[* Considerable "improvement" had certainly taken place between the time of Malcolm Canmore and Alexander III., in whose reign Scotland seems to have been in some respects richer than she was for nearly two centuries afterwards. Cp. Burton, *History of Scotland*, ii. 105–111, 325. And see below, *note* 28.—Ed.]

invasion until the failure of the last great attack, in 1263, when Haco left Norway with a prodigious armament, which he further strengthened by reinforcements from the Orkneys and Hebrides. Scotland could offer but little resistance. Haco, with his allies, sailed along the western coast to the Mull of Kentire, wasted the country with fire and sword, took Arran and Bute, entered the Firth of Clyde, suddenly fell upon Loch Lomond, destroyed all the property on its shores and on its islands, ravaged the whole county of Stirling, and threatened to descend with all his force upon Ayrshire. Fortunately the inclemency of the weather broke up this great expedition, and scattered or destroyed the entire fleet.[9] After its dispersal, the course of affairs in Norway prevented the attempt from being renewed; and danger from that quarter being over, it might have been hoped that Scotland would now enjoy peace, and would have leisure to develop the natural resources which she possessed, particularly those in the southern and more favoured districts.

This, however, was not to be. For scarcely were the attacks from Norway at an end when those from England began. Early in the thirteenth century the lines of demarcation which separated Normans from Saxons were in our country becoming so obliterated that in many cases it was impossible to distinguish them.[10] By the middle of the same century the two races were fused into one powerful nation; and, as that nation had a comparatively feeble neighbour, it was certain that the stronger people would try to oppress the weaker.[11] In an ignorant and barbarous age, military success is preferred to all other kinds of fame; and the English, greedy for conquest, set their eyes upon Scotland, which they were sure to invade at the first opportunity. That Scotland was near, made it tempting; that it was believed to be defenceless, made the temptation irresistible. In 1290 Edward I. determined to avail himself of the confusion into which Scotland was thrown by disputes respecting the succession to the crown. The intrigues which followed need not be related; it is enough to say that in 1296 the sword was drawn, and Edward invaded a country which he had long desired to conquer. But he little recked of the millions of treasure, and the hundreds of thousands of lives, which were to be squandered before that war was over.[12] The contest that ensued was of unexampled length and severity; and in its sad course the Scotch, notwithstanding their heroic resistance, and the victories they occasionally gained, had to endure every evil which could be inflicted by their proud and insolent neighbour. The darling object of the English was to subjugate the Scotch; and if anything could increase the disgrace of so base an enterprise, it would be that, having undertaken it, they ignominiously failed.[13] The suffering, however, was incalculable, and was aggravated by the

[9] *Tytler's History of Scotland*, vol. i. pp. 38–54. The account in *Hollinshead's Scottish Chronicle*, vol. i. pp. 399–403, ascribes too much to the prowess of the Scotch, and too little to the elements which dispersed the fleet. Compare *Irving's History of Dumbartonshire*, second edition, 4to. 1860, pp. 48, 49.

[10] Above, vol. i. pp. 565, 566.

[11] In *Tytler's History of Scotland*, vol. i. p. 18, "the early part of the reign" of Alexander III. is indicated as the period in which "the first approaches were made towards the great plan for the reduction of Scotland" by the English. Alexander III. came to the throne in 1249. Earlier, the feeling was very different. Thus, late in the twelfth century, "the two nations, according to Fordun, seemed one people; Englishmen travelling at pleasure through all the corners of Scotland (?); and Scotchmen in like manner through England." *Ridpath's Border History*, p. 76. Compare *Dalrymple's Annals of Scotland*, vol. i. p. 158. At that time, England, being weak, was peaceably disposed.

[12] An old Scotch writer says, with some exaggeration, "The year 1296, at which tyme the bloodyest and longest warr that ever was betwixt two nationes fell out, and continued two hundreth and sextie years, to the undoeing and ruineing of many noble families, with the slaughter of a million of men." *Somerville's Memoire of the Somervilles*, vol. i. p. 61.

[13] See some just and biting remarks in *Hume's History of the House of Douglas*, vol. i. p. 85.

important fact that it was precisely the most fertile part of Scotland which was most exposed to the English ravages. This, as we shall presently see, produced some very curious results on the national character; and for that reason I will, without entering into many details, give a slight summary of the more immediate consequences of this long and sanguinary struggle.

In 1296 the English entered Berwick, the richest town Scotland possessed, and not only destroyed all the property, but slew nearly all the inhabitants.[14] They then marched on to Aberdeen and Elgin; and so completely desolated the country that the Scotch, flying to the mountains, and stripped of their all, had no resource left but to wage from their native fastnesses a war similar to that which their savage ancestors, twelve centuries earlier, had conducted against the Romans.[15] In 1298 the English again broke in, burnt Perth and St. Andrews, and ravaged the whole territory south and west.[16] In 1310 they invaded Scotland by the eastern march, and carrying off such provisions as were left, caused so terrible a dearth, that the people were forced to feed on horses and other carrion.[17] All over southern Scotland, both east and west, the inhabitants were now reduced to a horrible condition, being for the most part houseless and starved.* In 1314,

[14] "Anno gratiæ MCCXCVI. tertio kalendas Aprilis, villa et castro de Berevvico, per magnificum regem Angliæ Eadvvardum captis, omnes ibidem inuentos Angli gladio occiderunt, paucis exceptis, qui ipsam villam postmodum abiurarùt." *Flores Historiarum per Matthæum Westmonasteriensem collecti*, Lond. 1570, folio, lib. ii. p. 403. "Atque modo prædicto villâ captâ, civibus prostratis, rex Angliæ prædictus nulli ætati parcens aut sexui, duobus diebus rivulis de cruore occisorum fluentibus, septem millia et quingentas animas promiscui sexûs jusserat, in sua tyrannide desæviens, trucidari." *Fordun's Scotichronicon, cura Goodall*, Edinb. 1775, folio, vol. ii. pp. 159, 160. "Secutus Rex cum peditum copiis miserabilem omnis generis cædem edit." *Buchanan's Rerum Scoticarum Historia*, Abredoniæ, 1762, lib. viii. p. 200. "They left not one creature alive of the Scotish blood within all that toune." *Hollinshead's Scottish Chronicle*, Arbroath, 1805, 4to. vol. i. p. 418. In 1286, that is, only ten years earlier, "No other port of Scotland, in point of commercial importance, came near to a comparison with Berwick." *Macpherson's Annals of Commerce*, London, 4to, 1805, vol. i. p. 446. Such were the brutal crimes of our wretched and ignorant ancestors.

[15] "The Scots assembled in troops and companies, and betaking themselves to the woods, mountains, and morasses, in which their fathers had defended themselves against the Romans, prepared for a general insurrection against the English power." *Scott's History of Scotland*, London, 1830, vol. i. p. 70. Elgin appears to have been the most northern point of this expedition. See *Tytler's History of Scotland*, vol. i. p. 119, and *Chalmers' Caledonia*, vol. i. p. 657. The general results are summed up by Buchanan: "Hanc stragem ex agrorum incultu consecuta est fames, et famem pestis, unde major, quàm e bello clades timebatur." *Rerum Scoticarum Historia*, lib. viii. p. 203.

[16] "The army then advanced into Scotland by moderate marches, wasting and destroying everything on their way." . . . "A party of Edward's army, sent northwards, wasted the country, and burnt Perth and Saint Andrews." *Ridpath's Border History*, pp. 146, 147.

[17] "The king entered Scotland by the eastern march with a great army." . . . "There was this year so terrible a dearth and scarcity of provisions in Scotland, arising from the havoc of war, that many were obliged to feed on the flesh of horses and other carrion." *Ibid.* pp. 164, 165. See also *Fordun's Scotichronicon*, vol. ii. pp. 242, 243. "Quo anno, propter guerrarum discrimina, tanta erat panis inopia et victualium caristia in Scotia, quod in plerisque locis, compellente famis necessitate, multi carnibus equorum et aliorum pecorum immundorum vescebantur."

[* The word "houseless" is misleading. The people were wont to live in huts, easily constructed of boughs, and in general their state was that of hardy barbarians, not of a civilized population reduced to misery. It should be remembered, too, that the Scots frequently devastated the north of England. Cp. Burton, *History of Scotland*, ii. 195, 261, 280–2, 290, 298–302, 354, 356, 357–368, 375, 378.—ED.]

made desperate by their state, they rallied for a moment, and, in the battle of Bannockburn, gloriously defeated their oppressors.* But their unrelenting enemy was at hand, and pressed them so hard that in 1322 Bruce, in order to baffle an English invasion, was obliged to lay waste all the districts south of the Firth of Forth; the people taking refuge as before in the mountains.[18] This time therefore, when Edward II. reached Edinburgh, he plundered nothing, because, the country being a desert, there was nothing to plunder; but on his return he did what he could, and meeting with some convents, which were the only signs of life that he encountered, he fell upon them, robbed the monasteries of Melrose and Holyrood, burnt the abbey of Dryburgh, and slew those monks who from age or disease were unable to escape.[19] In 1336 the next king, Edward III., equipped a numerous army, devastated the Lowlands and great part of the Highlands, and destroyed everything he could find, as far as Inverness.[20] In 1346 the English overran the districts of Tweeddale, the Merse, Ettrick, Annandale, and Galloway;[21] and in 1355 Edward, in a still more barbarous inroad, burnt every church, every village, and every town he approached.[22] And scarcely were these frightful losses somewhat repaired, when another storm burst upon the devoted land. In 1385 Richard II. traversed the southern counties to Aberdeen, scattering destruction on every side, and reducing to ashes the cities of Edinburgh, Dunfermline, Perth, and Dundee.[23]

[18] Bruce "carefully laid the whole borders waste as far as the Firth of Forth, removing the inhabitants to the mountains, with all their effects of any value. When the English army entered, they found a land of desolation, which famine seemed to guard." *Scott's History of Scotland*, vol. i. p. 145. See also *Buchanan's Rerum Scoticarum Historia*, lib. viii. p. 218. [It must be remembered that in these invasions the people always drove their cattle into the hills and forests, returning with them after the starving invaders had retreated. And the rivers abounded in salmon. Cp. *Hume Brown, Scotland before* 1700, 1893, pp. 10–11, 45, 118, 119, 140, etc.; and *Early Travellers in Scotland*, 1891, p. 44.—Ed.]

[19] "Eadwardus, rex Angliæ, intravit Scotiam cum magno exercitu equitum et peditum, ac navium multitudine copiosa, duodecimo die mensis Augusti, et usque villam de Edinburgh pervenit." . . . "Spoliatis tamen tunc in reditu Anglorum et prædatis monasteriis Sanctæ Crucis de Edinburgh et de Melros, atque ad magnam desolationem perductis. In ipso namque monasterio de Melros dominus Willelmus de Peblis, ejusdem monasterii Prior, unus etiam monachus tunc infirmus, et duo conversi cæci effecti, in dormitorio eorundem ab eisdem Anglis sunt interfecti, et plures monachi lethaliter vulnerati. Corpus Dominicum super magnum altare fuit projectum, ablatâ pixide argenteâ in quâ erat repositum. Monasterium de Driburgh igne penitùs consumptum est et in pulverem redactum. Ac *alia pia loca quamplurima* per prædicti regis violentiam ignis flamma consumpsit: quod, Deo retribuente, eisdem in prosperum non cessit." *Fordun's Scotichronicon*, vol. ii. p. 278. "In redeundo sacra juxta ac prophana spoliata. Monasteria Driburgum et Mulrossia etiam cæsis monachis infirmioribus, qui vel defectu virium, vel senectutis fiducia soli remanserant, incensa." *Buchanan's Rerum Scoticarum Historia*, lib. viii. p. 219. [The invading army, however, seems to have suffered more than the invaded. See Burton, ii. 289.—Ed.]

[21] *Tytler's History of Scotland*, vol. i. p. 451.

[22] *Dalrymple's Annals*, vol. ii. p. 288. *Fordun's Scotichronicon*, vol. ii. pp. 352–354. [The date was 1355 O.S., 1356 N.S.—Ed.]

[23] "Rex Angliæ, Richardus secundus ægrè ferens Scotos et Francos tam atrociter terram suam deprædare, et municipia sua assilire et ad terram prosternere, exercitum

[* The rally was for more than a moment: it lasted, broadly speaking, from 1307 to 1332. And between the immense booty taken at Bannockburn and the great sums received in addition for ransoms, the total movable wealth of Scotland must have been more than doubled at a stroke. See Burton, ii. 269; *Hume Brown, History of Scotland*, 1899, i. 161.—Ed.]

By these disasters the practice of agriculture was everywhere interrupted, and in many places ceased for several generations.[24] The labourers either fled or were murdered; and there being no one to till the ground, some of the fairest parts of Scotland were turned into a wilderness, overgrown with briers and thickets. Between the invasions, a few of the inhabitants, taking courage, issued from the mountains, and raised wretched huts in the place of their former abodes.* But even then they were pursued to their very doors by wolves, searching for food, and maddened with hunger. If they escaped from these famished and ferocious animals, they and their families were exposed to a danger still more horrible. For in those terrible days, when famine stalked abroad, despair perverted the souls of men, and drove them to new crime. There were cannibals in the land; and we have it on contemporary authority that a man and his wife, who were at length brought to justice, subsisted during a considerable period on the bodies of children, whom they caught alive in traps, devouring their flesh, and drinking their blood.[25]

collegit grandem, et intravit Scotiam, ætate tunc novemdecim annorum, in multitudine superba progrediens, omnia circumquaque perdens, et nihil salvans; templa Dei et sanctuaria religiosorum monasteria viz. Driburgh, Melros et Newbottel, ac nobilem villam de Edinburgh, cum ecclesia Sancti Ægidii ejusdem, voraci flammâ incineravit; et, destructione permaximâ factâ per eum in Laudonia, ad propria sine damno repatriavit." *Fordun's Scotichronicon*, vol. ii. p. 401. "En ce séjour que le roi Richard fit en Haindebourch les Anglois coururent tout le pays d'environ et y firent moult de desrois; mais nullui n'y trouvèrent; car tout avoient retrait ens ès forts, et ens és grands bois, et là chassé tout leur bêtail." . . . "Et ardirent les Anglois la ville de Saint-Jean-Ston en Ecosse, où la riviere du Tay cuert, et y a un bon port pour aller partout le monde; et puis la ville de Dondie; et n'épargnoient abbayes ni moûtiers; tout mettoient les Anglois en feu et en flambe; et coururent jusques à Abredane les coureurs et l'avant-garde." *Les Chroniques de Froissart*, edit. Buchon, vol. ii. pp. 334, 335, Paris, 1835. See also, on this ruffianly expedition, *Chalmers' Caledonia*, vol. ii. pp. 592, 593, and *Buchanan's Rerum Scoticarum Historia*, lib. ix. p. 253: "Nulli loco, neque sacro, neque profano, nulli homini, qui modo militari esset ætate, parcebat." [See however in Burton, ii. 354–5, how, as soon as the starving invaders had retreated, the people returned from the hills with their cattle, grain, and effects, taking "the devastation of their land with marvellous indifference," rebuilding their huts, and partly replenishing them with the plunder taken in the simultaneous raid made with French help in England, where "the French said among themselves they had burned in the bishoprics of Durham and Carlisle more than the value of all the towns in the kingdom of Scotland."—Ed.]

[24] "Agriculture was ruined; and the very necessaries of life were lost, when the principal lords had scarcely a bed to lye on." *Chalmers' Caledonia*, vol. ii. p. 142. See also, in p. 867 of the same volume of this learned work, some curious extracts from Scotch charters and other sources, illustrating the horrible condition of the country. And on the difficulty of obtaining food, compare *Fordun's Scotichronicon*, vol. ii. pp. 242, 324; *Dalrymple's Annals*, vol. i. p. 307, vol. ii. pp. 238, 330; and *Tytler's History of Scotland*, vol. ii. p. 94.

[25] Notices of Scotch cannibals will be found in *Lindsay of Pitscottie's Chronicles of Scotland*, edit. 1814, vol. i. p. 163; and in *Hollinshead's Scottish Chronicle*, 4to. 1805, vol. ii. pp. 16, 99. In *Fordun's Scotichronicon*, vol. ii. p. 331, the following horrible account is given; it refers to the neighbourhood of Perth in the year 1339: "Tota illa patria circumvicina eo tempore in tantum fuit vastata, quod non remansit quasi domus inhabitata, sed feræ et cervi de montanis descendentes circa villam sæpius venabantur. Tanta tunc temporis facta est caristia, et victualium inopia, ut passim plebicula deficeret, et tanquam oves herbas depascentes, in foveis mortua reperirentur.

[* As we have seen, not "a few" but the whole of the inhabitants normally returned to their places as soon as an invasion was over. The further details about the wolves and the cannibals are greatly overstated. Cannibalism was an exceptional horror, belonging to times of famine such as fell upon England also in the same age and gave rise there to similar stories. See *Social England*, ed. 1902, i. 641, 679, ii. 161.—Ed.]

Thus the fourteenth century passed away. In the fifteenth century the devastations of the English became comparatively rare; and although the borders were the scene of constant hostilities,[26] there is no instance, since the year 1400, of any of our kings invading Scotland.[27] An end being put to those murderous expeditions which reduced the country to a desert, Scotland drew breath, and began to recover her strength.[28] But though the material losses were gradually repaired; though the fields were again cultivated, and the towns rebuilt, there were other consequences which were less easy to remedy, and from whose effects the people long smarted. These were the inordinate power of the nobles, and the absence of the municipal spirit. The strength of the nobles, and the weakness of the citizens, are the most important peculiarities of Scotland during the fifteenth and sixteenth centuries; and they, as I am about to show, were directly encouraged by the ravages committed by the English troops.* We shall moreover see that this combination of events increased the authority of the clergy, weakened the influence of the intellectual classes,† and made superstition more prevalent than it would otherwise have been. It is in this way that in Scotland as in all other countries everything is linked together; nothing is casual or accidental; ‡ and the whole march of affairs is governed by general causes, which, owing to their largeness and remoteness, often escape attention, but which, when once recognized, are found to be marked by a simplicity and uniformity which are the invariable characteristics of the highest truths that the mind of man has reached.

The first circumstance favourable to the authority of the nobles was the structure of the country. Mountains, fens, lakes, and morasses, which even the resources of modern art have only recently made accessible, supplied the great Scottish chieftains with retreats in which they could with impunity defy the power of the crown.[29] The poverty of the soil also made it difficult for armies

Prope illinc in abditis latitabat quidam robustus rusticus, Crysticleik nomine, cum viragine sua, qui mulierculis et pueris ac juvenibus insidiabantur, et, tanquam lupi eos strangulantes, de ipsorum carnibus victitabant."

[26] Even when the two nations were at peace, the borderers were at war. See *Ridpath's Border History*, pp. 240, 308, 394; and for other evidence of this chronic anarchy, compare *Hollinshead's Scottish Chronicle*, vol. ii. p. 30. *Lesley's History of Scotland*, pp. 40, 52, 67. *Sadler's State Papers*, vol. i. pp. 300, 301, 444, 449. *State Papers of the Reign of Henry VIII.*, 4to, 1836, vol. iv. pp. 366, 370, 569, 570, vol. v. pp. 17, 18, 161. *Historie of James the Sext*, pp. 21, 91, 146.

[27] In 1400 Henry IV. made "the last invasion which an English monarch ever conducted into Scotland." *Tytler's History of Scotland*, vol. ii. p. 406. It is said, however, that it was not till the reign of Elizabeth that an English sovereign "had the policy to disavow any claim of sovereignty over Scotland." *Chalmers' Caledonia*, vol. i. p. 650.

[28] But very slowly. Pinkerton (*History of Scotland*, vol. i. pp. 166, 167) says: "The frequent wars between Scotland and England, since the death of Alexander III., had occasioned to the former country the loss of more than a century in the progress of civilization. While in England only the northern provinces were exposed to the Scottish incursions, Scotland suffered in its most civilized departments. It is apparent that in the reign of Alexander III. the kingdom was more abundant in the useful arts and manufactures than it was in the time of Robert III."

[29] Owing to this, their castles were by position the strongest in Europe; Germany

[* Add the many periods in which the king was a minor, from the death of Bruce onwards.—Ed.]

[† It would be hard to specify, in medieval Scotland, any "intellectual classes" apart from the clergy. But an educated layman, Sir David Lyndsay, was able early in the fifteenth century to make head against the clergy as no one of the same period did in England. Cp. Burton, iii. 171, 324, 341, 421.—Ed.]

[‡ If "nothing is accidental," what does "accidental" mean? Buckle seems to have forgotten his remark on the subject in a previous chapter. Above p. 292. Cp. p. 250.—Ed.]

to find means of subsistence ; and from this cause alone, the royal troops were often unable to pursue the lawless and refractory barons.[30] During the fourteenth century Scotland was constantly ravaged by the English ; and in the intervals of their absence it would have been a hopeless undertaking for any king to try to repress such powerful subjects, since he would have had to march through districts so devastated by the enemy that they no longer yielded the common necessaries of life. Besides this, the war with the English lessened the authority of the crown, absolutely as well as relatively. Its patrimony, lying in the south, was incessantly wasted by the borderers, and before the middle of the fourteenth century greatly deteriorated in value.[31] In 1346 David II. fell into the hands of the English, and during his captivity of eleven years the nobles carried all before them, and affected, says an historian, the style and title of princes.[32] The longer the war with England continued, the more these consequences were felt ; so that before the close of the fourteenth century a few of the leading Scotch families had raised themselves to such pre-eminence that it was evident, either that a deadly struggle must ensue between them and the crown, or else that the executive government would have to abdicate its most essential functions, and leave the country a prey to these headstrong and ferocious chiefs.[33]

At this crisis the natural allies of the throne would have been the citizens and free burgesses, who in most European countries were the eager and resolute opponents of the nobles, whose licentious habits interfered not only with their trade and manufactures, but also with their personal liberty. Here again, however, the long war with England was favourable to the aristocracy of Scotland. For, as the invaders ravaged the southern parts of Scotland, which were also the only tolerably fertile parts, it was impossible that towns should flourish in the places which nature had appointed for them. There being no large cities, there was no asylum for the citizens, and there could be no municipal spirit. There being no municipal spirit, the crown was deprived of that great resource which enabled the English kings to curtail the power of the nobles, and to punish a lawlessness which long impeded the progress of society.

During the Middle Ages the Scotch towns were so utterly insignificant that but few notices have been preserved of them ; contemporary writers concentrat-

alone excepted. Respecting their sites, which were such as to make them in many instances almost unassailable, see *Chalmers' Caledonia*, vol. ii. pp. 122, 406, 407, 918, 919, vol. iii. pp. 268, 269, 356–359, 864 ; *Pennant's Scotland*, vol. i. pp. 175, 177 ; *Sinclair's Scotland*, vol. iii. p. 169, vol. vii. p. 510, vol. xi. pp. 102, 212, 407, 408, vol. xii. pp. 25, 58, vol. xiii. p. 598, vol. xv. p. 187, vol. xvi. p. 554, vol. xviii. p. 579, vol. xix. p. 474, vol. xx. pp. 56, 312 ; *Macky's Scotland*, pp. 183, 297 ; and some good remarks in *Nimmo's History of Stirlingshire*, p. 56. Neither England, nor France, nor Italy, nor Spain, afforded such immense natural advantages to their aristocracy.

[30] " By retiring to his own castle, a mutinous baron could defy the power of his sovereign, it being almost impracticable to lead an army through a barren country to places of difficult access to a single man." *History of Scotland*, book i. p. 59, in *Robertson's Works*, edit. London, 1831. Notwithstanding the immense materials which have been brought to light since the time of Robertson, his *History of Scotland* is still valuable ; because he possessed a grasp of mind which enabled him to embrace general views that escape ordinary compilers, however industrious they may be.

[31] " The patrimony of the Crown had been seriously dilapidated during the period of confusion which succeeded the battle of Durham." *Tytler's History of Scotland*, vol. ii. p. 86.

[32] " During the long captivity of David," the nobles had been completely insubordinate and " affected the style and title of princes." *Tytler's History of Scotland*, vol. ii. p. 85. See also, on the state of the barons under David II., *Skene's Highlanders*, vol. ii. pp. 63–67.

[33] In 1299 " a superior baron was in every respect a king in miniature." *Tytler's History of Scotland*, vol. ii. p. 150. In 1377 " the power of the barons had been decidedly increasing since the days of Robert the First." p. 332. And by 1398 it had risen still higher. p. 392.

ing their attention upon the proceedings of the nobles and clergy. Respecting the people who found shelter in such miserable cities as then existed, our best accounts are very imperfect; it is however certain that during the long English wars the inhabitants usually fled at the approach of the invaders, and the wretched hovels in which they lived were burned to the ground.[34] Hence the population acquired a fluctuating and vagabond character, which prevented the formation of settled habits of industry, and thus took away one reason which men have for congregating together. This applied more especially to the southern Lowlands; for the north, there were other evils equally threatening. The ferocious Highlanders, who lived entirely by plunder,* were constantly at hand; and to them were not unfrequently added the freebooters of the Western Isles. Anything which bore even the semblance of wealth was an irresistible excitement to their cupidity. They could not know that a man had property without longing to steal it; and next to stealing, their greatest pleasure was to destroy.[35] Aberdeen and Inverness were particularly exposed to their assaults; and twice during the fifteenth century Inverness was totally consumed by fire, besides having to pay at other times a heavy ransom, to save itself from a similar fate.[36]

[34] On this burning of Scotch towns, which appears to have been the invariable practice of our humane forefathers, see *Chalmers' Caledonia*, vol. ii. pp. 592, 593; *Kennedy's Annals of Aberdeen*, vol. i. pp. 18, 27, 375, vol. ii. p. 304; *Mercer's History of Dunfermline*, pp. 55, 56; *Sinclair's Scotland*, vol. v. p. 485, vol. x. p. 584, vol. xix. p. 161; *Ridpath's Border History*, pp. 147, 221, 265.

[35] A curious description of them is given in a Scotch statute of the year 1597. "They hawe lykwayis throche thair barbarus inhumanitie maid and presentlie makis the saidis hielandis and Iles qlk are maist comodious in thame selwes alsueill be the ferteillitie of the ground as be riche fischeingis altogidder vnproffitabill baithe to thame selffis and to all vthuris his hienes liegis within this realme: Thay nathair intertening onie ciuil or honest societie amangis thame selffis neyther zit admittit vtheris his hienesse lieges to trafficque within thair boundis vithe saiftie of thair liues and gudes: for remeid quhairof and that the saidis inhabitantis of the saidis hilandeis and Iles may the better be reduced to ane godlie, honest, and ciuill maner of living, it is statute and ordanit," &c. *Acts of the Parliaments of Scotland*, vol. iv. p. 138, edit. folio, 1816.

These little peculiarities of the Highlanders remained in full force until about the middle of the eighteenth century, as will appear in the course of this history. But without anticipating what will be narrated in a subsequent chapter, I will merely refer the reader to two interesting passages in *Pennant's Scotland*, vol. i. p. 154, and in *Heron's Scotland*, vol. i. pp. 218, 219; both of which illustrate the state of things a little before 1745.

[36] Inverness was burned in 1429. *Gregory's History of the Western Highlands*, p. 36; and again in 1455, *Buchanan's Rerum Scoticarum Historia*, lib. xi. p. 322. "The greatest part" of it was also burned in 1411. See *Anderson on the Highlands*, Edinb. 1827, p. 82.

Aberdeen, being richer, was more tempting, but was likewise more able to defend itself. Still, its burgh records supply curious evidence of the constant fear in which the citizens lived, and of the precautions which they took to ward off the attacks, sometimes of the English, and sometimes of the clans. See the *Council Register of Aberdeen* (published by the Spalding Club, Aberdeen, 1844–1848, 4to), vol. i pp. 8, 19, 60, 83, 197, 219, 232, 268, vol. ii. p. 82. The last entry, which is dated July 31, 1593, mentions "the disordourit and lawles helandmen in Birss, Glentanner, and their about, nocht onlie in the onmerciful murthering of men and bairnis, bot in the maisterfull and violent robbing and spulzeing of all the bestiall, guidis, and geir of a gryt pairt of the inhabitantis of theas boundis.

[* An obvious over-statement. The account here given of the Highlanders and Islanders, though in harmony with much of the language of Pinkerton and Burton, is out of perspective. The Lowlanders had originally taken the lands of the Highlanders, who simply regarded themselves as at perpetual war with the other race. But an exactly similar life was led by the Lowland clans on the borders. See the account of Bishop Leslie, given in *Hume Brown's Scotland before 1700*, pp. 166–170. And see below, *note* 82.—Ed.]

Such insecurity [37] both on the north and on the south made peaceful industry impossible in any part of Scotland. Nowhere could a town be built without being in danger of immediate destruction. The consequence was that during many centuries there were no manufactures; there was hardly any trade; and nearly all business was conducted by barter.[38] Some of the commonest arts were unknown. The Scotch were unable to make even the arms with which they fought. This, among such a warlike people, would have been a very profitable labour; but they were so ignorant of it that early in the fifteenth century most of the armour which they wore was manufactured abroad, as also were their spears, and even their bows and arrows; and the heads of these weapons were entirely imported from Flanders.[39] Indeed, the Flemish artizans supplied the Scotch with ordinary farming implements, such as cart-wheels and wheel-barrows, which, about the year 1475, used to be regularly shipped from the Low Countries.[40] As to the arts which indicate a certain degree of refinement, they were

rasing of gryt hairschip furth of the samen, being committit to ewous and nar this burgh, within xx mylis theirunto, deuysit and ordanit for preservatioun of this burgh and inhabitantis theirof, fra the tyrannous invasion of the saidis hieland men, quha has na respect to God nor man; that the haill inhabitantis of this burgh, fensiball persones als weill onfrie as frie, salbe in reddiness weill armit for the defence of this burgh, thair awin lyvis, gudis, and geir, and resisting and repressing of the said heland men as occasioun salbe offered, at all tymes and houris as thay salbe requirt and chargit."

Even in 1668 we find complaints that Highlanders had forcibly carried off women from Aberdeen or from its neighbourhood. *Records of the Synod of Aberdeen*, p. 290. Other evidence of their attacks in the sixteenth and seventeenth centuries may be seen in *Kennedy's Annals of Aberdeen*, vol. i. p. 133; *Spalding's History of the Troubles*, vol. i. pp. 25, 217; *Extracts from the Presbytery Book of Strathbogie*, pp. 62, 73.

[37] Even Perth ceased to be the capital of Scotland, because "its vicinity to the Highlands" made it dangerous for the sovereign to reside there. *Lawson's Book of Perth*, p. xxxi.

[38] On the prevalence of barter, and lack of specie, in Scotland, see the *Spalding Club Miscellany*, vol. iv. pp. lvii.–lx., Aberdeen, 1849, 4to. In 1492, the treasury of Aberdeen was obliged to borrow £4 16s. Scots. *Kennedy's Annals of Aberdeen*, vol. i. p. 61. Compare *Sinclair's Statistical Account of Scotland*, vol. x. p. 542. Fynes Moryson, who was in Scotland late in the sixteenth century, says, "the gentlemen reckon their revenues not by rents of money, but by chauldrons of victuals." *Moryson's Itinerary*, part iii. p. 155, London, folio, 1617; a rare and extremely curious book, which ought to be reprinted. [See it in *Hume Brown's Early Travellers in Scotland*, 1891.—Ed.] A hundred years after Moryson wrote, it was observed that "in England the rents are paid in money; in Scotland they are, generally speaking, paid in kind, or victual, as they call it." *De Foe's History of the Union*, p. 130.

[39] In the reign of James I. (1424–1436), "It appears that armour, nay spears, and bows and arrows, were chiefly imported." . . . "In particular, the heads of arrows and of spears seem to have been entirely imported from Flanders." *Pinkerton's History of Scotland*, vol. i. p. 163. We learn from Rymer's *Fœdera* that, in 1368, two Scotchmen having occasion to fight a duel, got their armour from London. *Macpherson's Annals of Commerce*, vol. i. p. 575. [On the other hand, "the making of brass cannon in Scotland seems to have preceded that art in England" (*The Days of James IV.*, ed. by G. Gregory Smith, 1890, app. L. p. 211), the Scots being well supplied in that respect at Flodden in 1513.—Ed.]

[40] From the *Bibel of English Policy*, supposed to have been written in the reign of Edward IV., we learn that "the Scottish imports from Flanders were mercery, but more haberdashery, cart-wheels, and wheel-barrows." *Pinkerton's History of Scotland*, vol. i. p. 408. In *Mercer's History of Dunfermline*, p. 61, we are told that, in the fifteenth century, "Even in the best parts of Scotland, the inhabitants could not manufacture the most necessary articles. Flanders was the great mart in those times, and from Bruges chiefly the Scots imported even horse-shoes, harness, saddles, bridles, cart-wheels, and wheel-barrows, besides all their mercery and haberdashery."

then and long afterwards quite out of the question.[41] Until the seventeenth century no glass was manufactured in Scotland,[42] neither was any soap made there.[43] Even the higher class of citizens would have deemed windows absurd in their wretched abodes ;[44] and as they were alike filthy in their persons as in their houses, the demand for soap was too small to induce any one to attempt its manufacture.[45] Other branches of industry were equally backward. In

[41] Aberdeen was for a long period one of the most wealthy, and in some respects the most advanced, of all the Scotch cities. But it appears from the council-registers of Aberdeen that "in the beginning of the sixteenth century there was not a mechanic in the town capable to execute the ordinary repairs of a clock." *Kennedy's Annals of Aberdeen*, vol. i. p. 99. On the Scotch clocks in the middle of the sixteenth century, compare Mr. Morley's interesting *Life of Cardan*, London, 1854, vol. ii. p. 128. Cardan was in Scotland in 1552.

[42] About 1619 Sir George Hay "set up at the village of Wemyss, in Fife, a small glass-work, being the first known to have existed amongst us." *Chambers' Annals*, vol. i. p. 506. See also p. 428. [Hay got his licence in 1590. See *Cochran-Patrick's Mediæval Scotland*, 1892, p. 57, where "1690" is a misprint.—Ed.]

[43] Before this time, soap was imported into Scotland from foreign countries, chiefly from Flanders." *Ibid.*, vol. i. p. 507, under the year 1619, where mention is made of the manufactory set up at Leith. "The sope-workes of Leith" are noticed in 1650, in *Balfour's Annales*, vol. iv. p. 68.

[44] Ray, who visited Scotland in 1661, says, "In the best Scottish houses, even the king's palaces, the windows are not glazed throughout, but the upper part only; the lower have two wooden shuts or folds to open at pleasure and admit the fresh air." . . . "The ordinary country-houses are pitiful cots, built of stone, and covered with turves, having in them but one room, many of them no chimneys, the windows very small holes and not glazed." *Ray's Itineraries*, p. 153, edited by Dr. Lankester, London, 1846. "About 1752 the glass window was beginning to make its appearance in the small farm-houses." *Brown's History of Glasgow*, vol. ii. p. 265, Edinburgh, 1797. [There seems to have been retrogression in this matter after the prosperous period of James IV. and James V.; for De Ayala, the Spanish agent, who visited Scotland in 1496 and 1497, writes that "the houses are good, all built of hewn stone, and provided with excellent doors, glass windows, and a great number of chimneys." He further praises the furniture (cited in *Hume Brown's Early Travellers in Scotland*, 1893, p. 47, and in his *History of Scotland*, 1899, i. 349). Ayala appears to be given to exaggeration, but there is also the testimony of Alesius that in 1529 Edinburgh was "not built of brick, but of natural stones squared" (cited in *Hume Brown's Scotland before 1700*, p. 107.—Ed.]

[45] In 1650 it was stated of the Scotch that "many of their women are so sluttish, that they do not wash their linen above once a month, nor their hands and faces above once a year." *Whitelock's Memorials*, p. 468, London, 1732, folio. Six or seven years after this, a traveller in Scotland says, "The linen they supplied us with, were it not to boast of, was little or nothing different from those female complexions that never washed their faces to retain their christendom." *Franck's Northern Memoirs*, edit. Edinburgh, 1821, p. 94. A celebrated Scotchman notices, in 1698, the uncleanly habits of his countrymen, but gives a comical reason for them; since, according to him, they were in a great measure caused by the position of the capital. "As the happy situation of London has been the principal cause of the glory and riches of England, so the bad situation of Edinburgh has been one great occasion of the poverty and uncleanliness in which the greater part of the people of Scotland live." *Second Discourse on the Affairs of Scotland*, in *Fletcher of Saltoun's Political Works*, p. 119, Glasgow, 1749. Another Scotchman, among his reminiscences of the early part of the eighteenth century, says that "table and body linen (were) seldom shifted." *Memoires by Sir Archibald Grant of Monymusk*, in *Spalding Club Miscellany*, vol. ii. p. 100, Aberdeen, 1842, 4to. Finally, we have positive proof that in some parts of Scotland, even at the end of the eighteenth century, the people used, instead of soap, a substitute too disgusting to mention. See the account communicated by the Rev. William Leslie to Sir John Sinclair, in *Sinclair's Statistical Account of Scotland*, vol. ix. p. 177, Edinburgh, 1793.

1620 the art of tanning leather was for the first time introduced into Scotland ;[46] and it is stated on apparently good authority that no paper was made there until about the middle of the eighteenth century.[47]

In the midst of such general stagnation the most flourishing towns were, as may be easily supposed, very thinly peopled. Indeed, men had so little to do, that if they had collected in large numbers they must have starved. Glasgow is one of the oldest cities in Scotland, and is said to have been founded about the sixth century.[48] At all events, in the twelfth century it was according to the measure of that age a rich and prosperous place, enjoying the privilege of holding both a market and a fair.[49] It had also a municipal organization, and was governed by its own provosts and baillies.[50] Yet even this famous town had no kind of trade before the fifteenth century, when the inhabitants began to cure salmon and export it.[51] That was the only branch of industry with which Glasgow was acquainted. We need not therefore be surprised at hearing that so late as the middle of the fifteenth century the entire population did not exceed fifteen hundred persons, whose wealth consisted of some small cattle and a few acres of ill-cultivated land.[52]

Other cities, though bearing a celebrated name, were equally backward at a still more recent period. Dunfermline is associated with many historic reminiscences ; it was a favourite residence of Scotch kings, and many Scotch parlia-

[46] *Chambers' Annals*, vol. i. p. 512.

[47] A paper-mill was established near Edinburgh in 1675 ; but "there is reason to conclude this paper-mill was not continued, and that paper-making was not successfully introduced into Scotland till the middle of the succeeding century." *Chambers' Annals*. vol. ii. p. 399. I have met with so many proofs of the great accuracy of this valuable work that I should be loath to question any statement made by Mr. Chambers, when, as in this case, I have only my memory to trust to. But I think that I have seen evidence of paper being successfully manufactured in Scotland late in the seventeenth century, though I cannot recall the passages. [A paper mill was set up in Scotland by a German in 1590 (*Cochran-Patrick's Mediæval Scotland*, p. 61). The mill set up in 1675 was burned down, but was going again in 1679, and a company for making superior paper got its Act of Parliament in 1695 (*Id.* p. 62).—Ed.] However, Arnot, in his *History of Edinburgh*, p. 599, edit. 4to, says, "About forty years ago, printing or writing paper began to be manufactured in Scotland. Before that, papers were imported from Holland, or brought from England." As Arnot's work was printed in 1788, this coincides with Mr. Chambers' statement. I may add that at the end of the eighteenth century there were "two paper-mills near Perth." *Heron's Journey through Scotland*, vol. i. p. 117, Perth, 1799 ; and that in 1751 and 1763 the two first paper-mills were erected north of the Forth. *Sinclair's Statistical Account of Scotland*, vol. ix. p. 593, vol. xvi. p. 373. Compare *Lettice's Letters from Scotland in* 1792, p. 420.

[48] "This city was founded about the sixth century." *M'Ure's History of Glasgow*, edit. 1830, p. 120. Compare *Denholm's History of Glasgow*, p. 2, Glasgow, 1804.

[49] In 1172 a market was granted to Glasgow ; and in 1190, a fair. See the charters in the Appendix to *Gibson's History of Glasgow*, pp. 299, 302, Glasgow, 1777.

[50] By the sale of land made by Robert de Mythyngby to Mr. Reginald de Irewyne, A.D. 1268, it is evident that the town was then governed by provosts, aldermen, or wardens, and baillies, who seem to have been independent of the bishop, and were possessed of a common seal, distinct from the one made use of by the bishop and chapter." *Gibson's History of Glasgow*, p. 72.

[51] "A Mr. William Elphinston is made mention of as the first promoter of trade in Glasgow, so early as the year 1420 the trade which he promoted was in all probability the curing and exporting of salmon." *Gibson's History of Glasgow*, p. 203. See also *M'Ure's History of Glasgow*, p. 93.

[52] Gibson (*History of Glasgow*, p. 74), with every desire to take a sanguine view of the early state of his own city, says that in 1450 the inhabitants "might perhaps amount to fifteen hundred ;" and that "their wealth consisted in a few burrow-roods very ill-cultivated, and in some small cattle, which fed on their commons."

ments have been held there.[53] Such events are supposed to confer distinction; but the illusion vanishes when we inquire more minutely into the condition of the place where they happened. In spite of the pomp of princes and legislators, Dunfermline, which at the end of the fourteenth century was still a poor village, composed of wooden huts,[54] had by the beginning of the seventeenth century advanced so slowly that its whole population, including that of its wretched suburbs, did not exceed one thousand persons.[55] For a Scotch town that was a considerable number. About the same time, Greenock, we are assured, was a village consisting of a single row of cottages, tenanted by poor fishermen.[56] Kilmarnock, which is now a great emporium of industry and of wealth, contained in 1668 between five and six hundred inhabitants.[57] And to come down still lower, even Paisley itself, in the year 1700, possessed a population which, according to the highest estimate, did not amount to three thousand.[58]

Aberdeen, the metropolis of the north, was looked up to as one of the most influential of the Scotch towns, and was not a little envied during the Middle Ages for its power and importance. These, however, like all other words, are relative, and mean different things at different periods. Certainly, we shall not be much struck by the magnitude of that city when we learn, from calculations made from its tables of mortality, that so late as 1572 it could only boast of about two thousand nine hundred inhabitants.[59] Such a fact will dispel many a dream respecting the old Scotch towns, particularly if we call to mind that it refers to a date when the anarchy of the Middle Ages was passing away, and Aberdeen had for some time been improving. That city—if so miserable a collection of persons deserves to be termed a city—was nevertheless one of the

[53] "Dunfermline continued to be a favourite royal residence as long as the Scottish dynasty existed. Charles I. was born here; as also his sister Elizabeth, afterwards Queen of Bohemia, from whom her present Majesty is descended: and Charles II. paid a visit to this ancient seat of royalty in 1650. The Scottish parliament was often held in it." *M'Culloch's Geographical Dictionary*, London, 1849, vol. i. p. 723. Compare *Mercer's History of Dunfermline*, 1828, pp. 56, 58, and *Chalmers' History of Dunfermline*, 1844, p. 264.

[54] In 1385 it was "only a sorry wooden village, belonging to the monastery." *Mercer's History of Dunfermline*, p. 62.

[55] See "Ms. Annals." in *Chalmers' History of Dunfermline*, p. 327. In 1624, we learn from *Balfour's Annales*, edit. 1825, vol. ii. p. 99, that "the quholl bodey of the towne, wich did consist of 120 tenements, and 287 families, was brunt and consumed."

[56] "Greenock, which is now one of the largest shipping towns in Scotland, was in the end of the sixteenth century a mean fishing village, consisting of a single row of thatched cottages, which was inhabited by poor fishermen." *Chalmers' Caledonia*, vol. iii. p. 806, 4to, 1824.

[57] In May, 1668, Kilmarnock was burnt; and "the event is chiefly worthy of notice as marking the smallness of Kilmarnock in those days, when as yet there was no such thing as manufacturing industry in the country. A hundred and twenty families speaks to a population of between five and six hundred." *Chambers' Annals*, Edinburgh, 1858, vol. ii. p. 320. In 1658, their houses are described by an eye-witness as "little better than huts." *Franck's Northern Memoirs*, reprinted Edinburgh, 1821, p. 101.

[58] "Betwixt two and three thousand souls." *Denholm's History of Glasgow*, p. 542, edit. Glasgow, 1804.

[59] In 1572 the registers of Aberdeen show that seventy-two deaths occurred in the year. An annual mortality of 1 in 40 would be a very favourable estimate; indeed rather too favourable, considering the habits of the people at that time. However, supposing it to be 1 in 40, the population would be 2,880; and if, as I make no doubt, the mortality was more than 1 in 40, the population must of course have been less. Kennedy, in his valuable but very uncritical work, conjectures that "one fiftieth part of the inhabitants had died annually;" though it is certain that there was no town in Europe anything like so healthy as that. On this hypothesis, which is contradicted by every sort of statistical evidence that has come down to us, the number would be $72 \times 50 = 3,600$. See *Kennedy's Annals of Aberdeen*, vol. i. p. 103, London, 1818, 4to.

most densely peopled places in Scotland. From the thirteenth century to the close of the sixteenth, nowhere else were so many Scotchmen assembled together, except in Perth, Edinburgh, and possibly in Saint Andrews.[60] Respecting Saint Andrews, I have been unable to meet with any precise information ;[61] but of Perth and Edinburgh some particulars are preserved. Perth was long the capital of Scotland, and after losing that pre-eminence it was still reputed to be the second city in the kingdom.[62] Its wealth was supposed to be astonishing ; and every good Scotchman was proud of it, as one of the chief ornaments of his country.[63] But according to an estimate recently made by a considerable authority in these matters, its entire population in the year 1585 was under nine thousand.[64] This will surprise many readers ; though, considering the state of society at that time, the real wonder is, not that there were so few, but that there were so many. For Edinburgh itself, notwithstanding the officials and numerous hangers-on which the presence of a court always brings, did not contain, late in the fourteenth century, more than sixteen thousand persons.[65] Of their general condition, a contemporary observer has left us some account. Froissart, who visited Scotland, and records what he saw as well as what he heard, gives a lamentable picture of the state of affairs. The houses in Edinburgh were mere huts, thatched with boughs ; and were so slightly put together that when one of them was destroyed it only took three days to rebuild it. As to the people who inhabited these wretched hovels, Froissart, who was by no means given to exaggeration, assures us that the French, unless they had seen them, could not have believed that such destitution existed, and that now, for the first time, they understood what poverty really was.[66]

[60] "St. Andrews, Perth, and Aberdeen, appear to have been the three most populous cities before the Reformation." *Lawson's Roman Catholic Church in Scotland*, 1836, p. 26. The same assertion is made in *Lyon's History of St. Andrews*, 1843, vol. i. p. 2. But neither of these writers appears to have made many researches on the subject, or else they would not have supposed that Aberdeen was larger than Edinburgh.

[61] I have carefully read the two histories of St. Andrews, by Dr. Grierson and by Mr. Lyon, but have found nothing in them of any value concerning the early history of that city. Mr. Lyon's work, which is in two thick volumes, is unusually superficial, even for a local history ; and that is saying much.

[62] "Of the thirteen parliaments held in the reign of King James I., eleven were held at Perth, one at Stirling, and one at Edinburgh. The National Councils of the Scottish clergy were held there uniformly till 1459. Though losing its pre-eminence by the selection of Edinburgh as a capital, Perth has uniformly and constantly maintained the second place in the order of burghs, and its right to do so has been repeatedly and solemnly acknowledged." *Penny's Traditions of Perth*, Perth, 1836, p. 231. See also p. 305. It appears, however, from Froissart, that Edinburgh was deemed the capital in the latter half of the fourteenth century.

[63] I find one instance of its being praised by a man who was not a Scotchman. Alexander Necham "takes notice of Perth in the following distich, quoted in *Camden's Britannia :*

'Transis ample Tai, per rura, per oppida, per Perth :
Regnum sustentant illius urbis opes.'

Thus Englished in Bishop Gibson's Translation of Camden's Book :

'Great Tay, through Perth, through towns, through country flies :
Perth the whole kingdom with her wealth supplies.'"

Sinclair's Scotland, vol. xviii. p. 511.

[64] $1,427 \times 6 = 8,562$, the computed population in 1584 and 1585, exclusive of the extraordinary mortality caused by the plague. *Chambers' Annals of Scotland*, 1858, vol. i. p. 158.

[65] "The inhabitants of the capital, in the reign of Robert II., hardly exceeded sixteen thousand." *Pinkerton's History of Scotland*, vol. i. p. 152.

[66] When the French arrived in Edinburgh, the Scotch said, "'Quel diable les a mandés ? Ne savons-nous pas bien faire notre guerre sans eux aux Anglois ? Nous ne ferons jà bonne besogne tant comme ils soient avec nous. On leur dise que ils s'en revoisent, et que

After this period there was no doubt considerable improvement; but it was very slow, and even late in the sixteenth century skilled labour was hardly known, and honest industry was universally despised.[67] It is not therefore surprising that the citizens, poor, miserable, and ignorant, should frequently purchase the protection of some powerful noble by yielding to him the little independence that they might have retained.[68] Few of the Scotch towns ventured

nous sommes gens assez en Escosse pour parmaintenir notre guerre, et que point nous ne voulons leur compagnie. Ils ne nous entendent point, ni nous eux; nous ne savons parler ensemble; ils auront tantôt riflé et mangé tout ce qui est en ce pays: ils nous feront plus de contraires, de dépits, et de dommages, si nous les laissons convenir, que les Anglois ne feroient si ils s'étoient embattus entre nous sans ardoir. Et si les Anglois ardent nos maisons, que peut il chaloir? Nous les aurons tantôt refaites à bon marché, nous n'y mettons au refaire que trois jours, mais que nous ayons quatre ou six estaches et de la ramée pour lier par dessus.' "

"Ainsi disoient les Escots en Escosse à la venue des seigneurs de France." . . . "Et quand les Anglois y chevauchent ou que ils y vont, ainsi que ils y ont été plusieurs fois, il convient que leurs pourvéances, si ils veulent vivre, les suivent toujours au dos; car on ne trouve rien sur le pays: à grand'peine y recuevre-l'en du fer pour serrer les chevaux, ni du cuir pour faire harnois, selles ni brides. Les choses toutes faites leur viennent par mer de Flandre, et quand cela leur défaut, ils n'ont nulle chose. Quand ces barons et ces chevaliers de France qui avoient appris ces beaux hôtels à trouver, ces salles parées, ces chasteaux et ces bons mols lits pour reposer, se virent et trouverent en celle povreté, si commencerent à rire et à dire: 'En quel pays nous a ci amenés l'amiral? Nous ne sçumes oncques que ce fût de povreté ni de dureté fors maintenant.' " *Les Chroniques de Froissart*, edit. Buchon, Paris, 1835, vol. ii. pp. 314, 315. "The hovels of the common people were slight erections of turf or twigs, which, as they were often laid waste by war, were built merely for temporary accommodation. Their towns consisted chiefly of wooden cottages." . . . "Even as late as 1600 the houses of Edinburgh were chiefly built of wood." *Chalmers' Caledonia*, vol. i. p. 802. Another account, written in 1670, says, "The houses of the commonalty are very mean, mud-wall and thatch, the best; but the poorer sort live in such miserable huts as never eye beheld." . . . "In some parts, where turf is plentiful, they build up little cabbins thereof, with arched roofs of turf, without a stick of timber in it: when the house is dry enough to burn, it serves them for fuel, and they remove to another." *Harleian Miscellany*, vol. vi. p. 139, 4to, 1810.

[67] "Our manufactures were carried on by the meanest of the people, who had small stocks, and were of no reputation. These were for the most part workmen for home-consumpt, such as masons, house-carpenters, armourers, blacksmiths, taylors, shoemakers, and the like. Our weavers were few in number, and in the greatest contempt, as their employments were more sedentary, and themselves reckoned less fit for war, in which all were obliged to serve when the exigencies of the country demanded their attendance." *The Interest of Scotland Considered*, Edinburgh, 1733, p. 82. Pinkerton (*History of Scotland*, vol. ii. p. 392), referring to the Sloane manuscripts, says, "The author of an interesting memoir concerning the state of Scotland about 1590 observes that the husbandmen were a kind of slaves, only holding their lands from year to year; that the nobility being too numerous for the extent of the country, there arose too great an inequality of rank and revenue; and there was no middle station between a proud landholder and those who, having no property to lose, were ready for any tumult. A rich yeomanry, numerous merchants and tradesmen of property, and all the denominations of the middle class, so important in a flourishing society, were long to be confined to England." Thirteen years later, we are told that the manufacturers of Scotland "were confined to a few of the coarsest nature, without which the poorest nations are unable to subsist." *Laing's History of Scotland*, vol. iii. p. 7, under the year 1603.

[68] Thus, for instance, "the town of Dunbar naturally grew up under the shelter of the castle of the same name." . . . "Dunbar became the town, in demesn, of the successive Earls of Dunbar and March, partaking of their influences, whether unfortunate or happy. *Chalmers' Caledonia*, vol. ii. p. 416. "But when the regal government became at any time feeble, these towns, unequal to their own protection, placed themselves under the shelter of the most powerful lord in their neighbourhood. Thus the town of Elgyn found it

to elect their chief magistrate from among their own people ; but the usual course was to choose a neighbouring peer as provost or baillie.[69] Indeed, it often happened that his office became hereditary, and was looked upon as the vested right of some aristocratic family.[70] To the head of that family everything gave way. His authority was so incontestable that an injury done even to one of his retainers was resented as if it had been done to himself.[71] The burgesses who were sent to parliament were completely dependent on the noble who ruled the town. Down to quite modern times there was in Scotland no real popular representation. The so-called representatives were obliged to vote as they were ordered ; they were in fact delegates of the aristocracy ; and as they possessed no chamber of their own, they sat and deliberated in the midst of their powerful masters, by whom they were openly intimidated.[72]

necessary, at various periods between the years 1389 and 1452, to accept of many charters of protection, and discharges of taxes, from the Earls of Moray, who held it in some species of vassalage." *Sinclair's Scotland*, vol. v. p. 3. Compare *Pinkerton's History of Scotland*, vol. ii. p. 396 ; and two letters, written in 1543 and 1544, by the magistrates of Aberdeen, to the Earl of Huntly, and printed in the *Council Register of Aberdeen*, vol. i. pp. 190, 201, Aberdeen, 1844, 4to. They say to him, " Ye haf our band as protectour to wss."

[69] *Tytler's History of Scotland*, vol. iv. p. 225. See also p. 131 ; and *Pinkerton's History of Scotland*, vol. ii. p. 179. Sometimes the nobles did not leave to the citizens even the appearance of a free election, but fought it out among themselves. An instance of this happened at Perth, in 1544, " where a claim for the office of provost was decided by arms, between Lord Ruthven on the one side, supported by a numerous train of his vassals, and Lord Gray, with Norman Lesley master of Rothes, and Charteris of Kinfauns, on the other." *Tytler*, vol. iv. p. 323.

[70] For illustrations of this custom, see *Hollinshead's Scottish Chronicle*, vol. ii. p. 230. *Brown's History of Glasgow*, vol. ii. p. 154. *Denholm's History of Glasgow*, p. 249. *Mercer's History of Dunfermline*, p. 83.

[71] " An injury inflicted on the ' man ' of a nobleman was resented as much as if he himself had been the injured party." *Preface to the Council Register of Aberdeen*, vol. i. p. xii.

[72] See, in *Macaulay's History of England*, vol. i. p. 93, 1st edit., a spirited description of Scotland in 1639. " The parliament of the northern kingdom was a very different body from that which bore the same name in England." . . . " The three estates sat in one house. The commissioners of the burghs were considered merely as retainers of the great nobles," &c. To come down much later, Lord Cockburn gives a terrible account of the state of things in Scotland in 1794, the year in which Jeffrey was called to the bar. " There was then, in this country, no popular representation, no emancipated burghs, no effective rival of the established church, no independent press, no free public meetings, and no better trial by jury, even in political cases (except high treason), than what was consistent with the circumstances that the jurors were not sent into court under any impartial rule, and that, when in court, those who were to try the case were named by the presiding judge. The Scotch representatives were only forty-five, of whom thirty were elected for counties, and fifteen for towns. Both from its price and its nature (being enveloped in feudal and technical absurdities), the elective franchise in counties, where alone it existed, was far above the reach of the whole lower, and of a great majority of the middle, and of many even of the higher, ranks. There were probably not above 1,500 or 2,000 county electors in all Scotland ; a body not too large to be held, hope included, in government's hand. The return, therefore, of a single opposition member was never to be expected." . . . " Of the fifteen town members, Edinburgh returned one. The other fourteen were produced by clusters of four or five unconnected burghs electing each one delegate, and these four or five delegates electing the representative. Whatever this system may have been originally, it had grown, in reference to the people, into as complete a mockery as if it had been invented for their degradation. The people had nothing to do with it. It was all managed by town-councils, of never more than thirty-three members ; and every town-council was self-elected, and consequently perpetuated its own interests. The election of either the town or the county member was a matter of

Under these circumstances, it would have been idle for the crown to have expected aid from a body of men who themselves had no influence, and whose scanty privileges existed only on sufferance. But there was another class which was extremely powerful, and to which the Scotch kings naturally turned. That class was the clergy; and the interest which both parties had in weakening the nobles caused a coalition between the church and the throne, against the aristocracy. During a long period, and indeed until the latter half of the sixteenth century, the kings almost invariably favoured the clergy, and increased their privileges in every way they could. The Reformation dissolved this alliance, and gave rise to new combinations, which I shall presently indicate. But while the alliance lasted it was of great use to the clergy, by imparting to their claims a legitimate sanction, and making them appear the supporters of order and of regular government. The result, however, clearly proved that the nobles were more than equal to the confederacy which opposed them. Indeed, looking at their enormous power, the only wonder is that the clergy could have prolonged the contest as they did; since they were not actually overthrown until the year 1560. That the struggle should have been so arduous, and should have extended over so considerable a period, is what, on a superficial view, no one could have expected. The reason of this I shall now endeavour to explain; and I shall, I trust, succeed in proving that in Scotland there was a long train of general causes which secured to the spiritual classes immense influence, and which enabled them not only to do battle with the most powerful aristocracy in Europe, but to rise up, after what seemed their final defeat, fresh and vigorous as ever, and eventually to exercise, as Protestant preachers, an authority nowise inferior to that which they had wielded as Catholic priests.

Of all Protestant countries, Scotland is certainly the one where the course of affairs has for the longest period been most favourable to the interests of superstition. How those interests were encouraged during the seventeenth and eighteenth centuries I shall hereafter relate. At present, I purpose to examine the causes of their early growth, and to show the way in which they were not only connected with the Reformation, but gave to that great event some peculiarities which are extremely remarkable, and are diametrically opposed to what happened in England.

If the reader will bear in mind what I have elsewhere stated,[73] he will remember that the two principal sources of superstition are ignorance and danger; ignorance keeping men unacquainted with natural causes, and danger making them recur to supernatural ones. Or, to express the same proposition in other words, the feeling of veneration, which under one of its aspects takes the form of superstition, is a product of wonder and of fear;[74] and it is obvious that wonder is connected with ignorance, and that fear is connected with danger.[75] Hence it is that whatever in any country increases the total amount of amazement, or whatever in any country increases the total amount of peril, has a direct tendency

such utter indifference to the people that they often only knew of it by the ringing of a bell, or by seeing it mentioned next day in a newspaper: for the farce was generally performed in an apartment from which, if convenient, the public could be excluded, and never in the open air." *Cockburn's Life of Jeffrey*, Edinburgh, 1852, vol. i. pp. 74–76. On the state of Scotch representation between this and the Reform Bill, compare *Irving's History of Dumbartonshire*, 4to, 1860, pp. 275, 276, with *Moore's Memoirs*, edited by Lord John Russell, vol. iv. p. 268, vol. vi. p. 163, London, 1853–4.

[73] Above, pp. 68–71, 211-215.

[74] Above, p. 384.

[75] We must discriminate between wonder and admiration. Wonder is the product of ignorance; admiration is the product of knowledge. Ignorance wonders at the supposed irregularities of nature; science admires its uniformities. The earlier writers rarely attended to this distinction, because they were misled by the etymology of the word "admiration." The Romans were very superficial thinkers upon all matters except jurisprudence; and their blundering use of "admirari" gave rise to the error, so common among our old writers, of "I admire," instead of "I wonder."

to increase the total amount of superstition, and therefore to strengthen the hands of the priesthood.

By applying these principles to Scotland, we shall be able to explain several facts in the history of that country. In the first place, the features of its scenery offer a marked contrast to those of England, and are much more likely, among an ignorant people, to suggest effective and permanent superstitions.* The storms and the mists, the darkened sky flashed by frequent lightning, the peals of thunder reverberating from mountain to mountain, and echoing on every side, the dangerous hurricanes, the gusts sweeping the innumerable lakes with which the country is studded, the rolling and impetuous torrent flooding the path of the traveller and stopping his progress, are strangely different to those safer and milder phenomena among which the English people have developed their prosperity, and built up their mighty cities. Even the belief in witchcraft, one of the blackest superstitions which has ever defaced the human mind, has been affected by these peculiarities; and it has been well observed that while according to the old English creed the witch was a miserable and decrepit hag, the slave rather than the mistress of the demons which haunted her, she in Scotland rose to the dignity of a potent sorcerer, who mastered the evil spirit, and, forcing it to do her will, spread among the people a far deeper and more lasting terror.[76]

[76] "Our Scottish witch is a far more frightful being than her supernatural coadjutor on the south side of the Tweed. She sometimes seems to rise from the proper sphere of the witch, who is only the slave, into that of the sorcerer, who is master of the demon." . . . "In a people, so far behind their neighbours in domestic organization, poor and hardy, inhabiting a country of mountains, torrents, and rocks, where cultivation was scanty, accustomed to gloomy mists and wild storms, every impression must necessarily assume a corresponding character. Superstitions, like funguses and vermin, are existences peculiar to the spot where they appear, and are governed by its physical accidents." . . . "And thus it is that the indications of witchcraft in Scotland are as different from those of the superstition which in England receives the same name, as the Grampian Mountains from Shooter's Hill or Kennington Common." *Burton's Criminal Trials in Scotland*, vol. i. pp. 240–243. This is admirably expressed, and exhausts the general view of the subject. The relation between the superstition of the Scotch and the physical aspects of their country is also touched upon, though with much inferior ability, in *Browne's History of the Highlands*, vol. i. p. 106, and in *Sinclair's Scotland*, vol. iv. p. 560. Hume, in his *Commentaries on the Law of Scotland*, vol. ii. p. 556, has an interesting passage on the high pretensions of Scotch witchcraft, which never degenerated, as in other countries, into a mere attempt at deception, but always remained a sturdy and deep-rooted belief. He says, "For, among the many trials for witchcraft which fill the record, I have not observed that there is even one which proceeds upon the notion of a vain or cheating art, falsely used by an impostor to deceive the weak and credulous."† Further information respecting Scotch witchcraft will be found in *Mackenzie's Criminal Laws of Scotland*, Edinburgh, folio, 1699, pp. 42–56; *Correspondence of Mrs. Grant of Laggan*, London, 1844, vol. iii. pp. 186, 187; *Southey's Life of Bell*, London, 1844, vol. i. p. 52; *Vernon Correspondence*, edited by James, London, 1841, vol. ii. p. 301; *Weld's History of the Royal Society*, London, 1848, vol. i. p. 89 *Letters from a Gentleman in the*

[* The weak point in the following eloquent description is that it applies mainly to the Highlands, which were not the seat of the Reformation movement. Even there, the hurricanes and thunderstorms are not more frequent than in England. On the other hand, the description applies well to the bulk of Switzerland, where, in the terms of the argument, the superstition should be enormous. It is true, however, that the early superstitions, Celtic and Teutonic, kept their force longer in Scotland than in Southern England. Broadly, this may be set down to the much longer continuance of barbaric conditions.—Ed.]

[† There is here a complete confusion between the beliefs of the accused and the beliefs of their judges. That there were cheats as well as deluded persons among those *charged* with witchcraft in Scotland, as in other countries, is certain. The passage cited tells only of the unrelieved superstition of their prosecutors.—Ed.]

Similar results were produced by the incessant and sanguinary wars to which Scotland was exposed, and especially by the cruel ravages of the English in the fourteenth century. Whatever religion may be in the ascendant, the influence of its ministers is invariably strengthened by a long and dangerous war, the uncertainties of which perplex the minds of men, and induce them, when natural resources are failing, to call on the supernatural for help. On such occasions the clergy rise in importance; the churches are more than usually filled; and the priest, putting himself forward as the exponent of the wishes of God, assumes the language of authority, and either comforts the people under their losses in a righteous cause, or else explains to them that those losses are sent as a visitation for their sins, and as a warning that they have not been sufficiently attentive to their religious duties; in other words, that they have neglected rites and ceremonies in the performance of which the priest himself has a personal interest.

No wonder therefore that in the fourteenth century, when the sufferings of Scotland were at their height, the clergy flourished more than ever; so that as the country became poorer, the spiritual classes became richer in proportion to the rest of the nation. Even in the fifteenth and first half of the sixteenth century, when industry began somewhat to advance, we are assured that notwithstanding the improvement in the position of laymen, the whole of their wealth put together, and including the possessions of all ranks, was barely equal to the wealth of the Church.[77] If the hierarchy were so rapacious and so successful during a period of comparative security, it would be difficult to overrate the enormous harvest they must have reaped in those earlier days when, danger being much more imminent, hardly any one died without leaving something to them; all being anxious to testify their respect towards those who knew more than their fellows, and whose prayers could either avert present evil, or secure future happiness.[78]

North of Scotland, edit. 1815, vol. i. pp. 220, 221; *The Spottiswoode Miscellany*, vol. ii. p. 41, Edinburgh, 1845; *Lyon's History of St. Andrews*, Edinburgh, 1843, vol. ii. pp. 56, 57. The work of James I., and that of Sir Walter Scott, need hardly be referred to, as they are well known to every one who is interested in the history of witchcraft; but Pitcairn's *Criminal Trials*, though less read, are in every respect more valuable, on account of the materials they contain for a study of this department of Scotch superstition.

[77] Pinkerton (*History of Scotland*, vol. i. p. 414) says that in the reigns of James II. and James III., "the wealth of the Church was at least equivalent to that of all the lay interest." See also *Life of Spottiswoode*, p. liii., in volume i. of his *History of the Church of Scotland*. "The numerous devices employed by ecclesiastics, both secular and regular, for enriching the several Foundations to which they were attached, had transferred into their hands more than half of the territorial property of Scotland, or of its annual produce."

In regard to the first half of the sixteenth century, it is stated by a high authority that just before the Reformation "the full half of the wealth of the nation belonged to the clergy." *M'Crie's Life of Knox*, p. 10. And another writer says, "If we take into account the annual value of all these abbeys and monasteries, in conjunction with the bishoprics, it will appear at once that the Scottish Catholic hierarchy was more munificently endowed, considering the extent and resources of the kingdom, than it was in any other country in Europe." *Lawson's Roman Catholic Church in Scotland*, p. 22. See also, respecting the incomes of the Scotch bishops, which, considering the poverty of the country, were truly enormous, *Lyon's History of St. Andrews*, Edinburgh, 1843, vol. i. pp. 97, 125.

[78] "They could employ all the motives of fear and of hope, of terror and of consolation, which operate most powerfully on the human mind. They haunted the weak and the credulous; they besieged the beds of the sick and of the dying; they suffered few to go out of the world without leaving marks of their liberality to the Church, and taught them to compound with the Almighty for their sins by bestowing riches upon those who called themselves his servants." *History of Scotland*, book ii. p. 89, in *Robertson's Works*, London, 1831. It is interesting to observe the eagerness with which the clergy of one persuasion expose the artifices of those of another. By comparing their different statements, laymen gain an insight into the entire scheme.

Another consequence of these protracted wars was that a more than ordinary proportion of the population embraced the ecclesiastical profession, because in it alone there was some chance of safety; and the monasteries in particular were crowded with persons who hoped, though frequently in vain, to escape from the burnings and slaughterings to which Scotland was exposed. When the country, in the fifteenth century, began to recover from the effects of these ravages, the absence of manufactures and of commerce made the Church the best avenue to wealth;[79] so that it was entered by peaceful men for the purpose of security, and by ambitious men as the surest means of achieving distinction.

Thus it was that the want of great cities, and of that form of industry which belongs to them, made the spiritual classes more numerous than they would otherwise have been; and what is very observable is that it not only increased their number, but also increased the disposition of the people to obey them. Agriculturists are naturally, and by the very circumstances of their daily life, more superstitious than manufacturers, because the events with which they deal are more mysterious, that is to say, more difficult to generalize and predict.[80] Hence it is that, as a body, the inhabitants of agricultural districts pay greater respect to the teachings of their clergy than the inhabitants of manufacturing districts. The growth of cities has therefore been a main cause of the decline of ecclesiastical power; and the fact that until the eighteenth century Scotland had nothing worthy of being called a city, is one of many circumstances which explain the prevalence of Scotch superstition, and the inordinate influence of the Scotch clergy.

To this we must add another consideration of great moment. Partly from the structure of the country, partly from the weakness of the crown, and partly from the necessity of being constantly in arms to repel foreign invaders, the predatory habits incidental to an early state of society were encouraged, and consequently the reign of ignorance was prolonged. Little was studied, and nothing was known. Until the fifteenth century there was not even an university in Scotland, the first having been founded at St. Andrews in 1412.[81] The nobles, when they were not making war upon the enemy, occupied themselves in cutting each other's throats, and stealing each other's cattle.[82] Such was their ignorance, that even late in the fourteenth century there is said to be no instance of a Scotch baron being able to sign his own name.[83] And as nothing approaching to a middle class had

[79] Pinkerton observes, under the year 1514, that "ecclesiastical dignities presented almost the only path to opulence." *History of Scotland*, vol. ii. p. 123.

[80] Above, pp. 213-215.

[81] Arnot (*History of Edinburgh*, p. 386) says that the University of St. Andrews was founded in 1412; and the same thing is stated in *Kennedy's Annals of Aberdeen*, vol. ii. p. 83. Grierson, in his *History of St. Andrews*, Cupar, 1838, p. 14, says, "In 1410 the city of St. Andrews first saw the establishment of its famous university, the most ancient institution of the kind that exists in Scotland;" but at p. 144 of the same work we are told that the charter, "constituting and declaring it to be a university," is "dated at St. Andrews, the 27th of February, 1411." See also *Lyon's History of St. Andrews*, vol. i. pp. 203–206, vol. ii. p. 223. At all events, "at the commencement of the fifteenth century, no university existed in Scotland; and the youth who were desirous of a liberal education were under the necessity of seeking it abroad." *M'Crie's Life of Melville*, vol. i. p. 211. The charter granted by the Pope, confirming the university, reached Scotland in 1413. *Lawson's Roman Catholic Church in Scotland*, Edinburgh, 1836, p. 12.

[82] Those were times when, as a Scotch lawyer delicately expresses himself, "thieving was not the peculiar habit of the low and indigent, but often common to them with persons of rank and landed estate." *Hume's Commentaries on the Law of Scotland*, 4to, 1797, vol. i. p. 126. The usual form of robbery being cattle-stealing, a particular name was invented for it; see p. 148, where we learn that it "was distinguished by the name of Hership or Herdship, being the driving away of numbers of cattle, or other bestial, by the masterful force of armed people."

[83] Tytler, who was a great patriot, and disposed to exaggerate the merit of everything which was Scotch, does nevertheless allow that, "from the accession of Alexander III.

been yet formed, we may from this gain some idea of the amount of knowledge possessed by the people at large.[84] Their minds must have been immersed in a darkness which we can now barely conceive. No trades or arts being practised which required skill or dexterity, there was nothing to exercise their intellects. They consequently remained so stupid and brutal that an intelligent observer who visited Scotland in the year 1360 likens them to savages, so much was he struck by their barbarism and their unsocial manners.[85] Another writer, early in the fifteenth century, uses the same expression; and, classing them with the animals which they tended, he declares that Scotland is fuller of savages than of cattle.[86]

By this combination of events, and by this union of ignorance with danger, the clergy had in the fifteenth century obtained more influence in Scotland than in any other European country, Spain alone excepted. And as the power of the nobles had increased quite as rapidly, it was natural that the crown, completely overshadowed by the great barons, should turn for aid to the Church. During the fifteenth century and part of the sixteenth, this alliance was strictly preserved;[87] and the political history of Scotland is the history of a struggle by the kings and the clergy against the enormous authority of the nobles. The contest, after lasting about a hundred and sixty years, was brought to a close in 1560, by the triumph of the aristocrary and the overthrow of the Church. With such force, however, had the circumstance just narrated engrained superstition into the Scotch character, that the spiritual classes quickly rallied, and under their new name of Protestants they became as formidable as under their old name of Catholics. Forty-three years after the establishment of the Reformation in Scotland, James VI. ascended the throne of England, and was able to array the force of the southern country against the refractory barons of the northern.* From that moment the Scotch aristocracy began to decline; and the equipoise to the clergy being removed, the Church became so powerful that during the seventeenth and eighteenth centuries it was the most effectual obstacle to the progress of Scotland; and even now it exercises a sway which is incomprehensible to those who have not carefully studied the whole chain of its antecedents. To

to the death of David II. (*i.e.* in 1370), it would be impossible, I believe, to produce a single instance of a Scottish baron who could sign his own name." *Tytler's History of Scotland*, vol. ii. pp. 239, 240. Early in the sixteenth century, I find it casually mentioned that "David Straiton, a cadet of the house of Laureston," . . . "could not read." *Wodrow's Collections*, vol. i. pp. 5, 6. The famous chief, Walter Scott of Harden, was married in 1567; and "his marriage contract is signed by a notary, because none of the parties could write their names." *Chambers' Annals*, vol. i. p. 46. Crawfurd (*History of Renfrew*, part iii. p. 313) says: "the modern practice of subscribing names to writs of moment was not used in Scotland till about the year 1540:" but he forgets to tell us why it was not used. In 1564 Robert Scot of Thirlstane, "ancestor of Lord Napier," could not sign his name. See *Pitcairn's Criminal Trials in Scotland*, vol. iii. p. 394.

[84] A Scotchman of considerable learning says: "Scotland was no less ignorant and superstitious at the beginning of the fifteenth century than it was towards the close of the twelfth." *Dalrymple's Annals of Scotland*, vol. i. p. 428.

[85] "Et sont ainsi comme gens sauvages qui ne se savent avoir ni de nulli accointer." *Les Chroniques de Froissart*, edit. Buchon, Paris, 1835, vol. ii. p. 315.

[86] "Plus pleine de sauvagine que de bestail." *Hist. de Charles VI., par Le Laboureur*, quoted in *Pinkerton's History of Scotland*, vol. i. p. 149.

[87] Occasionally we find evidence of it earlier, but it was hardly systematic. Compare *Tytler's History of Scotland*, vol. i. p. 66, with *Dalrymple's Annals*, vol. i. pp. 72, 110, 111, 194, vol. iii. p. 296; *Nimmo's History of Stirlingshire*, p. 88; *Chalmers' History of Dunfermline*, pp. 133, 134.

[* In reality, no such array ever took place, save in so far as James could summon a troublesome subject like Andrew Melville to England. By that time the barons were glutted with the spoils of the Church.—Ed.]

trace with minuteness the long course of affairs which has led to this unfortunate result, would be incompatible with the object of an Introduction whose only aim it is to establish broad and general principles. But to bring the question clearly before the mind of the reader, it will be necessary that I should give a slight sketch of the relation which the nobles bore to the clergy in the fifteenth and sixteenth centuries, and of the way in which their relative position, and their implacable hatred of each other, brought about the Reformation. By this means we shall perceive that the great Protestant movement which in other countries was democratic, was in Scotland aristocratic. We shall also see that in Scotland the Reformation, not being the work of the people, has never produced the effects which might have been expected from it, and which it did produce in England. It is indeed but too evident that while in England Protestantism has diminished superstition, has weakened the clergy, has increased toleration, and, in a word, has secured the triumph of secular interests over ecclesiastical ones, its result in Scotland has been entirely different ; and that in that country the Church, changing its form without altering its spirit, not only cherished its ancient pretensions, but unhappily retained its ancient power ; and that, although that power is now dwindling away, the Scotch preachers still exhibit, whenever they dare, an insolent and domineering spirit which shows how much real weakness there yet lurks in the nation, where such extravagant claims are not immediately silenced by the voice of loud and general ridicule.

CHAPTER XVII

Condition of Scotland in the Fifteenth and Sixteenth Centuries.

Early in the fifteenth century the alliance between the Crown and the Church, and the determination of that alliance to overthrow the nobles, became manifest. Indications of this may be traced in the policy of Albany, who was Regent from 1406 to 1419, and who made it his principal object to encourage and strengthen the clergy.[1] He also dealt the first great blow upon which any government had ventured against the aristocracy. Donald, who was one of the most powerful of the Scottish chieftains,* and who, indeed, by the possession of the Western Isles, was almost an independent prince, had seized the earldom of Ross, which, if he could have retained, would have enabled him to set the Crown at defiance. Albany, backed by the Church, marched into his territories in 1411, forced him to renounce the earldom, to make personal submission, and to give hostages for his future conduct.[2] So vigorous a proceeding on the part of the executive was extremely unusual in Scotland ;[3] and it was the first of a series of aggressions which ended in the Crown obtaining for itself not only Ross, but also the Western Isles.[4] The policy inaugurated by Albany was followed up with still greater energy by James I.† In 1424 this bold and active prince procured an enactment,

[1] "The Church was eminently favoured by Albany." *Pinkerton's History of Scotland*, vol. i. p. 86. But Pinkerton misunderstands his policy in regard to the nobles. [The statement as to the Church appears to be an error. See note on next page.—Ed.]

[2] *Skene's Highlanders*, vol. ii. pp. 72–74 ; *Browne's History of the Highlands*, vol. i. p. 162, vol. iv. pp. 435, 436. [Donald had been resisted by the whole Lowland nobility. It was a struggle not of church with nobles, but of race with race. Donald's son, however, kept the earldom.—Ed.]

[3] Chalmers (*Caledonia*, vol. i. pp. 826, 827), referring to the state of things before Albany, says, "There is not a trace of any attempt by Robert II. to limit the power of the nobles, whatever he may have added, by his improvident grants, to their independence. He appears not to have attempted to raise the royal prerogative from the debasement in which the imprudence and misfortunes of David II. had left it." And of his successor, Robert III., "So mild a prince, and so weak a man, was not very likely to make any attempt upon the power of others, when he could scarcely support his own."

[4] In 1476, "the Earldom of Ross was inalienably annexed to the Crown ; and a great

[* Buckle has not realized that the Lord of the Isles, a Gaelic prince, always hitherto hostile to the Scoto-Norman kings, was on quite a different footing from the Scoto-Norman nobles. Albany attacked him only after the battle of Harlaw, in which Donald, the aggressor, was defeated (*Tytler, History of Scotland*, ed. 1869, ii. 42). So far from seeking to strengthen the crown against the nobles, Albany merely sought to maintain his own position ; and the sending of Prince James to France—frustrated by his capture by the English—was planned by the loyal nobles in the interest of the crown.—Ed.]

[† James's policy was entirely new. Albany had been his enemy, perhaps his betrayer. The nobles whom James arrested, as noted below, were of Albany's party ; and those whom he put to death were of Albany's house—his own kindred. See Tytler, ii. 56–59. Tytler notes "the *indulgence* to which the aristocracy were accustomed under Albany" (p. 58).—Ed.]

obliging many of the nobles to show their charters, in order that it might be ascertained what lands they held which had formerly belonged to the Crown.[5] And to conciliate the affections of the clergy, he in 1425 issued a commission, authorizing the Bishop of Saint Andrews to restore to the Church whatever had been alienated from it* ; while he at the same time directed that the justiciaries should assist in enforcing execution of the decree.[6] This occurred in June ; and what shows that it was part of a general scheme is that in the preceding spring the king suddenly arrested, in the parliament assembled at Perth, upwards of twenty of the principal nobles, put four of them to death, and confiscated several of their estates.[7] Two years afterwards, he with equal perfidy summoned the Highland chiefs to meet him at Inverness, laid hands on them also, executed three, and imprisoned more than forty, in different parts of the kingdom.[8]

By these measures, and by supporting the Church with the same zeal that he attacked the nobles, the king thought to reverse the order of affairs hitherto established, and to secure the supremacy of the throne over the aristocracy.[9] But herein he overrated his own power. Like nearly all politicians, he exaggerated the value of political remedies. The legislator and the magistrate may for a moment palliate an evil ; they can never work a cure. General mischiefs depend upon general causes, and these are beyond their art. The symptoms of the disease they can touch, while the disease itself baffles their efforts, and is too often exasperated by their treatment. In Scotland the power of the nobles was a cruel malady, which preyed on the vitals of the nation ; but it had long been

blow was thus struck at the power and grandeur of a family which had so repeatedly disturbed the tranquillity of Scotland." *Gregory's History of the Western Highlands*, Edinburgh, 1836, p. 50. In 1493 " John, fourth and last Lord of the Isles, was forfeited, and deprived of his title and estates." *Ibid.* p. 58.

[5] As those who held crown lands were legally, though not in reality, the king's tenants, the act declared, that " gif it like the king, he may ger sumonde all and sindry his tenand at lauchfull day and place to schawe thar chartis." *The Acts of the Parliaments of Scotland*, vol. ii. p. 4, § 9, edit. folio, 1814.

[6] " On the 8th June, 1425, James issued a commission to Henry, Bishop of St. Andrews, authorizing him to resume all alienations from the Church, with power of anathema, and orders to all justiciaries to assist. This curious paper is preserved in Harl. MS. 4637, vol. iii. f. 189." *Pinkerton's History of Scotland*, vol. i. p. 116. Archbishop Spottiswoode, delighted with his policy, calls him a " good king," and says that he built for the Carthusians " a beautiful monastery at Perth, bestowing large revenues upon the same." *Spottiswoode's History of the Church of Scotland*, vol. i. p. 113. And Keith assures us that on one occasion James I. went so far as to give to one of the bishops " a silver cross, in which was contained a bit of the wooden cross on which the apostle St. Andrew had been crucified." *Keith's Catalogue of Scotch Bishops*, Edinburgh, 1755, 4to, p. 67.

[7] Compare *Balfour's Annales*, vol. i. pp. 153–156, with *Pinkerton's History*, vol. i. pp. 113–115. Between these two authorities there is a slight but unimportant discrepancy.

[8] *Tytler's History of Scotland*, vol. iii. pp. 95–98 ; *Skene's Highlanders*, vol. ii. p. 75 ; and an imperfect narrative in *Gregory's History of the Western Highlands*, p. 35.

[9] Tytler (*History of Scotland*, vol. iii. p. 126), under the year 1433, says: " In the midst of his labours for the pacification of his northern dominions, and his anxiety for the suppression of heresy, the king never forgot his great plan for the diminution of the exorbitant power of the nobles." See also p. 84. " It was a principle of this enterprising monarch, in his schemes for the recovery and consolidation of his own power, to cultivate the friendship of the clergy, whom he regarded as a counterpoise to the nobles." Lord Somerville (*Memorie of the Somervilles*, vol. i. p. 173), says that the superior noblity were " never or seldome called to counsell dureing this king's reign."

[* The statement of Tytler (ed. 1869, ii. 64) is that the bishop (of *Aberdeen*) was authorized " to resume all alienations of the lands of the church which had been made *during the regencies of the two Albanies* "—a proof that the first Albany had *not* strengthened the Church against the nobles.—ED.]

preparing ; it was a chronic disorder ; and, having worked into the general habit, it might be removed by time, it could never be diminished by violence. On the contrary, in this as in all matters, whenever politicians attempt great good, they invariably inflict great harm. Overaction on one side produces reaction on the other, and the balance of the fabric is disturbed. By the shock of conflicting interests, the scheme of life is made insecure. New animosities are kindled, old ones are embittered, and the natural jar and discordance are aggravated, simply because the rulers of mankind cannot be brought to understand that, in dealing with a great country, they have to do with an organization so subtle, so extremely complex, and withal so obscure, as to make it highly probable that whatever they alter in it they will alter wrongly, and that while their efforts to protect or to strengthen its particular parts are extremely hazardous, it does undoubtedly possess within itself a capacity of repairing its injuries, and that to bring such capacity into play, there is merely required that time and freedom which the interference of powerful men too often prevents it from enjoying.

Thus it was in Scotland in the fifteenth century. The attempts of James I. failed because they were particular measures directed against general evils. Ideas and associations, generated by a long course of events, and deeply seated in the public mind, had given to the aristocracy immense power ; and if every noble in Scotland had been put to death, if all their castles had been razed to the ground, and all their estates confiscated, the time would unquestionably have come when their successors would have been more influential than ever, because the affection of their retainers and dependants would be increased by the injustice that had been perpetrated. For every passion excites its opposite. Cruelty to-day produces sympathy to-morrow. A hatred of injustice contributes more than any other principle to correct the inequalities of life and to maintain the balance of affairs. It is this loathing at tyranny which, by stirring to their inmost depth the warmest feelings of the heart, makes it impossible that tyranny should ever finally succeed. This, in sooth, is the noble side of our nature. This is that part of us which, stamped with a godlike beauty, reveals its divine origin, and, providing for the most distant contingencies, is our surest guarantee that violence shall never ultimately triumph ; that sooner or later despotism shall always be overthrown ; and that the great and permanent interests of the human race shall never be injured by the wicked counsels of unjust men.

In the case of James I., the reaction came sooner than might have been expected; and, as it happened in his lifetime, it was a retribution as well as a reaction. For some years he continued to oppress the nobles with impunity ;[10] but in 1436 they turned upon him and put him to death, in revenge for the treatment to which he had subjected many of them.[11] Their power now rose as suddenly as it had fallen. In the south of Scotland, the Douglases were supreme,[12] and the earl of that family possessed revenues about equal to those of the Crown.[13] And to show that his authority was equal to his wealth, he, on the marriage of James II. in 1449, appeared at the nuptials with a train composed of five thousand followers.[14] These were his own retainers, armed and resolute men, bound to

[10] Compare *Chalmers' Caledonia*, vol. ii. p. 263, with *Buchanan's Rerum Scoticarum Historia*, lib. x. p. 286.

[11] *Tytler's History of Scotland*, vol. iii. pp. 157, 158. [The statement in the text is misleading. James was assassinated by a few malcontents, who took him by surprise, and there was no combination of " the nobles " for the purpose. Finally, his widow was able to put the assassins to death.—Ed.]

[12] Lindsay of Pitscottie (*Chronicles*, vol. i. p. 2) says that directly after the death of James I., " Alexander, Earle of Douglas, being uerie potent in kine and friendis, contemned all the kingis officeris, in respect of his great puissance." The best account I have seen of the rise of the Douglases is in Chalmers' learned but ill-digested work, *Caledonia*, vol. i. pp. 579–583.

[13] In 1440 " the chief of that family had revenues, perhaps equivalent to those of the Scottish monarch." *Pinkerton's History of Scotland*, vol. i. p. 192.

[14] " It may give us some idea of the immense power possessed at this period by the Earl

obey any command he might issue to them. Not, indeed, that compulsion was needed on the part of a Scotch noble to secure the obedience of his own people. The servitude was a willing one, and was essential to the national manners. Then and long afterwards it was discreditable, as well as unsafe, not to belong to a great clan ; and those who were so unfortunate as to be unconnected with any leading family were accustomed to take the name of some chief, and to secure his protection by devoting themselves to his service.[15]

What the Earl of Douglas was in the south of Scotland, that were the Earls of Crawford and of Ross in the north.[16] Singly they were formidable ; united they seemed irresistible. When, therefore, in the middle of the fifteenth century they actually leagued together, and formed a strict compact against all their common enemies, it was hard to say what limit could be set to their power, or what resource remained to the government, except that of sowing disunion among them.[17]

But in the meantime, the disposition of the nobles to use force against the Crown had been increased by fresh violence. Government, instead of being warned by the fate of James I., imitated his unscrupulous acts, and pursued the very policy which had caused his destruction. Because the Douglases were the most powerful of all the great families, it was determined that their chiefs should be put to death ; and because they could not be slain by force, they were to be murdered by treachery. In 1440 the Earl of Douglas, a boy of fifteen, and his brother, who was still younger than he, were invited to Edinburgh on a friendly visit to the king.* Scarcely had they arrived, when they were seized by order of

of Douglas, when we mention that on this chivalrous occasion the military suite by which he was surrounded, and at the head of which he conducted the Scottish champions to the lists, consisted of a force amounting to five thousand men." *Tytler's History of Scotland*, vol. iii. p. 215. The old historian of his family says : " He is not easy to be dealt with ; they must have mufles that would catch such a cat. Indeed, he behaved himself as one that thought he would not be in danger of them ; he entertained a great family ; he rode ever well accompanied when he came in publick ; 1,000 or 2,000 horse were his ordinary train." *Hume's History of the House of Douglas*, vol. i. pp. 273, 274, reprinted Edinburgh, 1743.

[15] In the seventeenth century, " to be without a chief, involved a kind of disrepute ; and those who had no distinct personal position of their own would find it necessary to become a Gordon or a Crichton, as prudence or inclination might point out." *Burton's Criminal Trials in Scotland*, vol. i. p. 207. Compare *Pitcairn's Criminal Trials in Scotland*, vol. iii. p. 250, on " the protective surname of Douglas ; " and *Skene's Highlanders*, vol. ii. p. 252, on the extreme importance attached to the name of Macgregor.

[16] " Men of the greatest puissance and force next the Douglasses, that were in Scotland in their times." *Hume's History of the House of Douglas*, vol. i. p. 344. The great power of the Earls of Ross in the north dates from the thirteenth century. See *Skene's Highlanders*, vol. i. pp. 133, 134, vol. ii. p. 52.

[17] In 1445 the Earl of Douglas concluded " ane offensiue and defensiue league and combinatione aganist all, none excepted, (not the king himselue), with the Earle of Crawfurd, and Donald, Lord of the Isles ; wich was mutually sealled and subscriued by them three, the 7 day of Marche." *Balfour's Annales*, vol. i. p. 173. This comprised the alliance of other noble families. " He maid bandis with the Erle of Craufurd, and with Donald lorde of the Ylis, and Erle of Ross, to take part every ane with other, and with dyvers uther noble men also." *Lesley's History of Scotland*, from 1436 to 1561, p. 18. [There is some error here. It appears to be certain that Donald, Lord of the Isles, was dead about 1420 (*Gregory's History of the Western Highlands*, ed, 1881, p. 33). Mr. Lang (*Hist. of Scotland*, 1900

[* Buckle has here been misled by the family history of the Douglases. The young earl was seventeen years old at his accession in 1439 (Tytler, ed. cited, ii. 125 ; Burton, ii. 414), so that at the time of his execution he was eighteen. He was certainly no " child," but rode with a train of a thousand men-at-arms, defied the laws openly, and appears to have had some idea of claiming the succession to the throne, as he might do with some plausibility (Tytler and Burton, as cited). He was charged with high treason.—Ed.]

the chancellor, subjected to a mock trial, declared guilty, dragged to the castle-yard, and the heads of the poor children cut off.[18]

Considering the warm feelings of attachment which the Scotch entertained for their chiefs, it is difficult to overrate the consequences of this barbarous murder in strengthening a class it was hoped to intimidate. But this horrible crime was committed by the government only, and it occurred during the king's minority: the next assassination was the work of the king himself. In 1452 the Earl of Douglas [19] was, with great show of civility, requested by James II. to repair to the court then assembled at Stirling. The earl hesitated, but James overcame his reluctance by sending to him a safe-conduct with the royal signature, and issued under the great seal.[20] The honour of the king being pledged, the fears of Douglas were removed. He hastened to Stirling, where he was received with every distinction. The evening of his arrival, the king, after supper was over, broke out into reproaches against him, and, suddenly drawing his dagger, stabbed him. Gray then struck him with a battle-axe, and he fell dead on the floor, in presence of his sovereign, who had lured him to court that he might murder him with impunity.[21]

The ferocity of the Scotch character, which was the natural result of the ignorance and poverty of the nation, was no doubt one cause, and a very important one, of the commission of such crimes as these, not secretly, but in the open light of day, and by the highest men in the State.* It cannot however be denied

i. 328), disputes the narrative of Tytler (who follows Lesley and Balfour), arguing that there is "no evidence for the early date of this bond." But such a league does seem to have been entered into about 1451. *Hume Brown, Hist. of Scotland*, i. (1899) 232.—Ed.]

[18] [The executions were not simultaneous; the younger brother and another kinsman were beheaded some days later.—Ed.] An interesting account of this dastardly crime is given in *Hume's History of the House of Douglas*, vol. i. pp. 274–288, where great, but natural, indignation is expressed. On the other hand, Lesley, Bishop of Ross, narrates it with a cold-blooded indifference, characteristic of the ill-will which existed between the nobles and the clergy, and which prevented him from regarding the murder of two children as an offence. "And eftir he was set doun to the burd with the governour, chancellour, and otheris noble men present, the meit was sudantlie removed, and ane bullis heid presented, quhilk in thay daies was ane signe of executione; and incontinent the said erle, David his broder, and Malcolme Fleming of Cummernald, wer heidit before the castell yett of Edenburgh." *Lesley's History*, p. 16.

[19] The cousin of the boys who were murdered in 1440. See *Hume's History of the House of Douglas*, vol. i. pp. 297, 316. [His father and predecessor, the grand-uncle of the slain youths, seems to have connived at their death (Tytler, ii. 133).—Ed.]

[20] "With assurance under the broad seal." *Hume's House of Douglas*, vol. i. p. 351, See also *Nimmo's History of Stirlingshire*, Edinb. 1777, pp. 246, 322, 323.

[21] *Hume's House of Douglas*, vol. i. pp. 351–353. The king "stabbed him in the breast with a dagger. At the same instant Patrick Gray struck him on the head with a pole-ax. The rest that were attending at the door, hearing the noise, entred, and fell also upon him; and, to show their affection to the king, gave him every man his blow after he was dead." Compare *Lindsay of Pitscottie's Chronicles of Scotland*, vol. i. p. 103. "He strak him throw the bodie thairwith; and thairefter the guard, hearing the tumult within the chamber, rusched in and slew the earle out of hand." [It is not at all likely that the king had premeditated the assassination. (Burton, ii. 425, insists that there was no plan. Cp. Hume Brown, i. 233; Lang, i. 329). The only narratives of the episode represent the king as appealing to Douglas (his former friend) to break his treasonable league: and Douglas as replying with an insolence which provoked the king to fury. What is certain is that Douglas was an open and brutal violator of the laws, and guilty of many infamous slaughters, friends of the king being among his victims. It seems clear, however, that he came on a safe-conduct. Tytler, ed. cited, ii. 153–7.—Ed.]

[* The period was that of the Wars of the Roses. It is doubtful whether there was a pin to choose between the Scottish and the English character at that period.—Ed.]

that another cause was the influence of the clergy, whose interest it was to humble the nobles, and who were by no means scrupulous as to the means that they employed.[22] As the crown became more alienated from the aristocracy, it united itself still closer with the Church. In 1443 a statute was enacted, the object of which was to secure ecclesiastical property from the attacks made upon it by the nobles.[23] And although, in that state of society, it was easier to pass laws than to execute them, such a measure indicated the general policy of the government, and the union between it and the Church. Indeed, as to this, no one could be mistaken.[24] For nearly twenty years, the avowed and confidential adviser of the Crown was Kennedy, Bishop of Saint Andrews, who retained power until his death, in 1466, during the minority of James III.[25] He was the bitter enemy of the nobles, against whom he displayed an unrelenting spirit, which was sharpened by personal injuries; for the Earl of Crawford had plundered his lands, and the Earl of Douglas had attempted to seize him, and had threatened to put him into irons.[26] The mildest spirit might well have been roused by this; and as James II., when he assassinated Douglas, was more influenced by Kennedy than by any one else, it is probable that the bishop was privy to that foul transaction.* At all events, he expressed no disapprobation of it; and when, in consequence of the murder, the Douglases and their friends rose in open rebellion, Kennedy gave to the king a crafty and insidious counsel, highly characteristic of the cunning of his profession. Taking up a bundle of arrows, he showed James, that when they were together, they were not to be broken; but that if separated they

[22] In *Nimmo's History of Stirlingshire*, pp. 99, 100, the alienation of the nobles from the Church is dated "from the middle of the fifteenth century;" and this is perhaps correct in regard to general dislike, though the movement may be clearly traced fifty years earlier.

[23] See *Acts of the Parliaments of Scotland*, vol. ii. p. 33, edit. folio, 1814; respecting the "statute of haly kirk quhilk is oppressit and hurt."

[24] In 1449 James II., "with that affectionate respect for the clergy, which could not fail to be experienced by a prince who had successfully employed their support and advice to escape from the tyranny of his nobles, granted to them some important privileges." *Tytler's History of Scotland*, vol. iii. p. 226. See also p. 309. Among many similar measures, he conceded to the monks of Paisley some important powers of jurisdiction that belonged to the Crown. Charter, 13th January, 1451-2, in *Chalmers' Caledonia*, vol. iii. p. 823.

[25] *Pinkerton's History of Scotland*, vol. i. pp. 188, 209, 247, 254. *Keith's Catalogue of Scotch Bishops*, p. 19. *Ridpath's Border History*, p. 298. *Hollinshead's Scottish Chronicle*, vol ii. p. 101. In *Somerville's Memorie of the Somervilles*, vol. i. p. 213, it is stated, under the year 1452, that fear of the great nobles "had once possest his majestie with some thoughts of going out of the countrey; but that he was perswaded to the contrary by Bishop Kennedie, then Arch-bishop of Saint Andrewes, whose counsell at that tyme and eftirward in most things he followed, which at length proved to his majesties great advantage." See also *Lesley's History*, p. 23. "The king wes put to sic a sharp point, that he wes determinit to haif left the realme, and to haif passit in Fraunce by sey, were not that bischop James Kennedy of St. Androis causit him to tarrye."

[26] "His lands were plundered by the Earl of Crawford and Alexander Ogilvie of Inveraritie, at the instigation of the Earl of Douglas, who had farther instructed them to seize, if possible, the person of the bishop, and to put him in irons." Memoir of Kennedy, in *Chambers' Lives of Scotchmen*, vol. iii. p. 307, Glasgow, 1834. "Sed Kennedus et ætate, et consilio, ac proinde auctoritate cæteros anteibat. In eum potissimum ira est versa. Crafordiæ comes et Alexander Ogilvius conflato satis magno exercitu, agros ejus in Fifa latè populati, dum prædam magis, quam causam sequuntur, omni genere cladis in vicina etiam prædia grassati, nemine congredi auso pleni prædarum in Angusiam revertuntur. Kennedus ad sua arma conversus comitem Crafordiæ disceptationem juris fugientem diris ecclesiasticis est prosecutus." *Buchanan, Rerum Scoticarum Historia*, lib. xi. p. 306.

[* There being no appearance of premeditation, there is no basis for the charge against Kennedy.—ED.]

were easily destroyed. Hence he inferred that the aristocracy should be overthrown by disuniting the nobles, and ruining them one by one.[27]

In this he was right, so far as the interests of his own order were concerned; but looking at the interest of the nation, it is evident that the power of the nobles, notwithstanding their gross abuse of it was on the whole beneficial, since it was the only barrier against despotism. The evil they actually engendered was indeed immense. But they kept off other evils which would have been worse. By causing present anarchy, they secured future liberty. For as there was no middle class, there were only three orders in the commonwealth; namely, government, clergy, and nobles. The two first being united against the last, it is certain that if they had won the day Scotland would have been oppressed by the worst of all yokes to which a country can be subjected. It would have been ruled by an absolute king and an absolute Church, who, playing into each other's hands, would have tyrannized over a people who, though coarse and ignorant, still loved a certain rude and barbarous liberty, which it was good for them to possess, but which, in the face of such a combination, they would most assuredly have forfeited.*

Happily, however, the power of the nobles was too deeply rooted in the popular mind† to allow of this catastrophe. In vain did James III. exert himself to discourage them,[28] and to elevate their rivals, the clergy.[29] Nothing could shake their authority; and in 1482 they, seeing the determination of the king, assembled together, and such was their influence over their followers that they had no

[27] "This holie bischop schew ane similitud to the king, quhilk might bring him to experience how he might invaid againes the Douglass, and the rest of the conspiratouris. This bischop tuik furth ane great scheife of arrowes knitt togidder werrie fast, and desired him to put thame to his knie, and break thame. The king said it was not possible, becaus they war so many, and so weill fastened togidder. The bischop answeired, it was werrie true, bot yitt he wold latt the king sea how to break thame; and pulled out on be on, and tua be tua, quhill he had brokin thame all; then said to the king, 'Yea most doe with the conspiratouris in this manner, and thair complices that are risen againes yow, quho are so many in number, and so hard knit togidder in conspiracie againes yow, that yea cannot gett thame brokin togidder. Butt be sick pratick as I have schowin yow be the similitud of thir arrowes, that is to say, yea must conqueis and break lord by lord be thamselffis, for yea may not deall with thame all at once.'" *Lindsay of Pitscottie's Chronicles of Scotland*, vol. i. pp. 172, 173. [As this story is proverbial, there is no reason to believe that it is true as told by Pitscottie. It is therefore gratuitous to charge it on the "cunning" of the bishop's profession. Kennedy has by far the best character of all the Scots statesmen of his age. See Tytler, ed. 1869, ii. 138, 196; and Buchanan, as there cited.—Ed.]

[28] "He wald nocht suffer the noblemen to come to his presence, and to governe the realme be thair counsell." *Lesley's History of Scotland*, p. 48. "Wald nocht use the counsall of his nobillis." p. 55. "Excluding the nobility." *Hume's History of the House of Douglas*, vol. ii. p. 33. "The nobility seeing his resolution to ruin them." p. 46. "Hes conteming his nobility." *Balfour's Annales*, vol. i. p. 206.

[29] Also to aggrandize them. See, for instance, what "has obtained the name of the golden charter, from the ample privileges it contains, confirmed to Archbishop Shevez by James III. on 9th July, 1480." *Grierson's History of Saint Andrews*, p. 58, Cupar, 1838.

[* Buckle's words read strangely to a student of Scots history of the period in question. The nobles were as brutal tyrants as ever lived, and the Douglases in particular respected neither laws nor liberties which crossed their will. The Church *could not* in such an age tyrannize as they did; and Kennedy was a protector of the people against them.—Ed.]

[† The "popular mind" counted for little in the matter. The nobles maintained themselves by their own armed forces, and in the revolt which ended in the death of James III. the popular feeling was on the side of the king. See Burton, iii. 38.—Ed.]

difficulty in seizing his person and imprisoning him in the Castle of Edinburgh.[30] After his liberation, fresh quarrels arose;[31] and in 1488 the principal nobles collected troops, met him in the field, defeated him, and put him to death.[32] He was succeeded by James IV., under whom the course of affairs was exactly the same ; that is to say, on one side the nobles, and on the other side the Crown and the Church. Everything that the king could do to uphold the clergy he did cheerfully.* In 1493 he obtained an act to secure the immunities of the sees of Saint Andrews and of Glasgow, the two most important in Scotland.[33] In 1503 he procured a general revocation of all grants and gifts prejudicial to the Church, whether they had been made by the Parliament or by the Council.[34] And in 1508 he, by the advice of Elphinston, Bishop of Aberdeen, ventured on a measure of still greater boldness. That able and ambitious prelate induced James to revive against the nobility several obsolete claims, by virtue of which the king could under certain circumstances take possession of their estates, and could, in every instance in which the owner held of the Crown, receive nearly the whole of the proceeds during the minority of the proprietor.[35]

To make such claims was easy ; to enforce them was impossible. Indeed, the nobles were at this time rather gaining ground than losing it ; and after the death of James IV. in 1513, they, during the minority of James V., became so powerful that the regent, Albany, twice threw up the government in despair, and at length abandoned it altogether.[36] He finally quitted Scotland in 1524, and

[30] " Such was the influence of the aristocracy over their warlike followers, that the king was conveyed to the castle of Edinburgh, without commotion or murmur." *Pinkerton's History of Scotland*, vol. i. p. 308.

[31] " The king and his ministers multiplied the insults which they offered to the nobility." . . . " A proclamation was issued, forbidding any person to appear in arms within the precincts of the court ; which, at a time when no man of rank left his own house without a numerous retinue of armed followers, was in effect debarring the nobles from all access to the king." . . . " His neglect of the nobles irritated, but did not weaken them." *History of Scotland*, book i. p. 68, in *Robertson's Works*, edit. London, 1831.

[32] *Balfour's Annales*, vol. i. pp. 213, 214 ; *Buchanan, Rerum Scoticarum Historia*, lib. xii. p. 358. Lindsay of Pitscottie (*Chronicles*, vol. i. p. 222) says : " This may be ane example to all kingis that cumes heirefter, not to fall from God." . . . " For, if he had vsed the counsall of his wyse lordis and barrones, he had not cum to sick disparatioun."

[33] *Acts of the Parliaments of Scotland*, folio, 1814, vol. ii. p. 232. " That the said abbaceis confiirmit be thame sall neid na prouisioun of the court of Rome."

[34] *Acts of the Parliaments of Scotland*, vol. ii. p. 240 ; and the summary of the statute (p. 21), " Revocation of donations, statutis, and all uthir thingis hurtand the croune or hali kirk." In the next year (1504) the king " greatly augmented " the revenues of the bishoprick of Galloway. *Chalmers' Caledonia*, vol. iii. p. 417.

[35] *Pinkerton's History of Scotland*, vol. ii. p. 63 ; *Calderwood's History of the Kirk of Scotland*, vol. viii. p. 135, edit. Wodrow Society, Edinburgh, 1849. The latter authority states that " The bishop devysed wayes to King James the Fourth, how he might attaine to great gaine and profit. He advised him to call his barons and all those that held any lands within the realme, to show their evidents by way of recognition ; and, if they had not sufficient writings for their warrant, to dispone upon their lands at his pleasure ; for the which advice he was greatlie hated. But the king perceaving the countrie to grudge, agreed easilie with the possessors."

[36] The Regency of Albany, little understood by the earlier historians, has been carefully examined by Mr. Tytler, in whose valuable though too prolix work the best account of it will be found. *Tytler's History of Scotland*, vol. iv. pp. 98–160, Edinburgh, 1845. On the hostility between Albany and the nobles, see *Irving's History of Dumbartonshire*, p. 99 ; and, on the revival of their power in the north, after the death of James IV., see *Gregory's History of the Western Highlands*, pp. 114, 115.

[* This was precisely the kind of period Buckle had formerly described as one in which the Church could do something for progress as against mere feudal tyranny ; and the reign of James IV. was one of great national progress in industry, culture, and well-being. Compare Burton, iii. 68, 401, 424, 440, 448.—Ed.]

with him the authority of the executive seemed to have vanished. The Douglases soon obtained possession of the person of the king, and compelled Beaton, Archbishop of Saint Andrews, the most influential man in the Church, to resign the office of chancellor.[37] The whole command now fell into their hands; they or their adherents filled every office; secular interests predominated, and the clergy were thrown completely into the shade.[38] In 1528, however, an event occurred by which the spiritual classes not only recovered their former position but gained a pre-eminence which, as it turned out, was eventually fatal to themselves. Archbishop Beaton, impatient at proceedings so unfavourable to the Church, organized a conspiracy by means of which James effected his escape from the Douglases, and took refuge in the castle of Stirling.[39] This sudden reaction was not the real and controlling cause, but it was undoubtedly the proximate cause, of the establishment of Protestantism in Scotland. For the reins of government now passed into the hands of the Church; and the most influential of the nobles were consequently persecuted, and some of them driven from the country. But though their political power was gone, their social power remained They were stripped of their honours and their wealth. They became outcasts, traitors, and beggars. Still the real foundation of their authority was unshaken, because that authority was the result of a long train of circumstances, and was based on the affections of the people.* Therefore it was that the nobles, even those who were exiled and attainted, were able to conduct an arduous but eventually a successful struggle against their enemies. The desire of revenge whetted their exertions, and gave rise to a deadly contest between the Scotch aristocracy and the Scotch Church. This most remarkable conflict was in some degree a continuation of that which began early in the fifteenth century. But it was far more bitter; it lasted without interruption for thirty-two years; and it was only concluded by the triumph of the nobles, who in 1560 completely overthrew the Church, and destroyed almost at a blow the whole of the Scotch hierarchy.

[37] *Tytler's History of Scotland*, vol. iv. pp. 180–182: "Within a few months, there was not an office of trust or emolument in the kingdom which was not filled by a Douglas, or by a creature of that house." See also pp. 187, 194; and *Keith's Catalogue of Scotch Bishops*, pp. 22, 23. Beaton, who was so rudely dispossessed of the chancellorship that, according to Keith, he was, in 1525, obliged "to lurk among his friends for fear of his life," is mentioned, in the preceding year, as having been the main supporter of Albany's government; "that most hath favoured the Duke of Albany." *State Papers of the Reign of Henry VIII.*, vol. iv. p. 97, 4to, 1836.

[38] The complete power of the Douglases lasted from the cessation of Albany's regency to the escape of the king, in 1528. *Keith's History of the Affairs of Church and State in Scotland*, edit. Edinburgh, 1835, vol. i. pp. 33–35. Compare *Balfour's Annales*, vol. i. p. 257. "The Earle of Angus violently takes one him the gouerniment, and retanes the king in effecte a prisoner with him; during wich tyme he, the Earle of Lennox, and George Douglas, his auen brother, frely disposses vpone all affaires both of churche and staite."

[39] *Tytler's History of Scotland*, vol. iv. pp. 195, 196. The curious work, entitled *A Diurnal of Occurrents*, p. 10, says, "In the zeir of God 1500, tuantie aucht zeiris, the kingis grace by slicht wan away fra the Douglassis." From Stirling he repaired to Edinburgh, on 6th July, 1528, and went to "the busshop of Sainct Andros loegeing." See a letter written on the 18th of July, 1528, by Lord Dacre to Wolsey, in *State Papers of Henry VIII.*, vol. iv. p. 501, 4to, 1836. Compare a proclamation on 10th September, 1528, in *Pitcairn's Criminal Trials in Scotland*, vol. i. part i. pp. 138*, 139*, Edinburgh, 4to, 1833. I particularly indicate these documents, because Lindsay of Pitscottie (in his *Chronicles of Scotland*, vol. ii. p. 335) erroneously places the flight of James in 1527; and he is generally one of the most accurate of the old writers, if indeed he be the author of the work which bears his name. [This view of Pitscottie's narrative is not now held by students of Scottish history. It is very untrustworthy as to dates. Compare Hume Brown, i. 374; and Lang, vol. ii., preface, as to his story of the king's escape.—Ed.]

[* This is an over-statement. The nobles had the "affections" of their own retainers but hardly that of other people.—Ed.]

The events of this struggle, and the vicissitudes to which during its continuance both parties were exposed, are related, though somewhat confusedly, in our common histories; it will be sufficient if I indicate the salient points, and, avoiding needless detail, endeavour to throw light on the general movement. The unity of the entire scheme will thus be brought before our minds, and we shall see that the destruction of the Catholic Church was its natural consummation, and that the last act of that gorgeous drama, so far from being a strained and irregular sequence, was in fit keeping with the whole train of the preceding plot.

When James effected his escape in 1528, he was a boy of sixteen, and his policy, so far as he can be said to have had any mind of his own, was of course determined by the clergy, to whom he owed his liberty, and who were his natural protectors. His principal adviser was the Archbishop of Saint Andrews; and the important post of chancellor, which under the Douglases had been held by a layman, was now conferred on the Archbishop of Glasgow.[40] These two prelates were supreme; while at the same time the Abbot of Holyrood was made treasurer, and the Bishop of Dunkeld was made privy seal.[41] All nobles, and even all followers, of the house of Douglas, were forbidden to approach within twelve miles of the court, under pain of treason.[42] An expedition was fitted out and sent against the Earl of Caithness, who was defeated and slain.[43] Just before this occurred, the Earl of Angus was driven out of Scotland, and his estates confiscated.[44] An act of attainder was passed against the Douglases.[45] The government, moreover, seized and threw into prison the Earl of Bothwell, Home, Maxwell, the two Kerrs, and the barons of Buccleuch, Johnston, and Polwarth.[46]

All this was vigorous enough, and was the consequence of the Church recovering her power. Other measures, equally decisive, were preparing. In 1531 the king deprived the Earl of Crawford of most of his estates, and threw the Earl of Argyle into prison.[47] Even those nobles who had been inclined to follow him, he now discouraged. He took every opportunity of treating them with coldness, while he filled the highest offices with their rivals, the clergy.[48] Finally, he in

[46] *Tytler's History of Scotland*, vol. iv. p. 207.

[47] *Tytler*, vol. iv. p. 212.

[48] "His preference of the clergy to the temporal lords disgusted these proud chiefs." *Tytler's History of Scotland*, vol. iv. p. 230. See also p. 236. His reasons are stated by himself, in a curious letter, which he wrote so late as 1541, to Henry VIII. "We persaif," writes James, "be zoure saidis writingis yat Ze ar informyt yat yair suld be sum thingis laitlie attemptat be oure kirkmen to oure hurte and skaith, and contrar oure mynde and plesure. We can nocht understand, quhat suld move Zou to beleif the samyn, assuring Zou *We have nevir fund bot faithfull and trew obedience of yame at all tymes*, nor yai seik nor attemptis nouthir jurisdictioun nor previlegijs, forthir nor yai have usit sen the first institutioun of the Kirk of Scotland, quhilk We may nocht apoun oure conscience alter nor change in the respect We have to the honour and faith of God and Halikirk, and

1532 aimed a deadly blow at their order by depriving them of a large part of the jurisdiction which they were wont to exercise in their own country, and to the possession of which they owed much of their power. At the instigation of the Archbishop of Glasgow, he established what was called the College of Justice, in which suits were to be decided, instead of being tried as heretofore by the barons at home in their castles. It was ordered that this new tribunal should consist of fifteen judges, eight of whom must be ecclesiastics; and, to make the intention still more clear, it was provided that the president should invariably be a clergyman.[49]

This gave the finishing touch to the whole, and it, taken in connexion with previous measures, exasperated the nobles almost to madness. Their hatred of the clergy became uncontrollable; and in their eagerness for revenge they not only threw themselves into the arms of England, and maintained a secret understanding with Henry VIII., but many of them went even further, and showed a decided leaning towards the principles of the Reformation. As the enmity between the aristocracy and the Church grew more bitter, just in the same proportion did the desire to reform the Church become more marked. The love of innovation was encouraged by interested motives, until in the course of a few years an immense majority of the nobles adopted extreme Protestant opinions; hardly caring what heresy they embraced, so long as they were able by its aid to damage a Church from which they had recently received the greatest injuries, and with which they and their progenitors had been engaged in a contest of nearly a hundred and fifty years.[50]

In the meantime, James V. united himself closer than ever with the hierarchy. In 1534 he gratified the Church by personally assisting at the trial of some heretics, who were brought before the bishops and burned.[51] The next year

douttis na inconvenient be yame to come to Ws and oure realme yerthrou; for sen the Kirk wes first institute in our realme, the stait yair of hes nevir failzeit, bot *hes remanyt evir obedient to oure progenitouris, and in our tyme mair thankefull to Ws, nor evir yai wer of before*." This letter, which, in several points of view, is worth reading, will be found in *State Papers of Henry VIII.*, vol. v. pp. 188–190, 4to, 1836.

[49] *Tytler's History of Scotland*, vol. iv. pp. 212, 213, and *Arnot's History of Edinburgh*, 4to, 1788, p. 468: "fifteen ordinary judges, seven churchmen, seven laymen, and a president, whom it behoved to be a churchman." The statute, as printed in the folio edition of 1814 (*Acts of the Parliaments of Scotland*, vol. ii. p. 335), says, "xiiij psouñs half spūale half temporall wt ane president." Mr. Lawson (*Roman Catholic Church in Scotland*, Edinburgh, 1836, p. 81) supposes that it was the Archbishop of St. Andrews who advised the erection of this tribunal. [The costs, however, were met by a tax laid on ecclesiastical benefices, which offended the clergy. (*Hume Brown, History of Scotland*, 1899, i. 380.) The number of them among the judges was not abnormal for the time.—Ed.]

[50] Keith, who evidently does not admire this part of the history of his country, says, under the year 1546, "Several of our nobility found it their temporal interest, as much as their spiritual, to sway with the new opinions as to religious matters." *Keith's Affairs of Church and State*, vol. i. pp. 112, 113. Later, and with still more bluntness: "The noblemen wanted to finger the patrimony of the kirkmen." vol. iii. p. 11. [No proof is here given that "an immense majority of the nobles adopted extreme Protestant opinions," and the statement must be much modified. Extreme Protestant opinions were at this time very rare in England. We know from the correspondence of Sir Ralph Sadler that the nobles were in general hostile to new religious opinions, however ready they might be to plunder the Church. Tytler, ed. 1869, iii. 20. Mr. Hume Brown even holds that after the overthrow of the Church "the great majority of the country—nobles, barons, and commons—were still on the side of the old religion" (*Hist. of Scotland*, ii. 97.) See also below, *note* 73.—Ed.]

[51] "In the month of August (1534), the bishops having gotten fitt opportunitie, renewed their battell aganest Jesus Christ. David Stratilon, a gentelman of the House of Lawrestoune, and Mr. Norman Gowrlay, was brought to judgement in the Abby of Halyrudhouse. The king himself, all cloathed with reid, being present, grait pains war taken upon David Stratoun to move him to recant and burn his bill; bot he, ever standing to his defence, was in end adjudged to the fire. He asked grace at the king. The

he was offered, and he willingly accepted, the title of Defender of the Faith, which was transferred to him from Henry VIII. ; that king being supposed to have forfeited it by his impiety.[52] At all events, James well deserved it. He was a staunch supporter of the Church, and his privy-council was chiefly composed of ecclesiastics, as he deemed it dangerous to admit laymen to too large a share in the government.[53] And in 1538 he still further signalized his policy by taking for his second wife Mary of Guise ; thus establishing an intimate relation with the most powerful Catholic family in Europe, whose ambition, too, was equal to their power, and who made it their avowed object to uphold the Catholic faith, and to protect it from those rude and unmannerly invasions which were now directed against it in most parts of Europe.[54]

This was hailed by the Church as a guarantee for the intentions of the king. And so indeed it proved to be. David Beaton, who negotiated the marriage, became the chief adviser of James during the rest of his reign. He was made Archbishop of Saint Andrews in 1539,[55] and, by his influence, a persecution hotter than any yet known was directed against the Protestants. Many of them escaped into England,[56] where they swelled the number of the exiles, who were waiting till the time was ripe to take a deadly revenge. They, and their adherents at home, coalesced with the disaffected nobles, particularly with the Douglases,[57] who were by far the most powerful of the Scotch aristocracy, and who were connected with most of the great families, either by old associations or by the still closer bond of the interest which they all had in reducing the power of the Church.[58]

bishops answred proudlie, that ' the king's hands war bound, and that he had no grace to give to such as were by law condemned.' So was he, with Mr. Norman, after dinner, upon the 27th day of Agust, led to a place beside the Rude of Greenside, between Leth and Edinbrug, to the intent that the inhabitants of Fife, seeing the fire, might be striken with terrour and feare." *Pitcairn's Criminal Trials in Scotland*, vol. i. part i. p. 210*. Also *Calderwood's Historie of the Kirk of Scotland*, vol. i. pp. 106, 107.

[52] " It appears, by a letter in the State-paper Office, that Henry remonstrated against this title being given to James." *Tytler's History of Scotland*, vol. iv. p. 223. See also p. 258.

[53] In 1535, " his privy council were mostly ecclesiastics." *Ibid.* vol. iv. p. 222. And Sir Ralph Sadler, during his embassy to Scotland in 1539-40, writes : " So that the king, as far as I can perceive, is of force driven to use the bishops and his clergy as his only ministers for the direction of his realm. They be the men of wit and policy that I see here ; they be never out of the king's ear. And if they smell anything that in the least point may touch them, or that the king seem to be content with any such thing, straight they inculk to him, how catholic a prince his father was, and feed him both with fair words and many, in such wise as by those policies they lead him (having also the whole governance of his affairs) as they will." *State Papers and Letters of Sir Ralph Sadler*, Edinb., 1809, 4to, vol. i. p. 47. [In 1536, however, Angus writes to his brother that the clergy are much offended by the king's resistance to their exactions in the way of death-duties and tithes. " James had alienated his nobles by repressing their disorders. Now he is alienating his clergy by repressing their greed " (*Lang, History of Scotland*, 1900, i. 433).—Ed.]

[57] Tytler (*History of Scotland*, vol. iv. p. 241) says that the cruelties of 1539 forced " many of the persecuted families to embrace the interests of the Douglases."

[58] It is asserted of the Douglases that early in the sixteenth century their " alliances

At this juncture the eyes of men were turned towards the Douglases, whom Henry VIII. harboured at his court, and who were now maturing their plans.[59] Though they did not yet dare to return to Scotland, their spies and agents reported to them all that was done, and preserved their connections at home. Feudal covenants, bonds of manrent, and other arrangements, which, even if illegal, it would have been held disgraceful to renounce, were in full force; and enabled the Douglases to rely with confidence on many of the most powerful nobles, who were, moreover, disgusted at the predominance of the clergy, and who welcomed the prospect of any change which was likely to lessen the authority of the Church.[60]

and power were equal to one-half of the nobility of Scotland." *Brown's History of Glasgow*, vol. i. p. 8. See also, on their connexions, *Hume's House of Douglas*, vol. i. pp. xix. 252, 298, vol. ii. p. 293.

[59] Henry VIII., "in the year 1532, sought it directly, among the conditions of peace, that the Douglas, according to his promise, should be restored. For King Henry's own part, he entertained them with all kind of beneficence and honour, and made both the Earl and Sir George of his Privy Council." *Hume's History of the House of Douglas*, vol. ii. pp. 105, 106. James was very jealous of any communication taking place between the Douglases and his other subjects; but it was impossible for him to prevent it. See a letter which he wrote to Sir Thomas Erskine (in *Miscellany of the Spalding Club*, vol. ii. p. 193, Aberdeen, 1842, 4to) beginning, "I commend me rycht hartly to yow, and weit ye that it is murmuryt hyr that ye sould a spolkyn with Gorge and Archebald Dougles in Ingland, quhylk wase again my command and your promys quhan we departyt." See also the cases of Lady Trakware, John Mathesone, John Hume, and others, in *Pitcairn's Criminal Trials in Scotland*, vol. i. part i. pp. 161*, 177*, 202*, 243*, 247*.

[60] "The Douglases were still maintained with high favour and generous allowances in England; their power, although nominally extinct, was still far from being destroyed; their spies penetrated into every quarter, followed the king to France, and gave information of his most private motions; their feudal covenants and bands of manrent still existed, and bound many of the most potent nobility to their interest; whilst the vigour of the king's government, and his preference of the clergy to the temporal lords, disgusted these proud chiefs, and disposed them to hope for a recovery of their influence from any change which might take place." *Tytler's History of Scotland*, vol. iv. pp. 229, 230. These bonds of manrent, noticed by Tytler, were among the most effective means by which the Scotch nobles secured their power. Without them, it would have been difficult for the aristocracy to have resisted the united force of the Crown and the Church. On this account, they deserve especial attention. Chalmers (*Caledonia*, vol. i. p. 824) could find no bond of manrent earlier than 1354; but in Lord Somerville's *Memorie of the Somervilles*, edit. Edinburgh, 1815, vol. i. p. 74, one is mentioned in 1281. This is the earliest instance I have met with; and they did not become very common till the fifteenth and sixteenth centuries. Compare *Hume's History of the House of Douglas*, vol. ii. p. 19. *Somerville's Memorie of the Somervilles*. vol. i. p. 234. *Pitcairn's Criminal Trials of Scotland*, vol. iii. p. 83. *Irving's History of Dumbartonshire*, pp. 142, 143. *Skene's Highlanders*, vol. ii. p. 186. *Gregory's History of the Western Highlands*, p. 126. *Kennedy's Annals of Aberdeen*, vol. i. p. 55. *Miscellany of the Spalding Club*, vol. ii. pp. cvi. 93, 251, vol. iv. pp. xlviii. 179. As these covenants were extremely useful in maintaining the balance of power, and preventing the Scotch monarchy from becoming despotic, acts of parliament were of course passed against them. See one in 1457, and another in 1555, respecting "lige" and "bandis of manrent and mantenance," in *Acts of the Parliament of Scotland*, folio, 1814, vol. ii. pp. 50, 495. Such enactments being opposed to the spirit of the age, and adverse to the exigencies of society, produced no effect upon the general practice, though they caused the punishment of several individuals. Manrent was still frequent until about 1620 or 1630, when the great social revolution was completed by which the power of the aristocracy was subordinated to that of the Church. Then the change of affairs effected, without difficulty, and indeed spontaneously, what the legislature had vainly attempted to achieve. The nobles, gradually sinking into insignificance, lost their spirit, and ceased to resort to those contrivances by which they had long upheld their order. Bonds of manrent became every year less common, and it is doubtful if there is any instance of them after 1661. See *Chalmers' Caledonia*, vol. iii. pp. 32, 33.

With such a combination of parties in a country where, there being no middle class,* the people counted for nothing, but followed wherever they were led, it is evident that the success or failure of the Reformation in Scotland was simply a question of the success or failure of the nobles. They were bent on revenge. The only doubt was as to their being strong enough to gratify it. Against them they had the Crown and the Church. On their side they had the feudal traditions, the spirit of clanship, the devoted obedience of their innumerable retainers, and, what was equally important, that love of names and of family associations for which Scotland is still remarkable, but which in the sixteenth century possessed an influence difficult to exaggerate.

The moment for action was now at hand. In 1540 the government, completely under the control of the clergy, caused fresh laws to be enacted against the Protestants, whose interests were by this time identical with those of the nobles. By these statutes, no one even suspected of heresy could for the future hold any office; and all Catholics were forbidden to harbour or to show favour to persons who professed the new opinions.[61] The clergy, now flushed with conquest, and greedy for the destruction of their ancient rivals, proceeded to still further extremities. So unrelenting was their malice that in that same year they presented to James a list containing the names of upwards of three hundred members of the Scotch aristocracy, whom they formally accused as heretics who ought to be put to death, and whose estates they recommended the king to confiscate.[62]

These hot and vindictive men little knew of the storm which they were evoking, and which was about to burst on their heads, and cover them and their Church with confusion. Not that we have reason to believe that a wiser conduct would have ultimately saved the Scotch hierarchy. On the contrary, the probability is that their fate was sealed; for the general causes which governed the entire movement had been so long at work that at this period it would have,

It is, however, so dangerous to assert a negative that I do not wish to rely on this date and some few cases may exist later: but if so, they are very few, and it is certain that, speaking generally, the middle of the seventeenth century is the epoch of their extinction.

[61] *Acts of the Parliaments of Scotland*, vol. ii. pp. 370, 371. "That na mañ quhatsueuir stait or conditiouñ he be luge ressauve cherish nor favor ony heretike." . . . "And alswa that na persouñ that hes bene suspectit of heresie howbeit thai be ressauit to pẽnance and grace sall in this realme exers haif nor brouk ony honest estait degre office nor judicator spũall nor tẽporale in burgh nor wtout nor na salbe admittit to be of our counsale."

[62] Lindsay of Pitscottie (*Chronicles*, vol. ii. p. 383) says that they "devysed to put ane discord and variance betwixt the lordis and gentlmen with thair prince; for they delaited, and gave vp to the king in writt, to the number of thrittie scoir of earles, lordis, and barrones, gentlmen and craftismen, that is, as thei alledgit, wer all heretickis, and leived not after the Pope's lawis, and ordinance of the hollie kirk; quhilk his grace sould esteme as ane capitall cryme, to ony man that did the same" . . . "all thair landis, rentes, guidis, and geir apperteanis propperlie to your grace, for thair contempt of our hollie father the Pope, and his lawis, and high contempt of your grace's authoritie." This document was found among the king's papers after his death, when it appeared that of the six hundred names on the list, more than three hundred belonged to the principal nobility: "Eum timorem auxerunt codicilli post regis intritum reperti, e quibus supra trecentorum è prima nobilitate nomina continebantur." *Buchanan, Rerum Scoticarum Historia*, lib. xv. p. 424. Compare *Sadler's State Papers*, 1809, vol. i. p. 94; and *Watson's Historicall Collections of Ecclesiastick Affairs in Scotland*, 1657, p. 22. According to Watson, it "was called the bloudy scroll."

[* "No middle class" is an over-statement. The total population being small, the burghs were small, but they were "in that dark age the nurseries of industry and freedom" (Tytler, ed. 1869, ii. 357). And where the nobles were in large measure ready to sell the national independence, the traders were not. *Id.* iii. 19.—ED.]

been hardly possible to have baffled them. But even if we admit as certain that the Scotch clergy were doomed, it is also certain that their violence made their fall more grievous, by exasperating the passions of their adversaries. The train indeed was laid ; their enemies had supplied the materials, and all was ready to explode ; but it was themselves who at last applied the match, and sprung the mine to their own destruction.

In 1542 the nobles, seeing that the Church and the Crown were bent on their ruin, took the most decisive step on which they had yet ventured, and peremptorily refused to obey James in making war upon the English. They knew that the war in which they were desired to participate had been fomented by the clergy, with the twofold object of stopping all communication with the exiles, and of checking the introduction of heretical opinions.[63] Both these intentions they resolved to frustrate, and, being assembled on the field, they declared with one voice that they would not invade England. Threats and persuasions were equally useless. James, stung with vexation, returned home, and ordered the army to be disbanded. Scarcely had he retired when the clergy attempted to rally the troops, and to induce them to act against the enemy. A few of the peers, ashamed at what seemed a cowardly desertion of the king, appeared willing to march. The rest however refused ; and while they were in this state of doubt and confusion, the English, taking them unawares, suddenly fell upon their disorderly ranks, utterly routed them, and made a large number prisoners. In this disgraceful action ten thousand Scotch troops fled before three hundred English cavalry.[64] The news being brought to James, while he was still smarting from the disobedience of the nobles, was too much for his proud and sensitive mind. He reeled under the double shock ; a slow fever wasted his strength ; he sunk into a long stupor ; and, refusing all comfort, he died in December, 1542, leaving the Crown to his infant daughter, Mary, during whose reign the great contest between the aristocracy and the Church was to be finally decided.[65]

[63] In the autumn of 1542 James "was encouraged by the clergy to engage in a war against King Henry, who both assured him of victory, since he fought against an heretical prince, and advanced an annuity of 50,000 crowns for prosecuting the war." *Crawfurd's History of the Shire of Renfrew*, 1782, 4to, part i. p. 48. Compare in *State Papers of Henry VIII.*, vol. v. p. 154, a letter written in 1539 by Norfolk to Cromwell : "By diverse other waies I am advertised that the clergie of Scotlande be in such feare that their king shold do theire, as the kinges highnes hath done in this realme, that they do their best to bring their master to the warr ; and by many waies I am advertised that a great parte of the temporaltie there wold their king shold followe our insample, wich I pray God yeve hym grace to come unto." Even after the battle of Solway, the policy of the clergy was notoriously the same. "And undoubtedlie the kyrkemen labor, by all the meanes they can, to empeche the unitie and establishment of thiese two realmes ; uppon what groundes ye can easelie conjecture." Letter from Sadler to Parr, dated Edinburgh, 27th March 1543, in *State Papers of Henry VIII.*, vol. v. p. 271, 4to, 1836. [The nobles argued primarily that the war was in the interest of France and not of Scotland. It seems to have been on their urging the risk of his being killed and leaving no heir (and thus leaving the country to the troubles which had followed on the death of his father) that he stayed behind. Hume Brown i, 393.—ED.]

[64] "Ten thousand Scottish troops fled at the sight of three hundred English cavalry, with scarce a momentary resistance." *Tytler's History of Scotland*, vol. iv. p. 264. [This, the traditional narrative, deriving from Knox, is now discredited. Despatches found in the Hamilton Papers show that the English numbered 3,000, not 300 ; that the disputes of the nobles threw the Scots army into confusion, though the leaders sought to steady it; and that the rout took place at the ford of the Esk, which was crossed in confusion. Compare Hume Brown, i. 393–4 ; Lang, i. 453–5.—ED.]

[65] The best account of these events will be found in *Tytler's History of Scotland*, vol. iv. pp. 260–267. I have also consulted *Ridpath's Border History*, pp. 372, 373. *Hollinshead's Scottish Chronicle*, vol. ii. pp. 207–209. *Lesley's History*, pp. 163–166. *Lindsay of Pitscottie's Chronicles*, vol. ii. pp. 399–406. *Calderwood's History of the Kirk of Scotland*, vol. i. pp. 145–152. *Buchanan, Rerum Scoticarum Historia*, lib. xiv, pp. 420 421.

The influence of the nobles was increased by the death of James V., and yet more by the bad repute into which the clergy fell for having instigated a war of which the result was so disgraceful.[66] Their party was still further strengthened by the exiles, who, as soon as they heard the glad tidings, prepared to leave England.[67] Early in 1543 Angus and Douglas returned to Scotland,[68] and were soon followed by other nobles, most of whom professed to be Protestants, though, as the result clearly proved, their Protestantism was inspired by a love of plunder and of revenge. The late king had in his will appointed Cardinal Beaton to be guardian of the queen, and governor of the realm.[69] Beaton, though an unprincipled man,*was very able, and was respected as the head of the national church; he being Archbishop of Saint Andrews, and primate of Scotland. The nobles, however, at once arrested him,[70] deprived him of his regency, and put in his place the Earl of Arran, who at this time affected to be a zealous Protestant, though on a fitting occasion he afterwards changed his opinions.[71] Among the sup-

[66] "This defeat being so very dishonourable, especially to the clergy, who stirred up the king to that attempt, and promised him great success from it; and there being such a visible evidence of the anger of God, fighting by his providence against them, all men were struck with fear and astonishment; the bishops were ashamed to show their faces for a time." *Stevenson's History of the Church of Scotland*, reprinted, Edinburgh, 1840, p. 30.

[67] We may readily believe the assertion of an old chronicler, that "the nobilitie did not greatlie take his death grievouslie, because he had fined manie, imprisoned more, and caused no small few (for avoiding his displeasure) to flie into England, and rather to commit themselves to the enemie than to his anger." *Hollinshead's Scottish Chronicle*, vol. ii. p. 210.

[68] *Hume's History of the House of Douglas*, vol. ii. p. 111.

[69] It has been often said that this will was forged; but for such an assertion I cannot find the slightest evidence, except the declaration of Arran (*Sadler's State Papers*, Edinburgh, 1809, vol. i. p. 138), and the testimony, if testimony it can be called, of Scotch historians, who do not profess to have examined the handwriting, and who, being themselves Protestants, seem to suppose that the fact of a man being a cardinal qualifies him for every crime. There is no doubt that Beaton was thoroughly unprincipled, and therefore was capable of the forgery. Still we have no proof, and the will is such as we might have expected from the king. In regard to Arran, his affirmation is not worth the paper it is written on: for he hated Beaton; he was himself very unscrupulous; and he succeeded to the post which Beaton had to vacate on the ground that the will was forged. If such circumstances do not disqualify a witness, some of the best-established principles of evidence are false. The reader who cares to look further into this subject may compare, in favour of the will being forged, *Buchanan, Rerum Scoticarum Historia*, lib. xv. p. 422, Abredoniæ, 1762; *Knox's History of the Reformation*, edit. Laing, Edinburgh, 1846, vol. i. pp. 91, 92; *Irving's History of Dumbartonshire*, second edition, 4to, 1860, p. 102; and in favour of its being genuine, *Lyon's History of St. Andrews*, Edinburgh, 1843, vol. i. pp. 304, 305. Some other writers on the subject leave it doubtful: *Tytler's History of Scotland*, 1845, vol. iv. p. 274; *Lawson's Roman Church in Scotland*, 1836, p. 99; and a note in *Keith's Church and State in Scotland*, 1844, vol. i. p. 63. [Mr. Hume Brown, ii. 4, *note*, citing article by D. Hay Fleming, in *Contemp. Review*, Sept. 1898, decides that "there can be little doubt that Beaton did forge the will." Dr. Fleming's case is certainly very strong.—Ed.]

[70] On the 26th of January, 1542–3, "the said cardinall was put in pressoune in Dalkeith." *A Diurnal of Occurrents*, p. 26. See also, respecting his imprisonment, a letter written, on the 16th of March, by Angus and Douglas, in *State Papers of Henry VIII.*, vol. v. p. 263. He was then in "firmance."

[71] His appointment was confirmed by parliament on the 12th of March. *Acts of the Parliaments of Scotland*, vol. ii. p. 411: "tuto^{r} lau^{t}full to the quenis grace and gounour of this realme." He excluded the clergy from power. On 20th March, in the same year, Sir Ralph Sadler writes to Henry VIII., that Sir George Douglas "brought me

[* It is necessary to remember that in this respect Beaton had many rivals among the nobles.—Ed.]

porters of the new creed, the most powerful were the Earl of Angus and the Douglases. They were now freed from a proscription of fifteen years; their attainder was reversed, and their estates and honours were restored to them.[72] It was evident that not only the executive authority, but also the legislative, had passed from the Church to the aristocracy. And they who had the power were not sparing in the use of it. Lord Maxwell, one of the most active of their party, had, like most of them in their zeal against the hierarchy, embraced the principles of the Reformation.[73] In the spring of 1543 he obtained the sanction of the Earl of Arran, the governor of Scotland, for a proposal which he made to the Lords of the Articles, whose business it was to digest the measures to be brought before Parliament. The proposal was that the people should be allowed to read the Bible in a Scotch or English translation. The clergy arrayed all their force against what they rightly deemed a step full of danger to themselves, as conceding a fundamental principle of Protestantism. But all was in vain. The tide had set in and was not to be turned. The proposition was adopted by the Lords of the Articles. On their authority it was introduced into Parliament. It was passed. It received the assent of the government; and amid the lamentations of the Church it was proclaimed, with every formality, at the market-cross of Edinburgh.[74]

Scarcely had the nobles thus attained the upper hand, when they began to quarrel among themselves. They were resolved to plunder the Church; but they could not agree as to how the spoil should be shared. Neither could they determine as to the best mode of proceeding; some being in favour of an open and immediate schism, while others wished to advance cautiously, and to temporize with their opponents, that they might weaken the hierarchy by degrees. The more active and zealous section of the nobles were known as the English party,[75] owing to the intimate connexion with Henry VIII., from whom many of them received supplies of money. But in 1544 war broke out between the two countries, and the clergy, headed by Archbishop Beaton, roused with such success the old feelings of national hatred against the English, that the nobles were compelled for a moment to bend before the storm, and to advocate an

into the council-chamber, where I found a great number of noblemen and others at a long board, and divers standing, but *not one bishop nor priest among them.* At the upper end of the board sat the governour." *Sadler's State Papers*, vol. i. p. 78.

[72] *Acts of the Parliaments of Scotland*, vol. ii. pp. 415, 419, 424, 423*; and *Tytler's History of Scotland*, vol. iv. p. 285.

[73] "Had become a convert to its doctrines." *Tytler's Hist. of Scotland*, vol. iv. p. 286. But he, as well as the other nobles, neither knew nor cared much about doctrines; and he was, moreover, very venal. In April, 1543, Sir Ralph Sadler writes to Henry VIII.; "And the lord Maxwell told me apart, 'That, indeed, he lacked silver, and had no way of relief but to your majesty;' which he prayed me to signify unto the same. I asked him what would relieve him? and he said, 300*l.*; 'for the which,' he said, 'as your majesty seemed, when he was with your grace, to have him in more trust and credit than the rest of your majesty's prisoners, so he trusted to do you as good service as any of them; and amongst them they will do you such service, as, if the war succeed, ye shall make an easy conquest of this realm; as *for his part he shall deliver into your hands, at the entry of your army, the keys of the same on the west marches, being all the strongholds there in his custody.*' I offered him presently to write to my lord of Suffolk for 100*l.* for him, if he would; but he said, 'he would stay till he heard again from your majesty in that behalf.'" *Sadler's State Papers*, vol. i. p. 165.

[74] *Acts of the Parliaments of Scotland*, vol. ii. pp. 415, 425. *Sadler's State Papers*, vol. i. p. 83. Knox, in his *History of the Reformation* (edit. Laing, vol. i. p. 100). archly says, "The cleargy hearto long repugned; butt in the end, convicted by reassonis, *and by multitud of votes in thare contrare*, thei also condiscended; and so, by Act of Parliament, it was maid free to all man and woman to reid the Scriptures in thair awin toung, or in the Engliss toung; and so war all Actes maid in the contrair abolished."

[75] Or, as Keith calls them, "English lords." *History of the Affairs of Church and State in Scotland*, vol. i. p. 80.

alliance with France. Indeed, it seemed for a few months as if the Church and aristocracy had forgotten their old and inveterate hostility, and were about to unite their strength in one common cause.[76]

This however was but a passing delusion. The antagonism between the two classes was irreconcilable.[77] In the spring of 1545 the leading Protestant nobles formed a conspiracy to assassinate Archbishop Beaton,[78] whom they hated more than anyone else, partly because he was the head of the Church, and partly because he was the ablest and most unscrupulous of their opponents.

A year, however, elapsed before their purpose could be effected ; and it was not till May, 1546, that Lesley, a young baron, accompanied by the Laird of Grange and a few others, burst into Saint Andrews, and murdered the primate in his own castle.[79]

[76] In May, 1544, the English attacked Scotland, *Tytler's History*, vol. iv. p. 316 ; and in that same month, the "Anglo-Scottish party" consisted only of the Earls of Lennox and of Glencairn, since even "Angus, George Douglas, and their numerous and powerful adherents, joined the cardinal." p. 319. As to the part taken by the Scotch clergy, see, in *Sadler's State Papers*, vol. i. p. 173, a letter to Henry VIII., written on the 1st of May, 1543: "And as to the kirk-men, I assure your majesty they seek the war by all the means they can, and do daily entertain the noblemen with money and rewards to sustain the wars, rather than there should be any agreement with your majesty ; thinking, verily, that if peace and unity succeed, that they shall be reformed, and lose their glory, which they had rather die, and put all this realm in hazard, than they would forego." See also p. 184, note.

[77] Buchanan records a very curious conversation between the Regent and Douglas, which, as I do not remember to have met with it elsewhere, I shall transcribe. The exact date of it is not mentioned but, from the context it evidently took place in 1544 or 1545. "Ibi cum Prorex suam de ploraret solitudinem, et se a nobilitate derelictum quereretur, Duglassius ostendit 'id ipsius culpa fieri, non nobilium, qui et fortunas omnes et vitam ad publicam salutem tuendam conferrent, quorum consilio contempto ad sacrificulorum nutum circumageretur, qui foris imbelles, domi seditiosi, omniumque periculorum expertes alieni laboris fructu ad suas voluptates abuterentur. Ex hoc fonte inter te et proceres facta est suspitio, quæ (quod neutri alteris fidatis) rebus gerendis maxime est impedimento.'" *Rerum Scoticarum Historia*, lib. xv. p. 435. Buchanan was at this time about thirty-eight years old ; and that some such conversation as that which he narrates actually took place is, I think, highly probable, though the historian may have thrown in some touches of his own. At all events, he was too great a rhetorician to invent what his contemporaries would deem unlikely to happen ; so that, from either point of view, the passage is valuable as an evidence of the deep-rooted hostility which the nobles bore towards the Church.

[78] *Tytler's History of Scotland*, vol. iv. p. 337. "The plot is entirely unknown either to our Scottish or English historians ; and now, after the lapse of nearly three centuries, has been discovered in the secret correspondence of the State-paper Office." The first suggestion of the murder was in April, 1544. See *State Papers of Henry VIII.*, vol. v. p. 377, and the end of the Preface to vol. iv. But Mr. Tytler and the editor of the *State Papers* appear to have overlooked a still earlier indication of the coming crime in *Sadler's Papers*. See, in that collection, vol. i. p. 77, a conversation, held in March, 1543, between Sir Ralph Sadler and the Earl of Arran ; Sadler being conducted by the Earl of Glencairn. On that occasion, the Earl of Arran used an expression concerning Beaton, the meaning of which Sir Ralph evidently understood. "'By God,' quoth he, 'he shall never come out of prison whilst I may have mine own will, *except it be to his farther mischief*.' I allowed the same well" (replied Sadler), "and said, 'It were pity, but he should receive such reward as his merits did require.'"

[79] *State Papers of Henry VIII.*, vol. v. p. 560. *A Diurnal of Occurrents*, p. 42. *Calderwood's History of the Kirk of Scotland*, vol. i. pp. 221–223. Lindsay of Pitscottie (*Chronicles*, vol. ii. p. 484) relates a circumstance respecting the murder which is too horrible to mention, and of which it is enough to say, that it consisted of an obscene outrage committed on the corpse of the victim. Though such facts cannot now be published, they are so characteristic of the age, that they ought not to be passed over in complete silence.

The horror with which the Church heard of this foul and barbarous deed[80] may be easily imagined. But the conspirators, nothing daunted, and relying on the support of a powerful party, justified their act, seized the castle of Saint Andrews, and prepared to defend it to the last. And in this resolution they were upheld by a most remarkable man, who now first appeared to public view, and who, being admirably suited to the age in which he lived, was destined to become the most conspicuous character of those troublous times.

That man was John Knox. To say that he was fearless and incorruptible, that he advocated with unflinching zeal what he believed to be the truth, and that he devoted himself with untiring energy to what he deemed the highest of all objects, is only to render common justice to the many noble attributes which he undoubtedly possessed. But on the other hand he was stern, unrelenting, and frequently brutal; he was not only callous to human suffering, but he could turn it into a jest, and employ on it the resources of his coarse though exuberant humour;[81] and he loved power so inordinately, that, unable to brook the slightest opposition, he trampled on all who crossed his path, or stood even for a moment in the way of his ulterior designs.

The influence of Knox in promoting the Reformation has indeed been grossly exaggerated by historians, who are too apt to ascribe vast results to individual exertions; overlooking those large and general causes, in the absence of which the individual exertion would be fruitless. Still he effected more than any single man;[82] although the really important period of his life, in regard to Scotland, was in and after 1559, when the triumph of Protestantism was already secure, and when he reaped the benefit of what had been effected during his long absence from his own country. His first effort was a complete failure, and more than any one of his actions has injured his reputation. This was the sanction which he gave to the cruel murder of Archbishop Beaton, in 1546. He repaired to the Castle of Saint Andrews; he shut himself up with the assassins;* he prepared to share their fate; and, in a work which he afterwards wrote, openly justified what they had done.[83] For this nothing can excuse him;

[80] Respecting which, two Scotch Protestant historians have expressed themselves in the following terms: "God admonished men, by this judgement, that he will in end be avenged upon tyranns for their crueltie, howsoever they strenthen themselves." *Calderwood's History of the Kirk of Scotland*, vol. i. p. 224. And whoever considers all the circumstances "must acknowledge it was a stupendous act of the judgment of the Lord, and that the whole was overruled and guided by Divine Providence." *Stevenson's History of the Church and State of Scotland*, p. 38.

[81] Even the editor of *M'Crie's Life of Knox*, Edinburgh, 1841, p. xxxv., notices "the ill-timed merriment he displays in relating the foul deed" of Beaton's murder.

[82] Shortly before his death he said, with honest and justifiable pride, "What I have been to my countrie, albeit this vnthankfull aige will not knowe, yet the aiges to come wil be compelled to bear witnes to the treuth." *Bannatyne's Journal*, Edinburgh, 1806, p. 119. Bannatyne was Knox's secretary. It is to be regretted that no good life of Knox should have yet been published. That by M'Crie is an undistinguishing and injudicious panegyric, which, by provoking a reaction of opinion, has damaged the reputation of the great reformer. On the other hand, the sect of Episcopalians in Scotland are utterly blind to the real grandeur of the man, and unable to discern his intense love of truth, and the noble fearlessness of his nature.

[83] *Tytler's History of Scotland*, vol. iv. pp. 374, 375. *M'Crie's Life of Knox*, pp. 27, 28. *Lawson's Roman Catholic Church in Scotland*, p. 154. *Presbytery Displayed*, 1663, 4to, p. 28. *Shield's Hind Let Loose*, 1687, pp. 14, 39, 638. In his *History of the Reformation*, edit. Laing, vol. i. pp. 177, 180, he calls it a "godly fact," and says, "These ar the workis of our God;" which, in plain language, is terming the Deity an assassin. But,

[* This account is unfair to Knox. Mr. Hume Brown more justly writes that "After being hunted from place to place as a heretic and a friend of England, John Knox was driven to seek refuge with the murderers of the Cardinal." *History of Scotland*, ii. (1902) 27.—Ed.]

and it is with a certain sense of satisfied justice that we learn that in 1547, the castle being taken by the French, Knox was treated with great severity, and was made to work at the galleys, from which he was not liberated till 1549.[84]

During the next five years Knox remained in England, which he quitted in 1554, and arrived at Dieppe.[85] He then travelled abroad; and did not revisit Scotland till the autumn of 1555, when he was eagerly welcomed by the principal nobles and their adherents.[86] From some cause, however, which has not been sufficiently explained, but probably from an unwillingness to play a subordinate part among those proud chiefs, he in July, 1556, again left Scotland, and repaired to Geneva, where he had been invited to take charge of a congregation.[87] He stayed abroad till 1559, by which time the real struggle was almost over; so completely had the nobles succeeded in sapping the foundations of the Church.

For the course of events, having been long prepared, was now rapid indeed. In 1554 the queen dowager had succeeded Arran as regent.[88] She was that Mary of Guise whose marriage with James V. we have noticed as one of the indications of the policy then prevailing. If left alone, she would probably have done little harm;[89] but her powerful and intolerant family exhorted her to suppress the heretics, and, as a natural part of the same scheme, to put down the nobles. By the advice of her brothers, the Duke of Guise and the Cardinal of Lorraine, she in 1555 proposed to establish a standing army, to supply the place of the troops, which consisted of the feudal barons and their retainers. Such a force, being paid by the Crown, would have been entirely under its control; but the nobles saw the ulterior design, and compelled Mary to abandon it, on the ground that they and their vassals were able to defend Scotland without further aid.[90] Her next attempt was to consolidate the interests of the Catholic

bad as this is, I agree with M'Crie that there is no trustworthy evidence for deeming him privy to the murder. Compare, however, *A Diurnal of Occurrents*, p. 42, with *Lyon's History of St. Andrews*, vol. ii. p. 364. [Knox testified of the assassins that "their corrupt life could not escape punishment of God" (Hume Brown, as cited, ii. 27). —Ed.]

[84] *M'Crie's Life of Knox*, pp. 38, 43, 350. *Argyll's Presbytery Examined*, 1848, p. 19.

[85] *M'Crie's Life of Knox*, pp. 44, 71.

[86] *Ibid.*, p. 99. As to the nobles, who received him and heard him preach, see p. 102.

[87] "Influenced by motives which have never been fully comprehended, he departed to Geneva, where for a time he became pastor of a Protestant congregation." *Russell's History of the Church in Scotland*, 1834, vol. i. p. 193. M'Crie, who sees no difficulty, simply says, "In the month of July, 1556, he left Scotland, and, having arrived at Dieppe, he proceeded with his family to Geneva." *Life of Knox*, p. 107.

[88] Knox, in his savoury diction, likens her appointment to putting a saddle on the back of a cow. "She maid Regent in the year of God 1554; and a croune putt upone hir head, als seimlye a sight (yf men had eis), as to putt a sadill upoun the back of ane unrewly kow." I copy this passage from Mr. Laing's excellent edition of *Knox's History of the Reformation*, vol. i. p. 242; but in *Watson's Historicall Collections of Ecclesiastick Affairs in Scotland*, 1657, p. 73, there is a slightly different version. "'As seemly a sight,' saith John Knox, in the new gospel language, 'as to put the saddle upon the back of an unruly *sow*.'"

[89] The Duke of Argyll, in his *Presbytery Examined*, p. 9, calls her "ambitious and intriguing." Not only, however, is she praised by Lesley (*History*, pp. 289, 290), which might have been expected, but even Buchanan does justice to her, in a passage unusually gracious for so Protestant and democratic a writer. "Mors ejus varie mentes hominum affecit. Nam et apud quosdam eorum, quibuscum armis contendit, non mediocre sui desiderium reliquit. Erat enim singulari ingenio prædita, et animo ad æquitatem admodum propenso." *Buchanan, Rerum Scoticarum Historia*, lib. xvi. p. 487.

[90] *History of Scotland*, book ii. p. 91, in Robertson's Works, 1831. *Tytler's History*, vol. v. pp. 22, 23. It appears from Lesley (*History*, pp. 254, 255), that some of the nobles were in favour of this scheme, hoping thereby to gain favour. "Albeit sum

party, which she effected in 1558, by marrying her daughter to the dauphin. This increased the influence of the Guises,[91] whose niece, already queen of Scotland, would now, in the ordinary course of affairs, become queen of France. They urged their sister to extreme measures, and promised to assist her with French troops. On the other hand the nobles remained firm, and prepared for the struggle. In December, 1557, several of them had drawn up a covenant, agreeing to stand by each other, and to resist the tyranny with which they were threatened.[92] They now took the name of Lords of the Congregation, and sent forth their agents to secure the subscriptions of those who wished for a reformation of the Church.[93] They moreover wrote to Knox, whose style of preaching, being very popular, would, they thought, be useful in stirring up the people to rebellion.[94] He was then in Geneva, and did not arrive in Scotland till May, 1559,[95] by which time the result of the impending contest was hardly doubtful, so successful had the nobles been in strengthening their party, and so much reason had they to expect the support of Elizabeth.

Nine days after Knox entered Scotland, the first blow was struck. On the 11th of May, 1559, he preached in Perth. After the sermon, a tumult arose, and the people plundered the churches, and pulled down the monasteries.[96] The queen-regent, hastily assembling troops, marched towards the town. But the nobles were on the alert. The Earl of Glencairn joined the Congregation with two thousand five hundred men; and a treaty was concluded, by which both sides agreed to disarm, on condition that no one should be punished for what had already happened.[97] Such, however, was the state of the public mind

of the lordis of the nobilitie for pleasour of the quene seamed to aggre thairto for the tyme, yit the barronis and gentillmen was nathing content thairwith" . . . "affirming that thair foirfatheris and predicessouris had defendit the samyn" (*i.e.* the realm) "mony hundreth yeris, vailyeantlie with thair awin handis."

[91] "It completed the almost despotic power of the house of Guise." *Tytler's History of Scotland*, vol. v. 27.

[92] This covenant, which marks an important epoch in the history of Scotland, is dated 3rd of December, 1557. It is printed in *Stevenson's History of the Church of Scotland*, p. 47; in *Calderwood's History of the Kirk*, vol. i. pp. 326, 327; and in *Knox's History of the Reformation*, vol. i. pp. 273, 274.

[93] In 1558 "the lords of the congregation had sent agents through the kingdom to solicit the subscriptions of those who were friendly to a reformation." *Stephen's History of the Church of Scotland*, London, 1848, vol. i p. 58.

[94] Keith (*Affairs of Church and State in Scotland*, vol. iii. p. 82) calls him "a trumpeter of rebellion," which he undoubtedly was, and very much to his credit too, though the courtly bishop imputes it to him as a fault. The Scotch, if it had not been for their rebellious spirit, would long since have lost their liberties.

[95] "He sailed from Dieppe on the 22nd of April, 1559, and landed safely at Leith in the beginning of May." *M'Crie's Life of Knox*, p. 139. Knox himself says, "the secound of Maij." *History of the Reformation*, edit. Laing, vol. i. p. 318. "He was called home by the noblemen that enterprised the Reformation." *Spottiswoode's History of the Church of Scotland*, edit. Russell, vol. ii. p. 180.

[96] *Penny's Traditions of Perth*, p. 310. *Knox's History of the Reformation*, vol. i. pp. 321–323. *Lyon's History of St. Andrews*, vol. i. p. 329; and a spirited narrative in *Buchanan's Rerum Scoticarum Historia*, lib. xvi. pp. 471, 472. Some interesting circumstances are also preserved in *Lesley's History*, pp. 271, 272; but though Lesley was a contemporary, he erroneously places the riot in 1558. He, moreover, ascribes to Knox language more inflammatory than that which he really used. [According to Knox, as cited, the monasteries too were only plundered, not pulled down. Lesley seems to exaggerate.—ED.]

[97] *Tytler's History of Scotland*, vol. v. pp. 59, 62, 63. Of the Earl of Glencairn, Chalmers (*Caledonia*, vol. iii. p. 485) says, that he was a "religious ruffian, who enjoyed pensions from Henry VIII. for injuring the country of his birth, and benefits." This, besides being ungrammatical, is foolish. Glencairn, like the other aristocratic leaders of the Reformation, was no doubt influenced by sordid motives: but so far from injuring

that peace was impossible.* In a few days war again broke out ; and this time the result was more decisive. The Lords of the Congregation mustered in great force. Perth, Stirling, and Linlithgow fell into their hands. The queen-regent retreated before them. She evacuated Edinburgh ; and on the 29th of June the Protestants entered the capital in triumph.[98]

All this was done in seven weeks from the breaking out of the first riot. Both parties were now willing to negotiate, with the view of gaining time ; the queen-regent expecting aid from France, the Lords expecting it from England.[99] But the proceedings of Elizabeth being tardy, the Protestants, after waiting for some months, determined to strike a decisive blow before the reinforcements arrived. In October, the principal peers, headed by the Duke of Chastelherault, the Earl of Arran, the Earl of Argyle, and the Earl of Glencairn, assembled at Edinburgh. A great meeting was held, of which Lord Ruthven was appointed president, and in which the queen-regent was solemnly suspended from the government, on the ground that she was opposed to "the glory of God, to the liberty of the realm, and to the welfare of the nobles."[100]

In the winter, an English fleet sailed into the Frith, and anchored near Edinburgh.[101] In January, 1560, the Duke of Norfolk arrived at Berwick, and

his country, he rendered it great service. [There is nothing ungrammatical in Chalmers' phrase, though the idiom is obsolete, whereas Buckle's own grammar is sometimes faulty. Glencairn was worse than mercenary : he was guilty of gross treachery to both sides (Tytler, ed. 1869, ii. 20) ; and it is not unreasonable to say that he injured his country when by his treason he helped to cause the Solway rout after getting a promise of a pension from Henry VIII. (*Id.* pp. 24, 27), and again took the English side when Scotland was being ravaged by the Protector Somerset. *Id.* p. 64. In the long series of convulsions following on the death of James V., Scotland suffered more miseries than she had known for two centuries. Cp. Tytler, ii. 64, 68, 69, 339, 343–4.—Ed.]

[98] *Tytler's History of Scotland*, vol. v. pp. 64–73.

[99] It is stated of the queen-regent that in July, 1559, "shee had sent alreadie to France for more men of warr." See the curious pamphlet entitled "A Historie of the Estate of Scotland, from July 1558 to April 1560," in *Miscellany of the Wodrow Society*, p. 63, Edinburgh, 1844. All sorts of rumours were circulated ; and a letter dated 12th October, 1559, says, "Summe thinke the regent will departe secretlie. Summe that she will to Ynchkeith, for that three shippes are a preparing. Summe saye that she is verie sicke. Summé saye the devill cannot kill her." *Sadler's State Papers*, vol. i. p. 499.

[100] *Tytler's History of Scotland*, vol. v. p. 104. This was on the 22nd of October, 1559. Compare *Sadler's State Papers*, vol. i. p. 512. "This Mondaye, the 22 of October, was the douagier deprived from her authoritie by commen consent of all lords and barons here present." On this occasion, "Johne Willocke," the preacher, delivered himself of a discourse in favour of her deposition. Among other arguments he said "that in deposing of princes, and these that have beene in authoritie, God did not alwayes use His immediat power, but sometimes he used other meanes, which His wisdome thought good, and justice approved. As by Asa He removed Maacha, his owne mother, from honour and authoritie, which before she had used ; by Jehu He destroyed Joram, and the whole posteritie of Achab." *Therefore* "he" (the orator) "could see no reasoun why they, the borne counsellers, the nobilitie and barons of the realme, might not justlie deprive her from all regiment." *Calderwood's History of the Kirk*, vol. i. pp. 540, 541 ; and *Knox's History of the Reformation*, vol. i. pp. 442, 443.

[101] The *Diurnal of Occurrents*, pp. 55, 272, says that the fleet arrived on 24th of January, 1559–60 ; "aucht greit schippis of Ingland in the raid of Leith." And a letter (in *Sadler's State Papers*, vol. i. p. 697), dated the 23rd of January, says, "the shippes arrived yesterdaye in the Frythe to the nomber of ix. or x., as yet, and the remanent followith." The date, therefore, of the 10th of January, given in a note to *Keith's Church and State in*

[* There was a better reason than this for the renewal of the fighting. The queen-regent certainly broke faith. See Tytler, ed. 1869, ii. 95.—Ed.]

concluded on the part of Elizabeth a treaty with the Lords of the Congregation, by virtue of which the English army entered Scotland on the 2nd of April.[102] Against this combination the government could effect nothing, and in July was glad to sign a peace, by which the French troops were to evacuate Scotland, and the whole power of administration was virtually consigned to the Protestant Lords.[103]

The complete success of this great revolution, and the speed with which it was effected, are of themselves a decisive proof of the energy of those general causes by which the whole movement was controlled.* For more than a hundred and fifty years there had been a deadly struggle between the nobles and the Church; and the issue of that struggle was the establishment of the Reformation, and the triumph of the aristocracy. They had at last carried their point. The hierarchy was overthrown, and replaced by new and untried men. All the old notions of apostolic succession, of the imposition of hands, and of the divine right of ordination, were suddenly discarded. The offices of the Church were performed by heretics, the majority of whom had not even been ordained.[104] Finally, and to crown the whole, in the summer of that same year, 1560, the Scotch parliament passed two laws which utterly subverted the ancient scheme. By one of these laws, every statute which had ever been enacted in favour of the Church was at once repealed.[105] By the other law it was declared that whoever either said

Scotland, vol. i. p. 255, is evidently erroneous. Important as the event was, its exact date is not mentioned either by Tytler (*History of Scotland*, vol. v. pp. 114, 115), or by Chalmers (*Caledonia*, vol. ii. p. 631).

[102] *Chalmers' Caledonia*, vol. ii. p. 632. *Knox's History of the Reformation*, vol. ii. p. 57. The Berwick treaty, in February, is printed in *Keith's Church and State in Scotland*, vol. i. pp. 258–262. So great was the influence of the nobles, that the English troops were well received by the people, in spite of the old and bitter animosity between the two nations. "Especially in Fyfe they were thankfully receaved, and well entreated, with such quietnes and gentle entertainement betwixt our nation and them, as no man would have thought that ever there had beine any variance." *A Historie of the Estate of Scotland*, from 1558 to 1560, in *Miscellany of the Wodrow Society*, p. 78.

[103] "Vpoun the vi. day of Julij, it wes concludit and finallie endit betuix the saids ambassatouris, tuitching all debaittis, contraversies and materis concernyng the asseiging of Leith, depairting of the Frenchemen thairfra, and randering of the same; and the said peax daitit this said day." *A Diurnal of Occurrents*, pp. 277, 278. See also p. 60; and *Keith's Affairs of Church and State in Scotland*, vol. i. p. 295.

[104] "That Knox himself was in priest's orders is a fact which his biographer, the late Dr. M'Crie, has placed beyond dispute; and some of the other leaders were also priests; but the greater number of the preachers, and all those who subsequently became ministers, were totally without any orders whatever, not even such as the superintendents could have given them; for their own supposed call, the election of the people, and the *civil* ceremony of induction to the living, was all that was then 'judged necessary.'" *Stephen's History of the Church of Scotland*, 1848, vol. i. pp. 145, 146. "A new-fashioned sort of ministry, unknown in the Christian Church for all preceding generations." *Keith's Church and State in Scotland*, vol. iii. p. 204. Compare *Argyll's Presbytery Examined*, pp. 34–36.

[105] "The thre estaitis of parliament hes anullit and declarit all sik actes maid in tymes bipast not aggreing w^t^ goddis word and now contrair to the confessioun of oure fayt according to the said word publist in this parliament, Tobe of nane avale force nor effect. And decernis the said actis and every ane of thame to haue na effect nor strenth in tyme to cum." *Acts of the Parliaments of Scotland*, 1814, folio, vol. ii. p. 535. This was on 24th August, 1560.

[* In the next paragraph it appears to be argued that the "general causes" were of another kind. The efficient causes of the overthrow of the Church were the economic interest and the military strength of the nobility as against a weakened crown held by an absent minor.—ED.]

mass, or was present while it was said, should for the first offence lose his goods ; for the second offence be exiled, and for the third offence be put to death.[106]

Thus it was that an institution which had borne the brunt of more than a thousand years was shivered and fell to pieces. And from its fall great things were augured. It was believed that the people would be enlightened, that their eyes were opening to their former follies, and that the reign of superstition was about to end.* But what was forgotten then, and what is too often forgotten now, is that in these affairs there is an order and a natural sequence which can never be reversed. This is that every institution, as it actually exists, no matter what its name or pretences may be, is the effect of public opinion far more than the cause ; and that it will avail nothing to attack the institution unless you can first change the opinion. In Scotland, the Church was grossly superstitious ; but it did not therefore follow that to overthrow the establishment would lessen the evil. They who think that superstition can be weakened in this way do not know the vitality of that dark and ill-omened principle. Against it there is only one weapon, and that weapon is knowledge. When men are ignorant, they must be superstitious ; and wherever superstition exists it is sure to organize itself into some kind of system, which it makes its home. If you drive it from that home, it will find another. The spirit transmigrates ; it assumes a new form ; but still it lives. How idle then is that warfare which reformers are too apt to wage, in which they slay the carcass, and spare the life ! † The husk, forsooth, they seek out and destroy ; but within that husk is a seed of deadly poison, whose vitality they are unable to impair, and which, shifted from its place, bears fruit in another direction, and shoots up with a fresh and often a more fatal exuberance.

The truth is that every institution, whether political or religious, represents, in its actual working, the form and pressure of the age. It may be very old ; it may bear a venerated name ; it may aim at the highest objects ; but whoever carefully studies its history will find that, in practice, it is successively modified by successive generations, and that, instead of controlling society, it is controlled by it. When the Protestant Reformation was effected, the Scotch were excessively ignorant, and therefore, in spite of the Reformation, they remained excessively superstitious. How long that ignorance continued, and what its results were, we shall presently see ; but before entering into that inquiry, it will be advisable to trace the immediate consequences of the Reformation itself, in connexion with the powerful class by whose authority it was established.

The nobles, having overthrown the Church, and stripped it of a large part of its wealth, thought that they were to reap the benefit of their own labour. They had slain the enemy, and they wished to divide the spoil.[107] But this did not suit the views of the Protestant preachers. In their opinion it was impious

[106] " That na maner of person nor personis say mess nor zit heir mess nor be pñt thairat vnder the pane of confiscatiouñ of all thair gud movable and vnmovable and pvneissing of thair bodeis at the discretioun of the magistrat within quhais jurisdictiouñ sik personis happỹnis to be apprehendit ffor the first falt : Banissing of the Realme for the secund falt, and justifying to the deid for the thrid falt." *Ibid.*, 24th August, 1560, vol. ii. p. 535.

[107] As Robertson says, in his measured and somewhat feeble style, " Among the Scottish nobility, some hated the persons, and others coveted the wealth, of the dignified clergy ; and by abolishing that order of men, the former indulged their resentment, and the latter hoped to gratify their avarice." *History of Scotland*, book iii. p. 116, in *Robert-*

[* This is a verbal confusion. The reign of what the Protestants *held* to be superstition *was* at an end. In the terms of the following exposition, the Protestants were themselves superstitious with a difference. The phrase as to " what was forgotten then " is beside the case. It would be applicable only if the Reformers had been devoid of superstition.—Ed.]

[† Here again the proposition is beside the case. The reformers were *part of* " the life " in question, and equally part of " the carcase."—Ed.]

to secularise ecclesiastical property, and turn it aside to profane purposes. They held that it was right, indeed, for the lords to plunder the Church; but they took for granted that the proceeds of the robbery were to enrich themselves. They were the godly men; and it was the business of the ruling classes to endow them with benefices, from which the old and idolatrous clergy were to be expelled.[108]

In accordance with these opinions, Knox and his colleagues, in August, 1560, presented a petition to Parliament, calling on the nobles to restore the Church property which they had seized, and to have it properly applied to the support of the new ministers.[109] To this request those powerful chiefs did not even vouchsafe a reply.[110] They were content with matters as they actually stood, and were therefore unwilling to disturb the existing arrangement. They had fought the fight; they had gained the victory, and shared the spoil. It was not to be supposed that they would peaceably relinquish what they had won with infinite difficulty. Nor was it likely that after being engaged in an arduous struggle with the Church for a hundred and fifty years, and having at length conquered their inveterate enemy, they should forego the fruits of their triumph for the sake of a few preachers, whom they had but recently called to their aid; low-born and obscure men, who should rather deem it an honour that they were permitted to associate with their superiors in a common enterprise, but were not to presume on that circumstance, nor to suppose that they, who only entered the field at the eleventh hour, were to share the booty on anything approaching to terms of equality.[111]

But the aristocracy of Scotland little knew the men with whom they had to deal. Still less did they understand the character of their own age. They did not see that in the state of society in which they lived superstition was inevitable,* and that therefore the spiritual classes, though depressed for a moment, were sure speedily to rise again. The nobles had overturned the Church; but the principles on which Church authority is based remained intact. All that was done was to change the name and the form. A new hierarchy

son's Works, edit. 1831. The contemporary narrative, in *A Diurnal of Occurrents*, p. 269, sounds much more vigorous to my ear. "In all this tyme" (1559), "all kirkmennis goodis and geir wer spoulzeit and reft fra thame, in euerie place quhair the samyne culd be apprehendit; for euerie man for the maist pairt that culd get any thing pertenyng to any kirkmen, thocht the same as wele won geir."

108 "Knox never dreamed that the revenues of the Church were to be secularized; but that he and his colleagues were simply to remove the old incumbents, and then take possession of their benefices." *Stephen's History of the Church of Scotland*, vol. i. p. 106. "The ecclesiastical revenues, which they never contemplated for a moment were to be seized by the Protestant nobility." *Lawson's Roman Catholic Church in Scotland*, p. 233.

109 Compare *Knox's History of the Reformation*, vol. ii. pp. 89–92, with *M'Crie's Life of Knox*, p. 179. Of this document, M'Crie says, "There can be no doubt that it received the sanction, if it was not the composition, of the reformer." . . . "It called upon them" (the nobles) "to restore the patrimony of the Church, of which they had unjustly possessed themselves."

110 "Making no answer to the last point." *Spottiswoode's History of the Church of Scotland*, vol. i. p. 327. "Without taking any notice." *Keith's Affairs of Church and State*, vol. i. p. 321.

111 "They viewed the Protestant preachers as low-born individuals, not far raised above the condition of mechanics or tradesmen, without influence, authority, or importance." *Lawson's Roman Catholic Church in Scotland*, p. 251. "None were more unmercifull to the poore ministers than they that had the greatest share of the kirk rents." *Calderwood's History of the Kirk of Scotland*, vol. ii. p. 42.

[* The language here approaches absurdity. The nobles were no more concerned to cast out "superstition" in general than to pay the preachers. They held all the ordinary superstitions of their age.—ED.]

was quickly organized, which succeeded the old one in the affections of the people. Indeed it did more. For the Protestant clergy, neglected by the nobles, and unendowed by the state, had only a miserable pittance whereupon to live, and they necessarily threw themselves into the arms of the people, where alone they could find support and sympathy.[112] Hence a closer and more intimate union than would otherwise have been possible. Hence, too, as we shall presently see, the Presbyterian clergy, smarting under the injustice with which they were treated, displayed that hatred of the upper classes, and that peculiar detestation of monarchical government, which they showed whenever they dared. In their pulpits, in their presbyteries, and in their General Assemblies, they encouraged a democratic and insubordinate tone, which eventually produced the happiest results by keeping alive, at a critical moment, the spirit of liberty; but which for that very reason made the higher ranks rue the day when, by their ill-timed and selfish parsimony, they roused the wrath of so powerful and implacable a class.

The withdrawal of the French troops, in 1560, had left the nobles in possession of the government;[113] and it was for them to decide to what extent the Reformed clergy should be endowed. The first petition, presented by Knox and his brethren, was passed over in contemptuous silence. But the ministers were not so easily put aside. Their next step was to present to the Privy Council what is known as the First Book of Discipline, in which they again urged their request.[114] To the tenets contained in this book the council had no objection; but they refused to ratify it, because by doing so they would have sanctioned the principle that the new church had a right to the revenues of the old one.[115] A certain share, indeed, they were willing to concede. What the share should be was a matter of serious dispute, and caused the greatest ill-will between the two parties. At length the nobles broke silence and in December, 1561, they declared that the Reformed clergy should only receive one-sixth of the property of the Church; the remaining five-sixths being divided between the government and the Catholic priesthood.[116] The meaning of this was easily understood,

[112] In 1561, "notwithstanding the full establishment of the Reformation, the Protestant ministers were in a state of extreme poverty, and dependent upon the precarious assistance of their flocks." *Tytler's History of Scotland*, vol. v. p. 207. Compare a letter written by Knox in 1566, on "the extreame povertie wherein our ministers are brought." *Knox's History of the Reformation*, vol. ii. p. 542.

[113] "The limited authority which the Crown had hitherto possessed was almost entirely annihilated, and the aristocratical power, which always predominated in the Scottish government (?), became supreme and incontrollable." *Russell's History of the Church in Scotland*, 1834, vol. i. p. 223.

[114] See the *First Book of Discipline*, reprinted in *A Compendium of the Laws of the Church of Scotland*, part i., second edition, Edinburgh, 1837. They summed up their requests in one comprehensive passage (p. 119) that "the haill rentis of the Kirk abusit in Papistrie sal be referrit againe to the Kirk." In another part (p. 106), they frankly admit that "we doubt not but some of our petitions shall appeare strange unto you at the first sight."

[115] "The form of policy recommended in the First Book of Discipline never obtained the proper sanction of the State, chiefly in consequence of the avarice of the nobility and gentry, who were desirous of securing to themselves the revenues of the Church." *Miscellany of the Wodrow Society*, p. 324. See also *Argyll's Presbytery Examined*, p. 26. Many of the nobles, however, did sign it (*Knox's History of the Reformation*, vol. ii. p. 129); but, says Spottiswoode (*History of the Church of Scotland*, vol. i. p. 373), "Most of those that subscribed, getting into their hands the possessions of the Church, could never be induced to part therewith, and turned greater enemies in that point of church patrimony than were the papists, or any other whatsoever."

[116] *M'Crie's Life of Knox*, p. 204. *Knox's History of the Reformation*, vol. ii. pp. 298–301, 307–309. *Buchanan's Rerum Scoticarum Historia*, lib. xvii. p. 500. The nominal arrangement, which was contrived with considerable art, was that one-third of the church revenues should be divided into two parts; one part for the government,

since the Catholics were now entirely dependent on the government, and the government was in fact the nobles themselves, who were at that period the monopolizers of political power.

Such being the case, it naturally happened that when the arrangement was made known the preachers were greatly moved. They saw how unfavourable it was to their own interests, and therefore they held that it was unfavourable to the interests of religion. Hence, in their opinion, it was contrived by the devil, whose purposes it was calculated to serve.[117] For now they who travailed in the vineyard of the Lord were to be discouraged, and were to suffer, in order that what rightly belonged to them might be devoured by idle bellies.[118] The nobles might benefit for a time, but the vengeance of God was swift, and would most assuredly overtake them.[119] From the beginning to the end it was nothing but spoliation. In a really Christian land the patrimony of the Church would be left untouched.[120] But in Scotland,

and another part for the preachers. The remaining two-thirds were gravely assigned to the Catholic priesthood, who at that very moment were liable, by Act of Parliament, to the penalty of death, if they performed the rites of their religion. Men whose lives were in the hands of the government were not likely to quarrel with the government about money matters; and the result was that nearly everything fell into the possession of the nobles.

[117] "The Ministeris, evin in the begynnyng, in publict Sermonis opponed thame selves to suche corruptioun, for thei foirsaw the purpose of the Devill." *Knox's History of the Reformation*, vol. ii. p. 310.

[118] "For it seemeth altogether unreasonable that idle belleis sall devoure and consume the patrimonie of the Kirk, whill the faithfull travellers in the Lord's vineyarde suffer extreme povertie, and the needie members of Christ's bodie are altogether neglected." *Calderwood's History of the Kirk*, vol. ii. pp. 484, 485. This was in 1569; and in 1571 the celebrated Ferguson, in one of his sermons, declared that the holders of church property, most of whom were the nobility, were "ruffians." See an extract from his sermon, in *Chalmers' History of Dunfermline*, p. 309, Edinburgh, 1844. "For this day Christ is spuilzeit amang us, quhil yt quhilk aucht to mantene the Ministerie of the Kirk and the pure, is geuin to prophane men, flattereris in court, ruffianes, and hyrelingis."

[119] In September, 1571, John Row "preiched, wha in plane pulpet pronunced to the lordis, for thair covetusnes, and becaus they wold not grant the just petitiones of the Kirk, Godis heastie vengeance to fall upon them; and said, moreover, 'I cair not, my lordis, your displeasour; for I speik my conscience befoir God, wha will not suffer sic wickitnes and contempt vnpunished." *Bannatyne's Journal*, edit. Edinburgh, 1806, p. 257.

[120] In 1576 the General Assembly declared that their right to "the patrimonie of the Kirk" was "ex jure divino." *Acts of the General Assemblies of the Kirk of Scotland*, vol. i. p. 360, Edinburgh, 1839, 4to. More than a hundred years later, a Scotch divine evinces how deeply the members of his profession felt this spoliation of the Church, by going out of his way to mention it. See *Jacob's Vow, by Dr. John Cockburn*, Edinburgh, 1696, pp. 422, 423, 425. But this is nothing in comparison to a recent writer, the Reverend Mr. Lyon, who deliberately asserts that, because these and similar acts occurred in the reign of Mary, therefore the queen came to a violent end; such being the just punishment of sacrilege. "The practice" (of saying masses for the dead) "ceased, of course, at the Reformation; and the money was transferred by Queen Mary to the civil authorities of the town. This was undoubtedly an act of sacrilege; for though sacrificial masses for the dead was an error, yet the guardians of the money so bequeathed were under an obligation to apply it to a sacred purpose. This, and other sacrilegious acts on the part of Mary, of a still more decided and extensive character, have been justly considered as the cause of all the calamities which subsequently befell her." *History of St. Andrews, by the Rev. C. J. Lyon, M.A., Presbyter of the Episcopal Church, St. Andrews*, Edinburgh, 1843, vol. i. p. 54. Elsewhere (vol. ii. p. 400) the same divine mentions that the usual punishment for sacrilege is a failure of male issue. "The following examples, selected from the diocese of St. Andrews, according to its boundaries before the Reformation,

alas! Satan had prevailed,[121] and Christian charity had waxen cold.[122] In Scotland, property which should be regarded as sacred had been broken up and divided; and the division was of the worst kind, since by it, said Knox, two-thirds are given to the devil, and the other third is shared between God and the devil. It was as if Joseph, when governor of Egypt, had refused food to his brethren, and sent them back to their families with empty sacks.[123] Or, as another preacher suggested, the Church was now, like the Maccabees of old, being oppressed, sometimes by the Assyrians, and sometimes by the Egyptians.[124]

But neither persuasions nor threats[125] produced any effect on the obdurate minds of the Scotch nobles. Indeed their hearts, instead of being softened,

will corroborate the general doctrine contended for throughout this work, that sacrilege has ever been punished in the present life, and *chiefly* by the failure of male issue." The italics are in the text. See also vol. i. p. 118. For the sake of the future historian of public opinion, it may be well to observe that the work containing these sentiments is not a reprint of an older book, but was published for the first time in 1843, having apparently been just written.

[121] "The General Assemblie of the Kirk of Scotland, convenit at Edinburgh the 25 of December 1566, to the Nobilitie of this Realme that professes the Lord Jesus with them, and hes ronouncit that Roman Antichryst, desyre constancie in faith, and the spirit of righteous judgement. Seeing that Sathan, be all our negligence, Right Honourable, hes so farre prevailit within this Realme within these late dayes, that we doe stand in extream danger, not only *to lose our temporall possessiouns*, but also to be depryvit of the glorious Evangell," &c. *Keith's Church and State*, vol. iii. pp. 154, 155.

[122] In 1566, in their piteous communication to the English bishops and clergy, they said, "The days are ill; iniquitie abounds; christian charity, alas, is waxen cold." *Acts and Proceedings of the General Assemblies of the Kirk of Scotland*, vol. i. p. 87, Edinburgh, 1839, 4to.

[123] "I see twa partis freely gevin to the Devill, and the thrid maun be devided betwix God and the Devill: Weill, bear witnes to me, that this day I say it, or it be long the Devill shall have three partis of the thrid; and judge you then what Goddis portioun shalbe." . . . "Who wold have thought, that when Joseph reulled Egypt, that his brethren should have travailled for vittallis, and have returned with empty seckis unto thair families? Men wold rather have thought that Pharao's pose, treasure, and garnallis should have bene diminished, or that the household of Jacob should stand in danger to sterve for hungar." *Knox's History of the Reformation*, vol. ii. pp. 310, 311.

[124] In May, 1571, "This Sonday, Mr. Craig teiched the 130 Psalme; and, in his sermond, he compared the steat of the Kirk of God in this tovne vnto the steat of the Maccabeis; wha were oppressed sumtymes by the Assyrianis, and sumtymes by the Egiptianis." *Bannatyne's Journal*, p. 150.

[125] The first instance I have observed of anything like menace is in 1567, when "the Assembly of the Church being convened at Edinburgh," admonished all persons "as well noblemen as barons, and those of the other Estates, to meet and give their personal appearance at Edinburgh on the 20th of July, for giving their advice, counsel, and concurrence in matters then to be proponed; especially for purging the realm of popery, the establishing of the policy of the Church, and *restoring the patrimony thereof to the just possessors*. Assuring those that should happen to absent themselves at the time, due and lawful advertisement being made, that they should be reputed hinderers of the good work intended, and as *dissimulate professors be esteemed unworthy of the fellowship of Christ's flock*." *Spottiswoode's History of the Church of Scotland*, vol. ii. p. 64. This evidently alludes to the possibility of excommunicating those who would not surrender to the Protestant preachers the property stolen from the Catholic Church; and in 1570 we find another step taken in the same direction. Under that year, the following passage occurs in *Acts and Proceedings of the General Assemblies of the Kirk of Scotland*, vol. i. p. 181. "Q. If those that withhold the duty of the Kirk, *wherethrough Ministers want their stipends*, may be excommunicate? A. All things beand done that the civill ordour requyres of them that withhaldis the duetie of the Kirk, quherby Ministers wants their stipends; *the Kirk may proceed to excommunication, for their contempt*."

became harder. Even the small stipends which were allotted to the Protestant clergy were not regularly paid, but were mostly employed for other purposes.[126] When the ministers complained, they were laughed at and insulted by the nobles, who, having gained their own ends, thought that they could dispense with their former allies.[127] The Earl of Morton, whose ability, as well as connexions, made him the most powerful man in Scotland, was especially virulent against them; and two of the preachers who offended him he put to death, under circumstances of great cruelty.[128] The nobles, regarding him as their chief, elected him Regent in 1572;[129] and being now possessed of supreme power, he employed it against the Church. He seized upon all the benefices which became vacant, and retained their profits in his own hands.[130] His hatred of the preachers passed all bounds. He publicly declared that there would be neither peace nor order in the country until some of them were hung.[131] He refused to sanction the General Assemblies by his presence; he wished to do away with their privileges, and even with their name; and with such determination did he pursue his measures, that in the opinion of the historian of the Scotch Kirk nothing but the special interference of the Deity could have maintained its existing polity.[132]

[126] In 1562 "the poore ministers, exhorters, and readers, compleaned at church assembleis that neither were they able to live upon the stipends allowed, nor gett payment of that small portioun which was allowed." *Calderwood's History of the Kirk*, vol. ii. p. 172. Compare *Acts of the General Assemblies*, 1839, 4to, vol. i. p. 53; "To requyre payment to ministers of there stipends for the tyme by past, according to the promise made." This was in Decembèr, 1564. In December, 1565, the General Assembly said (p. 71), "that wher oft and divers tymes promise hes bein made to us, that our saids brethren, travelers and preachers in the Kirk of God, sould not be defraudit of their appointit stipends, neither zet in any ways sould be molestit in their functioun; zet nottheles universallie they want ther stipends appointit for diverse tymes by past." On the state of things in 1566, see "The Supplication of the Ministers to the Queen," in *Knox's History of the Reformation*, vol. ii. p. 529. See also, in the *Miscellany of the Spalding Club*, vol. iv. pp. 92–101, Aberdeen, 1849, 4to, a letter written by John Erskine in December, 1571, especially p. 97: "the gretest of the nobilitie haifing gretest rentie in possessione, and plaicet of God in maist hie honouris, ceasis nocht, maist wiolentlie blindit with awarice, to spoilve and draw to thame selfis the possessiones of the Kirk."

[127] "The ministers were called proud knaves, and receaved manie injurious words from the lords, speciallie from Morton, who ruled all. He said he sould lay their pride, and putt order to them." *Calderwood's History of the Kirk*, vol. iii. pp. 137, 138. This was in 1571.

[128] *Chambers' Annals of Scotland*, vol. i. pp. 79, 80.

[129] "The nobilitie wnderwrittin convenit in Edinburgh, and chesit and electit James erle of Mortoun regent." *A Diurnal of Occurrents*, p. 320.

[130] In 1573, "when any benefeces of Kirk vaikit, he keapit the proffet of thair rents sa lang in his awin hand, till he was urgit be the Kirk to mak donatioun tharof, and that was not gevin but proffeit for all that." *The Historie and Life of King James the Sext*, edit. Edinburgh, 1825, 4to, p. 147. Even in 1570, when Lennox was regent, "the Earle of Mortoun was the chiefe manager of every thing under him;" and was "master of the church rents," and made "gifts of them to the nobility." *Wodrow's Collections upon the Lives of the Reformers of the Church of Scotland*, vol. i. part i. pp. 27, 126, Glasgow, 1834, 4to.

[131] "During all these Assembleis and earnest endeavoures of the brethrein, the regent was often required to give his presence to the Assemblie, and further the caus of God. He not onlie refused, but threatned some of the most zealous with hanging, alledging that otherwise there could be no peace nor order in the countrie." *Calderwood's History of the Kirk*, vol. iii. pp. 393, 394. "Uses grait thretning against the maist zelus breithring, schoring to hang of thame, utherwayes ther could be na peace nor ordour in the countrey." *The Autobiography and Diary of James Melvill*, edited by R. Pitcairn, Edinburgh, 1842, pp. 59, 60.

[132] "He mislyked the Generall Assembleis, and would have had the name changed,

The rupture between Church and State was now complete. It remained to be seen which was the stronger side. Every year the clergy became more democratic; and after the death of Knox, in 1572, they ventured upon a course which even he would hardly have recommended, and which during the earlier period of the Reformation would have been impracticable.[133] But by this time they had secured the support of the people; and the treatment they were receiving from the government and from the nobles embittered their minds, and drove them into desperate counsels. While their plans were yet immature, and while the future was looming darkly before them, a new man arose who was well qualified to be their chief, and who at once stepped into the place which the death of Knox left vacant. This was Andrew Melville, who, by his great ability, his boldness of character, and his fertility of resource, was admirably suited to be the leader of the Scottish Church in that arduous struggle in which it was about to embark.[134]

In 1574 Melville, having completed his education abroad, arrived in Scotland.[135] He quickly rallied round him the choicest spirits in the Church; and, under his auspices a struggle began with the civil power, which continued, with many fluctuations, until it culminated sixty years later in open rebellion against Charles I. To narrate all the details of the contest would be inconsistent with the plan of this Introduction; and notwithstanding the extreme interest of the events which now ensued, the greater part of them must be omitted; but I will endeavour to indicate the general march, and to put the reader in possession of such facts as are most characteristic of the age in which they occurred.

Melville had not been in Scotland many months before he began his opposition, at first by secret intrigues, afterwards with open and avowed hostility.[136] In the time of Knox, episcopacy had been recognized as part of the Protestant Church, and had received the sanction of the leading Reformers.[137] But that

that he might take away the force and priviledge thereof; and no questioun he had stayed the work of policie that was presentlie in hands, if God had not stirred up a factioun against him." *Calderwood's History of the Kirk of Scotland*, vol. iii. p. 396. See also *The Autobiography of James Melvill*, p. 61.

[133] "During the two years following the death of Knox, each day was ripening the more determined opposition of the Church. The breach between the clergy with the great body of the people, and the government or higher nobility, was widening rapidly." *Argyll's Presbytery Examined*, p. 70.

[134] "Next to her Reformer, who, under God, emancipated her from the degrading shackles of papal superstition and tyranny, I know no individual from whom Scotland has received such important services, or to whom she continues to owe so deep a debt of national respect and gratitude, as Andrew Melville." *M'Crie's Life of Andrew Melville*, vol. ii. p. 473, Edinburgh, 1819. His nephew, himself a considerable person, says, "Scotland receavit never a graitter benefit at the hands of God nor this man." *The Autobiography of James Melvill*, p. 38.

[135] He left Scotland in 1564, at the age of nineteen, and returned "in the beginning of July, 1574, after an absence of ten years from his native country." *M'Crie's Life of Andrew Melville*, vol. i. pp. 17, 57. See also *Scot's Apologetical Narration of the State of the Kirk of Scotland*, edit. Wodrow Society, p. 34; and *Howie's Biographia Scoticana*, p. 111, Glasgow, 1781.

[136] He appears to have first set to work in November, 1574. See *Stephen's History of the Church of Scotland*, vol. i. p. 261, London, 1848.

[137] "The compilers of the Book of Discipline" (*i.e.* the First Book, in 1560) "were distinguished by prelatical principles to the end of their days." . . . . "That Knox himself was no enemy to prelacy, considered as an ancient and apostolical institution, is rendered clear by his 'Exhortation to England for the speedy embracing of Christ's Gospel.'" *Russell's History of the Church in Scotland*, 1834, vol. i. p. 240. "The associates of Knox, it is obvious, were not Presbyterians, and had no intention of setting up a system of parity among the ministers of their new establishment." p. 243. See also p. 332. Even in 1572, the year of Knox's death, I find it stated that "the whole Diocie

institution did not harmonize with the democratic spirit which was now growing up. The difference of ranks between the bishops and the inferior clergy was unpleasant, and the ministers determined to put an end to it.[138] In 1575 one of them, named John Dury, was instigated by Melville to bring the subject before the General Assembly at Edinburgh.[139] After he had spoken, Melville also expressed himself against episcopacy; but, not being yet sure of the temper of the audience his first proceedings were somewhat cautious. Such hesitation was however hardly necessary; for owing to the schism between the Church and the upper classes, the ministers were becoming the eager enemies of those maxims of obedience and of subordination which they would have upheld had the higher ranks been on their side. As it was, the clergy were only favoured by the people; they therefore sought to organize a system of equality, and were ripe for the bold measures proposed by Melville and his followers. This was clearly shown by the rapidity of the subsequent movement. In 1575 the first attack was made in the General Assembly at Edinburgh. In April, 1578, another General Assembly resolved that for the future bishops should be called by their own names, and not by their titles.[140] The same body also declared that no see should be filled up until the next Assembly.[141] Two months afterwards it was announced that this arrangement was to be perpetual, and that no new bishop should ever be made.[142] And in 1580 the Assembly of the Church at Dundee, pulling the whole fabric to the ground, unanimously resolved that the office of bishop was a mere human invention; that it was unlawful; that it

of Sanct Andrews is decerned be the Assembly to pertain to the Bishop of the same." *Acts and Proceedings of the General Assemblies of the Kirk of Scotland*, vol. i. p. 264, 4to, 1839. The Scotch Presbyterians have dealt very unfairly with this part of the history of their Church.

138 Some little time after this, David Ferguson, who died in 1598, and was minister at Dunfermline, said very frankly to James VI., "Yes, Sir, ye may have Bishops here, but *ye must remember to make us all equal*: make us all Bishops, els will ye never content us." *Row's History of the Kirk of Scotland from* 1558 *to* 1637, edit. Wodrow Society, p. 418. Compare *Calderwood's History of the Kirk*, vol. iv. p. 214: in 1584, "these monstruous titles of superioritie." In 1586, "that tyrannicall supremacie of bishops and archbishops over ministers." p. 604.

139 "He stirred up John Dury, one of the ministers of Edinburgh, in an Assembly which was then convened, to propound a question touching the lawfulness of the episcopal function, and the authority of chapters in their election. He himself, as though he had not been acquainted with the motion, after he had commended the speaker's zeal, and seconded the purpose with a long discourse of the flourishing estate of the church of Geneva, and the opinions of Calvin and Theodore Beza concerning church government, came to affirm, 'That none ought to be esteemed office-bearers in the Church whose titles were not found in the book of God. And, for the title of bishops, albeit the same was found in Scripture, yet was it not to be taken in the sense that the common sort did conceive, there being no superiority allowed by Christ amongst ministers,'" &c. *Spottiswoode's History of the Church of Scotland*, vol. ii. p. 200. See also *Acts of the General Assemblies*, vol. i. p. 331, where it appears that six bishops were present on this memorable occasion. The question raised was, "Whither if the Bischops, as they are now in the Kirk of Scotland, hes thair function of the word of God or not, or if the Chapiter appointit for creating of them aucht to be tollerated in this reformed Kirk." p. 340.

140 "It was ordained, That Bischops and all vthers bearand Ecclesiasticall functioun, be callit be thair awin names, or Brethren, in tyme comeing." *Acts of the General Assemblies of the Kirk of Scotland*, vol. ii. p. 404.

141 "Therfor the Kirk hes concludit, That no Bischops salbe electit or made heirafter, befor the nixt Generall Assemblie." *Ibid.*, vol. ii. p. 408.

142 "Anent the Act made in the last Assemblie, the 28 of Aprile 1578, concerning the electioun of Bischops, suspendit quhill this present Assemblie, and the farther ordour reservit thereto: The General Assemblie, all in ane voyce, hes concludit, That the said act salbe extendit for all tymes to come, ay and quhill the corruptioun of the Estate of Bischops be alluterlie tane away." *Ibid.*, vol. ii. p. 413.

must be immediately done away with ; and that every bishop should at once resign his office, or be excommunicated if he refused to do so.[143]

The minister and the people had now done their work, and, so far as they were concerned, had done it well.[144] But the same circumstances which made them desire equality, made the upper classes desire inequality.[145] A collision therefore was inevitable, and was hastened by this bold proceeding of the Church. Indeed the preachers, supported by the people, rather courted a contest than avoided it. They used the most inflammatory language against episcopacy ; and shortly before abolishing it they completed and presented to Parliament the Second Book of Discipline, in which they flatly contradicted what they had asserted in their First Book of Discipline.[146] For this they are often taunted with inconsistency.[147] But the charge is unjust. They were perfectly consistent ;* and they merely changed their maxims, that they might preserve their

[143] " Forsameikle as the office of a Bischop, as it is now vsit, and commounly takin within this realme, hes no sure warrand, auctoritie, nor good ground out of the (Book and) Scriptures of God ; but is brocht in by the folie and corruptions of (men's) invention, to the great overthrow of the Kirk of God : The haill Assemblie of the Kirk, in ane voyce, after libertie givin to all men to reason in the matter, *none opponing themselves in defending the said pretendit office*, Finds and declares the samein pretendit office, vseit and termeit, as is above said, vnlaufull in the selfe, as haveand neither fundament, ground nor warrant within the word of God : and ordaines, That all sick persons as bruiks, or sall bruik heirafter the said office, salbe chargeit simpliciter to demitt, quyt and leave of the samein, as ane office quhervnto they are not callit be God ; and siclyke to desist and cease from all preaching, ministration of the sacraments, or vsing any way the office of pastors, quhill they receive *de novo* admission from the Generall Assemblie, vnder the paine of excommunicatioun to be denuncit agains them ; quherin if they be found dissobedient, or contraveine this act in any point, the sentence of excommunicatioun, after dew admonitions, to be execute agains them." *Acts of the General Assemblies*, vol. ii. p. 453.

[144] As Calderwood triumphantly says, " the office of bishops was damned." *History of the Kirk*, vol. iii. p. 469. " Their whole estat, both the spirituall and civill part, was damned." p. 526. James Melvill (*Autobiography*, p. 52) says that in consequence of this achievement his uncle Andrew " gatt the nam of επισκοπομαστιξ, *Episcoporum exactor*, the flinger out of Bischopes."

[145] Tytler (*History of Scotland*, vol. vi. p. 302) observes that, while " the great body of the burghers and middle and lower classes of the people " were Presbyterians, " a large proportion of the nobility supported episcopacy." Instead of " a large proportion," he would not have been far wrong if he had said " all." Indeed, " Melville himself says the whole peerage was against him." *Stephen's History of the Church of Scotland*, vol. i. p. 269. Forbes ascribes the aristocratic movement against presbytery to " godles atheists," who insisted " that there could be nothing so contrair to the nature of a monarchie," &c., " than that paritie of authoritie in pastours." *Forbes, Certaine Records touching the Estate of the Kirk*, p. 349, edit. Wodrow Society. See also p. 355. " That Democratie (as they called it) whilk allwayes behoved to be full of sedition and troublle to ane Aristocratie, and so in end to a Monarchie." The reader will observe this important change in the attitude of classes in Scotland. Formerly, the clergy had been the allies of the crown against the nobles. Now, the nobles allied themselves with the crown against the clergy. The clergy, in self-defence, had to ally themselves with the people.

[146] On the difference between the two productions there are some remarks worth looking at in *Argyll's Presbytery Examined*, 1848, pp. 38–43. But this writer, though much freer from prejudice than most Presbyterian authors, is unwilling to admit how completely the Second Book of Discipline contradicts the First.

[147] By the Scotch episcopalians.

[* Buckle more than once forces a sense on this word which makes it useless. In his sense, no one is ever inconsistent who constantly seeks his own interests. If the word is to have any value, the action of the Scots clergy in the case under notice must be

principles. Like every corporation which has ever existed, whether spiritual or temporal, their supreme and paramount principle was to maintain their own power. Whether or not this is a good principle is another matter; but all history proves that it is an universal one. And when the leaders of the Scotch Church found that it was at stake, and that the question at issue was, who should possess authority, they with perfect consistency abandoned opinions that they had formerly held, because they now perceived that those opinions were unfavourable to their existence as an independent body.

When the First Book of Discipline appeared in 1560, the government was in the hands of the nobles, who had just fought on the side of the Protestant preachers, and were ready to fight again on their side. When the Second Book of Discipline appeared in 1578, the government was still held by the nobles; but those ambitious men had now thrown off the mask, and having effected their purpose in destroying the old hierarchy, had actually turned round and attacked the new one. The circumstances having changed, the Church changed with them; but in the change there was nothing inconsistent. On the contrary, it would have been the height of inconsistency for the ministers to have retained their former notions of obedience and of subordination; and it was perfectly natural* that, at this crisis, they should advocate the democratic idea of equality, just as before they had advocated the aristocratic idea of inequality.

Hence it was that, in their First Book of Discipline, they established a regularly ascending hierarchy, according to which the general clergy owed obedience to their ecclesiastical superiors, to whom the name of superintendents was given.[148] But in the Second Book of Discipline every vestige of this was swept away; and it was laid down in the broadest terms that, all the preachers being fellow-labourers, all were equal in power; that none had authority over others; and that to claim such authority, or to assert pre-eminence, was a contrivance of man, not to be permitted in a divinely constituted Church.[149]

[148] See the *First Book of Discipline*, reprinted in the first volume of *A Compendium of the Laws of the Church of Scotland*, 2nd edit., Edinburgh, 1837. The superintendents were "to set, order, and appoint ministers," p. 61; and it would seem (p. 88) that no minister could be deposed without the consent of his superintendent; but this could hardly be intended to interefere with the supreme authority of the General Assembly. See also the summary, p. 114, where it is said of the superintendents, that "in thair visitatioun thei sal not onlie preiche, but als examine the doctrine, life, diligence, and behavior of the ministeris, reideris, elderis, and deaconis." According to Spottiswoode (*History of the Church of Scotland*, vol. ii. p. 167), "the superintendents held their office during life, and their power was episcopal; for they did elect and ordain ministers, they presided in synods, and directed all church censures, neither was any excommunication pronounced without their warrant." See further, on their authority, *Knox's History of the Reformation*, vol. ii. p. 161. "That punyschment suld be appointed for suche as dissobeyid or contemned the superintendentes in thair functioun." This was in 1561; and in 1562 "it was ordained, that if ministers be disobedient to superintendents in anything belonging to edification, they must be subject to correction." *Acts of the General Assemblies of the Kirk*, vol. i. p. 14. Compare p. 131: "sick things as superintendents may and aught decyde in their synodall conventiouns."

[149] "For albeit the Kirk of God be rewlit and governit be Jesus Christ, who is the onlie King, hie Priest, and Heid thereof, yit he useis the ministry of men, as the most necessar middis for this purpose." . . . "And to take away all occasion of tyrannie, he willis that they sould rewl with mutuall consent of brether and *equality of power*, every one according to thair functiones." *Second Book of Discipline*, in *A Compendium*

pronounced inconsistent. The word can mean nothing but deflection from *professed* principles. They did not avow and explain change of opinion: they simply changed front. But it might reasonably be argued that they were justified in the change, if they had acknowledged it.—Ed.]

[* The proper statement would be that it was perfectly natural that they should be inconsistent.—Ed.]

The government, as may be supposed, took a very different view. Such doctrines were deemed by the upper classes to be anti-social, and to be subversive of all order.[150] So far from sanctioning them, they resolved if possible to overthrow them; and the year after the General Assembly had abolished episcopacy it was determined that upon that very point a trial of strength should be made between the two parties.

In 1581 Robert Montgomery was appointed archbishop of Glasgow. The ministers who composed the chapter of Glasgow refused to elect him; whereupon the Privy Council declared that the King, by virtue of his prerogative, had the right of nomination.[151] All was now confusion and uproar. The General Assembly forbade the archbishop to enter Glasgow.[152] He refused to obey their order, and threw himself upon the support of the Duke of Lennox, who had obtained the appointment for him, and to whom he in return had surrendered nearly all the revenues of the see, reserving for himself only a small stipend.[153] This was a custom which had grown up within the last few years, and was one of many contrivances by which the nobles plundered the Church of her property.[154]

of the Laws of the Church of Scotland, vol. i. pp. 126, 127. "As to Bischops, if the name επισκοπος be properly taken, *they ar all ane with the ministers*, as befoir was declairit. For it is *not a name of superioritie and lordschip*, bot of office and watching." p. 142. To understand the full meaning of this, it should be mentioned that the superintendents established by the Kirk in 1560 not unfrequently assumed the title of "Lordship," as an ornament to the extensive powers conferred upon them. See, for instance, the notes to *Wodrow's Collections upon the Lives of the Reformers of the Church of Scotland*, vol. i. part ii. p. 461. But in the Second Book of Discipline, in 1578, the superintendents are, if I rightly remember, not even once named. [Buckle has not here brought out the real cause of the change of front of the clergy as to bishops. As he mentions below in *note* 153, the nobility were drawing the revenues of the bishoprics by appointing men of straw to the offices. (The Scots commonalty called those bishops "tulchans," a word meaning "the stuffed skin of a calf, placed beside the cow at milking time to induce her to yield her milk freely.") It was to retain their power of thus appropriating the episcopal revenues, and not from any abstract concern for social order, that the aristocracy stood for episcopacy. Cp. Burton, *History*, v. 81.—Ed.]

[150] Just as in England we find that the upper classes are mostly Episcopalians; their minds being influenced, often unconsciously, by the to them pleasing spectacle of an inequality of rank which is conventional, and does not depend upon ability. On the other hand, the strength of the Dissenters lies among the middle and lower classes, where energy and intellect are held in higher respect, and where a contempt naturally arises for a system which, at the mere will of the sovereign or minister of the day, concedes titles and wealth to persons whom nature did not intend for greatness, but who, to the surprise of their contemporaries, have greatness thrust upon them. On this difference of opinion in Scotland, corresponding to the difference of social position, see the remarks on the seventeenth century in *Hume's Commentaries on the Law of Scotland*, vol. ii. p. 544, Edinburgh, 1797, 4to.

[151] Record of Privy Council, in *M'Crie's Life of Melville*, vol. i. p. 267. "The brethrein of Glasgow were charged, under paine of horning, to admitt Mr. Robert Montgomrie." *Calderwood's History of the Kirk*, vol. iii. p. 596.

[152] "Charges the said Mr. Robert to continue in the ministrie of the Kirk of Striveling," &c. *Acts of the General Assemblies*, vol. ii. p. 547. This was in October, 1581; the Record of the Privy Council was in April, 1582. Moysie, who was a contemporary, says that, in March, 1581-2, not only the dean and chapter but all the clergy (the "haill ministrie") declared from the pulpit that Montgomery's appointment "had the warrand of the deuill and not of the word of God, bot wes damnit thairby." *Moysie's Memoirs*, Edinburgh, 1830, 4to, p. 36.

[153] "The title whereof the said duke had procured to him, that he, having the name of bishop, and eight hundreth merks money for his living and sustentatioun, the whole rents and other duteis of the said benefice, might come to the duke's utilitie and behove." *Calderwood's History of the Kirk*, vol. iv. p. 111. See also p. 401.

[154] *Scot's Apologetical Narration of the State of the Kirk*, pp. 24, 25. *Calderwood's*

This, however, was not the question now at issue.[155] The point to be decided was one not of revenue but of power. For the clergy knew full well that if they established their power the revenue would quickly follow. They therefore adopted the most energetic proceedings. In April, 1582, the General Assembly met at St. Andrews, and appointed Melville as moderator.[156] The government, fearing the worst, ordered the members, on pain of rebellion, to take no steps respecting the archbishopric.[157] But the representatives of the Church were undaunted. They summoned Montgomery before them; they ratified the sentence by which he had been suspended from the ministry; and they declated that he had incurred the penalties of deposition and of excommunication.[158]

A sentence of excommunication was in those days so ruinous that Montgomery was struck with terror at the prospect before him. To avoid the consequences he appeared before the Assembly, and solemnly promised that he would make no further attempt to possess himself of the archbishopric.[159] By doing this, he probably saved his life; for the people, siding with their clergy, were ripe for mischief, and were determined at all hazards to maintain what they considered to be the rights of the Church, in opposition to the encroachments of the State.*

The government, on the other hand, was equally resolute.[160] The Privy Council called several of the ministers before them; and Dury, one of the most active, they banished from Edinburgh.[161] Measures still more violent were about to be taken, when they were interrupted by one of those singular events which not unfrequently occurred in Scotland, and which strikingly evince the inherent weakness of the Crown, notwithstanding the inordinate pretensions it commonly assumed.

This was the Raid of Ruthven, which happened in 1582, and in consequence of which the person of James VI. was held in durance for ten months.[162] The

History of the Kirk, vol. iii. p. 302. *Wodrow's Collections upon the Lives of the Reformers*, vol. i. part i. p. 206. *Lyon's History of St. Andrews*, vol. i. p. 379. *Gibson's History of Glasgow*, p. 59. *Hume's History of the House of Douglas*, vol. ii. pp. 216, 217. *Chalmers' Caledonia*, vol. iii. p. 624.

155 "But the Church passing this point" (*i.e.* the simony) "made quarrel to him for accepting the bishopric." *Spottiswoode's History of the Church of Scotland*, vol. ii. p. 282.

156 *Acts of the General Assemblies of the Kirk*, vol. ii. p. 548.

157 "A messenger-at-arms entered the house, and charged the moderator and members of the assembly, on the pain of rebellion, to desist from the process." *M'Crie's Life of Melville*, vol. i. p. 268.

158 "The Assemblie and brether present, after voteing in the said matter, depryvit the said Mr. Robert from all functioun of the Ministrie in the Kirk of God, dureing the will of the Kirk of God; and farther, descernit the fearefull sentence of excommunicatioun to be pronuncit against him in the face of the haill Assemblie, be the voyce and mouth of the Moderatour present; to the effect, that, *his proud flesh being cast into the hands of Satan*, he may be win againe, if it be possible, to God: and the said sentence (to) be intimat be every particular minister, at his awin particular kirk, solemnelie in the first sermoun to be made be them, after thair returning." *Acts of the General Assemblies of the Kirk*, vol. ii. p. 562.

159 *Ibid.*, vol. ii. p. 565. Calderwood (*History of the Kirk*, vol. iii. p. 604) says, "After long reluctatioun, at lenth he condescended."

160 M'Crie (*Life of Melville*, vol. i. p. 274) says, "In all these contendings, the ministers had no countenance or support from any of the nobility." It would have been strange if they had, seeing that the whole movement was essentially democratic.

161 *Melville's Autobiography*, p. 129. *Calderwood's History of the Kirk*, vol. iii. p. 620. *M'Crie's Life of Melville*, vol. i. p. 270.

162 He was seized in August, 1582, and was let loose again in June, 1583. *Tytler's History of Scotland*, vol. vi. pp. 321, 360. It is a pity that this valuable and really able

[* Not of the State, but of the nobles, who were pocketing the plunder. – Ed.]

clergy, true to the policy which now governed them, loudly approved of the captivity of the king, and pronounced it to be a godly act.[163] Dury, who had been driven from his pulpit, was brought back to the capital in triumph;[164] and the General Assembly, meeting at Edinburgh, ordered that the imprisonment of James should be justified by every minister to his own congregation.[165]

In 1583 the king recovered his liberty, and the struggle became more deadly than ever; the passions of both parties being exasperated by the injuries each had inflicted on the other. The Ruthven conspiracy, having been declared treason, as it undoubtedly was, Dury preached in its favour, and openly defended it; and although, under the influence of momentary fear, he afterwards withdrew what he had said,[166] it was evident from other circumstances that his feelings were shared by his brethren.[167] A number of them being summoned before the king for their seditious language, bade him take heed what he was about, and reminded him that no occupant of the throne had ever prospered after the ministers had begun to threaten him.[168] Melville, who exercised immense

work should be so superficial in regard to the ecclesiastical affairs of Scotland. Mr Tytler appears not to have studied at all the proceedings of the presbyteries, or even of the General Assemblies; neither does he display any acquaintance with the theological literature of his country. And yet, from the year 1560 to about 1700, these sources disclose more of the genuine history of the Scotch people than all other sources put together. [In the very act of thus severely condemning Tytler, Buckle has himself failed to explain the nature of the Raid of Ruthven, which Tytler brings out with great fulness and clearness (ed. 1869, iv. 41–53). The avowed reasons for the act were that the king was known to be in correspondence with France, that his advisers Lennox and Arran were believed to be plotting the subversion of the Protestant Church, and that James was believed to intend making a demission of the crown to his mother. Tytler also shows that the cause of episcopacy was felt to be bound up with that of the king's advisers. Buckle, finally, omits to note that Montgomery, after yielding on the sentence of excommunication, renewed his claim and was reinstated in his bishopric, the government pronouncing the excommunication null (*Id.* pp. 43, 47). Then it was that the trouble came to a head.—Ed.]

163 "The pulpit resounded with applauses of the godly deed." *Arnot's History of Edinburgh*, p. 37.

164 "As he is comming from Leith to Edinburgh, upon Tuisday the 4th of September, there mett him at the Gallow Greene two hundreth men of the inhabitants of Edinburgh. Their number still increassed, till he came within the Neather Bow. There they beganne to sing the 124 Psalme, 'Now may Israel say,' &c., and sang in foure parts, knowne to the most part of the people. They came up the street till they came to the Great Kirk, singing thus all the way, to the number of two thowsand. They were muche moved themselves, and so were all the beholders. The duke was astonished, and more affrayed at that sight than at anie thing that ever he had seene before in Scotland, and rave his beard for anger." *Calderwood's History of the Kirk*, vol. iii. pp. 646, 647.

165 *Acts of the General Assemblies*, vol. ii. pp. 595, 596. This was ordered by the General Assembly which met at Edinburgh on the 9th of October, 1582, p. 585. See also *Watson's Historicall Collections of Ecclesiastick Affairs in Scotland*, p. 192, "requiring the ministers in all their churches to commend it unto the people."

166 *Spottiswoode's History of the Church of Scotland*, vol. ii. p. 308.

167 James, after his escape, "convocat all his peceabill Prelatis and Nobles, and thair he notefeit unto thayme the greif that he consavit of his unlaughfull detentioun the yeir bygayne, and tharefore desyrit thame to acknawledge the same; and thay be thair generall voittis decernit the rayd of Ruthven to be manifest treasoun. The Ministers on the uther part, perswadit the people that it was a godly fact, and that whasoever wald not allow thareof in his hart, was not worthie to be estemit a Christien." *The Historie of King James the Sext*, p. 202, published by the *Bannatyne Club*, Edinburgh, 1825, 4to.

168 "Disregard not our threatening; for there was never one yet in this realm, in the place where your grace is, who prospered after the ministers began to threaten him." *Tytler's History of Scotland*, vol. vi. p. 364. See also, in *Calderwood's History of the Kirk*, vol. v. pp. 540, 541, a letter from one of the clergy in Fife, addressed to the king

influence over both clergy and people, bearded the king to his face, refused to account for what he had delivered in the pulpit, and told James that he perverted the laws both of God and of man.[169] Simpson likened him to Cain, and warned him to beware of the wrath of God.[170] Indeed, the spirit now displayed by the Church was so implacable, that it seemed to delight in venting itself in the most repulsive manner. In 1585 a clergyman named Gibson, in a sermon which he preached in Edinburgh, denounced against the king the curse of Jeroboam, that he should die childless, and that his race should end with him.[171] The year after this happened, James, finding that Elizabeth was evidently determined to take his mother's life, bethought him of what was valued in that age as an unfailing resource, and desired the clergy to offer up prayers on behalf of Mary. This they almost unanimously refused.[172] And not only did they abstain from supplication themselves, but they resolved that no one else should do what they had declined. The Archbishop of Saint Andrews being about to officiate before the king, they induced a certain John Cowper to station himself in the pulpit beforehand, so as to exclude the prelate. Nor was it until the captain of the guard threatened to pull Cowper from the place he had usurped, that the service could go on, and the king be allowed to hear his own mother prayed for, in this sad crisis of her fate, when it was still uncertain whether she would be publicly executed, or whether, as was more generally believed, she would be secretly poisoned.[173]

in 1597. "And now, Sir, lett me be free with you in writting other men's reports, and that of the wisest politicians. They say, our bygane historeis report, and experience teacheth, that *raro et fere nunquam* has a king and a prince continued long together in this realme; for *Filius ante diem patrios inquirit in annos*. And they say, Sir, farther, that whatsoever they were of your Majestie's predecessors in governement that oppouned themselves directlie or indirectlie to God's ordinance in his Kirk, it has beene their wracke and subversioun in the end. I might herein be more particular; but I leave it to your Majestie's owne grave and modest consideratioun, for it concerneth you most neere."

[169] "Saying 'He perverted the laws both of God and man.'" *Spottiswoode's History of the Church of Scotland*, vol. ii. p. 309. Also *Tytler's History of Scotland*, vol. vi. p. 371.

[170] "Mr. Patrick Simson, preaching before the king upon Gen. iv. 9, 'The Lord said to Cain, Where is Abel, thy brother?' said to the king, before the congregation, 'Sir, I assure you, in God's name, the Lord will ask at you where is the Earl of Moray, your brother?' The king replyed, before all the congregation, 'Mr. Patrik, my chalmer doore wes never steeked upon you: ye might have told me anything ye thought in secret.' He replyed, 'Sir, the scandall is publict.'" *Row's History of the Kirk*, p. 144. "Having occasion, *anno* 1593, to preach before the king, he publicly exhorted him to beware that he drew not the wrath of God upon himself in patronizing a manifest breach of divine laws." *Howie's Biographia Scoticana*, p. 120.

[171] "Saying, 'That Captain James, with his lady Jesabel, and William Stewart (meaning the colonel), were taken to be the persecutors of the Church; but that now it was seen to be the king himself, against whom he denounced the curse that fell on Jeroboam—that he would die childless, and be the last of his race.'" *Spottiswoode's History of the Church of Scotland*, vol. ii. p. 335.

[172] "The king, perceiving by all these letters, that the death of his mother was determined, called back his ambassadors, and at home gave order to the ministers to remember her in their public prayers, which they denied to do." . . . "Upon their denial, charges were directed to command all bishops, ministers, and other office-bearers in the Church to make mention of her distress in their public prayers, and commend her to God in the form appointed. But of all the number only Mr. David Lindsay at Leith and the king's own ministers gave obedience. *Spottiswoode's History of the Church*, vol. ii. pp. 355, 356. "They, with only one exception, refused to comply." *Russell's History of the Church in Scotland*, vol. ii. p. 23. Compare *Watson's Historicall Collections of Ecclesiastick Affairs in Scotland*, p. 208; and *Historie of James the Sext*, p. 225.

[173] "They stirred up Mr. John Cowper, a young man not entered as yet in the function, to take the pulpit before the time, and exclude the bishop. The king coming at the hour

In 1594 John Ross stated in the pulpit that the advisers of the king were all traitors, and that the king himself was likewise a traitor. He was also a rebel and a reprobate. That such should be the case was not surprising, considering the parentage of James. For his mother was a Guise, and a persecutor of the saints. He avoided open persecution, and spoke them fair; but his deeds did not correspond to his words; and so great was his dissimulation, that he was the most arrant hypocrite then living in Scotland.[174]

In 1596 David Black, one of the most influential of the Protestant ministers, delivered a sermon which made much noise. He said in his discourse that all kings were children of the devil; but that in Scotland the head of the Court was Satan himself. The members of the council, he added, were cormorants, and the lords of the session miscreants. The nobility had degenerated: they were godless; they were dissemblers; they were the enemies of the Church. As to the queen of England, she was nothing but an atheist. And as to the queen of Scotland, all he would say was, that they might pray for her if they list, and because it was the fashion to do so; but that there was no reason for it, inasmuch as no good would ever come from her to them.[175]

appointed, and seeing him in the place, called to him from his seat, and said, 'Mr. John, that place is destined for another; yet since you are there, if you will obey the charge that is given, and remember my mother in your prayers, you shall go on.' He replying, 'that he would do as the Spirit of God should direct him,' was commanded to leave the place: and making as though he would stay, the captain of the guard went to pull him out; whereupon he burst forth in these speeches: 'This day shall be a witness against the king in the great day of the Lord:' and then denouncing a woe to the inhabitants of Edinburgh, he went down, and the bishop of St. Andrews entering the pulpit did perform the duty required." *Spottiswoode's History of the Church of Scotland*, vol. ii. p. 356. "The Kingis Majestie, to testefie his earnest and naturall affection to his mother, causit pray for hir oppinly efter him selff; quhairvpone arrose a great dissensioun betuix sum of the ministrie and his Majestie, namely the ministrie of Edinburgh. Quhairvpone the king appoynted Patrik, archbischop of St. Androis to teache, bot he wes preuented be Mr. John Covpar minister, quho come befoir and filled the pulpit. And as the said Mr. John wes beginnand the prayer, the Kingis Majestie commandit him to stay: so as Mr. John raschit michtely vpone the pulpit, saying, 'This day sall bear witnes aganis yow in the day of the lord: woe be to ye Edinburgh, for the last of xi plaiges salbe the worst." *Moysie's Memoirs*, p. 59.

[174] See *The Historie of King James the Sext*, pp. 316–318, from "a just copie of his sermon" supplied by Ross himself. "His text was upon the 6 chapter of the Prophet Jeremias, verse 28. 'Brethren, we have manie, and almaist innumerable enormiteis in this cuntrie to be lamentit, as the misgovernement of our king be sinistrous counsall of sum particular men. They ar all rebellious traitors, evin the king the maist singular person, and particularlie everie estait of the land.' . . . 'Our king in sindrie poyntis hes bene rebellious aganis the Majestie of God.' . . . 'To this howre, we gat never gude of the Guysien blude, for Queyne Marie his mother was an oppin persecutor of the sanctis of God, and althoght the king be not an oppin persecutor, we have had many of his fayre wordis, wharein he is myghtie aneugh, bot for his gude deiddis, I commend me to thayme.' . . . 'Admit, that our king be a Christien king, yit but amendement, he is a reprobat king. Of all the men in this nation, the king himself is the maist fynest, and maist dissembling hypocreit.'" A very short notice of this sermon is given by Calderwood (*History of the Kirk*, vol. v. p. 299), who probably had not seen the original notes.

[175] The accusation, which was fully proved, was that "he had publictlie sayd in pulpit, that the papist erles wes come home be the kingis knavledge and consent, quhairin his Hienes treacherie wes detectit; that all kingis war deuilis and come of deuilis; that the deuill wes the head of the court and in the court; that he prayit for the Queine of Scotland for the faschione, because he saw na appearance of guid in hir tyme." *Moysie's Memoirs*, p. 128. [The return of the papist earls, which Buckle does not mention in the text, was the true gravamen.—Ed.] "Having been heard to affirm that the popish lords had returned into the country by the king's

For preaching this sermon, Black was summoned by the Privy Council. He refused to attend, because it was for a spiritual tribunal, and not for a temporal one, to take notice of what was uttered in the pulpit. The Church, to be sure, he would obey; but having received his message from God, he was bound to deliver it, and it would be a dereliction of duty if he were to allow the civil power to judge such matters.[176] The king, greatly enraged, ordered Black to be cast into prison; and it is difficult to see what other course was open to him; though it was certain that neither this nor any measure he could adopt would tame the indomitable spirit of the Scotch Church.[177]

In December the same year, the Church proclaimed a fast; and Welsh preached in Edinburgh a sermon, with the view of rousing the people against their rulers. The king, he told his audience, had formerly been possessed by a devil, and that devil being put out, seven worse ones had come in its place. It was therefore evident that James was demented, and it became lawful to take the sword of justice from his hands; just as it would be lawful for servants or children to seize the head of their family, if it had pleased heaven to afflict him with madness. In such case, the preacher observed, it would be right to lay hold of the madman, and to tie him hand and foot, that he might do no further harm.[178]

The hatred felt by the clergy was at this period so bitter, and the democratic spirit in them so strong,[179] that they seemed unable to restrain themselves; and

permission, and that thereby the king had discovered the 'treacherous hypocrisy of his heart;' that 'all kings were the devil's bairns, and that the devil was in the court, and the guiders of it.' He was proved to have used in this prayer these indecent words, when speaking of the queen, 'We must pray for her for fashion's sake; but we might as well not, for she will never do us any good.' He called the Queen of England an atheist, and the Lords of Session *bribers*; and said that the nobility at large 'were degenerate, godless, dissemblers, and enemies to the church.'" *Grierson's History of Saint Andrews*, p. 30, Cupar, 1838. Among the charges against him were, "Fourthly, that he had called the queen of England an atheist. Fifthly, that he had discussed a suspension granted by the lords of session in pulpit, and called them miscreants and bribers. Sixthly, that, speaking of the nobility, he said they were 'degenerated, godless, dissemblers, and enemies to the church.' Likewise, speaking of the council, that he had called them 'holiglasses, cormorants, and men of no religion.'" *Spottiswoode's History of the Church*, vol. iii. p. 21.

176 See the original papers on "The Declinatour of the King and Counsel's Judicatour in Maters Spirituall, namelie in Preaching of the Word," in *Calderwood's History of the Kirk*, vol. v. pp. 457–459, 475–480. Tytler (*History of Scotland*, vol. vii. pp. 326–332) has given extracts from them, and made some remarks on their obvious tendency. See also, on the Declinature of Jurisdiction claimed by the Scotch Church, *Hallam's Constitutional History*, 4th edit. 1842, vol. ii. p. 461; and *Mackenzie's Laws and Customs of Scotland in Matters Criminal*, Edinburgh, 1699, folio, pp. 181, 182.

177 M'Crie in his *Life of Melville*, vol. ii. pp. 70 seq., has given an account of the punishment of Black, but as usual conceals the provocation; or at least softens it down until it hardly becomes a provocation. According to him, "David Black had been served with a summons to answer before the privy council for certain expressions used by him in his sermons." Certain expressions, indeed! But why name the penalty, and suppress the offence? This learned writer knew perfectly well what Black had done, and yet all the information bestowed on the reader is a note at p. 72, containing a mutilated extract from Spottiswoode.

178 "Saying, 'He was possessed with a devil; that one devil being put out, seven worse were entered in place; and that the subjects might lawfully rise, and take the sword out of his hand:' which he confirmed by the example of a father that, falling into a frenzy, might be taken by the children and servants of the family, and tied hand and foot from doing violence." *Spottiswoode's History of the Church of Scotland*, vol. iii. p. 34. See also *Arnot's History of Edinburgh*, pp. 46, 47.

179 This did not escape the attention of the English government; and Elizabeth, who was remarkably well informed respecting Scotch affairs, wrote to James, in 1590, a warning which was hardly necessary, but which must have added to his fears. "And

Andrew Melville, in an audience with the king, in 1596, proceeded to personal insults, and, seizing him by the sleeve, called him God's silly* vassal.[180] The large amount of truth contained in this bitter taunt increased its pungency. But the ministers did not always confine themselves to words.[181] Their participation in the Ruthven conspiracy is unquestionable ; and it is probable that they were privy to the last great peril to which James was exposed, before he escaped from that turbulent land which he was believed to govern. Certain it is that the Earl of Gowrie, who in 1600 entrapped the king into his castle in order to murder him, was the hope and the mainstay of the Presbyterian clergy, and was intimately associated with their ambitious schemes.[182] Such indeed was their infatuation on behalf of the assassin, that when his conspiracy was defeated, and he himself slain, several of the ministers propagated a report that Gowrie had fallen a victim to the royal perfidy, and that in point of fact the only plot which ever existed was one concocted by the king, with fatal art, against his mild and innocent host.[183]

An absurdity of this sort[184] was easily believed in an ignorant and therefore a credulous age. That the clergy should have propagated it, and that in this as in many other cases they should have laboured with malignant industry to defame the character of their prince,[185] will astonish no one who knows how quickly the wrath of the Church can be roused, and how readily the spiritual classes always are to cover, even with the foulest calumny, those who stand in

lest fayre semblance, that easely may begile, do not brede your ignorance of suche persons as ether pretend religion or dissemble deuotion, let me warne you that ther is risen, bothe in your realme and myne, a secte of perilous consequence, suche as wold have no kings but a presbitrye, and take our place while the inioy our privilege, with a shade of Godes word, wiche non is juged to folow right without by ther censure the be so demed. Yea, looke we wel unto them." *Letters of Elizabeth and James VI.*, edited by John Bruce, Camden Society, 1849, 4to, p. 63.

[180] The Reverend James Melvill, who was present at the scene, describes it with exuberant delight. "To the quhilk, I beginning to reply, in my maner, Mr. Andro doucht nocht abyd it, bot brak af upon the king in sa zealus, powerfull, and unresistable a maner, that whowbeit the king used his authoritie in maist crabbit and colerik maner, yit Mr. Andro bure him down, and outtred the Commission as from the mightie God, calling the king bot 'God's sillie vassall ; ' and taking him be the sleive," &c. *Autobiography and Diary of James Melvill*, p. 370. See also *Shield's Hind Let Loose*, 1687, p. 52 ; and *M'Crie's Life of Melville*, vol. ii. p. 66.

[181] In 1593–4 some of them formed a plot to seize him. See the evidence from the State-paper Office, in *Tytler's History of Scotland*, vol. vii. p. 249, edit. Edinburgh, 1845.

[182] "He was the darling hope of the Presbyterian party." *Ibid.*, vol. vii. p. 410.

[183] "Gowry's conspiracy was by them charged on the king, as a contrivance of his to get rid of that earl." *Burnet's History of his own Time*, edit. Oxford, 1823, vol. i. p. 31. See also *Tytler's History of Scotland*, vol. vii. pp. 439, 440 ; and on the diffusion of "this absurd hallucination," see *The Spottiswoode Miscellany*, vol. ii. p. 320, Edinburgh, 1845.

[184] See a good note in *Pitcairn's Criminal Trials in Scotland*, vol. ii. p. 179, Edinburgh, 1833, 4to. Compare *Lawson's Book of Perth*, Edinburgh, 1847, p. xxxix. [The "absurdity" is not clear. The latest historians recognize that forged letters were afterwards produced as evidence against Gowrie ; that the king's story contains proved falsehoods and many discrepancies, and that the king was in Gowrie's debt to the extent of £80,000, with no prospect of releasing himself. The view of the clergy was thus not unwarranted. Cp. Hume Brown, ii. 235.—Ed.]

[185] Their language, and their general bearing, so enraged James, as to extort from him a passionate declaration, in 1592, that "it would not be weill till noblemen and gentlemen gott licence to breake ministers' heads." *Calderwood's History of the Kirk*, vol. v. p. 148.

[* "Silly" in Scots has not its English meaning, but properly signifies only "weak." Buckle has misunderstood the word.—Ed.]

their way. The evidence which has been collected proves that the Presbyterian ministers carried their violence against the constituted authorities of the state to an indecent if not to a criminal length ; and we cannot absolve them from the charge of being a restless and unscrupulous body, greedy after power, and grossly intolerant of whatever opposed their own views. Still, the real cause of their conduct was the spirit of their age,* and the peculiarities of their position. None of us can be sure that if we were placed exactly as they were placed, we should have acted differently. Now, indeed, we cannot read of their proceedings, as they are recorded in their own Assemblies, and by the historians of their own Church, without an uneasy feeling of dislike, I had almost said of disgust, at finding ourselves in presence of so much of superstition, of chicanery, of low, sordid arts, and yet, withal, of arrogant and unbridled insolence. The truth however is that in Scotland the age was evil, and the evil rose to the surface. The times were out of joint, and it was hard to set them right. The long prevalence of anarchy, of ignorance, of poverty, of force, of fraud, of domestic tumult, and of foreign invasion, had reduced Scotland to a state which it is scarcely possible for us to realize. Hereafter I shall give some evidence of the effect which this produced on the national character, and of the serious mischief which it wrought. In the meantime we should, in fairness to the Scotch clergy, admit that the condition of their country affords the best explanation of their conduct. Everything around them was low and coarse ; the habits of men in their daily life were violent, brutal, and utterly regardless of common decency ; and as a natural consequence the standard of human actions was so depressed that upright and well-meaning persons did not shrink from doing what to us, in our advanced state of society, seems incredible. Let us then not be rash in this matter. Let us not be too forward in censuring the leading actors in that great crisis through which Scotland passed during the latter half of the sixteenth century. Much they did which excites our strongest aversion. But one thing they achieved, which should make us honour their memory, and repute them benefactors of their species. At a most hazardous moment they kept alive the spirit of national liberty.[186] What the nobles and the crown had put in peril, that did the clergy save. By their care the dying spark was kindled into a blaze. When the light grew dim, and flickered on the altar, their hands trimmed the lamp, and fed the sacred flame. This is their real glory, and on this they may well repose. They were the guardians of Scotch freedom, and they stood to their post. Where danger was, they were foremost. By their sermons, by their conduct, both public and private, by the proceedings of their Assemblies, by their bold and frequent attacks upon persons without regard to their rank, nay, even by the very insolence with which they treated their superiors, they stirred up the minds of men, woke them from their lethargy, formed them to habits of discussion,

[186] "At the period of which we speak" (about the year 1584) "the pulpit was, in fact, the only organ by which public opinion was or could be expressed ; and the ecclesiastical courts were the only assemblies in the nation which possessed anything that was entitled to the name of liberty or independence. Parliament had its business prepared to its hand, and laid before it in the shape of acts which required only its assent. Discussion and freedom of speech were unknown in its meetings. The courts of justice were dependent on the will of the sovereign, and frequently had their preceedings regulated, and their discussions dictated, by letters or messages from the throne. It was the preachers who first taught the people to express an opinion on the conduct of their rulers ; and the assemblies of the Church set the earliest example of a regular and firm opposition to the arbitrary and unconstitutional measures of the Court." *M'Crie's Life of Melville*, vol. i. 302. [The clergy in reality opposed the Court very much in the spirit in which the nobles had previously done so ; and, as we have seen, they were no less ready to justify violent methods.—Ed.]

[* No such conduct was ventured on by the clergy in England. The position of the Scots clergy was quite exceptional, and depended not on a "spirit of the age," but on the local antecedents and circumstances.—Ed.]

and excited that inquisitive and democratic spirit which is the only effectual guarantee the people can ever possess against the tyranny of those who are set over them. This was the work of the Scotch clergy ; and all hail to them who did it. It was they who taught their countrymen to scrutinize, with a fearless eye, the policy of their rulers. It was they who pointed the finger of scorn at kings and nobles, and laid bare the hollowness of their pretensions.* They ridiculed their claims, and jeered at their mysteries. They tore the veil, and exposed the tricks of the scene which lay behind. The great ones of the earth they covered with contempt ; and those who were above them they cast down. Herein they did a deed which should compensate for all their offences, even were their offences ten times as great. By discountenancing that pernicious and degrading respect which men are too apt to pay to those whom accident, and not merit, has raised above them, they facilitated the growth of a proud and sturdy independence, which was sure to do good service at a time of need. And that time came quicker than any one had expected. Within a very few years, James became master of the resources of England, and attempted by their aid to subvert the liberties of Scotland.† The shameful enterprise which he began was continued by his cruel and superstitious son. How their attempts failed ; how Charles I. in the effort shipwrecked his fortune and provoked a rebellion, which brought to the scaffold that great criminal, who dared to conspire against the people, and who, as the common enemy and oppressor of all, was at length visited with the just punishment of his sins, is known to every reader of our history.‡ It is also well known that in conducting the struggle the English were greatly indebted to the Scotch, who had moreover the merit of being the first to lift their hand against the tyrant. What, however, is less known, but is undoubtedly true, is that both nations owe a debt they can never repay to those bold men who during the latter part of the sixteenth century disseminated from their pulpits and Assemblies sentiments which the people cherished in their hearts, and which at a fitting moment they reproduced, to the dismay, and eventually to the destruction, of those who threatened their liberties.

[* As Buckle goes on to show with great clearness, the clergy proceeded to substitute similarly hollow pretensions of their own. The above passage is thus overcharged. —Ed.]

[† See note above, p. 652 and below, p. 703.—Ed.]

[‡ As has been noted in an earlier chapter (above, p. 370), the troubles of Charles in Scotland began with his attempt to recover the tithes from the landowners who had appropriated them, not in any attack on popular liberties. In the end Cromwell interfered far more effectually with Scottish liberties than Charles did. And Charles was certainly not more superstitious, probably not more cruel, than his great antagonist. —Ed.]

CHAPTER XVIII

Condition of Scotland during the Seventeenth and Eighteenth Centuries.

Scarcely had James mounted the throne of England when he began seriously, and on a large scale, to attempt to subjugate the Scotch Church, which, as he clearly saw, was the principal obstacle that stood between him and despotic power. While he was merely King of Scotland he made several efforts, which were constantly baffled ; but now that he wielded the vast resources of England, the victory seemed easy.[1] As early as 1584 he had gained a temporary triumph by forcing many of the clergy to recognize episcopacy.[2] But that institution was so repugnant to their levelling and democratic principles, that nothing could overcome their abhorrence of it ; [3] and, completely overawing the king, they compelled him to give way, and to retrace his steps. The result was that in 1592 an Act of Parliament was passed which subverted the authority of the bishops, and established Presbyterianism ; a scheme based on the idea of equality, and therefore suited to the wants of the Scotch Church.[4]

To this statute James had assented with the greatest reluctance.[5] Indeed,

[1] Lord Dartmouth says (Note in *Burnet's History of his own Time*, vol. i. p. 15) : "The Earl of Seafield told me that King James frequently declared that he never looked upon himself to be more than King of Scotland in name, till he came to be King of England ; but now, he said, one kingdom would help him to govern the other, or he had studied kingcraft to very little purpose from his cradle to that time." Compare *Burnet's Memoirs of the Dukes of Hamilton*, Oxford, 1852, p. 36. "No sooner was he happily settled on the throne of England, but he went more roundly to work."

[2] Compare *Tytler's History of Scotland*, vol. vi. p. 430, with *Acts of the Parliaments of Scotland*, vol. iii. p. 303, § 20 ; also the Act (p. 293, § 4), likewise in 1584, limiting the power of the General Assemblies. James, who flattered himself that he had now settled everything, signalized his triumph by personally abusing the clergy ; "calling them lownes, smaicks, seditious knaves, and so furth." See a letter, dated 2nd of January, 1585–6, in *Miscellany of the Wodrow Society*, p. 438, Edinburgh, 1844.

[3] "Bishops were alwayes looked at with a frown." *Kirkton's History of the Church of Scotland*, p. 129.

[4] See this remarkable statute, in *Acts of the Parliaments of Scotland*, vol. iii. pp. 541, 2. As some of the historians of the Scotch Church have greatly misrepresented it, I will quote that part which expressly repeals the Act of 1584, in favour of the bishops. "Item oure said souerane lord and estaittis of Parliament foirsaid, abrogatis cass and anullis the xx act of the same pliamẽt haldin at Edinburgh the said zeir 1584 zeiris granting comissioun to bishoppis and vtheris iuges constitute in ecclesiastical causs To ressaue his heines presentatioun to benefices, To gif collatioun thairvpoun and to put ordor, in all causs ecclesiasticall qlk his Maiestie and estaittis foirsaid declairis to be expyrit in the self and to be null in tyme cuming and of nane availl force nor effect."

[5] "The King repented after that he had agreed unto it." *Calderwood's History of the Kirk*, vol. v. p. 162. But this gives a faint idea of his real feelings. It is perhaps hardly necessary to adduce evidence of the opinions entertained on this point by a prince, one of whose favourite sayings was, "No Bishop, no King." The reader will however find in the *Clarendon State Papers* (vol. ii. p. 260, Oxford, 1773, folio), a letter from Charles I., which is worth looking at, because it frankly avows that James, in loving

his feeling respecting it was so strong that he determined on the first opportunity to procure its repeal, even if he used force to effect his purpose. The course he adopted was characteristic both of the man and of the age. In December, 1596, one of those popular tumults arose in Edinburgh which are natural in barbarous times, and which under ordinary circumstances would have been quelled, and nothing more thought of it.[6] But James availed himself of this to strike what he deemed a decisive blow. His plan was nothing less than to turn into the capital of his own monarchy large bodies of armed and licensed banditti, who, by threatening to plunder the city, should oblige the clergy and their flocks to agree to whatever terms he chose to dictate. This magnanimous scheme was well worthy of the mind of James, and it was strictly executed. From the north he summoned the Highland nobles, and from the south the border barons, who were to be accompanied by their fierce retainers,—men who lived by pillage, and whose delight it was to imbrue their hands in blood. At the express command of James, these ferocious brigands, on the 1st of January, 1597, appeared in the streets of Edinburgh, gloating over the prospect before them, and ready, when their sovereign gave the word, to sack the capital and raze it to the ground.[7] Resistance was hopeless. Whatever the king demanded was conceded; and James supposed that the time was now come in which he could firmly establish the authority of the bishops, and by their aid control the clergy, and break their refractory spirit.[8]

In this undertaking three years were consumed. To insure its success, the king, supported by the nobles, relied not only on force but also on an artifice which now seems to have been employed for the first time. This was, to pack

episcopacy and hating presbyterianism, was actuated rather by political motives than by religious ones. Charles writes: "The prudentiall part of any consideration will never be found opposit to the conscientious, nay heere, they go hand in hand; for (according to lawyers lodgique) show me any president where ever Presbiteriall governement and Regall was together, without perpetuall rebellions. *Which was the cause that necessitated the King, my Father, to change that government in Scotland.*" Compare what is said by a Scotch Presbyterian of the seventeenth century, in *Biographies, edited for the Wodrow Society* by the Rev. W. K. Tweedie, Edinburgh, 1845, vol. i. p. 13. "The reason why King James was so violent for Bishops was neither their divine institution (which he denied they had), nor yet the profit the Church should reap by them (for he knew well both the men and their communications), but merely because he believed they were useful instruments to turn a limited monarchy into absolute dominion, and subjects into slaves, the design in the world he minded most."

[6] "Had it not been laid hold of by designing politicians as a handle for accomplishing their measures, it would not now have been known that such an event had ever occurred." *M'Crie's Life of Melville*, vol. ii. p. 85. "Harmless as this uproar was, it afforded the court a pretext for carrying into execution its designs against the liberties and government of the Church." p. 89. [Mc'Crie's account here is that of a mere partisan, and Buckle should not have taken it as his sole authority. The riot was a much more serious matter than he represents. See Tytler, ed. 1869, iv. 252–3. Any other king than James would in that day have punished it with massacre. He, a coward, was driven by it into the first vigorous act of his reign.—Ed.]

[7] *Tytler's History of Scotland*, vol. vii. pp. 342–345. *Calderwood's History of the Kirk*, vol. v. pp. 514, 515, 530, 531. [Tytler does not say what Buckle does in the text. The king evidently knew there would be no resistance, the burghers being panic-stricken.—Ed.]

[8] "Intimidated by these menaces, and distressed at the loss of the courts of justice, they came to the resolution of making surrender of their political and religious liberties to the King." *M'Crie's Life of Melville*, vol. ii. p. 92. This is said of the magistrates of Edinburgh. Among other threats, one was, the "razing and ploughing of Edinburgh, and sowing it with salt." *Wodrow's Life of Bruce*, p. 48, prefixed to *Bruce's Sermons*, edited by the Rev. William Cunningham, Edinburgh, 1843. On this occasion, Elizabeth wrote a letter to James, which is printed in *Letters of Queen Elizabeth and James VI.*, 1849, 4to, pp. 120, 121.

the General Assemblies, by inundating them with clergymen drawn from the north of Scotland, where, the old clannish and aristocratic spirit being supreme, the democratic spirit found in the south was unknown. Hitherto these northern ministers had rarely attended at the great meetings of the Church; but James in 1597 sent Sir Patrick Murray on a special mission to them, urging them to be present, in order that they might vote on his side.[9] They, being a very ignorant body, knowing little or nothing of the questions really at issue, and being moreover accustomed to a state of society in which men, notwithstanding their lawlessness, paid the most servile obedience to their immediate superiors, were easily worked upon, and induced to do what they were bid. By their help the crown and the nobles so strengthened their party in the General Assembly as to obtain in many instances a majority; and innovations were gradually introduced, calculated to destroy the democratic character of the Scotch Church.[10]

In 1597 the movement began. From then until 1600, successive Assemblies sanctioned different changes, all of which were marked by that aristocratic tendency which seemed about to carry everything before it. In 1600 the General Assembly met at Montrose; and government determined on making a final effort to compel the Church to establish an episcopal polity. Andrew Melville, by far the most influential man in the Church, and the leader of the democratic party, had been elected, as usual, a member of the Assembly; but the king, arbitrarily interposing, refused to allow him to take his seat.[11] Still, neither by threats, nor by force, nor by promises, could the court carry their point. All that they obtained was that certain ecclesiastics should be allowed to sit in parliament; but it was ordered that such persons should every year lay their commissions at the feet of the General Assembly, and render an account of their conduct. The Assembly was to have the power of deposing them; and, to keep them in greater subjection, they were forbidden to call themselves bishops, but were to be content with the inferior title of Commissioners of the Church.[12]

[9] *M'Crie's Life of Melville*, vol. ii. p. 100. Scot (*Apologetical Narration of the State of the Kirk*, p. 88) says, "Sir Patrick Murray, the diligent apostle of the North, made their acquaintance with the King." Also, *The Autobiography and Diary of James Melvill*, p. 403.

[10] *Tytler's History of Scotland*, vol. vii. pp. 350, 359. But by far the best account of the influence of these northern clergy will be found in *M'Crie's Life of Melville* (vol. ii. pp. 100–105, 109, 131, 152), drawn, in several instances, from manuscript authorities. Compare *Calderwood's History of the Kirk*, vol. v. p. 695.

[11] This is related by his nephew, James Melvill. "Mr. Andro Melvill come to the Assembly, by Commissioune of his Presbytrie, but wes commandit to keip his ludgeing; quho, being callit to the King in private, and demandit Quhy he wes so trublesume as to come to the Assembly being dischairgit? He answerit, He had a calling in the Kirk of God, and of Jesus Chryst, the King of kings, quhilk he behovit to dischairge at all occasiounes, being orderlie callit thairto, as he wes at this tyme; and that for feir of a grytter punischment then could any earthly King inflict." *The Autobiography and Diary of James Melvill*, p. 542.

[12] As, owing to the passions of the rival classes, every step of this part of Scotch history is the subject of angry controversy, and as even Mr. Tytler (*History of Scotland*, vol. vii. p. 360) asserts that "the final establishment of Episcopacy" took place at the Assembly of Montrose, in 1600, I subjoin a few extracts from the enactments of that Assembly, in order that the reader may judge for himself, and may test the accuracy of what I have stated in the text. "Concerning the maner of choosing of him that sall have vote in Parliament in name of the Kirk: It is condiscendit vpon, that *he sall first be recommendit be the Kirk to his Majestie*; and that the Kirk sall nominat sixe for every place that sall have neid to be filled, of quhom his Majestie sall choose ane, of quhom he best lykes; and his Majestie promises, obleises, and binds himselfe to choose no vther but ane of that number: And in cace his Majestie refuses the haill vpon ane just reason of ane insufficiency, and of greater sufficiencie of vthers that are not recommendit, the Kirk sall make ane new recommendatioun of men according to the first number, of the quhilk, ane salbe chosin be his Majestie without any farther refuisall or new nominatioun; and he that salbe chosin be his Majestie, salbe admittit be the Synods." *Acts of the General Assemblies of the*

After sustaining this repulse, James seems to have been disheartened ; as he made no further effort, though he still laboured underhand at the restoration of episcopacy.[13] If he had persevered, it might have cost him his crown. For his resources were few ; he was extremely poor ;[14] and recent events had shown that the clergy were stronger than he had supposed. When he thought himself most sure of success, they had subjected him to a mortifying defeat ; and this was the more remarkable, as it was entirely their own work ; they being by this time so completely separated from the nobles that they could not rely upon even a single member of that powerful body.

While affairs were in this state, and while the liberties of Scotland, of which the Church was the guardian, were trembling in the balance, Elizabeth died, and the King of Scotland became also King of England. James at once determined to employ the resources of his new kingdom to curb his old one. In 1604, that is, only the year after his accession to the English throne, he aimed a deadly blow at the Scotch Church by attacking the independence of their Assemblies ; and by his own authority he prorogued the General Assembly of Aberdeen.[15]

Kirk of Scotland, vol. iii. p. 954. " As to the cautions to keip him, that sall have vote in Parliament, from corruptiouns : They be these following : 1. *That he presume not, at any tyme, to propone at Parliament, Counsell or Conventioun, in name of the Kirk, any thing without expresse warrand and directioun from the Kirk*, and sick things as he sall answer (for) to be for the weill of the Kirk, vnder the paine of depositioun from his office." . . . 2. " He sall be bound at every Generall Assemblie, to give ane accompt anent the discharge of his commissioun sen the Assemblie gangand befor ; and *sall submitt himselfe to thair censure, and stand at thair determinatioun quhatsumever, without appellatioun ; and sall seik and obtain ratificatioun of his doings at the said Assemblie, vnder the paine of infamie and excommunicatioun.*" . . . 6. " In the administration of discipline, collatioun of benefices, visitatioun, and all vther points of ecclesiasticall government, he sall neither vsurpe nor acclaime to himselfe *any power or jurisdictioun farther than any vther of the rest of his breither*, unlesse he be imployit be his breither, vnder the paine of deprivatioun." p. 955. " Anent his name that for the Kirk sall (have) vote in Parliament : It is advyseit, be vniforme consent of the haill brether, that he salbe callit Commissioner of such a place." p. 956. " Therfor the Generall Assemblie having reasonit at length the said questioun, tuiching the continuance of him that sall have vote in Parliament, after votting of the same, finds and decernes, that *he sall annuatim give count of his commission obtainit from the Assemblie, and lay downe the samein at thair feitt*, to be continuit or alterit therfra be his Majestie and the Assemblie, as the Assemblie, with consent of his Maiestie, sall think most expedient for the weill of the Kirk." p. 959. [Compare however the comments of Calderwood, cited by Tytler, ed. 1869, iv. 203.—Ed.]

[13] " While James remained in Scotland, the scheme of introducing episcopacy, though never lost sight of, was cautiously prosecuted." *M'Crie's Life of Melville*, vol. ii. p. 178.

[14] James, during the whole of his reign, was chiefly dependent on the money which Elizabeth gave him, and which she dealt out rather niggardly. Such were his necessities that he was forced to pawn his plate, and even then he was often unable to defray his ordinary household expenses. See *Tytler's History of Scotland*, vol. vi. pp. 265, 266, 272 ; vol. vii. pp. 158, 378–380. *Miscellany of the Spalding Club*, vol. ii. pp. xlv. 114. *Gregory's History of the Western Highlands*, pp. 241, 277. See also a clamorous begging-letter from James to Elizabeth, written in 1591, in *Letters of Queen Elizabeth and James VI.*, 1849, 4to, pp. 68, 69. In 1593 she apologizes for sending him only a small sum : " The small token you shall receave from me I desire yt may serve to make you remember the tyme and my many weighty affaires, wich makes it les than else I would, and I dowt nothing but when you heare all, yow will beare with this." p. 84. A letter from James Hudson, written about the year 1591, states that " both the king's table and queen's had like to have been unserved by want ; and that the king had nothing he accounted certain to come into his purse, but what he had from the Queen of England." *Ridpath's Border History*, p. 465, Berwick, 1848, 4to.

[15] *Laing's History of Scotland*, edit. 1819, vol. iii. p. 28. *Calderwood's History of the Kirk*, vol. vi. pp. 264, 323. *Bower's History of the University of Edinburgh*, vol. i. p. 175, Edinburgh, 1817. *Stevenson's History of the Church of Scotland*, p. 88.

In 1605 he again prorogued it ; and to make his intentions clear, he this time refused to fix a day for its future meeting.[16] Hereupon some of the ministers, deputed by presbyteries, took upon themselves to convene it, which they had an undoubted right to do, as the act of the king was manifestly illegal. On the day appointed they met in the session-house of Aberdeen. They were ordered to disperse. Having, as they conceived, by the mere fact of assembling, sufficiently asserted their privileges, they obeyed. But James, now backed by the power of England, resolved that they should feel the change of his position, and therefore of theirs. In consequence of orders which he sent from London, fourteen of the clergy were committed to prison.[17] Six of them, who denied the authority of the privy-council, were indicted for high treason. They were at once put upon their trial. They were convicted. And sentence of death was only deferred that the pleasure of the king might first be taken, as to whether he would not be satisfied with some punishment that fell short of sacrificing the lives of these unhappy men.[18]

Their lives indeed were spared ; but they were subjected to a close imprisonment, and then condemned to perpetual exile.[19] In other parts of the country similar measures were adopted. Nearly all over Scotland numbers of the clergy were either imprisoned or forced to fly.[20] Terror and proscription were

[16] " Adde thereunto, that the letter of the commissioner and last moderator conteaned no certane tyme nor day whereto the said Assemblie sould be prorogued ; so that it imported a casting loose and deserting, yea, and tyning of the possessioun of our Assemblie ; than the which what could be more dangerous to the libertie and freedom of the Kirk of Jesus Christ, at suche a tyme, namelie of the treatie of the Unioun, when all the estates of the realme and everie particular are zealous and carefull of their rights and possessiouns ? " *Calderwood's History of the Kirk*, vol. vi. pp. 309, 310.

[17] See a list of them in *Calderwood's History of the Kirk*, vol. vi. p. 347, where the fourteen names are preserved with pious care.

[18] *Pitcairn's Criminal Trials in Scotland*, vol. ii. pp. 494–502. *Forbes' Certaine Records touching the Estate of the Kirk*, edit. Wodrow Society, Edinburgh, 1846, pp. 463–496. " Delayed the giving forth of the sentence of condemnation till the King's mind were further knowne." See also *Calderwood's History of the Kirk*, vol. vi. pp. 434, 449. When they were found guilty, " the peiple said, ' Certainely this wes a worke of darknes, to mak Chrystis faithfull Ministeres tratouris to the King ! God grant he be niver in greater dangeris nor off sic traitouris.' " *Melvill's Autobiography and Diary*, p. 626.

[19] *M'Crie's Life of Melville*, vol. ii. pp. 207, 208. *Pitcairn's Criminal Trials*, vol. ii. p. 504. In connexion with these transactions, a letter is preserved in the Winwood Papers, which is much too curious to be passed over in silence. It is addressed by the Earl of Salisbury to Sir Charles Cornwallis, and is dated 12th September, 1605. Salisbury, who was then at the head of affairs, writes, " True it is that his Majestie seeking to *adorne that kingdome of Scotland with Prelates as they are in England*, some of the Ministers have spurned against it ; and althouge his Majestie had ever warranted their calling of General Assemblies upon no other condition then that they should make him acquainted, receive his warrant, and a commissioner for his Majestie resident in their councells, yet have they (followed with some poor plebecall numbers) presumed to hold their General Assemblies in some parte of the Realme contrarie to his commandement. Whereupon his Majestie hath shewed himself displeased, and cyted divers of them before his councell," &c. *Memorials of Affairs of State, from the Papers of Sir Ralph Winwood*, London, 1725, folio, vol. ii. p. 132. And yet the man who could write such nonsense as this, and who could only see in the great democratic movement of the Scotch mind a disinclination to the *adornment* of episcopacy, was deemed one of the most eminent statesmen of his time, and his reputation has survived him. If great statesmen discern so little of what is before them and around them, we are tempted to inquire how much confidence ought to be placed in the opinions of those average statesmen by whom countries are ruled. For my own part I can only say that I have had occasion to read many thousand letters written by diplomatists and politicians, and I have hardly ever found an instance of one of them who understood the spirit and tendency of the age in which he lived.

[20] " Ministers in all parts of the country were thrown into prison, or declared rebels, and forced to abscond." *M'Crie's Life of Melville*, vol. ii. p. 250. Liberty of speech was

universal. Such was the panic, that it was generally believed that nothing could prevent the permanent establishment of despotism, unless there were some immediate and providential interference on behalf of the Church and the people.[21]

Nor can it be denied that there were plausible grounds for these apprehensions. The people had no friends except among the clergy, and the ablest of the clergy were either in prison or in exile.[22] To deprive the Church entirely of her leaders, James, in 1606, summoned to London Melville and seven of his colleagues, under pretence of needing their advice.[23] Having got possession of their persons, he detained them in England.[24] They were forbidden to return to Scotland; and Melville, who was most feared, was committed to custody. He was then imprisoned in the Tower, where he remained four years, and from which he was only liberated on condition of living abroad, and abandoning altogether his native country.[25] The seven ministers who had accompanied him to London were also imprisoned; but being considered less dangerous than their leader, they after a time were allowed to return home. The nephew of Melville was however ordered not to travel more than two miles from Newcastle; and his six companions were confined in different parts of Scotland.[26]

Everything now seemed ripe for the destruction of those ideas of equality of which, in Scotland, the Church was the sole representative. In 1610 a General Assembly was held at Glasgow; and as the members of it were nominated by the crown,[27] whatever the government wished was conceded. By their vote episcopacy was established, and the authority of the bishops over the ministers was fully recognized.[28] A little earlier, but in the same year, two courts of High

so completely suppressed, that in 1605, when the most zealous and intelligent clergy were banished, "a strait command" (was) "gevin to magistrats, and uther officiers of burrowis, that in cace any preacher sould speik opinlie aganis that baneisment, or for defence or mentenence of that assemblie, or pray publiklie for ther saiftie, that they sould be noted and manifested to the secret counsell, and corrected for their fault." *The Historie of King James the Sext*, p. 380.

[21] See an eloquent and touching passage in *Calderwood's History of the Kirk*, vol. vi. pp. 696, 697.

[22] "The godliest, wisest, learnedest, and most zealous men of the ministrie in Scotland, were either banished, warded, or detained in England, of purpose that they might not be a lett to the grand designe in hand." *Row's History of the Kirk*, p. 238.

[23] *Scot's Apologetical Narration of the State of the Kirk*, pp. 164, 165. Compare *The Autobiography and Diary of James Melvill*, pp. 642–645.

[24] "Quhen we wer gone out of the Palice a lytle way towardis Kingstoune, Mr. Alexander Hay sendis back for us, and withall, in the Uttir Court, reidis to us a chairge from the King not to returne to Scotland, nor to com neire the King, Quein, nor Prince their Courtis, without a speciall calling for and licence." *Melvill's Autobiography*, p. 661.

[25] *M'Crie's Life of Melville*, vol. ii. pp. 246, 252, 260, 337–339, 403, 407–411, 414. This truly great and fearless man died in exile, in 1622, p. 458.

[26] *Melvill's Autobiography and Diary*, p. 709. *Scot's Apologetical Narration*, p. 194. *M'Crie's Life of Melville*, vol. ii. pp. 252, 253, 267, 268.

[27] "Royal missives were sent to the presbyteries, nominating the individuals whom they should chuse as their representatives to it." *M'Crie's Life of Melville*, vol. ii. pp. 387, 388. On the character of its members, compare *Wodrow's History of the Sufferings of the Church of Scotland*, edit. Glasgow, 1838, vol. i. p. 256. *Stevenson's History of the Church of Scotland*, pp. 320, 321. *Crookshank's Church of Scotland*, Edinburgh, 1812, vol. i. p. 28; and *Calderwood's History of the Kirk*, vol. vii. pp. 97, 98.

[28] *Acts of the General Assemblies of the Kirk*, vol. iii. pp. 1096, 1097. The Assembly even forbade the democratic notion of equality to be advocated. See p. 1101. "Because it is vncivill that laws and constitutiouns, either Civill or Ecclesiasticall, being anes establischit and in force, by publick and opin consent, sould be controllit and callit in questioun by any person: therfor it is statute by vniforme consent of this haill Assemblie, that none of the Ministrie either in pulpitt in his preaching, or in the publick exercise, speake and reason against the acts of this present Assemblie, nor dissobey the same, vnder the paine of deprivatioun, being tryit and convict thereof; and *speciallie, that the questioun of equalitie and inequalitie in the Kirk be not treattit in pulpitt vnder the said paine.*"

Commission were erected, one at Saint Andrews, and one at Glasgow. To them all ecclesiastical courts were subordinate. They were armed with such immense power that they could cite any one they pleased before them, could examine him respecting his religious opinions, could have him excommunicated, and could fine or imprison him, just as they thought proper.[29] Finally, and to complete the humiliation of Scotland, the establishment of episcopacy was not considered complete until an act was performed which nothing but its being very ignominious could have saved from being ridiculed as an idle and childish farce. The Archbishop of Glasgow, the Bishop of Brechin and the Bishop of Galloway had to travel all the way to London in order that they might be touched by some English bishops. Incredible as it may appear, it was actually supposed that there was no power in Scotland sufficiently spiritual to turn a Scotchman into a prelate. Therefore it was that the Archbishop of Glasgow and his companions performed what was then an arduous journey to a strange and distant capital, for the sake of receiving some hidden virtue, which on their return home they might communicate to their brethren. To the grief and astonishment of their country, these unworthy priests, abandoning the traditions of their native land, and forgetting the proud spirit which animated their fathers, consented to abjure their own independence, to humble themselves before the English Church, and to submit to mummeries which in their hearts they must have despised, but which were now inflicted upon them by their ancient and inveterate foes.[30]

We may easily imagine what would be the future conduct of men who, merely

[29] Mr. Russell (*History of the Church in Scotland*, vol. ii. p. 88), misled, probably, by a passage in *Spottiswoode's History of the Church*, vol. iii. p. 210, says, "A Court of High Commission was instituted." But it is certain that there were two such courts; one for the diocese of Saint Andrews, and one for that of Glasgow. See the "commissioun givin under the great seale to the two archbishops," dated 15th of February, 1610, in *Calderwood's History of the Kirk*, vol. vii. pp. 57–62. See also p. 210. They were not united till December, 1615. See *Scot's Apologetical Narration of the State of the Kirk*, pp. 218, 239; and *Crookshank's History of the Sufferings of the Church of Scotland*, vol. i. p. 28. By the royal commission, these despotic tribunals were authorized (*Calderwood*, vol. vii. p. 59) "to call before them at suche tymes and places as they sall thinke meete, anie person or persons dwelling and remaining within their provinces respective above writtin of St. Andrews or Glasgow, or within anie dioceis of the same, being offenders ather in life or religioun, whom they hold anie way to be scandalous, and that they take tryell of the same; and if they find them guiltie and impenitent, refusing to acknowledge their offence, they sall give command to the preacher of that parish where they dwell, to proceed with sentence of excommunicatioun against them; which, if it be protracted, and their command by that minister be not presentlie obeyed, they sall conveene anie suche minister before them, and proceed in censuring of him for his disobedience, ather by suspensioun, deprivatioun, or wairding, according as in their discretioun they sall hold his obstinacie and refuse of their directioun to have deserved. And further, to fyne at their discretiouns, imprisoun, or warde anie suche persoun who, being convicted before them, they sall find upon tryell to have deserved anie suche punishment." Hereupon Calderwood justly remarks, p. 62: "This commissioun and executioun thereof, as it exalted the aspyring bishops farre above any prelat that ever was in Scotland, so it putt the king in possessioun of that which he had long tyme hunted for; to witt, of the royall prerogative, and absolute power to use the bodeis and goods of the subjects at pleasure, without forme or processe of the commoun law, even then when the Lower Hous in England was compleaning in their parliament upon the injurie therof. So our bishops were fitt instruments to overthrow the liberteis both of the Kirk and countrie."

[30] See *Stevenson's History of the Church of Scotland*, p. 93, and *Kirkton's History*, p. 15. Kirkton indignantly says that James "perswaded a few unworthy men to perjure themselves, and after their episcopall consecration by the English bishops in England, to exercise that odious office in Scotland against their own oath and the consciences of their brethren." Compare the contemptuous notice, in *Row's History of the Kirk*, p. 283, on the "anoynting of oyle and other ceremonies," and on "the foolish guyses in it." Indeed, on this subject every Scotch writer who cared for the liberty of his country expressed

for their own aggrandizement, and to please their prince, could thus renounce the cherished independence of the Scotch Church. They who crouch to those who are above them, always trample on those who are below them. Directly they returned to Scotland, they communicated the consecration they had received in England to their fellow-bishops,[31] who were of the like mould to themselves, in so far as all of them aided James in his attempt to subjugate the liberties of their native country. Being now properly ordained, their spiritual life was complete ; it remained for them to secure the happiness of their temporal life. This they did by gradually monopolizing all authority, and treating with unsparing severity those who opposed them. The full triumph of the bishops was reserved for the reign of Charles I., when a number of them obtained seats in the privy-council, where they behaved with such overbearing insolence that even Clarendon, notwithstanding his notorious partiality for their order, censures their conduct.[32] In the time however of James I. they carried nearly everything before them.[33] They deprived the towns of their privileges, and forced them to receive magistrates of their own choosing.[34] They accumulated wealth, and made an ostentatious display of it ; which was the more disgraceful, as the country was miserably poor, and their fellow-subjects were starving around them.[35] The Lords of the Articles, without whose sanction no measure could be

himself either with contempt or indignation. [As has been above related, the Protestant polity had been imposed on Scotland through the armed force of England, called in for the purpose, in 1560. The Catholics had had to submit in that case. The Protestants were now submitting to the ecclesiastical polity of their chosen allies.—Ed.]

[31] Calderwood, with ill-suppressed bitterness, says, " efter the same maner that they were consecrated themselfs, *als neere as they could imitate.*" *History of the Kirk*, vol. vii. p. 152. Compare *Wodrow's Collections*, vol. i. part i. p. 293. " The Bishops ordeaned in England keeped as near the manner taken with themselves there as they could."

[32] " Some of them, by want of temper, or want of breeding, did not behave themselves with that decency in their debates, towards the greatest men of the kingdom, as in discretion they ought to have done, and as the others reasonably expected from them." *Clarendon's History of the Rebellion*, edit. Oxford, 1843, p. 35. In 1633 " nine of them were privy councillors ; " and " their pride was cried out upon as unsupportable." *Burnet's Memoirs of the Dukes of Hamilton*, p. 38. Sir John Scot imputes to them " insolence, pride and avarice." *Scot's Staggering State of the Scots Statesmen*, Edinburgh, 1754, p. 41. Ses also *Spalding's History of the Troubles*, vol. i. pp. 46, 47, Edinburgh, 1828, 4to.

[33] So early as 1613, a letter from James Inglish (preserved in *Wodrow's Collections*, vol. ii. part i. p. 110, Glasgow, 1845, 4to) complains that " the libertys of the Lord's Kirk are greatly abridged by the pride of Bishops, and their power daily increases over her." Civil rights were equally set at nought by the bishops ; and, among other enactments which they obtained, one was, " that no man should be permitted to practise or profess any physic, unless he had first satisfied the bishop of the diocese touching his religion." *Spottiswoode's History of the Church of Scotland*, vol. iii. p. 236. This at once gave them the control of the whole medical profession.

[34] " Not satisfied with ruling the church-courts, they claimed an extensive civil authority within their dioceses. The burghs were deprived of their privileges, and forced to receive such magistrates as their episcopal superiors, in concert with the court, were pleased to nominate." . . . " Archbishop Gladstanes, in a letter to the King, June the 9th, 1611, says : ' It was your pleasure and direction that I sould be possessed with the like privileges in the electione of the magistrats there (in St Andrews), as my lord of Glasgow is endued with in that his city. Sir, whereas they are troublesome, I will be answerable to your Majesty and Counsell for them, after that I be possessed of my right.' MS. in Bibl. Jurid. Edin. M. 6, 9. nº. 72." *M'Crie's Life of Melville*, vol. ii. p. 422.

[35] And their prodigality was equal to their rapacity. When Archbishop Gladstanes died, in 1615, it was ascertained that, " notwithstanding of the great rent of his bishopricks he died in the debt of twentie thowsand pounds." *Calderwood's History of the Kirk*, vol. vii. p. 197. See also p. 303. Also the case of the Bishop of Galloway, who died in 1619, and of whom Calderwood says (*History of the Kirk*, vol. vii. p. 350), " It is thought

presented to parliament, had been hitherto elected by laymen; but the bishops now effected a change, by virtue of which the right of nomination devolved on themselves.[36] Having thus gained possession of the legislature, they obtained the enactment of fresh penalties against their countrymen. Great numbers of the clergy they suspended; others they deprived of their benefices; others they imprisoned. The city of Edinburgh being opposed to the rites and ceremonies lately introduced, and being, like the rest of the country, hostile to episcopacy, the bishops fell on it also, displaced several of its magistrates, seized some of the principal citizens, and threatened to deprive it of the courts of justice, and of the honour of being the seat of government.[37]

In the midst of all this, and while things seemed to be at their worst, a great reaction was preparing. And the explanation of the reaction is to be found in that vast and pregnant principle on which I have often insisted, but which our common historians are unable to understand; namely, that a bad government, bad laws, or laws badly administered, are indeed extremely injurious at the time, but can produce no permanent mischief; in other words, they may harm a country, but can never ruin it. As long as the people are sound, there is life, and while there is life there will be reaction. In such case, tyranny provokes rebellion, and despotism causes freedom. But if the people are unsound, all hope is gone, and the nation perishes.* In both instances, government is in the long run inoperative, and is nowise responsible for the ultimate result. The ruling classes have for the moment immense power, which they invariably abuse, except when they are restrained either by fear or by shame. The people may inspire them with fear; public opinion may inspire them with shame. But whether or not that shall happen, depends on the spirit of the people, and on the state of opinion. These two circumstances are themselves governed by a long chain of antecedents, stretching back to a period always very distant, and sometimes so remote as to baffle observation. When the evidence is sufficiently abundant those antecedents may be generalized; and their generalization

that if just calculation were made of the commoditie extorted by him through his diocie, by advice of his two covetous counsellours, Andro Couper, his brother, and Johne Gilmour, wrytter in Edinburgh, for his use and theirs, by racting of rents, getting of grassoumes, setting of tacks, of teithes, and other like meanes, wold surmount the soume of an hundreth thousand merks, or, in the opinion of others, almost the double; so that manie within that diocie, and the annexed prelacies, sall hardlie recover their estates in their time." Compare *Stevenson's History of the Church*, pp. 212, 392.

[36] On this change, which was completed in 1621, see *Laing's History of Scotland*, vol. iii. p. 88; *Calderwood's History of the Kirk*, vol. vii. p. 490; and *Baillie's Letters and Journals*, vol. i. p. 486, edit. Laing, Edinburgh, 1841.

[37] *Calderwood's History of the Kirk*, vol. vii. pp. 472–474, 507, 509, 511, 517–520, 530–543, 549–553, 566, 567, 614, 621. *Laing's History of Scotland*, vol. iii. pp. 90, 91. Laing, very unjustly, accuses the bishops of being so merciful as to disapprove of some of these transactions. But whoever has read much of the Scotch literature of the seventeenth century will cheerfully exonerate the bishops from a charge, which they would themselves have repelled, and to which they are nowise amenable.

[* Buckle here repeats a formula which we have before had to discount. No nation in modern times has "perished" save in the sense that Poland has been subjected; and to say that this is due to the "unsoundness" of the people is finally mere Pharisaism. Buckle proceeds to cite "general causes" as the determining forces. But these causes, on his own principles, must stand for either natural conditions or socio-political conditions. He here specifies neither. As no natural conditions can be stated that are adequate to the case, we must revert to socio-political conditions. These are in terms (*a*) of the influence of outside societies, and (*b*) of laws and governments. A nation, then, retrogades or progresses in terms either of its external or of its internal relations. Unless the former count for everything, the latter must count for something. The thesis that "government in the long run is inoperative" is thus an extravagance. "The long run" is simply the series of external and internal reactions.—Ed.]

conducts us to certain large and powerful causes, on which the whole movement depends. In short periods the operation of these causes is imperceptible, but in long periods it is conspicuous and supreme ; it colours the national character ; it controls the great sweep and average of affairs. In Scotland, as I have already shown, general causes * made the people love their clergy, and made the clergy love liberty.† As long as these two facts coexisted, the destiny of the nation was safe. It might be injured, insulted, and trampled upon. It might be harmed in various ways ; but the greater the harm the surer the remedy, because the higher the spirit of the country would be roused. All that was needed was a little more time, and a little more provocation. We who, standing at a distance, can contemplate these matters from an elevation, and see how events pressed on and thickened, cannot mistake the regularity of their sequence. Notwithstanding the apparent confusion, all was orderly and methodical. To us the scheme is revealed. There is the fabric, and it is of one hue and one make. The pattern is plainly marked, and fortunately it was worked into a texture whose mighty web was not to be broken, either by the arts or the violence of designing men.

It was therefore of no avail that tyranny did her utmost. It was of no avail that the throne was occupied by a despotic and unscrupulous king, who was succeeded by another, more despotic and more unscrupulous than himself. It was of no avail that a handful of meddling and intrusive bishops, deriving their consecration from London, and supported by the authority of the English church, took counsel together, and conspired against the liberties of their native land. They played the part of spies and of traitors, but they played it in vain. Yet everything that government could give them, it gave. They had the law on their side, and they had the right of administering the law. They were legislators, councillors, and judges. They had wealth ; they had high-sounding titles ; they had all the pomp and attributes for which they bartered their independence, and with which they hoped to dazzle the eyes of the vulgar. Still they could not turn back the stream ; they could not even stop it ; they could not prevent it from coming on, and swallowing them up in its course. Before that generation passed away, these little men, big though they were in their own conceit, succumbed, and fell. The hand of the age was upon them, and they were unable to resist.‡ They were struck down and humbled ; they were stripped of their offices, their honours, and their splendour ; they lost all which minds like theirs hold most dear. Their fate is an instructive lesson. It is a lesson both to the rulers of nations and to those who write the history of nations. To rulers, in so far as it is one of many proofs how little they can do, and how insignificant is the part which they play in the great drama of the world. To historians the result should be especially instructive, as convincing them that the events on which they concentrate their attention, and which they believe to be of supreme importance, are in reality of trifling value, and, so far from holding the first rank, ought to be made subservient to those large and comprehensive studies by whose aid alone we can ascertain the conditions which determine the trend and destiny of nations.

[* The causes specified have been distinctly " particular."—Ed.]

[† The next chapter fully demonstrates that what the Scots clergy strove for was not " liberty," but their own ascendancy. They insisted that all Catholics were " idolators," and as such ought to " die the death." Liberty was preserved only in the sense that monarchy and aristocracy were kept in check. See Buckle's later comments, below, at *note* 136.—Ed.]

[‡ Buckle again fails to explain the process of causation. The throne had gained power in the reign of James because the clergy and the nobles were now completely at variance on the fundamentally economic question of episcopacy. They were again united by the attempt of Charles to resume the alienated tithes on behalf of the crown. (See above, p. 370, *note*.) Between them, they had the people with them ; and the riots of 1637 were the planned result. The Covenant was part of the total scheme of self defence. Compare Burton, vol. vi. ch. 70.—Ed.]

The events that now happened in Scotland may be quickly told. The patience of the country was wellnigh exhausted, and the day of reckoning was at hand.[38] In 1637 the people began to rise. In the summer of that year, the first great riot broke out in Edinburgh.[39] The flame quickly spread, and nothing could stop it. By October, the whole nation was up, and an accusation was preferred against the bishops, which was signed by nearly every corporation, and by men of all ranks.[40] In November, the Scotch, in defiance of the Crown, organized a system of representation of their own, in which every class had a share.[41] Early in 1638 the National Covenant was framed; and the eagerness with which it was sworn to, showed that the people were determined at all hazards to vindicate their rights.[42] It was now evident that all was over. During the summer of 1638 preparations were made, and in the autumn the storm broke.[43] In November, the first General Assembly seen in Scotland for twenty years, met at Glasgow.[43] The Marquis of Hamilton, the king's commissioner, ordered the members to separate.[44] They refused.[45] Nor would they disband until they had done the work expected from them.[46] By their vote, the democratic institution of presbyteries was restored to its old power; the forms of consecration were done away with; the bishops were degraded from their functions, and episcopacy was abolished.[47]

[38] In October, 1637, Baillie, who was carefully watching the course of affairs, writes, "No man may speak any thing in publick for the king's part, except he would have himself marked for a sacrifice to be killed one day. I think our people possessed with a bloody devill, farr above any thing that ever I could have imagined, though the masse in Latine had been presented." And in a postscript dated 3rd October he adds: "My fears in my former went no farther then to ane ecclesiastik separation, but now I am more affrayit for a bloudie civill warr." *Baillie's Letters and Journals*, edit. Laing, Edinburgh, 1841, vol. i. pp. 23, 25.

[39] *Laing's History of Scotland*, vol. iii. p. 131. *Chambers' Annals*, vol. ii. pp. 101–104. *Spalding's History of the Troubles in Scotland*, vol. i. pp. 47, 48.

[40] "The accusation, among themselves a bond of union, and to their enemies a signa of hostility, was subscribed by the nobility, the gentry, the clergy, and afterwards by all ranks, and almost by every corporation in the kingdom." *Laing's History of Scotland*, vol. iii. p. 137.

[41] *Ibid.*, vol. iii. p. 138.

[42] "It was signed by a large majority of the people, in a paroxysm of enthusiasm beyond all example in our history." *Chambers' Annals*, vol. ii. p. 105. Kirkton, who was a contemporary, says, "And though only eleven private men (and some of them very inconsiderable) had the boldness first to begin this work, without ever asking leave of king or council, yet was it very quickly taken by all the people of Scotland, with hands lifted up in most solemn manner." *Kirkton's History of the Church of Scotland*, p. 33. Lord Somerville, taking a somewhat different view of affairs, remarks that "the generalitie of the natione entered into a hellish covenant, wherein they mutually obleidged themselves to extirpate episcopacy, and to defend each other against all persones whatsoever, noe not excepting the persone of his sacred majestie; but upon conditiones of ther oune frameing." *Somerville's Memorie of the Somervilles*, vol. ii. p. 187.

[43] There had been no General Assembly since 1618. *Argyll's Presbytery Examined*, p. 102; and the *Spottiswoode Miscellany*, vol. i. p. 88. But "the provincial synods, presbyteries, and sessions still remained, and in these good men mutually comforted one another." *Stevenson's History of the Church of Scotland*, p. 162.

[44] "The assembly went on at such a rate, that the marquis judged it no longer fit to bear with their courses." *Burnet's Memoirs of the Dukes of Hamilton*, p. 128. "In end, seeing nothing said in reason did prevail, he, in his majesty's name, dissolved the assembly, and discharged their further proceeding under pain of treason." p. 135.

[45] *Stevenson's History of the Church of Scotland*, p. 310.

[46] "Notwithstanding the Proclamation, the Assembly presently thereafter met, and sat daily for divers weeks, until they had done their affairs, and were themselves pleas'd to dissolve." *Guthry's Memoirs*, p. 41, edit. London, 1702.

[47] *Acts of the General Assembly of the Church of Scotland*, from 1638 to 1842, Edinburgh, 1843, pp. 9–18. *Stevenson's History of the Church of Scotland*, pp. 332, 338

Thus the bishops fell even more rapidly than they had risen.[48] As, however, their fall was merely a part of the democratic movement, matters could not stop there.[49] Scarcely had the Scotch expelled their bishops, when they made war upon their king. In 1639, they took up arms against Charles. In 1640, they invaded England. In 1641, the king, with the hope of appeasing them, visited Scotland, and agreed to most of their demands. It was too late. The people were hot, and a cry for blood had gone forth.* War again broke out. The Scotch united with the English, and Charles was everywhere defeated. As a last chance, he threw himself upon the mercy of his northern subjects.[50] But his offences were of that rank and luxuriant growth, that it was impossible to forgive them. Indeed, the Scotch, instead of pardoning him, turned him to profit.† He had not only trampled on their liberties, he had also put them to an enormous expense. For the injury he could offer no adequate atonement; but the expense they had incurred might be defrayed. And as it is an old and recognized maxim that he who cannot pay with his purse shall pay with his body, the Scotch saw no reason why they should not derive some advantage from the person of their sovereign, particularly as, hitherto, he had caused them nothing but loss and annoyance. They therefore gave him up to the English, and in return received a large sum of money, which they claimed as arrears due to them for the cost of making war on him.[51] By this arrangement both of the contracting parties benefited.

[48] See, on their fall, some highly characteristic remarks in *Baillie's Letters and Journals*, vol. i. p. 168. In 1639 Howell writes from Edinburgh, "The Bishops are all gone to wrack, and they have had but a sorry funeral; the very name is grown so contemptible, that a black dog, if he hath any white marks about him, is called *Bishop*. Our Lord of Canterbury is grown here so odious, that they call him commonly in the pulpit, the Priest of Baal, and the Son of Belial." *Howell's Letters*, edit. London, 1754, p. 276.

[49] "That people, after they had once begun, pursued the business vigorously, and with all imaginable contempt of the government." *Clarendon's History of the Rebellion*, p. 45. Now, for the first time, the English government began to tremble. On 13th December, 1639, Secretary Windebank writes: "His Majesty near these six weeks last past hath been in continual consultations with a select Committee of some of his Council (of which I have had the honour to be one), how to redress his affairs in Scotland, the fire continuing there, and growing to that danger, that *it threatens not only the Monarchical Government there, but even that of this kingdom.*" *Clarendon State Papers*, vol. ii. p. 81, Oxford, 1773, folio. This is the earliest intimation I have met with of Charles and his advisers being aware of their real peril. But though the king was capable of fear, he was incapable of compunction. There is no evidence on record to show that he even felt remorse for having planned and executed those arbitrary and unprincipled measures, by which he inflicted immense misery upon Scotland and England, but more especially upon Scotland.

[50] "The kinge was now so waik, haueing nether toune, fort, nor armie, and Oxford being a waik and onfortified toune, from whence he looked daylie to be taken perforce, he therefor resolues to cast himself into the arms of the Scots; who, being his native people, and of late so ongratfullie dealt with by the Inglish, he hoped their particular credit, and the credit of the wholl natione depending thereupon, they would not baslie rander him to the Inglish." *Gordon's Britane's Distemper*, p. 193, published by the Spalding Club, Aberdeen, 1844, 4to.

[51] That it may not be supposed that, as an Englishman, I misrepresent this transaction by looking at it from an English point of view, I will merely quote what Scotch writers have said respecting it. "Giveing up the king to the will and pleasure of the English parliament, that soe they might come by ther money." *Somerville's Memorie*

[* This is misleading. The civil war began in England in August, 1642; the Scotch Solemn League and Covenant was made only in September of 1643. There was now much less enthusiasm than had been shown for the previous National Covenant. See Hume Brown, ii. 330.—Ed.]

[† See editor's note above, p. 629, for a correct account of the situation. Buckle has generalized without proper study of the details.—Ed.]

The Scotch, being very poor, obtained what they most lacked. The English, a wealthy people, had indeed to pay the money, but they were recompensed by getting hold of their oppressor, against whom they thirsted for revenge ; and they took good care never to let him loose until they had exacted the last penalty of his great and manifold crimes.[52]

After the execution of Charles I., the Scotch recognized his son as his successor. But before they would crown the new king, they subjected him to a treatment which hereditary sovereigns are not much accustomed to receive. They made him sign a public declaration, expressing his regret for what had happened, and acknowledging that his father, moved by evil counsels, had unjustly shed the blood of his subjects. He was also obliged to declare that by these things he felt humbled in spirit. He had moreover to apologize for his own errors, which he ascribed partly to his inexperience, and partly to the badness of his education.[53] To evince the sincerity of this confession, and in order that the con-

of the Somervilles, vol. ii. p. 366. " The Scots sold their unfortunate king, who had fled to them for protection, to the commissioners of the English Parliament, for 200,000*l.* sterling." *Lyon's History of St. Andrews*, vol. ii. p. 38. " The incident itself was evidence of a bargain with a *quid pro quo*." *Burton's History of Scotland*, vol. i. p. 493. " The sale of the king to the parliament." *Napier's Life of Montrose*, Edinburgh, 1840, p. 448. " The king was delivered up, or rather sold, to the parliament's commissioners." *Brown's History of Glasgow*, vol. i. p. 91. " Their arrears were undoubtedly due ; the amount was ascertained before the dispute concerning the disposal of his person, and the payment was undertaken by the English parliament, five months previous to the delivery, or surrender of the king. But the coincidence, however unavoidable, between that event and the actual discharge and departure of their army, still affords a presumptive proof of the disgraceful imputation of having sold their king ; 'as the English, unless previously assured of receiving his person, would never have relinquished a sum so considerable as to weaken themselves, while it strengthened a people with whom such a material question remained to be discussed.' " *Laing's History of Scotland*, vol. iii. pp. 369, 370. [Most of these citations are from bigoted royalists, whose remarks should have reminded Buckle that " the Scotch " took different sides, like the English.—Ed.]

[52] A letter from Sir Edw. Hyde to Lord Hatton, dated April 12, 1649 (in the *Clarendon State Papers*, vol. ii. p. 479, Oxf. 1773, fol.), says of Charles II., that the Scotch " sold his father to those who murdered him." But this is not true. Charles I., though certainly bought by the English, was not murdered by them. He was tried in the face of day ; he was found guilty ; he was executed. And most assuredly never did a year pass without men far less criminal than he, suffering the same fate. Possibly they are right who deem all capital punishment needless. That, however, has never been proved ; and if this last and most terrible penalty is ever to be exacted, I cannot tell where we should find a more fitting subject to undergo it, than a despot who seeks to subjugate the liberties of the people over whom he is called to rule, inflicts cruel and illegal punishment on those who oppose him, and, sooner than renounce his designs, engages in a civil war, setting fathers against their children, disorganizing society, and causing the land to run with blood. Such men are outlaws ; they are the enemies of the human race ; who shall wonder f they fall, or, having fallen, who shall pity them ? [No historian now calls the execution of Charles I. a murder, but the statement in the text really gives some colour to that view by suggesting that the victors all along intended to execute Charles. They of course did not, but long hoped to come to a settlement with him. His duplicity forced on them final measures. On the other hand, however, the charge of despotism lies as irrefutably against Cromwell as against Charles, and the language of the text and of the foregoing note is thus far from being judicial.—Ed.]

[53] The declaration was signed by Charles on the 16th August, 1650. An abridgment of it is given in *Balfour's Annales of Scotland*, vol. iv. pp. 92–94 ; but the entire document is preserved by Sir Edward Walker. See *Journal of Affairs in Scotland*, in *Walker's Historical Discourses*, London, folio, 1705, pp. 170–176. In it Charles is made to state that "though his Majesty as a dutiful son be obliged to honour the memory of his Royal Father, and have in estimation the person of his Mother ; yet doth he desire to be deeply humbled and afflicted in spirit before God, because of his Father's hearkening unto and following

fession might be generally known, he was commanded to keep a day of fasting and humiliation, in which the whole nation would weep and pray for him, in the hope that he might escape the consequences of the sins committed by his family.[54]

The spirit of which acts like these are but symptoms, continued to animate the Scotch during the rest of the seventeenth century. And fortunately for them it did so. For the reigns of Charles II. and James II. were but repetitions of the reigns of James I. and Charles I.* From 1660 to 1688 Scotland was again subjected to a tyranny so cruel and so exhausting that it would have broken the energy of almost any other nation.[55] The nobles, whose power had been slowly but constantly declining,[56] were unable to resist the English, with whom indeed

evil councils and his opposition to the work of reformation, and to the solemn league and covenant by which so much of the blood of the Lord's people hath been shed in these kingdoms." He went on to say that though he might palliate his own misconduct by pleading "his education and age," he thinks it better to "ingeniously acknowledge all his own sins and the sins of his father's house." Burnet (*History of his own Time*, vol. ii. p. 97) says of this declaration: "In it there were many hard things. The king owned the sin of his father in marrying into an idolatrous family: he acknowledged the bloodshed in the late wars lay at his father's door: he expressed a deep sense of his own ill education," &c.

[54] In reference to this event, the following entry occurs in Lamont's Journal: "1650, Dec. 22.—The fast appointed by the commission of the kirke to be keiped throughe the kingdome before the coronatione, was keiped att Largo the forsaide day by Mr. Ja. Magill; his lecture, Reu. 3. from v. 14 to the end of the chapt.; his text Reu. 2. 4, 5. Vpon the Thursday following, the 26 of this instant, the fast was keiped in likemaner; his lecture 2. Chro. 29 to v. 12; his text 2. Chron. 12, 12. The causes of the first day (not read) was, the great contempt of the gospell, holden forth in its branches; of the second day (which were read), the sinns of the king, and of his father's house, where sundry offences of K. James the 6 were acknowledged, and of K. Charles the 1, and of K. Ch. the 2. nowe king." *The Diary of Mr. John Lamont of Newton*, p. 25, Edinburgh, 1830, 4to. See also *Baillie's Letters and Journals*, vol. iii. p. 107; *Nicoll's Diary*, Edinburgh, 4to, 1836, p. 38; *Row's Continuation of Blair's Autobiography*, edit. Wodrow Society, p. 255; *Bower's History of the University of Edinburgh*, vol. i. p. 253; *Presbytery Book of Strathbogie*, edit. Spalding Club, p. 169; and, above all, the *Registers of the Presbytery of Lanark*, published by the Abbotsford Club, Edinburgh, 1839, 4to, pp. 88, 89.

[55] Wodrow, who had before him the records of the Privy Council, besides other evidence now lost, says that the period from 1660 to 1688 was "a very horrid scene of oppression, hardships, and cruelty, which, were it not incontestably true, and well vouched and supported, could not be credited in after ages." *Wodrow's History of the Church of Scotland from the Restoration to the Revolution*, vol. i. p. 57. And the Reverend Alexander Shields quaintly but truly observes, "that the said government was the most untender, unpeaceable, tyrannical, arbitrary and wicked, that ever was in Scotland in any age or period." *Shields' Scots Inquisition*, Edinburgh, 1745, p. 24. [Nevertheless it was a minority who were tyrannized over, not the mass of the nation. See below, p. 711.—Ed.]

[56] When James I. ascended the throne of England, "the principal native nobility" accompanied him; and "the very peace which ensued upon the union of the crowns may be considered as the commencement of an era in which many of our national strongholds were either transformed into simple residences or utterly deserted." *Irving's History of Dumbartonshire*, 4to, 1860, pp. 137, 166. The nobles "had no further occasion to make a figure in war, their power in vassalage was of little use, and their influence of course decayed. They knew little of the arts of peace, and had no disposition to cultivate them." *The Interest of Scotland Considered*, Edinburgh, 1733, p. 85. Under Charles I. the movement continued; "which fell out partly through the giddiness of the times, but more by the way his Majesty had taken at the beginning of his reign; at which time he

[* This is inexact. In the reign of Charles II. there was no attempt to impose a ritual on the Presbyterian Church, though bishops were imposed. And there was no attempt to recover the tithes.—Ed.]

they rather seemed willing to combine, in order that they might have a share in plundering and oppressing their own country.[57] In this, the most unhappy period through which Scotland had passed since the fourteenth century, the government was extremely powerful; the upper classes, crouching before it, thought only of securing their own safety; the judges were so corrupt that justice, instead of being badly administered, was not administered at all;[58] and the parliament, completely overawed, consented to what was termed the recissory act, by which, at a single stroke, all laws were repealed which had been enacted since 1633; it being considered that those twenty-eight years formed an epoch of which the memory should if possible be effaced.[59]

did recover from divers of them their hereditary offices, and also pressed them to quit their tithes (which formerly had kept the gentry in a dependence upon them), whereby they were so weaken'd, that now when he stood most in need of them (except the chief of the clans), they could command none but their vassals" *Guthry's Memoirs*, edit. 1702, pp. 127, 128. Then came the civil wars, and the rule of Cromwell, during which they suffered both in person and in property. Compare *Chambers' Annals*, vol. ii. p. 225, with *Laing's History of Scotland*, vol. iii. pp. 515, 516. In 1654 Baillie writes (*Letters and Journals*, vol. iii. p. 249): "Our nobilitie, weell near all, are wracked." In 1656, "Our nobles lying up in prisons, and under forfaultries, or debts, private or publict, are for the most part either broken or breaking." *Ibid.*, p. 317. And, in 1658, the same observer writes (vol. iii. p. 387): "Our noble families are almost gone: Lennox hes little in Scotland unsold; Hamilton's estate, except Arran and the Baronrie of Hamilton, is sold; Argyle can pay little annuel rent for seven or eight hundred thousand merks; and he is no more drowned in debt than publict hatred, almost of all, both Scottish and English; the Gordons are gone; the Douglasses little better; Eglintoun and Glencairn on the brink of breaking; many of our chief families' estates are cracking; nor is there any appearance of any human relief for the tyme."

The result of all this is thus described by Wodrow, under the year 1661: "Our nobility and gentry were remarkably changed to the worse: it was but few of such, who had been active in the former years, were now alive, and those few were marked out for ruin. A young generation had sprung up under the English government, educated under penury and oppression; their estates were under burden, and many of them had little other prospect of mending their fortunes but by the king's favour, and so were ready to act that part he was best pleased with." *Wodrow's History of the Church of Scotland*, vol. i. p. 89.

[57] "At the Restoration, Charles II. regained full possession of the royal prerogative in Scotland; and the nobles, whose estates were wasted, or their spirit broken, by the calamities to which they had been exposed, were less able and less willing than ever to resist the power of the crown. During his reign, and that of James VII., the dictates of the monarch were received in Scotland with most abject submission. The poverty to which many of the nobles were reduced, rendered them meaner slaves and more intolerable tyrants than ever. The people, always neglected, were now odious, and loaded with every injury, on account of their attachment to religious and political principles, extremely repugnant to those adopted by their princes." *Robertson's History of Scotland*, book viii. pp. 257, 258.

[58] A writer of great authority, speaking of the time of William III., says: "It is scarcely possible to conceive how utterly polluted the fountain of justice had become during the two preceding reigns. The Scottish bench had been profligate and subservient to the utmost conceivable extent of profligacy and subserviency." *Burton's History of Scotland, from 1689 to 1748*, London, 1853, vol. i. p. 72. See also vol. ii. p. 37; and *Brown's History of Glasgow*, vol. i. p. 194, Glasgow, 1795.

[59] *Laing's History of Scotland*, vol. iv. p. 10. *Baillie's Letters and Journals*, vol. iii. p. 458. As few persons take the trouble to read Scotch Acts of Parliament, I will extract from this one its most argumentative passage. "And forasmuch as now it hath pleased Almighty God, by the power of his oune right hand, so miraculously to restore the Kings Maiestie to the Government of his Kingdomes, and to the exercise of his Royall power and Soveranity over the same: The estates of Parliat doe conceave themselffs obleidged in dischairge of ther duetie and conscience to God and the Kings Maiestie, to imploy all their

But though the higher ranks ignominiously deserted their post, and destroyed the laws which upheld the liberties of Scotland, the result proved that the liberties themselves were indestructible. This was because the spirit remained by which the liberties had been won. The nation was sound at the core ; * and while that was the case, legislators could, indeed, abolish the external manifestations of freedom, but could by no means touch the causes on which the freedom depended. Liberty was prostrate, but yet it lived. And the time would surely come when a people who loved it so dearly would vindicate their rights. The time would come, when, in the words of the great poet of English liberty, the nation would rouse herself like a strong man after sleep, and shaking her invincible locks, would be as an eagle muing her mighty youth, kindling her undazzled eyes at the midday beam, and purging and unscaling her sight at the heavenly fountain ; while the timorous birds of her evil destiny, loving the twilight, should flutter about, amazed at what she meant.

Still, the crisis was sad and dangerous. The people, deserted by every one except their clergy, were ruthlessly plundered, murdered, and hunted, like wild beasts, from place to place.† From the tyranny of the bishops they had so recently smarted, that they abhorred episcopacy more than ever ; and yet that institution was not only forced upon them, but government put at its head Sharp, a cruel and rapacious man, who, in 1661, was raised to the archbishopric of St. Andrews.[60] He set up a court of ecclesiastical commission, which filled

power and interest for vindicateing his Maiesties Authority from all these violent invasions that have been made upon it ; And so far as is possible to *remove out of the way every thing that may retaine any remembrance of these things* which have been so enjurious to his Mâtie and his Authority, so prejudiciall and dishonourable to the kingdome, and distructive to all just and true interests within the same." . . . " Not to retaine any remembrance thairof, but that the same shall be held in *everlasting oblivion*." *Acts of the Parliaments of Scotland*, vol. vii. p. 87, edit. folio, 1820. The date of this Act is 28th March, 1661.

[60] He was made " primate " in 1661, but did not arrive in Scotland till April, 1662. *Wodrow's History of the Church of Scotland*, vol. i. pp. 236, 247 ; and *Nicoll's Diary*, pp. 363, 364. " That he was decent, if not regular, in his deportment, endued with the most industrious diligence, and not illiterate, was never disputed ; that he was vain, vindictive, perfidious, at once haughty and servile, rapacious and cruel, his friends have never attempted to disown." *Laing's History of Scotland*, vol. iv. pp. 98, 99. The formal establishment of episcopacy was in the autumn of 1661, as we learn from an entry in Lamont's Diary. " 1661. Sept. 5 being Thursday, (the chancelour, Glencairne, and the E. of Rothes, haueing come downe from court some dayes before), the cownsell of state satt att Edb., and the nixt day, being Fryday, they caused emitte and be proclaimed ouer the Crosse, a proclamation in his Maj. name, for establishing Episcopacie againe in the church of Scotlande ; which was done with great solemnitie, and was afterwarde printed. *All persons, wither men or weomen, were discharged to speake against that office, under the paine of treason*." *The Diary of Mr. John Lamont*, p. 140. This, as we learn from another contemporary, was on account of " the Kinges Majestie having stedfastlie resolvit to promove the estait, power, and dignitie of Bischops, and to *remove all impedimentes contrary thairto*." *Nicoll's Diary*, 4to, p. 353 ; on 21st November, 1661. This curious diary, written by John Nicoll, and extending from 1650 to 1667, was printed at Edinburgh, in 1836, by the Bannatyne Club, and is now not often met with.

[* Buckle here applies to Scotland a very different measure from that which he has meted to Spain. On the face of the case, it was only the English Revolution of 1688 that " saved " Scottish liberties. Strictly speaking, they *had* been destroyed, and had to be reconstituted. " Sound at the core " is a metaphor which has no proper place in sociology, and the ensuing rhetoric really explains nothing.—Ed.]

[† It must not be forgotten that the persecuted Covenanters were a minority, and that in the Eastern Lowlands the common people had little or no sympathy with them. See Burton, *History*, vii. 172. It must further be remembered that the persecuted Cameronians were themselves determined opponents of toleration.—Ed.]

the prisons to overflowing; and when they would hold no more, the victims were transported to Barbadoes,* and other unhealthy settlements.[61] The people, being determined not to submit to the dictation of government respecting their religious worship, met together in private houses; and when that was declared illegal, they fled from their houses to the fields. But there, too, the bishops were upon them.[62] Lauderdale, who for many years was at the head of affairs, was greatly influenced by the new prelates, and aided them with the authority of the executive.[63] Under their united auspices a new con-

[61] *Wodrow's History of the Church of Scotland*, vol. i. pp. 383, 390–395. *Laing's History of Scotland*, vol. iv. p. 38: "A court of ecclesiastical commission was procured by Sharp." See also p. 41: "Under the influence of Sharp and the prelates, which Lauderdale's friends were unable to resist, the government seemed to be actuated by a blind resentment against its own subjects." Compare *Burnet's History of his own Time*, vol. i. p. 365. "The truth is, the whole face of the government looked liker the proceedings of an inquisition, than of legal courts; and yet Sharp was never satisfied." Another contemporary, Kirkton, says of these Commissioners: "For ought I could hear, never one appeared before them that escapt without punishment. Their custom was, without premonition or lybell, to ask a man a question, and judge him presently, either upon his silence or his answer." . . . "They many times doubled the legal punishment; and not being satisfied with the fyne appointed by law, they used to add religation to some remote places, or deportation to Barbadoes, or selling into slavery." *Kirkton's History of the Church of Scotland*, p. 206. See also *Naphtali, or the Wrestlings of the Church of Scotland*, 1667, pp. 126–130. But as particular cases bring such matters more clearly before the mind, I will transcribe, from *Crookshank's History of the Church of Scotland*, vol. i. p. 154, the sentences pronounced on a single occasion by this episcopal court. "The treatment of some of the parishioners of Ancrum is not to be omitted. When their excellent minister, Mr. Livingstone, was taken from them, one Mr. James Scot, who was under the sentence of excommunication, was presented to that charge. On the day fixed for his settlement, several people did meet together to oppose it; and particularly a country woman, desiring to speak with him in order to dissuade him from intruding himself upon a reclaiming people, pulled him by the cloak, intreating him to hear her a little; whereupon he turned and beat her with his staff. This provoked two or three boys to throw a few stones, which neither touched him nor any of his company. However, it was presently looked upon as a treasonable tumult, and therefore the sheriff and justices of the peace in that bounds fined and imprisoned some of these people, which, one would think, might atone for a crime of this nature. But the high-commission, not thinking that sufficient, ordered those criminals to be brought before them. Accordingly, the four boys and this woman, with two brothers of hers of the name of Turnbull, were brought prisoners to Edinburgh. The four boys confessed, that, upon Scot's beating the woman, they had thrown each a stone. The commissioner told them that hanging was too good for them. However, the sentence of this merciless court only was, that they should be scourged through the city of Edinburgh, burnt in the face with a hot iron, and then sold as slaves to Barbadoes. The boys endured their punishment like men and Christians, to the admiration of multitudes. The two brothers were banished to Virginia; and the woman was ordered to be whipped through the town of Jedburgh. Burnet, bishop of Glasgow, when applied to that she might be spared lest she should be with child, mildly answered, That he would make them claw the itch out of her shoulders."

[62] They were invested with such immense power, that "the old set of bishops made by the parliament, 1612, were but pigmies to the present high and mighty lords." *Wodrow's History of the Church of Scotland*, vol. i. p. 262. See also, at p. 286, the remarks of Douglas: "It is no wonder then the complaint against their bishops be, that their little finger is thicker than the loins of the former."

[63] In 1663 Middleton was dismissed; and was succeeded by Lauderdale, who "was dependent upon the prelates, and was compelled to yield to their most furious demands." *Laing's History of Scotland*, vol. iv. p. 33. "The influence, or rather

[* This was done by Cromwell to many of his victims, Irish and English.—Ed.]

trivance was hit upon ; and a body of soldiers, commanded by Turner, a drunken and ferocious soldier, was let loose upon the people.[64] The sufferers, galled to madness, rose in arms. This was made the pretence, in 1667, for fresh military executions, by which some of the fairest parts of western Scotland were devastated, houses burned, men tortured, women ravished.[65] In 1670 an act of parliament was passed, declaring that whoever preached in the fields without permission should be put to death.[66] Some lawyers were found bold enough to

the tyranny, which was thus at the discretion of the prelates, was unlimited ; and they exercised it with an unsparing hand." *Bower's History of the University of Edinburgh*, vol. i. p. 284.

[64] "Sir James Turner, that commanded them, was naturally fierce, but was mad when he was drunk ; and that was very often." *Burnet's History of his own Time*, vol. i. p. 364. Kirkton (*History of the Church*, p. 221) says : "Sir James Turner hade made ane expedition to the west countrey *to subdue it to the bishops*, in the year 1664 : another in the year 1665 ; and a third in the year 1666 ; and this was the worst." Full particulars will be found in *Wodrow's History of the Church of Scotland*, vol. i. pp. 373–375, 411, vol. ii. pp. 8, 17, vol. iii. pp. 264, 265. "This method of dragooning people to the church, as it is contrary to the spirit of Christianity, so it was a stranger in Scotland, till Bishop Sharpe and the prelates brought it in." vol. i. p. 401.

Sir James Turner, whose Memoirs, written by himself, were not published till thirty years ago, relates an anecdote of his own drunkenness in a strain of maudlin piety well worthy of his career. *Turner's Memoirs of his own Life*, Edinburgh, 1829, 4to, pp. 42, 43. At p. 206, this impudent man writes : "And yet I confesse, my humour never was, nor is not yet, one of the calmest ; when it will be, God onlie knoues ; yet by many sad passages of my life, I know that *it hath beene good for me to be afflicted.*" Perhaps, however, he may take the benefit of his assertion (p. 144), "that I was so farre from exceeding or transgressing my commission and instructions, that I never came the full length of them." Considering the cruelties he committed, what sort of instructions could his superiors have given to him ?

[65] "Sir James Turner lately had forced Galloway to rise in arms, by his cruelty the last and former years ; but he was an easy master, compared with General Dalziel, his ruffians, and Sir William Bannatyne, this year." *Wodrow's Church of Scotland*. vol. ii. p. 62. Dalziel "cruelly tortured whom he would." p. 63. One woman "is brought prisoner to Kilmarnock, where she was sentenced to be let down to a deep pit, under the house of the dean, full of toads and other vile creatures. Her shrieks thence were heard at a great distance." p. 64. Two countrymen were "bound together with cords, and hanged up by their thumbs to a tree, there to hang all night." *Ibid.* Sir William Bannatyne's soldiers seized a woman, "and bound her, and put lighted matches betwixt her fingers for several hours ; the torture and pain made her almost distracted ; she lost one of her hands, and in a few days she died." *Ibid.* "Oppressions, murders, robberies, rapes." p. 65. "He made great fires, and laid down men to roast before them, when they would not, or could not, give him the money he required, or the information he was seeking." p. 104. See also *Crookshank's History of the Church of Scotland*, vol. i. pp. 204–207. This History is based upon Wodrow's great work, but contains many facts with which Wodrow was unacquainted. See *Crookshank*, vol. i. p. 11. Respecting the outrages in 1667, there are some horrible details in a book published in that very year, under the title of *Naphtali, or the Wrestlings of the Church of Scotland*. See, especially, the summary at p. 174 : "wounding, beating, stripping and imprisoning men's persons, violent breaking of their houses both by day and night, and beating and wounding of wives and children, ravishing and deflowring of women, forcing wives and other persons by fired matches and other tortures to discover their husbands and nearest relations, although it be not within the compass of their knowledge, and driving and spoiling all their goods that can be carried away, without respect to guilt or innocency."

[66] "That whosoever without licence or authoritie forsaid shall preach, expound Scripture, or pray at any of these meetings in the ffeild, or in any house wher ther be moe persons nor the house contains, so as some of them be without doors (which is heerby declared to be a feild conventicle), or who shall convocat any number of people to these meetings, shall be punished with death and confiscation of ther goods." *Acts of the*

defend innocent men, when they were tried for their lives; it was therefore determined to silence them also, and, in 1674, a great part of the Faculty of Advocates was expelled from Edinburgh.[67] In 1678, by the express command of government, the Highlanders were brought down from their mountains, and, during three months, were encouraged to slay, plunder, and burn at their pleasure the inhabitants of the most populous and industrious parts of Scotland. For centuries the bitterest animosity had existed between the Highlanders and Lowlanders; and now these savage mountaineers * were called from their homes, that they might take full revenge. And well they glutted their ire. During three months they enjoyed every license. Eight thousand[68] armed Highlanders, invited by the English government, and receiving beforehand an indemnity for every excess,[69] were left to work their will upon the towns and villages of Western Scotland. They spared neither age nor sex. They deprived the people of their property; they even stripped them of their clothes, and sent them out naked to die in the fields. Upon many they inflicted the most horrible tortures. Children, torn from their mothers, were foully abused; while both mothers and daughters were subjected to a fate compared to which death would have been a joyful alternative.[70]

Parliaments of Scotland, vol. viii. p. 9, edit. 1820, folio. This was on the 13th August, 1670.

[67] The immediate pretence being to do away with appeals. See *Laing's History of Scotland*, vol. iv. pp. 72–74.

[68] "Savage hosts of Highlanders were sent down to depopulate the western shires to the number of ten or eleven thousand, who acted most outrageous barbarities, even almost to the laying some counties desolate." *A Cloud of Witnesses for the Royal Prerogatives of Jesus Christ*, edit. Glasgow, 1779, p. 18. But most authorities state the number to have been eight thousand. See *Kirkton's History*, p. 386; *Arnot's History of Edinburgh*, p. 154; *Burnet's History of his own Time*, vol. ii. p. 134; *Denholm's History of Glasgow*, p. 67; and *Life and Sufferings of John Nisbet*, in *Select Biographies*, published by the Wodrow Society, vol. ii. p. 381. Chalmers, however, in his *Caledonia*, vol. iii. p. 592, says 10,000. [Six thousand seems to be nearer the mark. To them were added, however, 3,000 Lowland militia. (Hume Brown, *Hist. of Scotland*, ii. 406.) And they had free quarters, not for three months but for one (*Ib.*) only, in the houses of those who refused to sign a document abjuring conventicles, etc. Even Burton, who accepts Wodrow's account of the plundering, silently sets aside (vii. 191) his stories of outrages. Buckle also, in the next chapter, rejects his testimony as to supernatural interventions on behalf of preachers. As regards his charges against the Lowland troops of Dalziel, there are other testimonies in corroboration. Here there are none. And it is certain that any thumb-screws possessed by Highlanders must have been supplied to them by the Lowland Government.—Ed.]

[69] "They were indemnified against all pursuits, civil and criminal, on account of killing, wounding, apprehending, or imprisoning, such as should oppose them." *Crookshank's History of the Church of Scotland*, vol. i. pp. 337, 338.

[70] Short and imperfect notices of this "Highland Host," as it was called at the time, may be found in *Kirkton's History*, pp. 385–390, and in *Crookshank's History*, vol. i. pp. 354, 355. But the fullest account of the enormities committed by these barbarians is in Wodrow's great work, collected from authentic and official documents. See his *History of the Church of Scotland*, vol. ii. pp. 375–413, 421–432, vol. iii. pp. 76, 79, 486. They were provided beforehand with implements of torture. "They had good store of iron shackles, as if they were to lead back vast numbers of slaves, and thumb-locks, as they call them" (*i.e.* thumb-screws), "to make their examinations and trials with," vol. ii. p. 389. "In some places they tortured people by scorching their bodies at vast fires, and otherwise," vol. ii. p. 422. Compare *Laing's History of Scotland*, vol. iv. p. 88. "Neither age nor sex was exempt from outrage, and torture was freely employed to

[* Above, in *note* 65, and below, in *note* 71, the grossest savageries are represented as committed by Lowlanders. Yet the epithet "savage" is always reserved by Buckle, as by his Lowland authorities, for the Highlanders.—Ed.]

It was in this way that the English government * sought to break the spirit, and to change the opinions, of the Scotch people. The nobles looked on in silence, and, so far from resisting, had not even the courage to remonstrate. The parliament was equally servile, and sanctioned whatever the government demanded.† Still the people were firm. Their clergy, drawn from the middle classes, clung to them ; they clung to their clergy, and both were unchanged. The bishops were hated as allies of the government, and were with reason regarded as public enemies. They were known to have favoured, and often to have suggested, the atrocities which had been committed ;[71] and they were so pleased with the punishment inflicted upon their opponents that no one was surprised when a few years later they, in an address to James II., the most cruel of all the Stuarts, declared that he was the darling of heaven, and hoped that God might give him the hearts of his subjects, and the necks of his enemies.[72]

The character of the prince whom the bishops thus delighted to honour is now well understood. Horrible as were the crimes which had been perpetrated, they were surpassed by what occurred when he in 1680 assumed the direction of affairs.[73] He had worked himself to that pitch of iniquity, as to derive actual enjoyment from witnessing the agonies of his fellow-creatures. This is an abyss of wickedness into which even the most corrupt natures rarely fall. There have been, and always will be, many men who care nothing for human suffering, and who will inflict any amount of pain in order to gain certain ends. But to take delight in the spectacle is a peculiar and hideous abomination. James, however, was so dead to shame that he did not care even to conceal his horrible tastes. Whenever torture was inflicted, he was sure to be present, feasting

extort a confession of hidden wealth." And, at p. 91, "The Highlanders, after exacting free quarters, and wasting the country for three months, were dismissed to their hills with impunity and wealth."

[71] "Indeed, the whole of the severity, hardships, and bloodshed from this year" (1661), "until the revolution, was either actually brought on by the bishops, procured by them, or done for their support." *Wodrow's History of the Church of Scotland*, vol. i. p. 223. "It was our prelates who pushed the council to most of their severities." p. 247. "The bishops, indeed, violently pushed prosecutions." *Crookshank's History of the Church*, vol. i. p. 298. In 1666, "As to the Prelates, they resolved to use all severities, and to take all imaginable cruel and rigorous ways and courses, first against the rest of the prisoners, and then against the whole west of Scotland." *Row's Continuation of Blair's Autobiography*, pp. 505, 506, edit. Edinburgh, 1848. This interesting work is edited by Dr. M'Crie, and published by the Wodrow Society.

[72] In 1688 "the bishops concurred in a pious and convivial address to James, as the darling of heaven, that God might give him the hearts of his subjects and the necks of his enemies." *Laing's History of Scotland*, vol. iv. p. 193.

[73] "After the Duke of York came down in October" (1680), "the persecution turned yet more severe." *Wodrow's History of the Church of Scotland*, vol. iii. p. 225. "Persecution and tryanny, mainly promoted by the Duke of York's instigation." *Shields' Hind Let Loose*, p. 147. "Immediately upon his mounting the throne, the executions and acts prosecuting the persecution of the poor wanderers were more cruel than ever." p. 200.

[* The tyranny in Scotland was carried on by Scottish officials. There were royalists there as well as in England. See below as to the bishops. Buckle's repeated allusions to "the English government" are thus misleading.—Ed.]

[† This misrepresents the facts. There was no parliament in 1678. In 1673 the Parliament had opposed the policy of the government, demanding redress of grievances before voting supplies. It was accordingly dissolved despite protest, and no other was summoned during the administration of Lauderdale, which ended in December, 1679. (Hume Brown, *History*, ii. 403–4). Nevertheless, "a body of gentlemen prepared to go to the court in London," and there protest against the employment of the Highland Host. They were prohibited by an Act of Council. (Burton, vii. 190.)—Ed.]

his eyes, and revelling with a fiendish joy.[74] It makes our flesh creep to think that such a man should have been the ruler of millions. But what shall we say to the Scotch bishops, who applauded him of whose conduct they were daily witnesses? Where can we find language strong enough to stigmatize those recreant priests, who, having passed years in attempting to subjugate the liberties of their country, did towards the close of their career, and just before their final fall, band together, and employ their united authority, as ministers of a holy and peaceful religion, to stamp with public approval a prince whose malignant cruelty made him loathed by his contemporaries, and whose revolting predilections, unless we ascribe them to a diseased brain, are not only a slur upon the age which tolerated them, but a disgrace to the higher instincts of our common nature?

So utterly corrupt, however, were the ruling classes in Scotland * that such crimes seem hardly to have excited indignation. The sufferers were refractory subjects, and against them everything was lawful. The usual torture, which was called the torture of the boots, was to place the leg in a frame, into which wedges were driven until the bones were broken.[75] But when James visited Scotland, an opinion began to grow up that this was too lenient, and that other means must be devised. The spirit which he communicated to his subordinates animated his immediate successors, and in 1684, during his absence, a new instrument was introduced, termed the thumbikins. This was composed of small steel screws, arranged with such diabolical art that not only the thumb,

[74] This was well known in Scotland; and is evidently alluded to by a writer of that time, the Rev. Alexander Shields, who calls James not a man, but a monster. See *Shields' Hind Let Loose*, 1687, p. 365. "This man, or monster rather, that is now mounted the throne." And a monster surely he was. Compare *Crookshank's History of the Church of Scotland*, vol. ii. p. 66, where it is mentioned that when Spreul was tortured "the Duke of York was pleased to gratify his eyes with this delightful scene." Also *Wodrow's History*, vol. iii. p. 253, and *Laing's History of Scotland*, vol. iv. p. 116. According to Burnet, the duke's pleasure at witnessing human agony was a cold and as it were a speculative pleasure, as if he were present for the purpose of contemplating some curious experiment. But James was so excitable a man that this is hardly likely. At all events, the remarks of Burnet have a painful interest for those who study these dark, and, as we may rejoice to think, these very rare forms of human malignity. "When any are to be struck in the boots, it is done in the presence of the council; and upon that occasion almost all offer to run away. The sight is so dreadful, that without an order restraining such a number to stay, the board would be forsaken. But the duke while he had been in Scotland was so far from withdrawing that he looked on all the while with an unmoved indifference, and *with an attention, as if he had been to look on some curious experiment.* This gave a terrible idea of him to all that observed it, as of a man that had no bowels nor humanity in him." *Burnet's History of his own Time*, vol. ii. pp. 416, 417. [There is no evidence here as to "revelling with a fiendish joy." That James was cruel there can be no question. But Buckle has expressly claimed for the old inquisitors, who showed the same disposition, that they were conscientious men. (Above, p. 108). The difference of tone here is hardly scientific.—Ed.]

[75] Shields (*A Hind Let Loose*, p. 186) describes the boots as "a cruel engine of iron, whereby, with wedges, the leg is tortured until the marrow come out of the bone." Compare *Naphtali, or the Wrestlings of the Church of Scotland*, 1667, p. 268: "the extraordinary compression both of flesh, sinews, and bones, by the force of timber wedges and hammer."

[* Such a statement does not consist with the facts (1) that fifty advocates withdrew from the Edinburgh bar in 1674–76, in resistance to the interference of Lauderdale with the administration of the courts; and (2) that on the passing of the Test Act in 1681 not only the Marquis of Argyle but the President of the Court of Session and many gentlemen and episcopal clergymen refused to subscribe. (Burton, vii. 194–5; Hume Brown, ii. 418; Mathieson, *Politics and Religion: a Study in Scottish History*, 1902, ii. 299.)—Ed.]

but also the whole hand, could be compressed by them, producing pain more exquisite than any hitherto known, and having moreover the advantage of not endangering life; so that the torture could be frequently repeated on the same person.[76]

After this, little more need be said.[77] From the mere mention of such things the mind recoils with disgust. The reader of the history of that time sickens and faints at the contrivances by which these abject creatures sought to stifle public opinion, and to ruin for ever a gallant and high-spirited people.* But now, as before, they laboured in vain. More yet was however to be borne. The short reign of James II. was ushered in by an act of singular barbarity. A few weeks after this bad man came to the throne all the children in Annandale and Nithsdale, between the ages of six and ten, were seized by the soldiers, separated from their parents, and threatened with immediate death.[78] The

[76] In 1684 Carstairs was subjected to this torture. See his own account, in a letter printed in *Wodrow's History of the Church of Scotland*, vol. iv. pp. 96–100. He writes (p. 99): "After this communing, the king's smith was called in, to bring in a new instrument to torture by the thumbkins, that had never been used before. For whereas the former was only to screw on two pieces of iron above and below with finger and thumb, these were made to turn about the screw with the whole hand. And under this torture I continued near an hour and a half." See also the case of Spence, in the same year, in *Burnet's History of his own Time*, vol. ii. p. 418. "Little screws of steel were made use of, that screwed the thumbs with so exquisite a torment, that he sunk under this; for Lord Perth told him, they would screw every joint of his whole body, one after another, till he took the oath." Laing (*History of Scotland*, vol. iv. p. 143) says, "the thumbikins; small screws of steel that compressed the thumb and the whole hand with an exquisite torture; an invention brought by Drummond and Dalziel from Russia." For other notices, see *Fountainhall's Notes of Scottish Affairs from 1680 till 1701*, Edinburgh, 4to, 1822, pp. 41, 97, 101; *Bower's History of the University of Edinburgh*, vol. ii. p. 30; *Crookshank's History of the Church of Scotland*, vol. ii. p. 192; *A Cloud of Witnesses for the Royal Prerogatives of Jesus Christ*, edit. Glasgow, 1779, p. 371; and *Life of Walter Smith*, p. 85, in the second volume of *Walker's Biographia Presbyteriana*, Edinburgh, 1827.

[77] "In 1684 the Scottish nation was in the most distressing and pitiable situation that can be imagined." . . . "The state of society had now become such that in Edinburgh attention to ordinary business was neglected, and every one was jealous of his neighbour." *Bower's History of the University of Edinburgh*, vol. i. p. 307.

[78] "Upon the 10th of March, all freeholders, heritors, and gentlemen in Nithsdale and Annandale, and, I suppose, in most other shires of the kingdom, but I name those as being the scene of the severities now used, were summoned to attend the king's standard; and the militia in the several shires were raised. Wherever Claverhouse came, he resolved upon narrow and universal work. He used to set his horse upon the hills and eminences, and that in different parties, that none might escape; and there his foot went through the lower, marshy, and mossy places, where the horse could not do so well. The shire he parcelled out in so many divisions, and six or eight miles square would be taken in at once. In every division the whole inhabitants, men and women, young and old, without distinction, were all driven into one convenient place." . . . "All the children in the division were gathered together by themselves, under ten years, and above six years of age, and a party of soldiers were drawn out before them. Then they were bid pray, for they were going to be shot. Some of them would answer, Sir, we cannot pray." . . . "At other times they treated them most inhumanly, threatening them with death, and at some little distance would fire pistols without ball in their face. Some of the poor children were frightened almost out of their wits, and others of them stood all out with a courage perfectly above their age. These accounts are so far out of the ordinary way of mankind, that I would not have inserted them, had I not

[* Here again the conduct which on the part of the inquisitors Buckle credits to conscientious fanaticism is treated as possible only to "abject creatures." Deductions must clearly be made for rhetoric at both points.—Ed.]

next step was to banish, by wholesale, large numbers of adults, who were shipped off to unhealthy settlements; many of the men first losing their ears, and the women being branded, some on the hand, some on the cheek.[79] Those however who remained behind were equal to the emergency, and were ready to do what remained to be done. In 1688, as in 1642, the Scotch people and the English people united against their common oppressor, who saved himself by sudden and ignominious flight. He was a coward as well as a despot, and from him there was no further danger. The bishops, indeed, loved him; but they were an insignificant body, and had enough to do to look to themselves. His only powerful friends were the Highlanders. That barbarous race thought with regret of those bygone days when the government had not only allowed them, but had ordered them, to plunder and oppress their southern neighbours. For this purpose Charles II. had availed himself of their services; and it could hardly be doubted that if the Stuart dynasty were restored they would be again employed, and would again enrich themselves by pillaging the Lowlanders.[80] War was their chief amusement; it was also their livelihood; and it was the only thing that they understood.[81] Besides this, the mere fact that James no longer possessed authority, wonderfully increased their loyalty towards him. The Highlanders flourished by rapine, and traded in anarchy.[82] They therefore hated any government which was strong enough to punish crime; and the Stuarts being now far away, this nation of thieves loved them with an ardour which nothing but their absence could have caused. From William III. they feared restraint; but the exiled prince could do them no hurt, and would look on their excesses as the natural result of their zeal.* Not that they cared

before me several informations agreeing in all these circumstances, written at this time by people who knew the truth of them." *Wodrow's History of the Church of Scotland*, vol. iv. pp. 255, 256.

[79] "Numbers were transported to Jamaica, Barbadoes, and the North American settlements; but the women were not unfrequently burnt in the cheek, and the ears of the men were lopt off, to prevent, or to detect, their return." *Laing's History of Scotland*, vol. iv. p. 162. "Great multitudes banished." *Wodrow's History of the Church*, vol. iv. p. 211. In July, 1685, "the men are ordered to have their ears cropt, and the women to be marked in their hand." p. 217. "To have the following stigma and mark, that they may be known as banished persons if they shall return to this kingdom, *viz.* that the men have one of their ears cut off by the hand of the hangman, and that the women be burnt by the same hand on the cheek with a burned iron." p. 218. These are extracts from the proceedings of the privy-council.

[80] "James II. favoured the Highland clans." Note in *Fountainhall's Scottish Affairs from 1680 till 1701*, p. 100. He could hardly do otherwise. The alliance was natural, and ready-made for him.

[81] Except robbing, which, however, in one form or other, is always a part of war. In this they were very apt. Burnet (*History of his own Time*, vol. i. p. 67) pithily describes them as "good at robbing;" and Burton (*Lives of Lovat and Forbes*, p. 47) says, "To steal even vestments was considerably more creditable than to make them." Otherwise, they were completely absorbed by their passion for war. See *Thomson's Memoirs of the Jacobites*, vol. ii. pp. 175, 176, London, 1845.

[82] "Revenge was accounted a duty, the destruction of a neighbour a meritorious exploit, and rapine an honourable employment." *Browne's History of the Highlands*, vol. iv. p. 395. "The spirit of rivalry between the clans kept up a taste for hostility, and converted rapine into a service of honour." *Thomson's Memoirs of the Jacobites*, vol. ii. p. 229.

[* Buckle's account of the Highlanders is somewhat surprisingly uncritical, though he followed the lead of Scotch writers such as Pinkerton and Burton. He has not realized the nature of the Highland barbarism. The tribesmen did not "think" and feel in the way he represents. They merely followed their chiefs against the Lowlanders as the English people had followed the Edwards against Scotland and France, and Henry V. in his French invasion. It is idle to denounce them for acting precisely as other races

about the principle of monarchical succession, or speculated on the doctrine of divine right.[83] The only succession that interested them was that of their chiefs. Their only notion of right was to do what those chiefs commanded. Being miserably poor,[84] they, in raising a rebellion, risked nothing except their lives, of which in that state of society men are always reckless. If they failed, they encountered a speedy and, as they deemed it, an honourable death. If they succeeded, they gained fame and wealth. In either case they were sure of many enjoyments. They were sure of being able, for a time at least, to indulge in pillage and murder, and to practise without restraint those excesses which they regarded as the choicest guerdon of a soldier's career.

So far, therefore, from the rebellions of 1715 and 1745 being wonderful,[85] the only wonder is that they did not break out sooner, and that they were not better supported. In 1745, when the sudden appearance of the rebels struck

[83] Hence, looking as they did merely at the physical qualities of individuals, the appearance of the Pretender in 1715 disgusted them, notwithstanding his splendid lineage. See some excellent remarks in *Burton's History of Scotland from 1689 to 1748*. London, 1853, vol. ii. pp. 198, 199. At p. 383, Mr. Burton justly observes that "those who really knew the Highlanders were aware that the followers were no more innate supporters of King James's claim to the throne of Britain, than of Maria Theresa's to the throne of Hungary. They went with the policy of the head of the clan, whatever that might be; and though upwards of half a century's advocacy of the exiled house" (this refers to the last rebellion in 1745) "had made Jacobitism appear a political creed in some clans, it was among the followers, high and low, little better than a nomenclature, which might be changed with circumstances." Since Robertson, Mr. Burton and Mr. Chambers are, I will venture to say, the two writers who have taken the most accurate and comprehensive views of the history of Scotland. Robertson's History stops short where the most important period begins; and his materials were scanty. But what he effected with those materials was wonderful. To my mind, his History of Scotland is much the greatest of his works.

[84] A curious description of their appearance, given by the *Derby Mercury* in 1746 (in *Thomson's Memoirs of the Jacobites*, vol. iii. p. 115) may be compared with the more general statement in *Anderson's Prize Essay on the Highlands*, Edinburgh, 1827, p. 128. "Cattle were the main resources of the tribe—the acquisition of these the great object of their hostile forrays. The precarious crops gave them wherewithal to bake their oaten cakes, or distil their ale or whisky. When these failed, the crowded population suffered every extreme of misery and want. At one time in particular, in Sutherland, they were compelled to subsist on broth made of nettles, thickened with a little oatmeal. At another, those who had cattle, to have recourse to the expedient of bleeding them and mixing the blood with oatmeal, which they afterwards cut into slices and fried."

[85] Several writers erroneously term them "unnatural." See, for instance, *Rae's History of the Rebellion*, London, 1746, pp. 158, 169; and *Home's History of the Rebellion*, London, 1802, 4to, p. 347. ["Unnatural" here is simply a royalist epithet, carrying in part the sense of "parricidal." In Buckle's sense the word can have no application whatever, as all events are strictly "natural."—Ed.]

had acted at the same or even a later stage of culture. To call them a "nation of thieves," and traders in anarchy, is idle. No nation can collectively live by thieving; and the Highlanders did what they could to breed cattle and grow corn in their wild country. They were non-industrious, just as we have seen the Lowlanders were in previous centuries; and they raided Lowland cattle as did the Lowland borderers. After representing them as collectively loving the Stuarts, Buckle goes on to put in qualifications and to cite from Burton, with approval, a passage which puts a different face on the whole matter. He ought to have rewritten the entire passage, which expresses a misconception. There was, in fact, no such racial or collective consciousness among the Highland clans as Buckle had supposed; and when he says "they" raised a rebellion—"they" as apart from their chiefs, whom they had just been represented as obeying blindly—he combines delusion with self-contradiction. It will be observed, finally, that Buckle says nothing of the Massacre of Glencoe.—Ed.]

England with terror, and when they penetrated even to the heart of the kingdom, their numbers, even at their height, including Lowland and English recruits, never reached six thousand men. The ordinary amount was five thousand ;[86] and they cared so little about the cause for which they professed to fight, that in 1715, when they numbered much stronger than in 1745, they refused to enter England and make head against the government until they were bribed by the promise of additional pay.[87] So too in 1745, after they had won the battle of Preston-pans, the only result of that great victory was that the Highlanders, instead of striking a fresh blow, deserted in large bodies, that they might secure the booty they had obtained, and which alone they valued. They heeded not whether Stuart or Hanoverian gained the day ; and at this critical moment they were unable, says the historian, to resist their desire to return to their glens, and decorate their huts with the spoil.[88]

[86] "When the rebels began their march to the southward, they were not 6,000 men complete." *Home's History of the Rebellion in the Year 1745*, 4to, p. 137. At Stirling, the army, "after the junction was made, amounted to somewhat more than 9,000 men, the greatest number that Charles ever had under his command." p. 164. But the actual invaders of England were much fewer. "The number of the rebels when they began their march into England was a few above 5,000 foot, with about 500 on horseback." *Home*, p. 331. Browne (*History of the Highlands*, vol. iii. p. 140) says: "When mustered at Carlisle, the prince's army amounted only to about 4,500 men ; and Lord George Murray states that at Derby "we were not above five thousand fighting men, if so many." *Jacobite Memoirs of the Rebellion of 1745*, edited by Robert Chambers, Edinburgh, 1834, p. 54. Another writer, relying mainly on traditional evidence, says, "Charles, at the head of 4,000 Highlanders, marched as far as Derby." *Brown's History of Glasgow*, vol. ii. p. 41, Edinburgh, 1797. Compare *Johnstone's Memoirs of the Rebellion*, 3rd edit., London, 1822, pp. xxxvii. xxxviii. 30–32, 52. Johnstone says, p. 60, "M. Patullo, our muster-master, reviewed our army at Carlisle, when it did not exceed four thousand five hundred men." Afterwards, returning to Scotland, "our army was suddenly increased to eight thousand men, the double of what it was when we were in England." p. 111.

[87] "Orders were given to proceed in the direction of Carlisle, and recall the detachment sent forward to Dumfries. The Highlanders, still true to their stagnant principles, refused obedience." . . . "Pecuniary negotiations were now commenced, and they were offered sixpence a day of regular pay—reasonable remuneration at that period to ordinary troops, but to the wild children of the mountain a glittering bribe, which the most steady obstinacy would alone resist. It was partly effective." *Burton's History of Scotland*, vol. ii. p. 168. "And from this day the Highlanders had sixpence a head per day payed them to keep them in good order and under command." *Patten's History of the late Rebellion*, London, 1717, p. 73. See also, on the unwillingness of the Highlanders to enter England, *Rae's History of the Rebellion*, London, 1746, 2nd edit. pp. 270, 271. Browne says (*History of the Highlands*, vol. ii. pp. 300, 304): "The aversion of the Highlanders, from different considerations, to a campaign in England, was almost insuperable ;" but "by the aid of great promises and money, the greater part of the Highlanders were prevailed upon to follow the fortunes of their commander."

[88] "Few victories have been more entire. It is said that scarcely two hundred of the infantry escaped." . . . "The Highlanders obtained a glorious booty in arms and clothes, besides self-moving watches, and other products of civilization, which surprised and puzzled them. Excited by such acquisitions, a considerable number could not resist the old practice of their people to return to their glens, and decorate their huts with their spoil." *Burton's History of Scotland*, vol. ii. p. 465. Compare *Home's History of the Rebellion*, p. 123. This was an old practice of theirs, as Montrose found out, a century earlier, "when many of the Highlanders, being loaded with spoil, deserted privately, and soon after returned to their old country." *Wishart's Memoirs of the Marquis of Montrose*, Edinburgh, 1819, p. 189. So, too, Burnet (*Memoirs of the Dukes of Hamilton*, p. 272): "Besides, any companies could be brought down from the Highlands might do well enough for a while, but no order could be expected from them, for as soon as they were loaded with plunder and spoil, they would run away home to their

There are indeed few things more absurd than that lying spirit of romance which represents the rising of the Highlanders as the outburst of a devoted loyalty. Nothing was further from their minds than this. The Highlanders have crimes enough to account for without being burdened by needless reproach. They were thieves and murderers ; * but that was in their way of life, and they felt not the stigma. Though they were ignorant and ferocious, they were not so foolish as to be personally attached to that degraded family which, before the accession of William III., occupied the throne of Scotland. To love such men as Charles II. and James II. may perhaps be excused as one of those peculiarities of taste of which one sometimes hears. But to love all their descendants ; to feel an affection so comprehensive as to take in the whole dynasty, and, for the sake of gratifying that eccentric passion, not only to undergo great hardships, but to inflict enormous evil upon two kingdoms, would have been a folly as well as a wickedness, and would convict the Highlanders of a species of insanity alien to their nature. They burst into insurrection because insurrection suited their habits, and because they hated all government and all order.[89] But so far from caring for a monarch, the very institution of monarchy was repulsive to them. It was contrary to that spirit of clanship to which they were devoted ; and from their earliest childhood they were accustomed to respect none but their chiefs, to whom they paid a willing obedience, and whom they considered far superior to all the potentates of the earth.[90]

lurking holes, and desert those who had trusted them." See also p. 354. A more recent writer, drawing a veil over this little infirmity, remarks, with much delicacy, that " the Highlanders, brave as they were, had a custom of returning home after a battle." *Thomson's Memoirs of the Jacobites*, London, 1845, vol. i. p. 122. Not unfrequently they first robbed their fellow-soldiers. In 1746 Bisset writes : " The Highlanders, who went off after the battel, carried off horses and baggage from their own men, the Lowlanders." *Diary of the Reverend John Bisset*, in *Miscellany of the Spalding Club*, vol. i. p. 377, Aberdeen, 1841, 4to. [Here the " not unfrequently " is entirely unjustified ; and the expressions " they " and " the Highlanders " amount to charging on an entire army, or race, the deeds of its thieves. On that principle all armies, and all nations, are communities of thieves.—Ed.]

[89] " Whoever desired, with the sword, to disturb or overturn a fixed government, was sure of the aid of the chiefs, because a settled government was ruinous to their power, and almost inimical to their existence. The more it cultivated the arts of peace, and throve on industrially created well-being, the more did it drive into an antagonist position a people who did not change their nature, who made no industrial progress, and who lived by the swords which acquired for them the fruits of other men's industry. With their interests, a peaceful, strong government was as inconsistent as a well-guarded sheepfold with the interest of wolves." *Burton's History of Scotland*, vol. i. pp. 105, 106. " The Highlanders, in all reigns, have been remarkable for disturbing the established government of Scotland by taking up arms on every invasion for the invaders." *Marchant's History of the present Rebellion*, London, 1746, p. 18. See also *Macky's Journey through Scotland*, London, 1732, p. 129 ; and a short but very curious account of the Highlanders, in 1744, in *The Miscellany of the Spalding Club*, vol. ii. pp. 87–89. [Marchant's statement, here quoted, is certainly false ; and Burton's is one of many which discredit his work. The whole question of his unscientific prejudice is discussed by the editor in *The Saxon and the Celt*, 1897, sec. iv.—Ed.]

[90] An observer, who had excellent opportunities of studying their character between the rebellion of 1715 and that of 1745, writes, " The ordinary Highlanders esteem it the most sublime degree of virtue to love their chief, and pay him a blind obedience, although it be in opposition to the government, the laws of the kingdom, or even to the law of God. He is their idol ; and as *they profess to know no king but him* (I was

[* Murder, once more, was probably rarer in the Highlands than in the Lowlands or in England. Barbaric feuds are not acts of murder. Through the whole of this concluding section of his work, Buckle's ruined health is seen to give an increasingly feverish character to his writing, and his epithets become habitually overstrained.—Ed.]

No one, indeed, who is really acquainted with their history will think them capable of having spilt their blood on behalf of any sovereign, be he whom he might; still less can we believe that they would quit their native land, and undertake long and hazardous marches, with the object of restoring that corrupt and tyrannical dynasty whose offences smelt to heaven, and whose cruelties had at length kindled the anger even of humble and meek-minded men.

The simple fact is that the outbreaks of 1715 and 1745 were in our country the last struggle of barbarism against civilization. On the one side, war and confusion. On the other side, peace and prosperity. These were the interests for which men really fought; and neither party cared for Stuarts or for Hanoverians. The result of such a contest in the eighteenth century could hardly be doubtful. At the time the rebellions caused great alarm, both from their suddenness, and from the strange and ferocious appearance of the Highland invaders.[91] But the knowledge we now possess enables us to see that, from the

going farther), so will they say, they ought to do whatever he commands, without inquiry." *Letters from a Gentleman in the North of Scotland*, edit. London, 1815, vol. ii. pp. 83, 84. "The Highlanders in Scotland are, of all men in the world, the soonest wrought upon to follow their leaders or chiefs into the field, having a wonderful veneration for their Lords and Chieftains, as they are called there: *Nor do these people ever consider the validity of the engaging cause*, but blindly follow their chiefs into what mischief they please, and that with the greatest precipitation imaginable." *Patten's History of the Rebellion*, London, 1717, p. 151. "The power of the chiefs over their clans was the true source of the two rebellions. The clansmen cared no more about the legitimate race of the Stuarts, than they did about the war of the Spanish succession." . . . "The Jacobite Highland chiefs ranged their followers on the Jacobite side — the Hanoverians ranged theirs on the side of government. Lovat's conduct was a sort of *experimentum crucis*; he made his clan Hanoverian in one rebellion, and Jacobite in another." *Burton's Lives of Lovat and Forbes*, p. 150. Compare the change of side of the Mackintoshes, in *Browne's History of the Highlands*, vol. ii. p. 285. Even so late as the American war, the sovereign was deemed subordinate to the chief. "One Captain Frazer from the northern district brought down a hundred of his clan, all of the name of Frazer. Few of them could understand a word of English; and the only distinct idea they had of all the mustering of forces which they saw around them, was that they were going to fight for King Frazer and George ta Three." *Penny's Traditions of Perth*, pp. 49, 50, Perth, 1836. [Buckle and his authorities here treat as peculiar to the Highlanders a feudal habit which he ascribes below (p. 727) to "tens of thousands" of Lowlanders. This is the normal critical practice of the exponents of race-prejudice.—ED.]

[91] Which gave rise to a report that they were cannibals. "The late Mr. Halkston of Rathillet, who had been in this expedition" (the Rebellion of 1745), "told Mr. Young that the belief was general among the people of England, that the Highlanders ate children. *Johnstone's Memoirs of the Rebellion*, 3rd edit. London, 1822, p. 101. Such a rumour, notwithstanding its absurdity, was made somewhat plausible by the revolting conduct of the Highlanders in the first rebellion of 1715, when they committed, in the Lowlands, horrible outrages on corpses which they dug up. See the contemporary evidence, in *Correspondence of the Rev. Robert Wodrow*, published by the Wodrow Society, vol. ii. pp. 86, 87, 93. "They have even raised up some of my Lord Rothes's children and mangled their dead bodies" . . . "till the stench put them away." In 1745 they signalized their entrance into England in the following manner. "The rebels, during their stay in Carlisle, committed the most shocking detestable villanies; for, not contented with robbing families of their most valuable effects, they scrupled not to act their brutal insolence on the persons of some young ladies, even in the presence of their parents. A gentleman, in a letter to his friend in London, writes thus: 'That, after being in a manner stripped of everything, he had the misery to see three of his daughters treated in such a manner that he could not relate it.'" *Marchant's History of the present Rebellion*, London, 1746, pp. 181, 182. [Wodrow's story is extremely improbable, and as his gross credulity is held by Buckle to be obvious in other matters, it should be held to put his statement in doubt here. Marchant's lack of detailed evidence for his charges is significant. Even the anti-Celtic Burton admits (viii. 458) that the Highlanders behaved well, keeping good

beginning, success was impossible. Though the government was extremely remiss, and, notwithstanding the information it received, allowed itself on both occasions to be taken by surprise, there was no real danger.[92] The English, not being particularly enamoured either with the Highlanders or with the Stuarts, refused to rise ;[93] and it cannot be seriously supposed that a few thousand half-naked banditti had it in their power to prescribe to the people of England what sovereign they should obey, and under what sort of government they should live.

After 1745 there was no further interruption. The interests of civilization, that is, the interests of knowledge, of liberty, and of wealth, gradually assumed the upper hand, and reduced men like the Highlanders to utter insignificance. Roads were cut through their country ; and for the first time travellers from the south began to mingle with them in their hitherto inaccessible wilds.[94] In those

discipline. They certainly never approached the savagery displayed by English troops not merely in previous centuries, when England was at a far higher culture-level than the Highlands, but after the battle of Culloden.—Ed.]

[92] Even when they had penetrated to Derby, the best informed of their own party despaired of success. See the Jacobitical account in *The Lockhart Papers*, London, 4to, 1817, vol. ii. p. 458 : " The next thing to be considered of, was what was now to be done : they were now at Derby, with an army not half the number of what they were reported to be, surrounded in a manner with regular troops on all sides, and more than double their number. To go forward there was no encouragement, for their friends (if they had any) had kept little or no correspondence with them from the time they entered England." The Chevalier De Johnstone, who took an active part in the Rebellion, frankly says, " If we had continued to advance to London, and had encountered all the troops of England, with the Hessians and Swiss in its pay, there was every appearance of our being immediately exterminated, without the chance of a single man escaping." *Johnstone's Memoirs of the Rebellion in 1745 and 1746*, p. 79.

[93] Lord George Murray, the commander-in-chief in 1745, was unwilling to advance far south of Carlisle, " without more encouragement from the country than we had hitherto got." See his own account, in *The Jacobite Memoirs of the Rebellion of 1745*, edited by R. Chambers, Edinburgh, 1834, p. 48. But his prudent advice was overruled. The Highlanders pressed on ; and that happened which any one tolerably acquainted with England might have foreseen. Johnstone (*Memoirs of the Rebellion*, p. 70) says, " In case of a defeat in England, no one in our army could by any possibility escape destruction, as *the English peasants were hostile towards us in the highest degree* ; and, besides, the army of Marshal Wade was in our rear, to cut us off from all communication with Scotland." And at p. 81, " In every place we passed through, we found the English very ill disposed towards us, except at Manchester, where there appeared some remains of attachment to the house of Stuart." The champion of arbitrary power would find a different reception now, in that magnificent specimen of English prosperity, and of true, open-mouthed, English fearlessness. But a century ago the men of Manchester were poor and ignorant ; and the statement of Johnstone respecting them is confirmed by Home, who says, " At Manchester, several gentlemen, and about 200 or 300 of the common people, joined the rebel army ; *these were the only Englishmen (a few individuals excepted) who joined Charles in his march through the country of England.*" *Home's History of the Rebellion in 1745*, London, 1802, 4to, p. 145. In 1715 the English equally held back, except at Manchester. See *Patten's History of the late Rebellion*, London, 1717, pp. 89, 168.

[94] The establishment of roads caused great displeasure. Pennant, who visited Scotland in 1769, says, " These publick works were at first very disagreeable to the old chieftains, and lessened their influence greatly : for by admitting strangers among them, their clans were taught that the Lairds were not the first of men." *Pennant's Tour in Scotland*, 4th edit. Dublin, 1775, vol. i. p. 204. Towards the end of the eighteenth century this feeling began to die away. " Till of late, the people of Kintail, as well as other Highlands, had a strong aversion to roads. The more inaccessible, the more secure, was their maxim." *Sinclair's Statistical Account of Scotland*, vol. vi. p. 244, Edinburgh, 1793.

parts the movement was indeed very slow; but in the Lowlands it was much more rapid. For the traders and inhabitants of towns were now becoming prominent, and their authority helped to neutralize the old warlike and anarchical habits. Towards the end of the seventeenth century a taste for commercial speculation sprung up, and a large amount of the energy of Scotland was turned into this new channel.[95] Early in the eighteenth century the same tendency was displayed in literature; and works on mercantile and economical subjects became common.[96] A change in manners was also perceptible. About this period the Scotch began to lose something of that rugged ferocity which had distinguished them of old. This improvement was evinced in several ways; one of the most remarkable being an alteration, which was first observed in 1710, when it was noticed that men were leaving off armour, which had hitherto been worn by every one who could afford it, as a useful precaution in a barbarous, and therefore a warlike, society.[97]

To trace the general progress in its various parts, or even to indicate the immediate consequences, would require a separate volume. One of the results is, however, too conspicuous to be passed over in silence, though it does not deserve all the importance that has been attached to it. This is, the abolition of hereditary jurisdictions, which after all was but a symptom of the great movement, and not a cause of it; being itself due partly to the growth of the industrial spirit and partly to that diminution of the power of the aristocracy which had been visible as early as the beginning of the seventeenth century. During many ages certain persons of noble birth had enjoyed the privilege of trying offences, and even of inflicting capital punishment, simply because their ancestors had done so before them; the judicial power being in fact part of their patrimony, and descending to them like the rest of their property.[98] An institution of this sort,

[95] "Soon after the establishment of the revolution settlement, the ardent feelings of the Scottish people were turned out of their old channels of religious controversy and war in the direction of commercial enterprise." *Burton's Criminal Trials in Scotland*, vol. i. p. 104. Compare *Burnet's History of his own Time*, vol. iv. pp. 286, 287, 418; and the note (at p. 419): "The lords and commons of Scotland were then desirous of getting into trade." This is under the year 1699. In 1698 Fletcher of Saltoun writes: "By no contrivance of any man, but by an unforeseen and unexpected change of the genius of this nation, all their thoughts and inclinations, as if united and directed by a higher power, seem to be turned upon trade, and to conspire together for its advancement." *First Discourse on the Affairs of Scotland*, in *Fletcher of Saltoun's Political Works*, Glasgow, 1749, p. 57. At this the clergy were uneasy. In 1709 the Reverend Robert Wodrow expresses an opinion, in one of his letters, that "the sin of our too great fondness for trade, to the neglecting of our more valuable interests, I humbly think will be written upon our judgment." *Wodrow's Correspondence*, Edinburgh, 1842, 8vo, vol. i. p. 67. In the same year, some ships being taken by the French, part of the loss fell upon Glasgow. Thereupon Wodrow writes: "It's said that in all there is about eighty thousand pound sterling lost there, whereof Glasgow has lost ten thousand pound. I wish trading persons may see the language of such a Providence. I am sure the Lord is remarkably frouning upon our trade, in more respects than one, since it was put in the room of religion in the late alteration of our constitution." *Wodrow's Analecta*, vol. i. p. 218, 4to, published by the Maitland Club.

[96] Laing (*History of Scotland*, vol. iv. p. 296), under the year 1703, says: "Ever since the projected settlement at Darien, the genius of the nation had acquired a new direction: and as the press is the true criterion of the spirit of the times, the numerous productions on political and commercial subjects with which it daily teemed, had supplanted the religious disputes of the former age." Unfortunately for Scotland, they were by no means supplanted. Still, the movement was great, and not to be mistaken.

[97] "It was only in 1710 that they began to throw off their armour, and allow the soldier to merge into the quiet and industrious craftsman." *Penny's Traditions of Perth*, p. 335, Perth, 1836. This particularly applies to the citizens of Perth.

[98] On these "hereditary or proprietary jurisdictions," which conferred the right, or, I would rather say, the power, of putting people to death, see *Burton's History of Scotland*,

which made a man a judge, not because he was apt for the office, but because he was born under particular circumstances, was a folly which the revolutionary temper of the eighteenth century was not likely to spare. The innovating spirit for which that age was remarkable could hardly fail to attack so preposterous a custom; and its extinction was facilitated both by the decline of the nobles who possessed the privilege, and by the rise of their natural opponents, the trading and commercial classes. The decay of the Scotch nobility in the eighteenth century may be traced to two special causes, in addition to those general causes which were weakening the aristocracy nearly all over Europe. With the general causes, which were common to England and to most parts of the Continent, we are not now concerned. It is enough to say that they were entirely dependent on that advance of knowledge which, by increasing the authority of the intellectual class undermines, and must eventually overthrow, mere hereditary and accidental distinctions. But those causes which were confined to Scotland had a more political characrer, and though they were purely local, they harmonized with the whole train of events, and ought to be noticed, as links of a vast chain, which connects the present state of that singular country with its past history.

The first cause was the Union of Scotland with England, in 1707, which struck a heavy blow at the Scotch aristocracy. By it the legislature of the smaller country was absorbed in that of the larger, and the hereditary legislators suddenly sunk into insignificance. In the Scottish parliament there were a hundred and forty-five peers, all of whom, except sixteen, were by the Act of Union deprived of the power of making laws.[99] These sixteen were sent off to London, and took their seats in the House of Lords, of which they formed a small and miserable fraction. On every subject, however important to their own country, they were easily outvoted; their manners, their gesticulations, and particularly their comical mode of pronouncing English, were openly ridiculed;[100] and the chiefs of this

vol. i. p. 425, vol. ii. p. 402. The technical term for so monstrous a privilege was the right "of pit and gallows." *Pitcairn's Criminal Trials in Scotland*, vol. ii. p. 94: and *Mackenzie's Laws and Customs of Scotland in Matters Criminal*, pp. 70, 100, 187, 210. This meant that men were to be hung and women to be drowned. See also *Arnot's History of Edinburgh*. p. 224; *Fountainhall's Notes on Scottish Affairs*, p. 139; *Hume's History of the House of Douglas*, vol. i. p. 346; *Lettice's Scotland*, p. 271; *Sinclair's Scotland*, vol. i. p. 417, vol. iv. p. 478, vol. vi. pp. 195, 258, vol. viii. pp. 129, 348, vol. xiii. p. 563, vol. xiv. p. 34, vol. xvii. pp. 442, 600, vol. xviii. p. 473.

[99] Laing (*History of Scotland*, vol. iv. p. 345) says that in 1706 "the commons in the Scottish parliament were 160: the peers 145." Of these peers, the Treaty of Union declared that "sixteen shall be the number to sit and vote in the House of Lords." *De Foe's History of the Union between England and Scotland*, London, 1786, 4to, pp. 205, 538. The English House of Lords consisted of 179 members. See *The Lockhart Papers*, London, 1817, 4to, vol. i. pp. 343, 547. It was impossible to mistake the result of this sweeping measure, by which, as was said at the time, "Scotland was to retrench her nobility." *De Foe's History of the Union*, p. 495. Compare p. 471: "The nobility being thereby, as it were, degraded of their characters." In 1710 a Scotchman writes in his journal: "It was one of the melancholyest sights to any that have any sense of our antient Nobility, to see them going throu for votes, and making partys, and giving their votes to others who once had their oun vote; and I suspect many of them reu the bargain they made, in giving their oun pouer away." *Wodrow's Analecta*, vol. i. p. 308.

[100] The Scotch, consequently, became so eager to do away with this source of mirth, that even as late as the year 1761, when the notorious lecturer, Sheridan, visited Edinburgh, "such was the rage for speaking with an English accent, that more than three hundred gentlemen, among whom were the most eminent in the country for rank and learning, attended him." *Ritchie's Life of Hume, London*, 1807, p. 94. It was however during about twenty years immediately after the Union that the Scotch members of Parliament, both Lords and Commons, were most jeered at in London, and were treated with marked disrespect, socially and politically. Not only were they mocked and lampooned, but they were also made tools of. In September, 1711, Wodrow writes (*Analecta*, vol. i. p. 348, 4to, 1842): "In the beginning of this (month), I hear a generall dissatis-

old and powerful aristocracy found themselves, to their utter amazement, looked on as men of no account, and they were often obliged to fawn and cringe at the levee of the minister, in order to procure a place for some needy dependent. Their friends and relations applied to them for offices, and generally applied in vain. Indeed the Scotch nobles, being very poor, wanted for themselves more than the English government was inclined to give, and in the eagerness of their clamour they lost both dignity and reputation.[101] They were exposed to mortifying rebuffs, and their true position being soon known, weakened their influence at home, among a people already prepared to throw off their authority. To this, however, they were comparatively indifferent, as they looked for future fortune not to Scotland but to England. London became the centre of their intrigues and their hopes.[102] Those who had no seat in the House of Lords longed to have

faction our Nobility that wer at last Parliament have at their treatment at London. They complean they are only made use of as tools among the English, and cast by when their party designes are over." The next year (1712), the Scotch members of the House of Commons met together, and expressed their "high resentment of the uncivil, haughty treatment they mett with from the English." *The Lockhart Papers*, London, 1817, 4to, vol. i. p. 417. See, further, *Burton's History of Scotland*, vol. ii. p. 27. "Without descending to rudeness, the polished contemporaries of Wharton and St. John could madden the sensitive and haughty Scots by light shafts of raillery about their pronunciation or knowledge of parliamentary etiquette." Some curious observations upon the way in which the Scotch pronounced English, late in the seventeenth century, will be found in *Morer's Short Account of Scotland*, London, 1702, pp. 13, 14. The author of this book was chaplain to a Scotch regiment.

[101] Among many illustrations with which contemporary memoirs abound, the following is by no means the worst. Burnet, as a Scotchman, thinks proper to say that those of his countrymen who were sent to Parliament "were persons of such distinction, that they very well deserved" the respect and esteem with which they were treated. To which, Lord Dartmouth adds: "and were very importunate to have their deserts rewarded. A Scotch earl pressed Lord Godolphin extremely for a place. He said there was none vacant. The other said, his lordship could soon make one so, if he pleased. Lord Godolphin asked him, if he expected to have any body killed to make room? He said, No; but Lord Dartmouth commonly voted against the court, and every body wondered that he had not been turned out before now. Lord Godolphin told him, he hoped his lordship did not expect that he should be the person to propose it; and advised him never to mention it any more, for fear the queen should come to hear of it; for if she did, his lordship would run great risk never to have a place as long as she lived. But he could not forbear telling every where, how ill the lord treasurer had used him." *Burnet's History of his own Time*, vol. v. p. 349, Oxford, 1823. Compare the account, in 1710, in *Wodrow's Analecta*, vol. i. p. 293. "Argyle is both picked (*i.e.* piqued) at Marlburrou, and his brother Yla, for refuising him a regiment; and Godolphin should have said to the Queen that my Lord Yla was not to be trusted with a regiment! The Earl of Marr was one of the greatest cronnies Godolphine had, till the matter of his pension, after the Secretary office was taken from him, came about. Godolphine caused draw it during pleasure; Marr expected it during life, which the Treasurer would not yield to, and therefore they brake." The history of the time is full of these wretched squabbles, which show what the Scotch nobles were made of. Indeed their rapacity was so shameless that in 1711 severall of them refused to perform their legislative duties in London unless they received some offices which they expected. "About the midle of this moneth, I hear ther was a meeting of several of our Scots Peers, at the Viscount of Kilsyth's, where they concerted not to goe up to this parliament till peremptorly writ for; and (also) some assurance be given of the places they were made to hope for last session and have missed." *Wodrow's Analecta*, vol. i. p. 365. In 1712 the same Scotchman writes (*Analecta*, vol. ii. p. 8): "Our Scots Peers' secession from the House of Peers makes much noise; but they doe not hold by it. They somtimes come and somtimes goe, and *they render themselves base in the eyes of the English.*" See also a letter "concerning the Scots Peerage," in *Somers Tracts*, vol. xii. p. 607, edit. Scott, London, 1814, 4to.

[102] A Scotch writer, twenty years after the Union, says: "Most of our gentlemen and

one, and it was notorious that the darling object of nearly every Scotch noble was to be made an English peer.[103] The scene of their ambition being shifted, they were gradually weaned from their old associations. Directly this was apparent, the foundation of their power was gone. From that moment their real nationality vanished. It became evident that their patriotism was but a selfish passion. They ceased to love a country which could give them nothing, and as a natural consequence their country ceased to love them.

Thus it was that this great tie was severed. In this, as in all similar movements, there were of course exceptions. Some of the nobles were disinterested, and some of their dependents were faithful. But looking at the Lowlands as a whole, there can be no doubt that before the middle of the eighteenth century that bond of affection was gone which in former times made tens of thousands of Scotchmen ready to follow their superiors in any cause, and to sacrifice their lives at a nod.* That spirit, which was once deemed ardent and generous, but which a deeper analysis shows to be mean and servile, was now almost extinct, except among the barbarous Highlanders, whose ignorance of affairs long prevented them from being influenced by the stream of events. That the proximate cause of this change was the Union, will probably be denied by no one who has minutely studied the history of the period. And that the change was beneficial, can be questioned only by those sentimental dreamers with whom life is a matter rather of feeling than of judgment, and who, despising real and tangible interests, reproach their own age with its material prosperity, and with its love of luxury, as if they were the result of low and sordid desires unknown to the loftier temper of bygone days. To visionaries of this sort, it may well appear that the barbarous and ignorant noble, surrounded by a host of devoted retainers, and living with rude simplicity in his own dull and wretched castle, forms a beautiful picture of those unmercenary and uncalculating times when men, instead of seeking for knowledge, or for wealth, or for comfort, were content with the frugal innocence of their fathers, and when, protection being accorded by one class, and gratitude felt by the other, the subordination of society was maintained, and its different parts were knit together by sympathy, and by the force of common emotions, instead of, as now, by the coarse maxims of a vulgar and selfish utility.

people of quality, who have the best estates in our country, live for the most part a-London." *Reasons for Improving the Fisheries and Linen Manufacture of Scotland*, London, 1727, p. 22. I do not know who wrote this curious little treatise; but the author was evidently a native of Scotland. See p. 25. I have, however, still earlier evidence to adduce. A letter from Wodrow, dated 9th of August, 1725, complains of "the general sending our youth of quality to England;" and a letter to him, in 1716, describes the Anglicizing process going on among the Scotch aristocracy, only nine years after the Union. "Most of our Lords and others here do so much depend on the English for their posts, and *seeking somewhat or other*, that their mouths are almost quite stopped; and really *most of them go into the English way in all things*." *Wodrow's Correspondence*, vol. ii. p. 196, vol. iii. p. 224. The Earl of Mar lost popularity in Scotland on account of the court he paid to Lord Godolphin; for he "appears to have passed much more time in intrigues in London than among the gardens of Alloa." *Thomson's Memoirs of the Jacobites*, vol. i. p. 36. Even Earl Ilay, in his anxiety to advance himself at the English court, "used to regret his being a Scots peer, and to wish earnestly he was a commoner." *Letters of Lord Grange*, in *The Miscellany of the Spalding Club*, vol. iii. p. 39, Aberdeen, 4to, 1846.

[103] Indeed, their expectation ran so high, as to induce a hope, not only that those Commissioners of the Union who were Scotch peers should be made English ones, but that "the whole nobility of Scotland might in time be admitted." *Laing's History of Scotland*, vol. iv. p. 346. Compare *The Lockhart Papers*, vol. i. pp. 298, 343: "The Scots Peerage, many of whom had been bubled with the hopes of being themselves created British Peers." Also *The Gordon Letters*, in *The Miscellany of the Spalding Club*, vol. iii. pp. 227, 228.

[* Compare *note* 90, above, where precisely this attitude is specified as peculiar to Highlanders.—Ed.]

Those, however, whose knowledge gives them some acquaintance with the real course of human affairs, will see that in Scotland, as in all civilized countries, the decline of aristocratic power forms an essential part of the general progress. It must therefore be esteemed a fortunate circumstance that among the Scotch, where that power had long been enormous, it was weakened in the eighteenth century, not only by general causes, which were operating elsewhere, but also by two smaller and more special causes. The first of these minor causes was, as we have just seen, the Union with England. The other cause was, comparatively speaking, insignificant, but still it produced decided effect, particularly in the northern districts. It consisted in the fact that some of the oldest Highland nobles were concerned in the rebellion of 1745, and that, when that rebellion was put down, those who escaped from the sword were glad to save their lives by flying abroad, leaving their dependents to shift for themselves.[104] They became attached to the court of the Pretender, or at all events intrigued for him. That indeed was their only chance, their estates at home being forfeited. For nearly forty years several great families were in exile, and although about 1784 they began to return,[105] other associations had been formed during their absence, and new ideas had arisen, both in their own minds and in the minds of their retainers. A fresh generation had grown up, and fresh influences had been brought to bear. Strangers, with whom the people had no sympathy, had intruded upon the estates of the nobles, and though they might receive obedience, it was an obedience unaccompanied by deference. The real reverence was gone; the homage of the heart was no more. And as this state of things lasted for about forty years, it interrupted the old train of thought, and the former habits were so completely broken that even when the chiefs were restored to their forfeited honours, they found that there was another part of their inheritance which they were unable to recover, and that they had lost for ever that unreserved submission which in times of yore had been willingly paid to their fathers.[106]

[104] The Chevalier de Johnstone, in his plaintive remarks on the battle of Culloden, says: "The ruin of many of the most illustrious families in Scotland immediately followed our defeat." *Johnstone's Memoirs of the Rebellion in 1745*, p. 211. He of course could not perceive that, sad as such ruin was to the individual sufferers, it was an immense benefit to the nation. Mr. Skene, referring to the year 1748, says of the Highlanders: "Their long-cherished ideas of clanship gradually gave way under the absence and ruin of so many of their chiefs." *Skene's Highlanders*, vol. i. p. 147.

[105] "About 1784 the exiled families began to return." *Penny's Traditions of Perth*, p. 41. See also *Macpherson's Annals of Commerce*, vol. iv. p. 53. In 1784 "a bill passed the Commons without opposition," to restore the "Forfeited Estates" in the north of Scotland. See *Parliamentary History*, vol. xxiv. pp. 1316–1322. On that occasion, Fox said (p. 1321), the proprietors "had been sufficiently punished by forty years' deprivation of their fortunes for the faults of their ancestors."

[106] Dean Ramsay, in his *Reminiscences* (5th edit. Edinburgh, 1859, p. 57), notices that, owing to "transfers of property and extinction of old families in the Highlands, as well as from more general causes," the old clannish affection "is passing away." But this intelligent observer has not indicated the connexion between so important a fact and the Rebellion of 1745. In 1792, Heron writes: "The prejudices of clanship have almost died away." . . . "The dependents of the family of Kenmure are still attached to its representative with much of that affection and respect with which the tribes of the Highlands have *till lately* been accustomed to adhere to their lord." *Heron's Journey through the Western Counties of Scotland*, 2nd edit. Perth, 1799, vol. i. p. 248, vol. ii. p. 154. See also the remarks made, in the same year, in *Lettice's Letters on a Tour through various Parts of Scotland*, London, 1794, p. 340. To trace the movement back still further, Pennant writes, in 1769: "But in many parts of the Highlands, their character begins to be more faintly marked; they mix more with the world; and *become daily less attached to their chiefs*." . . . "During the feudal reign, their love for their cheftain induced them to bear many things, *at present intolerable*." These two important passages are in the 4th edition of *Pennant's Tour in Scotland*, vol. i. p. 194, vol. ii. p. 307, Dublin, 1775. They

Owing to these circumstances, the course of affairs in Scotland during the eighteenth century, and especially during the first half of it, was marked by a more rapid decline of the influence of the higher ranks than was seen in any other country. It was therefore an easy task for the English government to procure a law which, by abolishing hereditary jurisdictions, deprived the Scotch aristocracy, in 1748, of the last great ensign of their power.[107] The law, being suited to the spirit of the times, worked well; and in the Highlands in particular it was one immediate cause of the establishment of something like the order of a settled state.[108] But in this instance as in every other, the real and overruling cause is to be found in the condition of the surrounding society. A few generations earlier, hardly any one would have thought of abolishing these mischievous jurisdictions, which were then deemed beneficial, and were respected as belonging to the great families by natural and inalienable right. Such an opinion was the inevitable result of the state of things then existing. This being the case, it is certain that if the legislature had at that time been so rash as to lay its hand on what the nation respected, popular sympathy would have been aroused, and the nobles would have been strengthened by what was intended to weaken them.[109] In 1748, however, matters were very different. Public opinion had changed; and this change of opinion was not only the cause of the new law, but was the reason of the new law being effective. And so it always is. They, indeed, whose knowledge is almost confined to what they see passing around them, and who on account of their ignorance are termed practical men, may talk as they will about the reforms which government has introduced, and the improvement to be expected from legislation. But whoever will take a wider and more commanding view of affairs, will soon discover that such hopes are chimerical. They will learn that lawgivers are nearly always the obstructors of society, instead of its helpers; and that in the extremely few cases in which their measures have turned out well, their success has been owing to the fact that, contrary to their usual custom, they have implicitly obeyed the spirit of their time, and have been, as they always should be, the mere servants of the people, to whose wishes they are bound to give a public and legal sanction.*

Another striking peculiarity of Scotland during the remarkable period we are now considering was the sudden rise of trading and manufacturing interests. This preceded, by a whole generation, the celebrated statute of 1748, and was one of the causes of it, in so far as it weakened the great families, against whom

prove that, twenty-four years after the Rebellion of 1745, the decay of affection was so manifest as to strike a candid and careful but by no means philosophic observer. For Pennant to have discerned these changes, they must already have risen to the surface. Other and corroborative evidence will be found in *Sinclair's Account of Scotland*, vol. ii. p. 545, Edinburgh, 1792; and vol. iii. pp. 377, 437, vol. xiii. p. 310, vol. xv. p. 592, vol. xx. p. 33.

[107] *Burton's History of Scotland*, vol. ii. pp. 535–537. *Struthers' History of Scotland*, Glasgow, 1828, vol. ii. pp. 519–525.

[108] Macpherson (*Annals of Commerce*, vol. iii. p. 259) says, "This excellent statute may not unfitly be termed a new magna charta to the free people of Scotland."

[109] I cannot, therefore, agree with Macpherson, who asserts in his valuable work that the abolition of these jurisdictions "should undoubtedly have been made an essential preliminary of the consolidating union of the two kingdoms of England and Scotland, concluded forty years before." *Macpherson's Annals of Commerce*, vol. iii. p. 257. Compare *De Foe's History of the Union between England and Scotland*, pp. 458, 459, London, 1786, 4to.

[* Either it is here implied that lawgivers are *not* obeying the spirit of their time when they make bad laws, or the whole theorem falls to the ground. But if that proposition be maintained, another of Buckle's theses is destroyed, for it will then follow that legislators are nearly always able to legislate against the spirit of the age. In that case the spirit of the age has practically no effect on legislation. The passage is a *reductio ad absurdum*.—Ed.]

that statute was directed. The movement may be traced back, as I have already noticed, to the end of the seventeenth century, and it was in active operation before the first twenty years of the eighteenth century had passed away. A mercantile and money-making spirit was diffused to an extent formerly unknown, and men becoming valued for their wealth as well as for their birth, a new standard of excellence was introduced, and new actors appeared on the scene. Heretofore, persons were respected solely for their parentage ;* now they were also respected for their riches. The old aristocracy, made uneasy by the change, did everything they could to thwart and discourage these young and dangerous rivals.[110] Nor can we wonder at their feeling somewhat sore. The tendency which was exhibited was indeed fatal to their pretensions. Instead of asking who was a man's father, the question became, how much he had got. And certainly, if either question is to be put, the latter is the more rational. Wealth is a real and substantial thing, which ministers to our pleasures, increases our comfort, multiplies our resources, and not unfrequently alleviates our pains. But birth is a dream and a shadow, which, so far from benefiting either body or mind, only puffs up its possessor with an imaginary excellence, and teaches him to despise those whom nature has made his superiors, and who, whether engaged in adding to our knowledge or to our wealth, are in either case ameliorating the condition of society, and rendering to it true and valuable service.

This antagonism between the aristocratic and trading spirit lies in the nature of things, and is essential, however it may be disguised at particular periods. Therefore it is that the history of trade has a philosophic importance in reference to the progress of society, quite independent of practical considerations. On this account I have called the attention of the reader to what otherwise would be foreign to the objects of the present Introduction ; and I will now trace, as briefly as possible, the beginning of that great industrial movement, to the extension of which the overthrow of the Scotch aristocracy is to be partly ascribed.

The Union with England, which was completed in 1707, produced immediate and striking effects on trade. Its first effect was to throw open to the Scotch a new and extensive commerce with the English colonies in America. Before the Union, no goods of any kind could be landed in Scotland from the American plantations, unless they had first been landed in England, and paid duty there ; nor even, in that case, might they be conveyed by any Scotch vessel.[111] This was one of many foolish regulations by which our legislators interfered with the natural course of affairs, and injured the interests of their own country, as well as those of their neighbours. Formerly, however, such laws were considered †

[110] In 1740 "the rising manufacturing and trading interests of the country" were "looked down upon and discouraged by the feudal aristocracy." *Burton's Lives of Lovat and Forbes*, p. 361.

[111] "Whereas Scotland had before this prohibited all the English woollen manufactures, under severe penalties, and England on the other hand had excluded the Scots from trading with Scots ships to their colonies in America, directly from Scotland, and had confiscated even their own English ships trading to the said colonies from England, if navigated or manned with above one-third Scots seamen," &c. *De Foe's History of the Union*, p. 603. In 1696 the wise men in our English parliament passed a law, "that on no pretence whatever any kind of goods from the English American plantations should hereafter be put on shore, either in the kingdoms of Ireland or Scotland, without being first landed in England, and having also paid the duties there, under forfeiture of ship and cargo." *Macpherson's Annals of Commerce*, vol. ii. p. 684. Certainly, the more a man knows of the history of legislation, the more he will wonder that nations should have been able to advance in the face of the formidable impediments which legislators have thrown in their way.

[* Buckle has here forgotten his previous account of the respect of the people for their clergy. And it is not seriously to be supposed that before the eighteenth century rich citizens were not respected for their wealth.—ED.]

[† Considered, that is, by traders as well as by legislators.—ED.]

to be extremely sagacious, and politicians were constantly contriving protective schemes of this sort, which, with the best intentions, inflicted incalculable harm. But if, as seems probable, one of their objects in this instance was to retard the improvement of Scotland, they were more than usually successful in effecting the purpose at which they aimed. For the whole of the western coast, being cut off from direct intercourse with the American colonies, was debarred from the only foreign trade it could advantageously follow; since the European ports lay to the east, and could not be reached by the inhabitants of Western Scotland without a long circumnavigation, which prevented them from competing on equal terms with their countrymen, who, sailing from the other side, were already near the chief seats of commerce. The consequence was that Glasgow and the other western ports remained almost stationary; having comparatively few means of gratifying that enterprising spirit which rose among them late in the seventeenth century, and not daring to trade with those prosperous colonies which were just before them across the Atlantic, but from which they were entirely excluded by the jealous precautions of the English parliament.[112]

When, however, by the Act of Union, the two countries became one, these precautions were discontinued, and Scotland was allowed to hold direct intercourse with America and the West India Islands. The result which this produced on the national industry was almost instantaneous, because it gave vent to a spirit which had begun to appear among the people late in the seventeenth century, and because it was aided by those still more general causes which, in most parts of Europe, predisposed that age to increased industry. The west of Scotland, being nearest to America, was the first to feel the movement. In 1707 the inhabitants of Greenock, without the interference of government, imposed on themselves a voluntary assessment, with the object of constructing a harbour. In this undertaking they displayed so much zeal that by the year 1710 the whole of the works were completed; a pier and capacious harbour were erected, and Greenock was suddenly raised from insignificance to take an important part in the trade of the Atlantic.[113] For a while, the merchants were content to carry on their traffic with ships hired from the English. Soon, however, they became bolder; they began to build on their own account; and in 1719 the first vessel belonging to Greenock sailed for America.[114] From that moment their commerce

[112] "A spirit for commerce appears to have been raised among the inhabitants of Glasgow between the periods of 1660 and 1707, when the Union with England took place." . . But, "whatever their trade was at this time it could not be considerable; the ports to which they were obliged to trade lay all to the eastward; the circumnavigation of the island would therefore prove an almost insurmountable bar to the commerce of Glasgow; the people upon the east coast, from their situation, would be in possession of almost the whole commerce of Scotland." *Gibson's History of Glasgow*, p. 205, Glasgow, 1777.

[113] "The importance of the measure induced the inhabitants of Greenock to make a contract with the superior, by which they agreed to an assessment of 1*s.* 4*d.* sterling on every sack of malt brewed into ale within the limits of the town; the money so levied to be applied in liquidating the expence of forming a proper harbour at Greenock. The work was begun at the epoch of the Union, in 1707; and a capacious harbour, containing upwards of ten Scotish acres, was formed by building an extensive circular pier, with a straight pier, or tongue, in the middle, by which the harbour was divided into two parts. This formidable work, the greatest of the kind at that time in Scotland, incurred an expence of more than 100,000 marks Scots." *Chalmers' Caledonia*, vol. iii. p. 807, London, 1824, 4to. In *M'Culloch's Geographical and Statistical Dictionary*, London, 1849, vol. i. p. 930, it is stated that "the inhabitants took the matter (1707) into their own hands, and agreed with their superior to assess themselves at a certain rate, to build a proper pier and harbour. The work was finished in 1710, at an expense of 5,555*l.*"

[114] "The trade of Greenock has kept pace with the improvements made on its harbour. The union of the kingdoms (1707) opened the colonies to the enterprising inhabitants of this town, and generally of the west of Scotland; but it was not till 1719 that the first vessel belonging to Greenock crossed the Atlantic." *M'Culloch's Geographical and Statistical Dictionary*, vol. i. p. 930.

increased so rapidly that by the year 1740 the tax which the citizens had laid on themselves sufficed not only to wipe off the debt which had been incurred, but also to leave a considerable surplus available for municipal purposes.[115] At the same time, and by the action of the same causes, Glasgow emerged from obscurity. In 1718 its enterprising inhabitants launched in the Clyde the first Scotch vessel which ever crossed the Atlantic; thus anticipating the people of Greenock by one year.[116] Glasgow and Greenock became the two great commercial outlets of Scotland, and the chief centres of activity.[117] Comforts, and indeed luxuries, hitherto only attainable at enormous cost, began to be diffused through the country. The productions of the tropics could now be procured direct from the New World, which in return offered a rich and abundant market for manufactured goods. This was a further stimulus to Scotch industry, and its effects were immediately apparent. The inhabitants of Glasgow, finding a great demand among the Americans for linen, introduced its manufacture into their city in 1725, whence it extended to other places,* and, in a short time, gave

[115] "Such was the effect of the new harbour in increasing the trade and the population of the town, that the assessment and port-dues cleared off the whole debt before 1740, and left in that year a clear surplus of 27,000 marks Scots, or 1500*l.* sterling." *Chalmers' Caledonia*, vol. iii. p. 807. "After the Union, however, the trade of the port increased so rapidly that in the year 1740 the whole debt was extinguished, and there remained a surplus, the foundation of the present town's funds, of 27,000 merks." *Sinclair's Statistical Account of Scotland*, vol. v. p. 576, Edinburgh, 1793.

[116] "By the Union, however, new views were opened up to the merchants of the city; they thereby obtained the liberty of a free commerce to America and the West Indies, from which they had been before shut out; they chartered English vessels for these voyages, having none at first fit for the purpose; sent out cargoes of goods for the use of the colonies, and returned home laden with tobacco. The business doing well, vessels were built belonging to the city, and in the year 1718 the first ship, the property of Glasgow, crossed the Atlantic." *Denholm's History of Glasgow*, p. 405, 3rd edit. Glasgow, 1804. Brown (*History of Glasgow*, vol. ii. p. 330, Edinburgh, 1797) says that the Glasgow merchants "chartered Whitehaven ships for many years;" but that "in 1716 a vessel of sixty tons burden was launched at Crawford's dike, being the first Clyde ship that went to the British settlements in America with goods and a supercargo." But this date is probably two years too early. Mr. M'Culloch, in his excellent *Geographical and Statistical Dictionary*, London, 1849, vol. ii. p. 659, says: "But for a while the merchants of Glasgow, who first embarked in the trade to America, carried it on by means of vessels belonging to English ports; and it was not till 1718 that a ship built in Scotland (in the Clyde), the property of Scotch owners, sailed for the American colonies." Gibson also (*History of Glasgow*, 1777, p. 206), says: "In 1718 the first vessel of the property of Glasgow crossed the Atlantic." And, to the same effect, *Sinclair's Statistical Account of Scotland*, vol. v. p. 498, Edinburgh, 1793.

[117] The progress was so rapid that, in a work printed in 1732, it is stated that "this city of Glasgow is a place of the greatest trade in the kingdom, especially to the Plantations; from whence they have twenty or thirty sail of ships every year, laden with tobacco and sugar; an advantage this kingdom never enjoyed till the Union. They are purchasing a harbour on the Frith near Alloway, to which they have but twelve miles by land; and then they can re-ship their sugars and tobacco for Holland, Germany, and the Baltick Sea, without being at the trouble of sailing round England or Scotland." *Macky's Journey through Scotland*, pp. 294, 295, 2nd edit. London, 1732. The first edition of this book was also printed in 1732. See *Watt's Bibliotheca Britannica*, vol. i. p. 631 m., Edin-

[* It appears to be here implied that there had been no linen manufacture in Scotland previously. In reality it had existed in the days of Bruce (Cochran-Patrick, *Mediæval Scotland*, 1892, p. 48), and probably earlier. In 1639 an Act of Parliament declares it to be "ane of the pryme commodities of this Kingdome, wherby many people are put to worke and money is brought within the same." (*Ibid.*) The trade continued to develop, and in 1700, John Corse, *of Glasgow*, is found petitioning for the privileges accorded to a linen manufactory. (*Id.* p. 51.)—Ed.]

employment to thousands of workmen.[118] It is also from the year 1725 that Paisley dates its rise. So late as the beginning of the eighteenth century this rich and prosperous city was still a straggling village, containing only a single street.[119] But after the Union its poor and hitherto idle inhabitants began to be moved by the activity which they saw on every side. Gradually their views expanded; and the introduction among them, in 1725, of the manufacture of thread, was the first step in that great career in which they never stopped, until they had raised Paisley to be a vast emporium of industry, and a successful promoter of every art by which industry is nurtured.[120]

Nor was it merely in the west that this movement was displayed. In Scotland generally the spirit of trade became so rife that it began to encroach on the old theological spirit, which had long been supreme. Hitherto the Scotch had cared for little except religious polemics. In every society these had been the chief subject of conversation; and on them men had wasted their energies, without the least benefit either to themselves or to others. But about this time it was observed that the improvement of manufactures became a common topic of discourse.[121] Such a statement, made by a well-informed writer, who witnessed what he relates, is a curious proof of the change which was beginning, though very faintly, to steal over the Scotch mind. It shows that there was at all events a tendency to turn aside from subjects which are inaccessible to our understanding, and the discussion of which has no effect except to exasperate those who dispute, and to make them more intolerant than ever of theological opinions different from their own. Unhappily there were, as I shall presently point out, other causes at work which prevented this tendency from producing all the good that might have been expected. Still, so far as it went, it was a clear gain. It was a blow to superstition, inasmuch as it was an attempt to occupy the human mind with mere secular considerations. In a country like Scotland, this alone was extremely important. We must also add that though it was the effect of increased industry, it, as often happens, reacted upon and strengthened its cause. For by diminishing, however little, the inordinate respect formerly paid to theological pursuits, it was in the same proportion an inducement to ambitious and enterprising men to abstain from those pursuits, and to engage in temporal matters, where ability, being less fettered by prejudice, has more scope,

burgh, 1824, 4to. [Macky seems to have been a careless writer. Alloway (Alloa) is on the wrong side of the Firth for Glasgow. Her natural and nearest eastern port was Grangemouth, which is more than twenty miles away in a straight line.—Ed.]

[118] Gibson, who was a Glasgow merchant, says in his *History of Glasgow*, p. 236, "that the commerce to America first suggested the idea of introducing manufactures into Glasgow, is to me very evident; and that they were only attempted to be introduced about the year 1725 is apparent." Denholm (*History of Glasgow*, p. 412) says: "The linen manufacture, which began here in the year 1725, was for a long time the staple, not only of this city, but of the west of Scotland." Compare *Heron's Journey through the Western Counties of Scotland*, Perth, 1799, vol. ii. p. 412.

[119] "Consisting only of one principal street about half a mile in length." *Sinclair's Statistical Account of Scotland*, vol. vii. p. 62. But the local historian mentions, with evident pride, that this one street contained "handsome houses." *Crawfurd's History of the Shire of Renfrew*, part iii. p. 305, edit. Paisley, 1782, 4to.

[120] *Denholm's History of Glasgow*, pp. 546, 547; and *Sinclair's Statistical Account of Scotland*, vol. vii. pp. 62–64. See also, on the rise of Paisley, *Heron's Journey through the Western Counties of Scotland*, vol. ii. pp. 399, 400; *Pennant's Tour in Scotland*, vol. ii. p. 144; and *Crawfurd's History of the Shire of Renfrew*, part iii. p. 321. At an earlier period, Paisley was famous in a different way. In the Middle Ages, it swarmed with monks. Keith (*Catalogue of Scotch Bishops*, p. 252, Edinburgh, 1755, 4to) tells us that, "it formerly was a Priory, and afterwards changed into an Abbey of Black Monks."

[121] The author of *The Interest of Scotland Considered*, Edinburgh, 1733, says (p. xvi.) that since 1727 "we have happily turned our eyes upon the improvement of our manufactures, which is now a common subject in discourse, and this contributes not a little to its success."

and enjoys more freedom of action. Of those men, some rose to the first rank in literature; while others, taking a different but equally useful turn, became as eminent in trade. Hence Scotland, during the eighteenth century, possessed for the first time two powerful and active classes whose aim was essentially secular; the intellectual class, and the industrial class. Before the eighteenth century neither of these classes exercised an independent sway, or could indeed be said to have a separate existence. The intellect of the country was absorbed by the church; the industry of the country was controlled by the nobles. The effect which this change produced on the literature of Scotland will be traced in the last chapter of the present volume. Its effect on industry was equally remarkable, and for the well-being of the nation was equally valuable. But it does not possess that general scientific interest which belongs to the intellectual movement; and I shall therefore, in addition to the evidence already given, confine myself to a few more facts illustrative of the history of Scotch industry down to the middle of the eighteenth century, by which time there was no longer any doubt that the flood of material prosperity had fairly set in.

During the seventeenth century the only Scotch manufacture of any importance was that of linen, which, however, like every other branch of industry, was very backward, and was exposed to all sorts of discouragement.[122] But after the Union it received a sudden impetus, from two causes. One of these causes, as I have already noticed, was the demand from America, consequent upon the trade of the Atlantic being thrown open. The other cause was the removal of the duty which England had imposed upon the importation of Scotch linen. These two circumstances, occurring nearly at the same time, produced such effect on the national industry, that De Foe, who had a wider knowledge of the details of trade than any man of that age, said that it seemed as if for the future the Scotch poor could never lack employment.[123] Unfortunately this was not the case, and never will be, until society is radically changed. But the movement which provoked so bold a remark from so cautious an observer as De Foe must have been very striking; and we know from other sources that between 1728 and 1738 the manufacture of linen for exportation alone was more than doubled.[124] After that period, this and other departments of Scotch industry advanced with a constantly accelerating speed. It is mentioned by a contemporary who was likely to be well informed, that between 1715 and 1745 the trade and manufactures of Scotland increased more than they had done for ages before.[125] Such a statement, though valuable as corroborating other

[122] Morer, who was in Scotland in 1688 and 1689, says, "But that which employs great part of their land is hemp, of which they have mighty burdens, and on which they bestow much care and pains to dress and prepare it for making their linen, the most noted and beneficial manufacture of the kingdom." *Morer's Short Account of Scotland*, London, 1702, pp. 3, 4.

[123] "The duties upon linen from Scotland being taken off in England, made so great a demand for Scots linen more than usual, that it seemed the poor could want no employment." *De Foe's History of the Union between England and Scotland*, p. 604. Compare *Macpherson's Annals of Commerce*, vol. ii. p. 736: "a prodigious vent, not only in England, but for the American plantations." This concerns a later period.

[124] "The surplus of linen made above the consumption was in 1728 2,183,978 yards; in 1738, 4,666,011." *Chalmers' Caledonia*, vol. i. p. 873. On the increase between 1728 and 1732, see the Table in *The Interest of Scotland Considered*, Edinburgh, 1733, p. 97. In a work published in 1732, it is stated that "they make a great deal of linnen all over the kingdom, not only for their own use, but export it to England, and to the Plantations. In short, the women are all kept employ'd, from the highest to the lowest of them." *Macky's Journey through Scotland*, London, 1732, p. 271. This refers merely to the women of Scotland, whom Macky represents as much more industrious than the men.

[125] In 1745 Craik writes to Lord Nithisdale, "The present family have now reigned over us these thirty years, and though during so long a time they may have fallen into errors, or may have committed faults, (as what Government is without?) yett I will defy the most sanguine zealot to find in history a period equal to this in which Scotland possessed

evidence, is too vague to be entirely relied on; and historians, who usually occupy themselves with insignificant details about courts and princes and statesmen, desert us in matters which are really important, so that it is now hardly possible to reconstruct the history of the Scotch people during this, the first epoch of their material prosperity. I have however gathered a few facts which appear to rest on good authority, and which supply us with something like precise information as to dates. In 1739 the manufacture of linen was introduced into Kilbarchan,[126] and, in 1740, into Arbroath.[127] From the year 1742 the manufactures of Kilmarnock date their rise.[128] In 1748 the first linen was manufactured in Cullen;[129] and in the same year in Inverary.[130] In 1749 this great branch of industry and source of wealth was established on a large scale in Aberdeen;[131] while about 1750 it began to diffuse itself in Wemyss, in the county of Fife.[132] These things happening within eleven years, in parts of the country so distant from each other, and so totally unconnected, indicate the existence of general causes which governed the whole movement; though in this as in all instances everything is popularly ascribed to the influence of a few powerful individuals. We have however other proofs that the progress was essentially national. Even in Edinburgh, where hitherto no claims had been respected except those of the nobles or clergy, the voice of this new trading interest began to be heard. In that poor and warlike capital a society was now first established for the encouragement of manufactures; and we are assured that this was but a single manifestation of the enthusiasm which was generally felt on the subject.[133] Coinciding with this movement, and indeed forming part of it, we can discern the earliest symptoms of a monied class, properly so called. In 1749 there was established at Aberdeen the first county bank ever seen in Scotland; and in the very same year a similar establishment was formed at Glasgow.[134] These represented the east and the west, and by the advances which

so uninterrupted a felicity, in which liberty, civil and religious, was so universally enjoyed by all people of whatever denomination—nay, by the open and avowed ennemys of the family and constitution, or a period in which all ranks of men have been so effectually secured in their property. Have not trade, manufactures, agriculture, and the spirit of industry in our country extended themselves further during this period and under this family than for ages before?" *Thomson's Memoirs of the Jacobites*, London, 1845, vol. ii. pp. 60, 61.

126 *Crawfurd's History of the Shire of Renfrew*, part ii. p. 114.

127 *Sinclair's Statistical Account of Scotland*, vol. vii. p. 341, compared with vol. xii. pp. 176, 177.

128 *Chalmers'* *Caledonia*, vol. iii. p. 483.

129 *Sinclair's Statistical Account of Scotland*, vol. xii. p. 145.

130 *Ibid.*, vol. v. p. 297.

131 *Kennedy's Annals of Aberdeen*, vol. ii. pp. 199, 200.

132 *Sinclair's Statistical Account of Scotland*, vol. xvi. p. 520: "About the year 1750." I need hardly say that some of these dates, depending upon tradition, are given by the authors approximatively.

133 "Betwixt the year 1750 and 1760, a great degree of patriotic enthusiasm arose in Scotland to encourage arts and manufactures; and the *Edinburgh Society* was established in 1755 for the express purpose of improving these." *Bower's History of the University of Edinburgh*, vol. iii. pp. 126, 7.

134 "The first country-bank that anywhere appeared was the Aberdeen Bank, which was settled in 1749: it was immediately followed by a similar establishment in Glasgow during the same year." *Chalmers'* *Caledonia*, vol. iii. p. 9, 4to, 1824. Kennedy (*Annals of Aberdeen*, 4to, 1818, vol. ii. p. 195) says: "Banking was originally projected in Aberdeen about the year 1752, by a few of the principal citizens who were engaged in commerce and manufactures. They commenced business upon a limited scale, in an office on the north side of the Castle Street, issued notes of hand, of five pounds and of twenty shillings sterling, and discounted bills and promissory notes, for the accommodation of the public." It is uncertain if Chalmers knew of this passage; but he was a more accurate writer than Kennedy, and I therefore prefer his authority. Besides, Kennedy vaguely says, "about the year 1752."

they were able to make, each assisted the trade of its own district. Between eastern and western Scotland the intercourse, as yet, was difficult and costly. But this likewise was about to be remedied by an enterprise the mere conception of which would formerly have excited ridicule. After the Union, the idea arose of uniting the east with the west by a canal, which should join the Forth to the Clyde. The plan was deemed chimerical, and was abandoned. As soon, however, as the manufacturing and commercial classes had gained sufficient influence they adopted it, with that energy which is characteristic of their order, and which is more common among them than among any other rank of society. The result was that in 1768 the great work was fairly begun ;[135] and the first step was taken towards what, in a material point of view, was an enterprise of vast importance, but in a social and intellectual point of view was of still superior value, inasmuch as, by supplying a cheap and easy transit through the heart of the most populous part of Scotland, it had a direct tendency to make different districts and different places feel that each had need of others, and thus encouraging the notion that all belonged to one common scheme, it assisted in diminishing local prejudice and assuaging local jealousy ; while in the same proportion, by enticing men to move out of the narrow circle in which they had habitually lived, it prepared them for a certain enlargement of mind, which is the natural consequence of seeing affairs under various aspects, and which is never found in any country in which the means of travelling are either very hazardous or very expensive.

Such was the state of Scotland towards the middle of the eighteenth century ; and surely a fairer prospect was never opened to any country. The land was at peace. It had nothing to fear, either from foreign invasion or from domestic tyranny. The arts which increase the comfort of man, and minister to his happiness, were sedulously cultivated ; wealth was being created with unexampled speed, and the blessings which follow in the train of wealth were being widely diffused ; while the insolence of the nobility was so effectually curbed that industrious citizens could for the first time feel their own independence, could know that what they earned, that likewise they should enjoy, and could hold themselves erect, and with a manly brow, in the presence of a class before whom they had long crouched in abject submission.

Besides this, a great literature now arose, a literature of rare and surpassing beauty.* To narrate the intellectual achievements of the Scotch during the eighteenth century, in a manner at all commensurate with their importance, would require a separate treatise, and I cannot now stop even to mention what all educated persons are at least partly acquainted with ; each student recognizing the value of what was done in his own pursuit. In the last chapter of this volume I shall however attempt to give some idea of the general results considered as a whole ; at present it is enough to say that in every branch of knowledge this once poor and ignorant people produced original and successful thinkers. What makes this the more remarkable is its complete contrast to their former state. Down even to the beginning of the eighteenth century Scotland could only boast of two authors whose works have benefited mankind. They were Buchanan and Napier. Buchanan was the first political writer who held accurate views respecting government, and who clearly defined the true relation between the people and their rulers. He placed popular rights on a solid basis, and vindicated by anticipation all subsequent revolutions. Napier, equally bold in another department, succeeded by a mighty effort of genius in detecting and pushing

[135] "After having been frequently proposed since the Union, this canal was at length begun in 1768, and finished in 1790. The trade upon it is already great, and is rapidly increasing." *Sinclair's Statistical Account of Scotland*, vol. ii. pp. 279, 280, Edinburgh, 1792. See also vol. xii. p. 125 ; *Irving's History of Dumbartonshire*, 1860, 4to, p. 247 ; and an interesting contemporary notice in *Nimmo's History of Stirlingshire*, Edinburgh, 1777, pp. 468–481. In 1767 Watt was employed as a surveyor. See *Muirhead's Life of Watt*, 2nd edit. London, 1859, p. 167.

[* Buckle here means, not *belles lettres*, but philosophic and scientific literature. —Ed.]

to its extreme consequence a law of the progression of numbers, which is so simple and yet so potent that it unravels the most tedious and intricate calculations, and, thus economizing the labours of the brain, has saved an enormous and incalculable waste. These two men were, indeed, great benefactors of their species ; but they stand alone, and if all the other authors Scotland produced down to the close of the seventeenth century had never been born, or if, being born, they had never written, society would have lost nothing, but would be in exactly the same position as it now is.*

Early, however, in the eighteenth century a movement was felt all over Europe, and in that movement Scotland participated. A spirit of inquiry was abroad, so general and so searching, that no country could entirely escape from its action. Sanguine men were excited, and even grave men were stirred. It seemed as if a long night were about to close. Light broke forth where before there was nothing but darkness. Opinions which had stood the test of ages were suddenly questioned ; and in every direction doubts sprung up, and proofs were demanded. The human mind, waxing bold, would not be satisfied with the old evidence. Things were examined at their foundation, and the basis of every belief was jealously scrutinized. For a time this was confined to the higher intellects ; but soon the movement spread, and in the most advanced countries worked upon nearly all classes. In England and in France the result was extremely beneficial. It might have been hoped that in Scotland likewise the popular mind would gradually have become enlightened. But not so. Time rolled on ; one generation succeeded another ; the eighteenth century passed away ; the nineteenth century came ; and still the people made no sign. The gloom of the Middle Ages was yet upon them. While all around was light, the Scotch, enveloped in mist, crept on, groping their way dismally and with fear. While other nations were shaking off their old superstitions, this singular people clung to theirs with undiminished tenacity.† Now, indeed, their grasp is gradually slackening, but with extreme slowness, and threatening reactions frequently appear. This, as it always has been and still is the curse of Scotland, so also is it the chief difficulty with which the historian of Scotland has to contend. Everywhere else, when the rise of the intellectual classes and that of the trading and manufacturing classes have accompanied each other, the invariable result has been a diminution of the power of the clergy, and consequently a diminution of the influence of superstition. The peculiarity of Scotland is that during the eighteenth century, and even down to the middle of the nineteenth century, the

[* This thesis is on the lines of that concerning French literature dealt with above, p. 289. It ignores the remarkable literary work of Dunbar and Sir David Lyndsay, the former the most powerful British poet between Chaucer and Shakspere, the latter the most remarkable dramatic writer of his age in Europe. Compare *A. W. Ward's History of English Dramatic Literature*, i. 70–71. If Buckle's proposition can hold good of these writers, it must equally hold good of all writers of *belles lettres* ; and his own admiration of Shakspere must be disallowed. On his own principles, further, he should have joined with the name of Buchanan that of Rutherford, whose *Lex Rex* (1644) had great influence in the civil war. And after all, in a later chapter (ch. xx., at note 3) Buckle recognizes poetry and drama as important aspects of literature, and among the measures of an age's civilization.—Ed.]

[† Buckle here exaggerates concerning Scotland as he has done concerning Spain. While the theological frost was certainly deeper and more lasting in Scotland than in England, it was not such as he represents. He ignores the significance of Burns ; and he never gives any definition of the term " popular " by which he can be tested. It could hardly be maintained that the *mass* of the population became enlightened either in England or in France in the eighteenth century. In Scotland, on the other hand, Hume and Smith must have had *some* readers in the middle classes. Buckle has not realized that in their time there was a " Moderate " party in the Kirk (represented by three historians, Robertson, Henry and Watson), much railed against by the zealots. For light on the intellectual life of the period see the *Autobiography of the Rev. Alexander Carlyle*, published in 1860. Hume had many friends among the younger clergy (Carlyle, pp. 271–2).—Ed.]

industrial and intellectual progress has continued without materially shaking the authority of the priesthood.[136] Strange and unequalled combination! The country of bold and enterprising merchants, of shrewd manufacturers, of far-seeing men of business, and of cunning artificers; the country, too, of such fearless thinkers as George Buchanan, David Hume, and Adam Smith, is awed by a few noisy and ignorant preachers, to whom it allows a license, and yields a submission, disgraceful to the age, and incompatible with the commonest notions of liberty. A people in many respects very advanced, and holding upon political subjects enlightened views, do upon all religious subjects display a littleness of mind, an illiberality of sentiment, a heat of temper, and a love of persecuting others, which shows that the Protestantism of which they boast has done them no good; that in the most important matters it has left them as narrow as it found them; and that it has been unable to free them from prejudices which make them the laughing-stock of Europe, and which have turned the very name of the Scotch Kirk into a by-word and a reproach among educated men.*

I shall now endeavour to explain how all this arose, and how such apparent inconsistencies are to be reconciled. That they may be reconciled, and that the inconsistencies are merely apparent and not real, will be at once admitted by whoever is capable of a scientific conception of history. For in the moral world as in the physical world, nothing is anomalous; nothing is unnatural; nothing is strange. All is order, symmetry, and law. There are opposites, but there are no contradictions. In the character of a nation, inconsistency is impossible.† Such, however, is still the backward condition of the human mind, and with so evil and jaundiced an eye do we approach the greatest problems, that not only common writers, but even men from whom better things might be hoped, are on this point involved in constant confusion, perplexing themselves and their readers by speaking of inconsistency as if it were a quality belonging to the subject which they investigate, instead of being, as it really is, a measure of their own ignorance. It is the business of the historian to remove this ignorance, by showing that the movements of nations are perfectly regular, and that, like all other movements, they are solely determined by their antecedents. If he cannot do this, he is no historian. He may be an annalist, or a biographer, or a chronicler, but higher than that he cannot rise, unless he is imbued with that spirit of science which teaches as an article of faith the doctrine of uniform sequence; in other words, the doctrine that certain events having already happened, certain other events corresponding to them will also happen. To seize this idea with firmness, and to apply it on all occasions without listening to any exceptions, is extremely difficult, but it must be done by whoever wishes to elevate the study of history from its present crude and informal state, and do what he may towards placing it in its proper rank, as the head and chief of all the sciences. Even then he cannot perform his task unless his materials are ample, and derived from sources of

[136] I will quote, in a single passage, the opinions of an eminent German and of an eminent Scotchman. "Dr. Spurzheim, when he last visited Scotland, remarked that the Scotch appeared to him to be the most priest-ridden nation in Europe; Spain and Portugal not excepted. *After having seen other countries, I can understand the force of this observation.*" *Notes on the United States of North America by George Combe*, vol. iii. p. 32, Edinburgh, 1841. [Adam Smith had said virtually the same thing (*Wealth of Nations*, B. v. ch. i. Art. 3, near end). But he explained how the Scotch clergy had *won* the assent of their flocks.—ED.]

[* It is to be feared that England has not been exempt from European criticism in these matters. Alexander von Humboldt described it as the "priest-ridden kingdom of the leopards," and many Germans have agreed with him.—ED.]

[† These formulas simply reduce to insignificance the terms "anomaly" and "inconsistency." If "nothing is anomalous," what does "anomalous" mean? The following remarks on "inconsistency" amount to a mere verbal confusion, assuming as they do that "inconsistent" = "uncaused." It is of course a predication of *logical* inconsequence, not of inconsequence in events.—ED.]

unquestioned credibility. But if his facts are sufficiently numerous ; if they are very diversified ; if they have been collected from such various quarters that they can check and confront each other, so as to do away with all suspicion of their testimony being garbled ; and if he who uses them possesses that faculty of generalization without which nothing great can be achieved, he will hardly fail in bringing some part of his labours to a prosperous issue, provided he devotes all his strength to that one enterprise, postponing to it every other object of ambition, and sacrificing to it many interests which men hold dear. Some of the most pleasurable incentives to action he must disregard. Not for him are those rewards which, in other pursuits, the same energy would have earned ; not for him the sweets of popular applause ; not for him the luxury of power ; not for him a share in the councils of his country ; not for him a conspicuous and honoured place before the public eye. Albeit conscious of what he could do, he may not compete in the great contest ; he cannot hope to win the prize ; he cannot even enjoy the excitement of the struggle. To him the arena is closed. His recompense lies within himself, and he must learn to care little for the sympathy of his fellow-creatures, or for such honours as they are able to bestow. So far from looking for these things, he should rather be prepared for that obloquy which always awaits those who, by opening up new veins of thought, disturb the prejudices of their contemporaries. While ignorance, and worse than ignorance, is imputed to him, while his motives are misrepresented and his integrity impeached, while he is accused of denying the value of moral principles, and of attacking the foundation of all religion, as if he were some public enemy, who made it his business to corrupt society, and whose delight it was to see what evil he could do ; while these charges are brought forward, and repeated from mouth to mouth, he must be capable of pursuing in silence the even tenor of his way, without swerving, without pausing, and without stepping from his path to notice the angry outcries which he cannot but hear, and which he is more than human if he does not long to rebuke. These are the qualities, and these the high resolves, indispensable to him who, on the most important of all subjects, believe ing that the old road is worn out and useless, seeks to strike out a new one for himself, and in the effort not only perhaps exhausts his strength, but is sure to incur the enmity of those who are bent on maintaining the ancient scheme unimpaired. To solve the great problem of affairs ; to detect those hidden circumstances which determine the march and destiny of nations ; and to find, in the events of the past, a key to the proceedings of the future, is nothing less than to unite into a single science all the laws of the moral and physical world. Whoever does this will build up afresh the fabric of our knowledge, rearrange its various parts, and harmonize its apparent discrepancies. Perchance the human mind is hardly ready for so vast an enterprise. At all events, he who undertakes it will meet with little sympathy, and will find few to help him. And let him toil as he may, the sun and noontide of his life shall pass by, the evening of his days shall overtake him, and he himself have to quit the scene, leaving that unfinished which he had vainly hoped to complete. He may lay the foundation ; it will be for his successors to raise the edifice. Their hands will give the last touch ; they will reap the glory ; their names will be remembered when his is forgotten. It is indeed too true that such a work requires not only several minds, but also the successive experience of several generations. Once, I own, I thought otherwise. Once, when I first caught sight of the whole field of knowledge, and seemed, however dimly, to discern its various parts and the relation they bore to each other, I was so entranced with its surpassing beauty that the judgment was beguiled, and I deemed myself able not only to cover the surface, but also to master the details. Little did I know how the horizon enlarges as well as recedes, and how vainly we grasp at the fleeting forms, which melt away and elude us in the distance. Of all that I had hoped to do, I now find but too surely how small a part I shall accomplish. In those early aspirations there was much that was fanciful ; perhaps there was much that was foolish. Perhaps, too, they contained a moral defect, and savoured of an arrogance which belongs to a strength that refuses to recognize its own weakness. Still, even now that they are defeated and brought to nought, I cannot repent having indulged in them, but on the

contrary I would willingly recall them if I could. For such hopes belong to that joyous and sanguine period of life when alone we are really happy; when the emotions are more active than the judgment; when experience has not yet hardened our nature; when the affections are not yet blighted and nipped to the core; and when the bitterness of disappointment not having yet been felt, difficulties are unheeded, obstacles are unseen, ambition is a pleasure instead of a pang, and the blood coursing swiftly through the veins, the pulse beats high, while the heart throbs at the prospect of the future. Those are glorious days; but they go from us, and nothing can compensate their absence. To me they now seem more like the visions of a disordered fancy than the sober realities of things that were, and are not. It is painful to make this confession; but I owe it to the reader, because I would not have him to suppose that either in this or in the future volumes of my History I shall be able to redeem my pledge, and to perform all that I promised. Something I hope to achieve which will interest the thinkers of this age; and something, perhaps, on which posterity may build. It will, however, only be a fragment of my original design. In the two last chapters I have attempted, and in the two next chapters I shall still further attempt, to solve a curious problem in the history of Scotland which is intimately connected with other problems of a yet graver import: but though the solution will, I believe, be complete, the evidence of the solution will most assuredly be imperfect. I regret to add that such imperfection is henceforth an essential part of my plan. It is essential, because I despair of supplying those deficiencies in my knowledge of which I grow more sensible in proportion as my views become more extensive. It is also essential because, after a fair estimate of my own strength, of the probable duration of my life, and of the limits to which industry can safely be pushed, I have been driven to the conclusion that this Introduction, which I had projected as a solid foundation on which the history of England might subsequently be raised, must either be greatly curtailed and consequently shorn of its force, or that, if not curtailed, there will hardly be a chance of my being able to narrate, with the amplitude and fulness of detail which they richly deserve, the deeds of that great and splendid nation with which I am best acquainted, and of which it is my pride to count myself a member. It is with the free, the noble, and the high-minded English people that my sympathies are most closely connected; on them my affections naturally centre; from their literature, and from their example, my best lessons have been learnt; and it is now the most cherished and the most sacred desire of my heart that I may succeed in writing their history, and in unfolding the successive phases of their mighty career, while I am yet somewhat equal to the task, and before my faculties have begun to dwindle or the power of continuous attention has begun to decay.*

[* The pathetic stress of emotion here tells sufficiently of the breaking down of the historian's health, and explains the overstrained character of much of the writing in these chapters.—Ed.]

CHAPTER XIX

An Examination of the Scotch Intellect during the Seventeenth Century

The remaining part of this volume I purpose to devote to an attempt to unravel still further that two-fold paradox which forms the prominent peculiarity of the history of Scotland. The paradox consists, as we have seen, in the fact, first, that the same people have long been liberal in politics, and illiberal in religion * ; and, secondly, that the brilliant, inquisitive, and sceptical literature which they produced in the eighteenth century was unable to weaken their superstition, or to instil into them wiser and larger maxims on religious matters. From an early period there were, as I have endeavoured to show, many circumstances which predisposed the Scotch to superstition, and, so far, had a general connexion with the subject before us. But the remarkable phenomenon with which we are immediately concerned may, I think, be traced to two distinct causes. The first cause was that for a hundred and twenty years after the establishment of Protestanism the rulers of Scotland either neglected the Church or persecuted it, thereby driving the clergy into the arms of the people, from whom alone they could obtain sympathy and support. Hence an alliance between the two parties more intimate than would otherwise have been possible ; and hence, too, the rise of that democratic spirit which was the necessary consequence of such an union, and which the clergy encouraged, because they were opposed and thwarted by the upper classes. So far the result was extremely beneficial, as it produced a love of independence and a hatred of tyranny which, twice during the seventeenth century, saved the country from the yoke of a cruel despotism.† But these very circumstances, which guarded the people against political despotism, exposed them all the more to ecclesiastical despotism. For having no one to trust except their preachers, they trusted them entirely, and upon all subjects. The clergy gradually became supreme, not only in spiritual matters but also in temporal ones. Late in the sixteenth century, they had been glad to take refuge among the people ; before the middle of the seventeenth century they ruled the people. How shamefully they abused their power, and how, by encouraging the worst kind of superstition, they prolonged the reign of ignorance, and stopped the march of society, will be related in the course of this chapter ; but in fairness to them we ought to acknowledge that the religious servitude into which the Scotch fell during the seventeenth century was on the whole a willing one, and that, mischievous as it was, it had at least a noble origin, inasmuch as the influence of the Protestant clergy is mainly to be ascribed to the fearlessness with which they came forward as leaders of the people, at a period when that post was full of danger, and when the upper classes

[* The antithesis here set up is rather verbal than factual. In the sense in which the Scots were illiberal in religion, they were illiberal in politics, inasmuch as they were politically intolerant of other worships. Liberality is a matter of mental attitude, and if it exists in regard to politics it must react on religion. Scottish politics early became *demotic* on the ecclesiastical side; but the Scots were not on that score "liberal," any more than an early Teutonic tribe.—Ed.]

[† See above, pp. 370, 695, 705, editorial notes.—Ed.]

were ready to unite with the crown in destroying the last vestiges of national liberty.

To trace the operation of this cause of Scotch superstition will be the business of the present chapter; while in the next and concluding chapter I shall examine the other cause, which I have as yet hardly mentioned. This latter inquiry will involve some considerations respecting the philosophy of method, still imperfectly appreciated among us, and on which the history of the Scotch mind will throw considerable light. For it will appear that during the eighteenth century the ablest Scotchmen, with hardly an exception, adopted a method of investigating truth which cut them off from the sympathies of their countrymen, and prevented their works from producing the effect which they might otherwise have done. The result was that though a very sceptical literature was produced, scepticism made no progress, and therefore superstition was undiminished. The highly-educated minds, indeed, were affected; but they formed a class apart, and there were no means of communication between them and the people. That this was owing to the method which literary men employed I hope to prove in the next chapter: and if I succeed in doing so, it will be evident that I have been guilty of no exaggeration in terming this the second great cause of the prolongation of Scotch superstition, since it was sufficiently powerful to prevent the intellectual classes from exercising their natural functions as the disturbers of old opinions.

We have already seen that almost immediately after the Reformation ill-feeling arose between the upper classes and the spiritual leaders of the Protestant church, and that this ill-feeling increased until, in 1580, it vented itself by the abolition of episcopacy. This bold and decisive measure made the breach irreparable. The preachers had now committed themselves too far to recede, even if they had desired to do so; and from that moment, uniting themselves heartily with the people, they took up a position which they have never since abandoned. During the remaining twenty-three years that James was in Scotland they were occupied in exciting the people against their rulers; and as they became more democratic, so did the crown and nobles grow more hostile, and display, for the first time, a disposition to combine together in defence of their common interests. In 1603 James ascended the throne of England, and the struggle began in earnest. It lasted, with few interruptions, eighty-five years, and during its continuance the Presbyterian clergy never wavered; they were always steady to the good cause; always on the side of the people. This greatly increased their influence; and what favoured it still more was that, besides being the champions of popular liberty, they were also the champions of national independence. When James I. and the two Charleses attempted to force episcopacy upon Scotland, the Scotch rejected it, not only because they hated the institution but also because they looked on it as the mark of a foreign domination, which they were determined to resist. Their nearest and most dangerous enemy was England; and they spurned the idea of receiving bishops who must in the first instance be consecrated in London, and who, it was certain, would never have been admitted into Scotland unless England had been the stronger country. It was therefore on patriotic as well as religious grounds that the Scotch clergy during the seventeenth century struggled against episcopacy;[1] and when they overthrew it, in 1638, their bold

[1] In 1638, one of the most eminent of the Scotch clergy writes: "Our maine feare" is "to have our religion lost, our throats cutted, our poore countrey made ane English province, to be disposed upon for ever hereafter at the will of a Bishope of Canterburie." *Baillie's Letters and Journals*, vol. i. p. 66. Compare p. 450. "This kirk is a free and independant kirk, no less then the kingdom is a free and independant kingdom; and as our own Patriots can best judge what is for the good of the kingdom, so our own Pastors should be most able to judge what form of worship beseemeth our Reformation, and what serveth most for the good of the People." Two generations later, one of the most popular arguments against the Union was that it might enable the English to force episcopacy upon Scotland. See *De Foe's History of the Union between England and Scotland*, pp. 222, 284, 359. "The danger of the Church of Scotland from the suffrages of English bishops," &c.

and determined conduct associated in the popular mind the love of country with the love of the church. Subsequent events strengthened this association.[2] In 1650 Cromwell invaded Scotland, overthrew the Scotch in the battle of Dunbar, and intrusted to Monk the task of curbing their spirit, by building fortresses, and establishing a long chain of military posts.[3] The nation, cowed and broken, gave way, and, for the first time for three centuries, felt the pressure of a foreign yoke. The clergy alone remained firm.[4] Cromwell, who knew that they were the chief obstacle to completing his conquest, hated them, and did everything he could to ruin them.[5] But their power was too deeply seated to be shaken. From their pulpits they continued to influence and animate the people. In face of the invaders, and in spite of them, the Scotch church continued to hold its General Assemblies, until the summer of 1653. Then indeed they had to yield to brute force ; and the people, to their unutterable grief, beheld the venerated representatives of the Scotch kirk driven from their place of meeting by English soldiers, and led like criminals through the streets of Edinburgh.[6]

[2] The hatred which the Scotch naturally felt against the English for having inflicted so much suffering upon them, was intense about the middle of the seventeenth century, notwithstanding the temporary union of the two nations against Charles. In 1652 "the criminal record is full of cases of murder of English soldiers. They were cut off by the people whenever a fitting opportunity occurred, and were as much detested in Scotland as the French soldiers were in Spain during the Peninsular war." *The Spottiswoode Miscellany*, vol. ii. p. 98, Edinburgh, 1845. See also p. 167 : "A nationall quarrell, and not for the Stuarts."

[3] *Browne's History of the Highlands*, vol. ii. pp. 75–77 : "The English army was augmented to twenty thousand men, and citadels erected in several towns, and a long chain of military stations drawn across the country to curb the inhabitants."

[4] Clarendon, under the year 1655, says, "Though Scotland was vanquished, and subdued to that degree that there was no place nor person who made the least show of opposing Cromwell ; who, by the administration of Monk, made the yoke very grievous to the whole nation ; yet the preachers kept their pulpit license ; and, more for the affront that was offered to Presbytery than the conscience of what was due to majesty, many of them presumed to pray for the king ; and generally, though secretly, exasperated the minds of the people against the present government." *Clarendon's History of the Rebellion*, p. 803.

[5] And, what they must have felt very acutely, he would not go to hear them preach. A writer of that time informs us that, even in 1648, when Cromwell was in Edinburgh, "he went not to their churches ; but it is constantlie reported that ewerie day he had sermons in his oune ludginge, himself being the preacher, whensoewer the spirit came upon him ; which took him lyk the fitts of an ague, somtyms twise, sometyms thryse in a day." *Gordon's Britane's Distemper*, p. 212. In 1650, according to another contemporary, "he made stables of all the churches for hes horsses quhersoeuer he came, and burned all the seatts and pewes in them ; riffled the ministers' housses, and distrayed ther cornes." *Balfour's Annales of Scotland*, vol. iv. p. 88. The clergy, on the other hand, employing a resource with which their profession has always been familiar, represented Cromwell as opposing Providence, because he was opposing them. Rutherford (*Religious Letters*, reprinted Glasgow, 1824, p. 346) says that he fought "against the Lord's secret ones ; " and Row (*Continuation of Blair's Autobiography*, p. 335), under the year 1658, triumphantly observes : "In the beginning of September this year, the Protector, that old fox, died. It was observed, as a remarkable cast of divine providence, that he died upon the 3d of September, which he, glorying of routing of our armies at Dunbar and Worcester on that day, used to call *his day*. On that same very day the Just Judge called him to an account," &c.

[6] See contemporary notices of this, in *Nicoll's Diary*, p. 110 ; and in *The Diary of Mr. John Lamont of Newton*, pp. 56, 57. But the best account is that given by Baillie, in a letter to Calamy, dated Glasgow, 27th July, 1653. He writes : "That on the 20th of July last, when our Generall Assemblie wes sett in the ordinarie tyme and place, Lieutenant-Colonell Cotterall besett the church with some rattes of musqueteir and a troup of horse ; himself (after our fast, wherein Mr. Dickson and Mr. Dowglas had two gracious sermons)

Thus it was that in Scotland, after the latter part of the sixteenth century, everything tended to increase the reputation of the clergy, by raising them to the foremost rank among the defenders of their country. And it was but natural that the spiritual classes, finding themselves in the ascendant, should conduct the contest according to views habitual to their profession; and should be anxious for religious advantages rather than for temporal benefits. The war which the Scotch waged against Charles I. partook more of the character of a crusade than any war ever carried on by a Protestant nation.[7] The main object was to raise up presbyters, and to destroy bishops. Prelacy was the accursed thing, and that must be rooted out at every hazard. To this all other considerations were subordinate.[8] The Scotch loved liberty, and hated England. Yet even these two passions, notwithstanding their strength, were as nothing in comparison with their intense desire to extend and to propagate, if need be at the

entered the Assemblie-house, and, immediately after Mr. Dickson the Moderator his prayer, required audience; wherein he inquired, If we did sitt there by the authority of the Parliament of the Commonwealth of England? or of the Commanders-in-chiefe of the English forces? or of the English Judges in Scotland? The Moderator replyed, That we were ane Ecclesiasticall synod, ane Spirituall court of Jesus Christ, which medled not with any thing Civile; that our authoritie wes from God, and established by the lawes of the land yet standing unrepealed; that, by the Solemn League and Covenant, the most of the English army stood obliedged to defend our Generall Assemblie. When some speeches of this kind had passed, the Lieutenant-Colonell told us, his order was to dissolve us; whereupon he commanded all of us to follow him, else he would drag us out of the rowme. When we had entered a Protestation of this unheard-of and unexampled violence, we did ryse and follow him; he ledd us all through the whole streets a myle out of the towne, encompassing us with foot-companies of musqueteirs, and horsemen without; all the people gazing and mourning as at the saddest spectacle they had ever seen. When he had ledd us a myle without the towne, he then declared what further he had in commission. That we should not dare to meet any more above three in number; and that against eight o'clock to-morrow, we should depart the towne, under paine of being guiltie of breaking the publick peace: And the day following, by sound of trumpet, we were commanded off towne under the paine of present imprisonment. Thus our Generall Assemblie, the glory and strength of our Church upon earth, is, by your souldiarie, crushed and trod under foot, without the least provocatione from us, at this time, either in word or deed." *Baillie's Letters and Journals*, vol. iii. pp. 225, 226.

[7] In August, 1640, the army marched into England; and "it was very refreshfull to remark, that after we came to ane quarter at night, there was nothing almost to be heard throughout the whole army but singing of psalms, prayer, and reading of Scripture by the souldiers in their severall hutts." *Select Biographies*, edited by Mr. Tweedie for the Wodrow Society, vol. i. p. 163. "The most zealous among them boasted, they should carry the triumphant banners of the covenant to Rome itself." *Arnot's History of Edinburgh*, p. 124. In 1644 the celebrated divine, Andrew Cant, was appointed by the Commissioners of the General Assembly "to preach at the opening of the Parliament, wherein he satisfied their expectation fully. For the main point he drove at in his sermon, was to state an opposition betwixt King Charles and King Jesus (as he was pleased to speak), and upon that account to press resistance to King Charles for the interest of King Jesus. It may be wondered that such doctrine should have relish'd with men brought up in the knowledge of the Scriptures; and yet, such was the madness of the times, that none who preach'd in public since the beginning of the Troubles had been so cried up as he was for that sermon." *Guthry's Memoirs*, pp. 136, 137.

[8] "The rooting out of prelacy and the wicked hierarchy therein so obviously described, is the main duty." *Naphtali, or the Wrestlings of the Church of Scotland* pp. 53, 54. This refers to the Covenant of 1643. So, too, the continuator of *Row's History of the Kirk*, p. 521, says, under the year 1639, that the object of the war was, "to withstand the prelaticall faction and malignant, countenanced by the kinge in his owne persone." Compare the outbreak of the Reverend Samuel Rutherford against "the accursed and wretched prelates, the Antichrist's first-born, and the first fruit of his foul womb." *Rutherford's Religious Letters*, p. 179.

point of the sword, their own Presbyterian polity. This was their first and paramount duty. They fought indeed for freedom, but above all they fought for religion. In their eyes Charles was the idolatrous head of an idolatrous church, and that church they were resolved to destroy. They felt that their cause was holy, and they went forth full of confidence, convinced that the sword of Gideon was drawn on their side, and that their enemies would be delivered up to them.

The rebellion therefore against Charles, which on the part of the English was essentially secular,[9] was on the part of the Scotch essentially religious.* This was because with us the laymen were stronger than the clergy; while with them the clergy were stronger than the laymen. In 1643, both nations having united against the king, it was thought advisable that an intimate alliance should be concluded; but in the negotiations which followed it is noticed by a contemporary observer that though the English merely wished for a civil league, the Scotch demanded a religious covenant.[10] And as they would only continue the war on condition that this was granted, the English were obliged to give way. The result was the Solemn League and Covenant, by which what seemed a cordial union was effected between the two countries.[11] Such a compact was however sure to be short-lived, as each party had different objects; the aim of the English being political, while that of the Scotch was religious. The consequences of this difference were soon apparent. In January, 1645, negotiations having been opened with the king, commissioners met at Uxbridge, with the view of concluding a peace. The attempt failed, as might have been expected, seeing that not only were the pretensions of the king irreconcilable with those of his opponents, but that the pretensions of his opponents were irreconcilable with each other. At Uxbridge, during the conferences, the Scotch expressed their readiness to concede to him what he required, if he would gratify them in regard to the Church; while the English, occupying themselves with civil and political questions, cared less, says Clarendon, for what concerned the Church than for anything else.[12] A better illustration could hardly be found

[9] Our civil war was not religious; but was a struggle between the Crown and the Parliament. See note above, pp. 203–4. [The antithesis here is only formal. Cromwell himself declared that "religion was not the thing at first contested for, but God brought it to that issue at last." As a high modern authority puts it: "From the very beginning, men who were determined to maintain the Church intact adopted the king's cause, and those who desired to change the government in the Church, or sought freedom outside of it, supported the Parliament" (Firth, *Oliver Cromwell*, 1900, pp. 72–73).—Ed.]

[10] In September, 1643, Baillie, writing an account of the proceedings of the Westminster Assembly in the preceding month, says, "In our committees also we had hard enough debates. The English were for a civill League, we for a religious Covenant." Letter to Mr. William Spang, dated 22nd September, 1643, in *Baillie's Letters and Journals*, vol. ii. p. 90.

[11] "The Solemn League and Covenant," which "is memorable as the first approach towards an intimate union between the kingdoms; but, according to the intolerant principles of the age, a federal alliance was constructed on the frail and narrow basis of religious communion." *Laing's History of Scotland*, vol. iii. pp. 258, 259. The passage, however, which I have quoted in the last note from Baillie, shows that England was not responsible for the intolerant principles, or, consequently, for the narrow basis.

[12] The Chancellor of Scotland "did as good as conclude 'that if the king would satisfy them in the business of the Church, they would not concern themselves in any of the other demands.'" . . . "And it was manifest enough, by the private conferences with other of the commissioners, that the parliament took none of the points in controversy less to heart, or were less united in, than in what concerned the Church." *Clarendon's History of the Rebellion*, edit. Oxford, 1843, p. 522. See also p. 527: "that the Scots

[* As has been above shown (p. 370), the disaffection of the Scotch really originated in the king's policy of recovering the tithes—a strictly economic and political motive.—Ed.]

of the secular character of the English rebellion, as compared with the spiritual character of the Scotch rebellion. Indeed the Scotch, so far from concealing this, boasted of it, and evidently thought that it proved how superior they were to their worldly-minded neighbours. In February, 1645, the General Assembly issued an address to the nation, including not only those who were at home, but also those who served in armies out of Scotland. In this document, which, proceeding from such a quarter, necessarily exercised great influence, political considerations, as having to do merely with the temporal happiness of men, are treated as insignificant and almost despicable. That Rupert was defeated, and that York and Newcastle were taken, were but trifling matters. They were only the means of accomplishing an end, and that end was the reformation of religion in England, and the establishment there of the pure Presbyterian polity.[13]

A war undertaken with such holy objects, and conceived in so elevated a spirit, was supposed to be placed under the immediate protection of the Deity, on whose behalf it was carried on. In the language of the time, it was a war for God, and for God's church. Every victory that was obtained was the result not of the skill of the general, nor of the valour of the troops, but was an answer to prayer.[14] When a battle was lost, it was either because God was vexed at the sins of the people,[15] or else to show them that they must not trust to the

would insist upon the whole government of the Church, and in all other matters would defer to the king."

[13] See this extraordinary document in *Acts of the General Assembly of the Church of Scotland from 1638 to 1842*, pp. 122–128, Edinburgh, 1843. It is entitled "A solemne and seasonable warning to the noblemen, barons, gentlemen, burrows, ministers, and commons of Scotland; as also to armies without and within this kingdom." In it (p. 123) occurs the following passage: "And for our part, our forces sent into that kingdom, in pursuance of that Covenant, have been so mercifully and manifestly assisted and blessed from heaven (though in the mids of many dangers and distresses, and much want and hardship), and have been so farre instrumentall to the foyling and scattering of two principall armies; first, the Marquesse of Newcastle his army; and afterward Prince Rupert's and his together; and to the reducing of two strong cities, York and Newcastle, that we have what to answer the enemy that reproacheth us concerning that businesse, and that which may make iniquitie it self to stop her mouth. But which *is more unto us than all victories or whatsomever temporall blessing*, the reformation of religion in England, and uniformity therein between both kingdoms (a principal end of that Covenant), is so far advanced, that the English Service-Book with the Holy-Dayes and many other ceremonies contained in it, together with the Prelacy, the fountain of all these, are abolished and taken away by ordinance of parliament, and a directory for the worship of God in all the three kingdoms agreed upon in the Assemblies, and in the Parliaments of both kingdoms, without a contrary voice in either; the government of the kirk by congregational elderships, classical presbyteries, provincial and national assemblies, is agreed upon by the Assembly of Divines at Westminster, which is also voted and concluded in both Houses of the Parliament of England."

[14] In 1644 "God ansuered our Wednesday's prayers: Balfour and Waller had gotten a glorious victorie over Forth and Hopton, and routed them totallie, horse and foot." *Baillie's Letters and Journals*, vol. ii. p. 155. In the same year, thanksgivings being offered at Aberdeen for the victory of Leslie over Rupert, "oure minister Mr. William Strathauchin declairit out of pulpit that this victory wes miraculous, wrocht by the fynger of God." *Spalding's History of the Troubles*, vol. ii. p. 254. In 1648 the Commissioners of the General Assembly, in an address to the Prince of Wales, stated that the Deity had been "fighting for his people;" meaning by his people, the Scotch people. They added that the fact of their enemies having been repulsed was a proof of "how sore the Lord hath been displeased with their way." *Clarendon State Papers*, vol. ii. p. 424, Oxford, 1773, folio.

[15] Two Scotch notices are now before me of the fatal battle of Dunbar. According to one, the defeat was intended to testify against "the great sin and wickedness" of the people. *Naphtali, or the Wrestlings of the Church of Scotland*, p. 75. According to the

arms of the flesh.[16] Nothing was natural; all was supernatural. The entire course of affairs was governed not by their own antecedents, but by a series of miracles. To assist the Scotch, winds were changed, and storms were lulled. Such intelligence as was important for them to receive was often brought by sea; and on those occasions it was expected that, if the wind were unfavourable, Providence would interfere, would shift it from one quarter to another, and, when the news had safely arrived, would allow it to return to its former direction.[17]

It was in this way that, in Scotland, everything conspired to strengthen that religious element which the force of circumstances had at an early period made prominent, and which now threatened to absorb all the other elements of the national character. The clergy were supreme; and habits of mind natural and becoming to themselves were diffused among all classes. The theories of a single profession outweighed those of all other professions; and not only war, but also trade, literature, science, and art, were held of no account unless they ministered to the general feeling. A state of society so narrow and so one-sided has never been seen in any other country equally civilized. Nor did there appear much chance of abating this strange monopoly. As the seventeenth century advanced the same train of events was continued; the clergy and the people always making common cause against the crown, and being, by the necessity of self-preservation, forced into the most intimate union with each other. Of this the preachers availed themselves to strengthen their own influence; and for upwards of a century their exertions stopped all intellectual culture, discouraged all independent inquiry, made men in religious matters fearful and austere, and coloured the whole national character with that dark hue, which, though now gradually softening, it still retains.

other, it was owing to the anger of the Deity at the Scotch showing any favour to the partizans of Charles. For, says the Reverend Alexander Shields, "both at that time and since that time, the Lord never countenanced an expedition where that malignant interest was taken in unto the state of the quarrel. Upon this, our land was invaded by Oliver Cromwell, who defeat our army at Dunbar, where the anger of the Lord was evidently seen to smoke against us, for espousing that interest." *Shields' Hind Let Loose*, p. 75. These opinions were formed after the battle. Before the battle, a different hypothesis was broached. Sir Edward Walker, who was in Scotland at the time, tells us that the clergy assured the people that "they had an army of saints, and that they could not be beaten." *Journal of Affairs in Scotland in 1650*, in *Walker's Historical Discourses*, London, 1705, folio, p. 165.

[16] "Each new victory of Montrose was expressly attributed to the admonitory 'indignation of the Lord' against his chosen people for their sin, in 'trusting too much to the arm of flesh.'" *Napier's Life of Montrose*, Edinburgh, 1840, p. 283. Compare *Guthrie's Considerations contributing unto the Discovery of the Dangers that threaten Religion*, pp. 274, 275, reprinted Edinburgh, 1846. Guthrie was at the height of his reputation in the middle of the seventeenth century. Lord Somerville says of the Scotch, when they were making war against Charles I., that it was "ordinary for them, dureing the wholl tyme of this warre, to attribute ther great successe to the goodnesse and justice of their cause, untill Divyne Justice trysted them with some crosse dispensatione, and then you might have heard this language from them, that it pleased the Lord to give his oune the heavyest end of the tree to bear, that the saints and people of God must still be sufferers while they are here away; that that malignant party was God's rod to punish them for their unthankfullnesse," etc. *Somerville's Memorie of the Somervilles*, vol. ii. pp. 351, 352. [Buckle appears to forget that Cromwell habitually spoke of his victories as divine dispensations; and that a *Te Deum* is still the recognized ritual after a military success.—Ed.]

[17] Baillie mentions, in 1644, an instance of these expectations being fulfilled. He says (*Letters and Journals*, vol. ii. p. 138), "These things were brought in at a very important nick of time, by God's gracious providence: Never a more quick passage from Holy Island to Yarmouth in thirtie houres; they had not cast anchor halfe an houre till the wind turned contrare." Compare p. 142: "If this were past, we look for a new lyfe and vigoure in all affaires, especiallie if it please God to send a sweet north-wind, carrying the certain news of the taking of Newcastle, which we dailie expect."

The Scotch, during the seventeenth century, instead of cultivating the arts of life, improving their minds, or adding to their wealth, passed the greater part of their time in what were called religious exercises. The sermons were so long and so frequent that they absorbed all leisure, and yet the people were never weary of hearing them. When a preacher was once in the pulpit, the only limit to his loquacity was his strength. Being sure of a patient and reverential audience, he went on as long as he could. If he discoursed for two hours without intermission, he was valued as a zealous pastor, who had the good of his flock at heart; and this was about as much as an ordinary clergyman could perform, because, in uttering his sentiments, he was expected to display great vehemence, and to evince his earnestness by toiling and sweating abundantly.[18] This boundary was, however, often passed by those who were equal to the labour; and Forbes, who was vigorous as well as voluble, thought nothing of preaching for five or six hours.[19] But in the ordinary course of nature such feats were rare; and as the people were in these matters extremely eager, an ingenious contrivance was hit upon whereby their desires might be satisfied. On great occasions several clergymen were present in the same church, in order that, when one was fatigued, he might leave the pulpit, and be succeeded by another, who, in his turn, was followed by a third; the patience of the hearers being apparently inexhaustible.[20] Indeed, the Scotch, by the middle of the seventeenth century, had grown accustomed to look up to their minister as if he were a god, and to dwell with rapture upon every word that dropped from his lips. To hear a favourite preacher they would incur any fatigue, and would undertake long journeys without sleep or food.[21] Their power of attention was marvellous.

[18] No one, perhaps, carried this further than John Menzies, the celebrated professor of divinity at Aberdeen. "Such was his uncommon fervour in the pulpit, that, we are informed, he 'used to change his shirt always after preaching, and to wet two or three napkins with tears every sermon.'" Note in *Wodrow's Correspondence*, vol. ii. p. 222. James Forbes, also, was "an able and zealous preacher, who after every sermon behooved to change his shirt, he spoke with such vehemency and sweating." *Select Biographies*, published by the Wodrow Society, vol. i. p. 333. Lord Somerville, who wrote in 1679, mentions "their thundering preachings." *Memorie of the Somervilles*, vol. ii. p. 388. A traditionary anecdote, related by the Dean of Edinburgh, refers to a later period, but is characteristic of the class. "Another description I have heard of an energetic preacher more forcible than delicate—'Eh, our minister had a great power o' watter, for he grat, and spat, and swat like mischeef.'" *Reminiscences of Scottish Life and Character*, by E. B. Ramsay, Dean of Edinburgh, p. 201.

[19] He "was a very learned and pious man; he had a strange faculty of preaching five or six hours at a time." *Burnet's History of his own Time*, vol. i. p. 38. Even early in the eighteenth century, when theological fervour was beginning to decline, and sermons were consequently shorter, Hugh Thomson came near to Forbes. "He was the longest preacher ever I heard, and would have preached four (or) five hours, and was not generally under two hours; that almost every body expected." . . . "He was a piouse good man, and a fervent affectionat preacher, and, when I heard him, he had a vast deal of heads, and a great deal of matter, and generally very good and practicall, but very long." *Wodrow's Analecta*, vol. iv. p. 203.

[20] In 1653 Lamont casually mentions, in his journal, that "the one came doune from the pulpit and the other went vp, in the tyme that the psalme after the first sermon was singing, so that ther was no intermission of the exercise, nether were the peopell dismissed till both sermons were ended." *The Diary of Mr. John Lamont of Newton*, p. 58. Burnet (*History of his own Time*, vol. i. p. 92) says, "I remember in one fast day there were six sermons preached without intermission. I was there myself, and not a little weary of so tedious a service."

[21] When Guthrie preached at Fenwick, "his church, although a large country one, was overlaid and crowded every Sabbath-day, and very many, without doors, from distant parishes, such as Glasgow, Paisley, Hamilton, Lanerk, Kilbryde, Glasford, Strathaven, Newmills, Egelsham, and many other places, who hungered for the pure gospel preached, and got a meal by the word of his ministry. It was their usual practice to

The same congregation would sometimes remain together for ten hours, listening to sermons and prayers, interspersed with singings and readings.[22] In an account of Scotland in 1670, it is stated that, in a single church in Edinburgh, thirty sermons were delivered every week.[23] Nor is this at all unlikely, considering the religious enthusiasm of the age. For in those times the people delighted in the most harassing and ascetic devotions. Thus, for instance, in 1653, when the sacrament was administered, they pursued the following course. On Wednesday, they fasted, and listened to prayers and sermons for more than eight hours. On Saturday, they heard two or three sermons ; and on Sunday, the number of sermons was so great that they stayed in church more than twelve hours ; while, to conclude the whole, three or four additional ones were preached on Monday by way of thanksgiving.[24]

Such eagerness, and yet such patience, indicate a state of society altogether peculiar, and for which we find no parallel in the history of any civilized country. This intense desire to hear whatever the preachers had to say was in itself a homage of the most flattering kind, and was naturally accompanied by a belief that they were endowed with a light which was withheld from their less gifted countrymen. It is not surprising that the clergy, who, at no period, and in no nation, have been remarkable for their meekness, or for a want of confidence in themselves, should, under circumstances so eminently favourable to their pretensions, have been somewhat elated, and should have claimed an authority even greater than that which was conceded to them. And as this is intimately connected with the subsequent history of Scotland, it will be necessary to collect some evidence respecting their conduct, which will have the further advantage of exhibiting the true character of spiritual domination, and of showing how it works, not only on the intellectual, but also on the practical, life of a people.

According to the Presbyterian polity, which reached its height in the seventeenth century, the clergyman of the parish selected a certain number of laymen on whom he could depend, and who, under the name of elders, were his councillors, or rather the ministers of his authority. They, when assembled together, formed what was called the Kirk-Session, and this little court, which enforced the decisions uttered in the pulpit, was so supported by the superstitious reverence of the people, that it was far more powerful than any civil tribunal. By its aid

come to Fenwick on Saturday, and to spend the greatest part of the night in prayer to God, and conversation about the great concerns of their souls, to attend the public worship on the Sabbath, to dedicate the remainder of that holy day in religious exercises, and then to go home on Monday the length of ten, twelve or twenty miles without grudging in the least at the long way, want of sleep or other refreshments ; neither did they find themselves the less prepared for any other business through the week." *Howie's Biographia Scoticana*, 2nd edit. Glasgow, 1781, p. 311. One woman went forty miles to hear Livingstone preach. See her own statement, in *Wodrow's Analecta*, vol. ii. p. 249.

[22] Spalding gives the following account of what happened at Aberdeen in 1644. "So heir in Old Abirdene, upone the sevint of July, we had ane fast, entering the churche be nyne houris, and continewit praying and preiching whill tua houris. Efter sermon, the people sat still heiring reiding whill efternone's sermon began and endit, whiche continewit till half hour to sex. Then the prayer bell rang to the evening prayeris, and continewit whill seven." *Spalding's History of the Troubles*, vol. ii. p. 244, edit. Edinburgh, 1829, 4to. See also p. 42 : "The people keipit churche all day." This was also at Aberdeen, in 1642.

[23] "Out of one pulpit now they have thirty sermons per week, all under one roof." *A Modern Account of Scotland*, in *The Harleian Miscellany*, vol. vi. p. 138, edit. Park, London, 1810, 4to.

[24] "But where the greatest part was more sound, they gave the sacrament with a new and unusual solemnity. On the Wednesday before, they held a fast day, with prayers and sermons for about eight or ten hours together: on the Saturday they had two or three preparation sermons: and on the Lord's day they had so very many, that the action continued above twelve hours in some places: and all ended with three or four sermons on Monday for thanksgiving." *Burnet's History of his own Time*, vol. i. p. 108.

the minister became supreme. For whoever presumed to disobey him was excommunicated, was deprived of his property, and was believed to have incurred the penalty of eternal perdition.[25] Against such weapons, in such a state of society, resistance was impossible. The clergy interfered with every man's private concerns, ordered how he should govern his family, and often took upon themselves the personal control of his household.[26] Their minions, the elders, were everywhere; for each parish was divided into several quarters, and to each quarter one of these officials was allotted, in order that he might take special notice of what was done in his own district.[27] Besides this, spies

[25] "The power of those kirk-sessions, which are now private assemblages, in whose meetings and proceedings the public take no interest whatever, is defined to be the cognizance of parochial matters and cases of scandal; but in the sixteenth and seventeenth centuries, especially during the Covenanting reign of terror after the outbreak of the Civil War against Charles I., the kirk-sessions of Scotland were the sources of excessive tyranny and oppression—were arbitrary, inquisitorial, and revengeful, to an extent which exceeds all belief. It is truly stated by the author of the 'Memoirs of Locheill'—'Every parish had a tyrant, who made the greatest Lord in his district stoop to his authority. The kirk was the place where he kept his court; the pulpit his throne or tribunal from whence he issued out his terrible decrees; and twelve or fourteen sour ignorant enthusiasts, under the title of Elders, composed his council. If any, of what quality soever, had the assurance to disobey his orders, the dreadful sentence of excommunication was immediately thundered out against him, his goods and chattels confiscated and seized, and he himself being looked upon as actually in the possession of the devil, and irretrievably doomed to eternal perdition.'" Introduction to *The Kirk-Session Register of Perth*, in *The Spottiswoode Miscellany*, vol. ii. pp. 229, 230, Edinburgh, 1845. In regard to the perdition which the sentence of excommunication was supposed to involve, one of the most influential Scotch divines of that time merely expresses the prevailing notion when he asserts that whoever was excommunicated was thereby given up to Satan. "That he who is excommunicated may be truly said to be delivered to Sathan is undeniable." *Gillespie's Aaron's Rod Blossoming, or the Divine Ordinance of Church Government Vindicated*, 1646, 4to, p. 239. "Excommunication, which is a shutting out of a Church-member from the Church, whereby Sathan commeth to get dominion and power over him." *Ibid.*, p. 297. "Sure I am an excommunicate person may truly be said to be delivered to Sathan." p. 424.

[26] Clarendon, under the year 1640, emphatically says (*History of the Rebellion*, p. 67), "The preacher reprehended the husband, governed the wife, chastised the children, and insulted over the servants, in the houses of the greatest men." The theory was, that "ministers and elders must be submitted unto as fathers." *Shields' Enquiry into Church Communion*, 2nd edit. Edinburgh, 1747, p. 66. In the middle of the seventeenth century, one of the most famous of the Scotch preachers openly asserted the right of his profession to interfere in family matters, on the ground that such was the custom in the time of Joshua. "The Ministers of God's house have not only the ministry of holy things, as Word and Sacraments, committed to their charge, but also the power of ecclesiastical government to take order with scandalous offences within the familie; both these are here promised to Joshua and the Priests." *Hutcheson's Exposition of the Minor Prophets*, vol. iii. p. 72, London, 1654. In 1603 the Presbytery of Aberdeen took upon themselves to order that every master of a house should keep a rod, that his family, including his servants, might be beaten if they used improper language. "It is concludit that thair salbe in ewerie houss a palmar." *Selections from the Records of the Kirk Session, Presbytery, and Synod of Aberdeen*, printed for the Spalding Club, 4to, Aberdeen, 1846, p. 194. It also appears (p. 303) that in 1674 the clergyman was expected to exercise supervision over all visitors to private houses; since he ought to be informed, "iff ther be anie persone receaved in the familie without testimoniall presented to the minister."

[27] In 1650 it was ordered "That everie paroche be divydit in severall quarteris, and each elder his owne quarter, over which he is to have speciall inspectioun, and that everie elder visit his quarter once everie month at least, according to the act of the Generall Assemblie, 1649, and in thair visitatioun tak notice of all disorderlie walkeris, especiallie

were appointed, so that nothing could escape their supervision.[28] Not only the streets, but even private houses, were searched, and ransacked to see if any one was absent from church while the minister was preaching.[29] To him all must listen, and him all must obey. Without the consent of his tribunal, no person might engage himself, either as a domestic servant, or as a field labourer.[30] If any one incurred the displeasure of the clergy, they did not scruple to summon his servants, and force them to state whatever they knew respecting him, and whatever they had seen done in his house.[31] To speak disrespectfully of a preacher was a grievous offence ; [32] to differ from him was a heresy ; [33] even to pass him in the streets without saluting him was punished as a crime.[34] His

neglectouris of God's worship in thair families, sueareris, haunteris of aill houses, especiallie at vnseasonable tymes, and long sitteris thair, and drinkeris of healthis ; and that he dilate these to the Sessioun." *Selections from the Minutes of the Synod of Fife*, printed for the Abbotsford Club, Edinburgh, 1837, 4to, p. 168. "The elders each one in his own quarter, for trying the manners of the people." *The Government and Order of the Church of Scotland*, Edinburgh, 1690, p. 14. This scarce little volume is reprinted from the edition of 1641. See the advertisement at the beginning.

[28] In 1652 the Kirk-Session of Glasgow "brot boyes and servants before them, for breaking the Sabbath, and other faults. They had clandestine censors, and gave money to some for this end." *Wodrow's Collections*, vol. ii. part ii. p. 74, Glasgow, 1848, 4to.

[29] "It is thocht expedient that ane baillie with tua of the sessioun pas throw the towne everie Sabboth day, and nott sic as thay find absent fra the sermones ather afoir or efter none ; and for that effect that thay pas and *sersche sic houss as they think maist meit*, and pas athort the streittis." *Selections from the Records of the Kirk Session, Presbytery, and Synod of Aberdeen*, p. 26. "To pas throw the towne to caus the people resort to the hering of the sermones." p. 59. "Ganging throw the towne on the ordinar preiching dayes in the weik, als weill as on the Saboth day, to caus the people resort to the sermones." p. 77. See also p. 94 ; and *Wodrow's Collections*, vol. ii. part ii. p. 37 : "The Session allous the searchers to go into houses and apprehend absents from the kirk."

[30] "Another peculiarity was the supervision wielded over the movements of people to such a degree that they could neither *obtain lodging nor employment* except by a licence from the Kirk-Session, or, by defying this police court, expose themselves to fine and imprisonment." *Lawson's Book of Perth*, p. xxxvii., Edinburgh, 1847.

[31] In 1652 Sir Alexander Irvine indignantly writes that the presbytery of Aberdeen, "when they had tried many wayes, bot in vaine, to mak probable this their vaine imaginatione, they at lenthe, when all other meanes failed thame, by ane unparalelled barbaritie, enforced my serwandis to reweall upon oathe what they sawe, herd, or knewe done within my house, beyond which no Turkische inquisitione could pase." *The Miscellany of the Spalding Club*, vol. iii. p. 206, Aberdeen, 1846, 4to.

[32] In 1656 a servant was ordered to be brought before the Kirk-Session of Aberdeen "for her rayleing againest Mr. Andrew Cant, minister, in saying that becaus the said Mr. Andrew spak againest Yuill, he spak lyke ane old fool." *Selections from the Records of the Kirk Session, Presbytery, and Synod of Aberdeen*, p. 138. In 1642 the Presbytery of Lanark had up a certain James Baillie, because he stated the extremely probable circumstance "that two fooles mett togither, when the Minister and his sone mett togither." *Selections from the Registers of the Presbytery of Lanark*, printed for the Abbotsford Club, Edinburgh, 1839, 4to, p. 30.

[33] In 1644, "If you dissent from them in a theological tenet, it is heresy." *Presbytery Displayed*, 1644, p. 39, reprinted London, 1663, 4to. In 1637, "If ye depart from *what I taught you in a hair-breadth* for fear or favour of men, or desire of ease in this world, I take heaven and earth to witness, that ill shall come upon you in end." *Rutherford's Religious Letters*, p. 116. In 1607 "Mr. William Cowper, Minister, complained upon Robert Keir that he had disdainfully spoken of his doctrine. The (Kirk) Session ordained him to be warned to the morrow." *Lawson's Book of Perth*, p. 247.

[34] In 1619 a man was summoned before the Kirk-Session of Perth, because, among other things, he would not perform "that civil duty of salutation, as becomes him to his pastor ; " but "passed by him without using any kind of reverence." *The Chronicle of Perth*, Edinburgh, 1831, 4to, p. 80. The complaint was preferred by the minister

very name was regarded as sacred, and not to be taken in vain. And that it might be properly protected, and held in due honour, an Assembly of the Church, in 1642, forbade it to be used in any public paper unless the consent of the holy man had been previously obtained.[35]

These and similar proceedings, being upheld by public opinion, were completely successful. Indeed they could hardly have been otherwise, seeing that it was generally believed that whoever gainsaid the clergy would be visited not only with temporal penalties, but also with spiritual ones. For such a crime there was punishment here, and there was punishment hereafter. The preachers willingly fostered a delusion by which they benefited. They told their hearers that what was spoken in the pulpit was binding upon all believers, and was to be regarded as immediately proceeding from the Deity.[36] This proposition being established, other propositions naturally followed. The clergy believed that they alone were privy to the counsels of the Almighty, and that by virtue of this knowledge they could determine what any man's future state would be.[37] Going still further, they claimed the power not only of foretelling his future state, but also of controlling it; and they did not scruple to affirm that by their censures they could open and shut the kingdom of heaven.[38] As if this were

himself. Indeed, the Scotch clergy took these things so much to heart, that they set up a theory to the effect that whoever showed them any disrespect was prompted thereto by Satan. "It is Satan's great engine to draw men to contemne God and his word, under pretext of disrespect and prejudice against the Messengers only." . . . "It may let us see their guilt who despise most eminent ordinary Messengers." *Hutcheson's Exposition of the Minor Prophets*, vol. i. pp. 205, 233.

[35] The General Assembly of Saint Andrews, in 1642, passed "an act against using ministers' names in any of the public papers, without their own consent." *Stevenson's History of the Church of Scotland*, p. 503.

[36] "Directions for a believer's walk, given by Christ's ministers from his word, are his own, and are accounted by him as if he did immediately speak them himself." *Durham's Exposition of the Song of Solomon*, p. 102. I quote from the Glasgow reprint of 1788. That my references may be easily verified, and any error, if error there be, detected, I mention that the exact edition used will, in every case, be found specified in the List of Authors at the beginning of the volume. But if it will give the reader any additional confidence, I will venture to observe, that I am always scrupulously careful in reference to quotations, having looked out each passage afresh as the sheets came from the printer's hands. Some of the circumstances narrated in this chapter are so monstrous, that I hope to be excused in saying that I have taken all possible pains to secure their literal accuracy.

[37] "Yea, such was their arrogance, that, as if they had been privy to the councils of God, or the dispensers of his vengeance to the world, they presumed to pronounce upon their future state, and doomed them, both body and soul, to eternal torments." *Wishart's Memoirs of the Marquis of Montrose*, p. 237. "Ye heard of me the whole counsel of God." *Rutherford's Religious Letters*, p. 16. "I am free from the blood of all men; for I have communicated to you the whole counsel of God." *Ibid.*, p. 191. "This is the great business of Gospel Ministers, to declare the whole counsel of God." *Halyburton's Great Concern of Salvation*, p. 4. "Asserting that he had declared the whole counsel of God, and had keeped nothing back." *Life of the Rev. Alexander Peden*, p. 41, in vol. i. of *Walker's Biographia Presbyteriana*.

[38] "The power of the keys is given to the ministers of the church, wherewith not only by the preaching of the word, but also to church censures, (*sic*) they open and shut the kingdom of heaven." *Dickson's Truth's Victory over Error*, p. 282. "To preach the Word, impugne, rebuik, admonishe, exhort and correct, and that under no less paine then casting both bodie and soull into eternall hell's fire." *Forbes' Certaine Records touching the Estate of the Kirk*, p. 519. "The next words, 'Whatsoever ye shall bind on Earth shall be bound in Heaven,' being spoken to the Apostles, and in them to other Ministers of Jesus Christ." *Gillespie's Aaron's Rod Blossoming*, p. 366. "The keys of the kingdom of Heaven" . . . "are committed and intrusted to the pastors and other ruling officers of the Church." *Ibid.*, p. 260.

not enough, they also gave out that a word of theirs could hasten the moment of death, and by cutting off the sinner in his prime, could bring him at once before the judgment-seat of God.[39]

Utterly horrible as such a pretension now appears, it was made not only with impunity but with advantage; and numerous instances are recorded in which the people believed that it was strictly enforced. The celebrated John Welsh, sitting one night at table, round which a party were assembled at supper, began to discourse to the company respecting the state of their souls. Those who were present listened with humility; but to this general feeling there was one exception. For it so happened that a Roman Catholic was in the room, and he, of course, disagreed with the opinions expressed by the Presbyterian divine. If he had been a cautious man, he would have kept his disagreement to himself; but being a hot-headed youth, and being impatient at seeing a single person engross the conversation, he lost his temper, and not only ridiculed Welsh, but actually made faces at him. Thereupon, Welsh charged the company to take heed, and see what the Lord was about to do to him who mocked. Scarcely had this threat been uttered, when it was carried into execution. He who had dared to jest at the minister, suddenly fell, sank under the table, and died there in presence of the whole party.[40]

This happened early in the seventeenth century, and, being bruited abroad, it became a great terror to all evildoers. But after a time its effect appears to have been weakened; since another man was equally rash some forty or fifty

[39] "Gird up the loins of your mind, and make you ready for meeting the Lord; I have often summoned you, and now I summon you again, to compear before your Judge, to make a reckoning of your life." *Rutherford's Religious Letters*, p. 235. "Mr. Cameron, musing a little, said, 'You, and all who do not know my God in mercy, shall know him in his judgments, which shall be sudden and surprising in a few days upon you; and I, as a sent servant of Jesus Christ, whose commission I bear, and whose badge I wear upon my breast, give you warning, and leave you to the justice of God.' Accordingly, in a few days after, the said Andrew, being in perfect health, took his breakfast plentifully, and before he rose fell a-vomiting, and vomited his heart's blood in the very vessel out of which he had taken his breakfast; and died in a most frightful manner." *Howie's Biographia Scoticana*, p. 406.

[40] "Sitting at supper with the Lord Ochiltree (who was uncle to Mr. Welsh's wife), as his manner was, he entertained the company with godly and edifying discourse, which was well received by all the company save only one debauched Popish young gentleman, who sometimes laughed, and sometimes mocked and made faces; whereupon Mr. Welsh brake out into a sad abrupt charge upon all the company to be silent, and observe the work of the Lord upon that profane mocker, which they should presently behold: upon which immediately the profane wretch sunk down and died beneath the table, but never returned to life again, to the great astonishment of all the company." *History of Mr. John Welsh, Minister of the Gospel at Ayr*, in *Select Biographies*, vol. i. p. 29. "Mr. Welsh being by the Captaine, set at the upper end, intertained the company with grave and edifying discourse which all delighted to hear, save this young Papist, who with laughter and derision laboured to silence him, which was little regarded by Mr. Welsh. But after supper while the guests sate a little, this youth stood up at the lower end of the table, and while Mr. Welsh proceeded from grave to gracious entertainment of his company, the youth came to that height of insolence as with the finger to point at him and with the face to make flouting grimaces, whereby he grieved the holy man, so as on a suddain he was forced to a silence. The whole company, who had heard him with delight, were silent with him. Within a little, Mr. Welsh, as moved by the spirit of God, broke forth into these words: 'Gentlemen, the spirit of God is provoked against us, and I shall intreat you not to be afraid to see what God shall do among you before you rise from the table, for he will smite some of you with death before you go hence.' All were silently astonished, waiting to see the issue with fear. And while every man feared himselfe, except the insolent youth, he fel down dead suddenly at the foot of the table to shew the power of God's jealousie against the mockers of his Spirit and the offers of his grace." *Fleming's Fulfilling of the Scripture*, pp. 374, 375.

years afterwards. It seems that a Scotch clergyman of considerable repute, Mr. Thomas Hog, was, like Welsh, sitting at supper, when it so chanced that the servant forgot to lay the knives. Mr. Hog, thinking the opportunity a favourable one, observed that such forgetfulness was of little moment, and that, while we thought so much of our comforts here, it was far more necessary to consider our condition hereafter. A gentleman present, amused either by the manner of Mr. Hog, or by the skill with which he introduced the topics of his own profession, was unable to restrain himself, and burst into a violent fit of laughter. The minister, however, was not to be checked, and he continued after such a fashion that the laughter was repeated louder than ever. At length Mr. Hog turned round, and told his merry comrade that very shortly he should seek for mercy, but find it not. That same night, the scoffer was taken ill, and in great alarm sent for Mr. Hog. It was, however, useless. Before the clergyman could reach his room, the sinner was lying dead, a lost and ruined man.[41]

Nor was it merely in private houses that such examples were made. Sometimes the clergyman denounced the offender from the pulpit, and the punishment was as public as the offence. It is said that Gabriel Semple, when preaching, had a strange habit of putting out his tongue, and that this excited the mirth of a drunken man, who went into the church, and by way of derision put out his tongue also. But to his horror he found that though he could put it out he could not draw it in again. The result was that the tongue stiffened; it lost all sensibility; and, paralysis coming on, the man died a few days after his transgression.[42]

[41] "When they sat doun to supper, it seems, knives were forgote; and when the servant was rebuked, Mr. Hogg said, there was noe matter, for he had one in his pocket, and it was a necessary companion for a travailer; and, as his use was upon evry thing, he took occasion to raise a spirituall discourse from it: 'If we wer soe carefull about accommodations in our way here, what care should we take in our spirituall journey!' and the like; at which the factour takes a kink of laughing. Mr. Hogg looked at him with a frown, and went on in his discourse. Within a little, at somewhat or other, he laughed out yet louder, and Mr. Hogg stoped a litle, and looked him very stern in the face, and went on in his discourse, upon the free grace of God; and, at some expression or other, the man fell a laughing and flouting very loud: Upon which Mr. Hogg stoped, and directed his discourse to him, to this purpose: 'Alace!' sayes he, 'my soul is afflicted to say what I must say to you, sir, and I am constrained and pressed in spirit to say it, and cannot help it. Sir, you now dispise the grace of God, and mock at it; but I tell you, in the name of the Lord, that the time is coming, and that very shortly, when you (will) seek ane offer of grace, but shall not find it!' Upon which the man arose, laughing and flouting, and went to his room. After he was away, the lady asked Mr. Hogg, What he thought would come upon him? He answered, he kneu noe more then he had said, and that he was constrained and oblidged to say it against his inclination; and he could not accompt for some of these impressions he sometimes felt, and after Providences would clear, and that shortly; but what it was, when, or where, he kneu not. The man told some of the servants that a phanatick Minister had been pronouncing a curse on him, but he did not value him nor it either. After Mr. Hogg had been somtime with the lady, he went to his room; and after he had, as he used to doe, spent some time in prayer, he putt off his cloaths, and just as he was stepping into his bedd, a servant comes and knocks at the dore and cryes, 'For the Lord's sake, Mr. Hogg, come doun staires, presently, to the factour's room!' He put on his cloaths, as quickly as possible, and came doun, but the wretch was dead before he reached him!" *Analecta, or Materials for a History of Remarkable Providences, mostly relating to Scotch Ministers and Christians*, by the Rev. Robert Wodrow, vol. i. pp. 265, 266. Compare *The Life of Mr. Thomas Hog*, in *Howie's Biographia*, p. 543, where a version is given, slightly different, but essentially the same.

[42] "He tells me, that when in the South country, he heard this story, which was not doubted about Geddart" (i.e. Jedburgh): "Mr. Gabriel Semple had gote a habite, when speaking and preaching, of putting out his tongue, and licking his lipps very frequently. Ther was a fellou that used to ape him, in a way of mock; and one day, in a druken

Occasionally the penalty was less severe, though the miracle was equally conspicuous. In 1682 a certain woman took upon herself to scold the famous divine, Peden, who was justly regarded as one of the great lights of the Scotch Church. "I wonder," said that eminent man, "I wonder your tongue is not sore with so much idle clatter." She indignantly replied that she had never suffered, either from a sore tongue, or from a sore mouth. He told her that she soon would. And the consequence of his saying so was that her tongue and gums swelled to that degree, that for some days she was unable to take her usual food.[43]

She escaped with her life; others were more sharply handled. A clergyman was interrupted in the midst of his sermon by three gentlemen leaving the church. It is not stated that there was anything offensive in their manner; but their object in going was to amuse themselves at some fair or race, and the minister, no doubt, thought that they should have been content with the gratification of hearing him. At all events he was dissatisfied, and after the sermon was over he censured their conduct, and threatened them with the divine displeasure. His words were remembered, and, to the awe of his parishioners, every tittle was fulfilled. Of the three gentlemen, all died violent deaths; one of them broke his neck by falling from his horse, and another was found in his room with his throat cut.[44]

Cases of this sort were frequent during the seventeenth century; and as in that credulous age they were firmly believed and widely circulated, the power of the clergy was consolidated by them. The Laird of Hilton once ventured to pull a minister out of a pulpit which was not his own, and into which he had unlawfully intruded. "For the injury you have done to the servant of God," cried the enraged preacher, "you shall be brought into this church like a sticked sow." And so indeed he was. Yet a little while, and Hilton became entangled in a quarrel, was run through the body, and his corpse, still bleeding, was carried into the very church where the outrage had been committed.[45]

caball, he was aping him and putting out his tongue; and it turned stiffe and sensless, and he could not drau it in again, but in a feu dayes dyed. This accompt is soe odd, that I wish I may have it confirmed from other hands." *Wodrow's Analecta*, vol. ii. p. 187.

[43] "About the same time, wading Douglas-water very deep," (he) "came to a house there; the goodwife of the house insisted (as most part of women do not keep a bridle-hand) in chiding of him; which made him to fret, and said, I wonder that your tongue is not sore with so much idle clatter. She said, I never had a sore tongue nor mouth all my days. He said, It will not be long so. Accordingly, her tongue and gooms swelled so that she could get no meat taken for some days." *Account of the Life and Death of Mr. Walter Smith*, p. 93, in vol. ii. of *Walker's Biographia Presbyteriana*.

[44] "I hear from Lady Henriett Campbell, who was present at a Communion at Jeddart (Jedburgh), some years before Mr. Gabriel Semple's death, that either on the fast day or Saturnday, ther wer three gentlmen either in the parish or noturely knouen thereabout, who rose in the time of the last sermon, and with their servants went out of (the church), either to some fair or some race, not farr off. After sermon, when Mr. Semple rose to give the ordinary advertisements, he began with taking nottice of this, and said, he had remarked three gentlmen rise in time of sermon, and contemptuously and boldly leave God's service to goe to a fair, or race, as he supposed; but sayes, 'It's born in upon me, and I am perswaded of it, the Lord will not suffer them to goe off time, without some remarkable judgment, and I am much mistaken if the most part that have seen them committ the sin, will not hear of the punishment of such open despite to the ordinances of Christ.' This peremptoryness did very much surprize Lady H(enriett), and coming home from sermon with my Lord Lothian and his Lady, in coach, she expressed her surprize at it. My Lord Lothian said, 'The Minister is a man of God, and I am perswaded not one word of his will fall to the ground!' Within some feu moneths, my Lord or my Lady, writing to Lady H(enriett), signifyed to her, that one of these gentlmen was found in his room, (if I forgett not), with his throat cutt; and a second, being drunk, fell off his horse, and broke his neck; and some while after, shee heard the third had dyed some violent death." *Wodrow's Analecta*, vol. i. pp. 344, 345.

[45] "In the time of sermon, the Laird of Hiltoun comes in, and charges him in the

Even when a clergyman was in prison he retained the same power. His authority was delegated to him from on high, and no temporal misfortune could curtail it. In 1673 the Reverend Alexander Peden, when in confinement, heard a young girl laughing at him outside the door of his room, while he was engaged in those vociferous devotions for which he was celebrated. The mirth of the poor child cost her dear. Peden denounced against her the judgment of God. In consequence of that denunciation, the wind blew her from a rock on which she was walking, and swept her into the sea, where she was quickly drowned.[46]

Sometimes the vengeance of the clergy extended to the innocent offspring of the man who had offended them. A certain minister, whose name has not been preserved, met with opposition in his parish, and fell into pecuniary and other difficulties. He applied for aid to a trader, who, being wealthy, ought, he thought, to afford him assistance. The trader however thought otherwise, and refused. Upon this, the clergyman declared that God would visit him. The result was that his business not only declined, but his mind became impaired, and he died an idiot. He had two sons and two daughters. Both his sons went mad. One of his daughters likewise lost her reason. The other daughter being married, even her husband became destitute, and the children of that marriage became beggars, that the heinous crime might be visited to the third generation.[47]

midst of his work, to come out of (the) pulpite, in the king's name. Mr. Douglasse refused; whereupon the Laird comes to the pulpit, and pulls him out by force! When he sau he behoved to yeild, he said, 'Hiltoun, for this injury you have done to the servant of God, knou what you are to meet with! In a litle time you shall be brought into this very church, like a sticked sou!' And in some litle time after, Hilton was run throu the body, and dyed by, if I mistake not, Annandale's brother, either in a douell or a drunken toilzie, and his corpes wer brought in, all bleeding, into that church. 'Touch not mine annoynted, and doe my prophets noe harm!'" *Wodrow's Analecta*, vol. ii. p. 154. In the same work (vol. iv. p. 268), the Reverend Mr. Wodrow writes that he had been subsequently informed "that the story is very true about the denuntiation upon the Laird of Hiltoun, as I have (I think) published it; and ther is a man yet alive who was witnes to it, and in the church at the time."

[46] "While prisoner in the Bass, one Sabbath morning, being about the publick worship of God, a young lass, about the age of thirteen or fourteen years, came to the chamber-door, mocking with loud laughter: He said, 'Poor thing, thou mocks and laughs at the worship of God; but ere long, God shall write such a sudden, surprising judgment on thee, that shall stay thy laughing, and thou shalt not escape it.' Very shortly thereafter, she was walking upon the rock, and there came a blast of wind, and sweeped her off the rock into the sea, where she was lost." *Life and Death of Mr. Alexander Peden*, p. 43, in vol. i. of *Walker's Biographia Presbyteriana*. See also *Howie's Biographia Presbyteriana*, p. 487.

[47] "He (Mr. Fordyce, in Aberdeen) tells me this following accompt, which he had from personall observation: When he lived near Frazerburge, in the North, there was a Minister setled there *jure devoluto*, the toun being biggotted against Presbytery to a pitch, and only two or three that had any seeming liking that way. After the Minister is setled, he expected much encouragment from one Ougstoun, I think his name was, who had professed much respect for him and that way. A while after, in some difficulty, the Minister came to him, and desired his countenance and assistance in the difficulty. He at first put the Minister off with delay; and within a little plainly mocked him, and would doe nothing. The Minister came from him to my informer, who lived a litle from the place, and gave him ane account (of) what had befallen him, and said, 'I expected much from that man, and reaconed upon his help and assistance, in soe comfortless a setlement as I have ventured on; and he has not only disappointed me, but mocked me!' And the Minister was like to sink under the thoughts of this carriage; and after some silence, he said, very peremptorly, 'I am much mistaken, yea, I'le say it, God hath sent me, and spoken by me. God will visite that man, and something more than ordinary will befall him and his!' My informer was very much stunned and greived at such a peremptory declaration. However, it was accomplished, to my informer's personall

To prosecute a minister, or even to assert one's rights against him before a civil tribunal, was not only a hazard but a certain ruin. About the year 1665 James Fraser was sued in a court of law for a large sum of money, said to be due from his father's estate. As usually happens in these cases, the party sued considered that he was unjustly treated, and that his opponent had no right to make the claim. So far, all was natural. But the peculiarity was that Fraser, against whom the action was brought, was a young man preparing for the ministry, and therefore under the immediate protection of Providence. Such an one was not to be vexed with impunity; and we are assured by Fraser himself that God specially interposed to prevent his ruin; that one of his opponents was made unable to appear in court, and that the Lord, laying his hand upon the others, put them to death, in order that every obstacle might be at once removed.[48]

While stories of this sort were generally believed, it was but natural that an opinion should grow up that it was dangerous to meddle with a minister, or in any way to interfere with his conduct.[49] The clergy, intoxicated by the

knowledge. The man was a trader, who was very rich, worth near four or five thousand pounds sterling in stock. He had two sons and two daughters. Within some litle time, one of his sons turned distracted, and I think continues soe still. The other son, in some distemper, turned silly, and litle better, and dyed. His daughters, one was maryed, and her husband lost all his stock at sea, twice or thrice; his good-father stocked him once or twice, and all was still lost, and they and their children are miserable. The other daughter fell into a distemper, wherein she lost her reason. The man himself, after that time, never throve; his means wasted away insensibly; and throu all things, he fell under melancholy, and turned silly, and dyed stupide. All this fell out in some feu years after what passed above; and my relator kneu all this particularly, and had occasion to be upon the man's bussiness and affairs." *Wodrow's Analecta*, vol. ii. pp. 175, 176. See also, in another work by this eminent Scotch divine, an account of what happened, when "a rash young man" having destroyed the property of a clergyman, named Boyd, "it was observed that that family did never thrive afterwards, but were in a decaying condition till they are reduced almost to nothing." *Wodrow's Collections upon the Lives of Ministers of the Church of Scotland*, vol. ii. part i. p. 215.

[48] See *Fraser's Life of Himself*, in vol. ii. of *Select Biographies*, edited by the Rev. W. K. Tweedie. "Nothing now remained of all my father's great fortune but a small wadset of sixteen chalders, liferented likewise by my mother. And about the same time a new (though an unjust) adversary charges both her and me for 36,000 merks, and a reduction of our rights; so that our whole livelihood was either gone or at the stake. For four years did this adversary vex us, and was like to have undone us as to our temporal condition, had not the Lord prevented." p. 196. "I, ignorant what defences to make, had in my company a registrate horning, which I accidentally and without premeditation (God putting it in my mind at the same time) did cast in, by which he, being the king's rebel, was incapacitate from pursuing me. And the Lord so ordered it that he never after compeared to trouble me, by which means I was delivered from a loss and a fashery, and had but one court to wait upon." p. 202. "My condition during this time was a wrestling condition with the sons of Zeruiah that were too strong for me; little or no overcoming, yet violent wrestling." . . . "For I humbled myself under the sense of the calamities of our family, and my own particular wants; I besought him to keep us from utter destruction. And the Lord was pleased to hear; *he destroyed by death my chief adversaries*, I found shifts to pay my many petty debts, gained our law-action, and was restored to some of my ancient possessions again." pp. 227, 228.

[49] "So hazardous a thing it is to meddle with Christ's sent servants." *Life of Mr. William Guthrie, Minister at Fenwick*, by the Rev. William Dunlop, reprinted in *Select Biographies*, vol. ii. p. 62. To arrest a clergyman on a civil or criminal process was an act full of danger, inasmuch as the Deity would hardly fail to avenge it. This applied even to the officers who executed the arrest, as well as to him by whom it was ordered. See, for instance, *Some Remarkable Passages of the Life and Death of Mr. John Semple, Minister of the Gospel*, p. 171 (in *Walker's Biographia Presbyteriana*, vol. i.). "Some time thereafter, he gat orders to apprehend Mr. Semple; he intreated to excuse him, for Mr. Semple was the minister and man he would not meddle with: for he was sure, if he did that, some terrible mischief would suddenly befal him. Mr. Arthur Coupar, who was Mr.

possession of power, reached to such a pitch of arrogance that they did not scruple to declare that whoever respected Christ was bound on that very account to respect them.[50] They denounced the judgments of God upon all who refused to hear the opinions they propounded in their pulpits.[51] Nor did this apply merely to persons who usually formed their audience. Such was their conceit, and so greedy were they after applause, that they would not allow even a stranger to remain in their parish unless he too came to listen to what they chose to say.[52]

Semple's precentor, told these passages to a Reverend Minister in the church, yet alive, worthy of all credit, who told me." Durham boasts that, " when Ministers have most to do, and *meet with most opposition*, God often furnisheth them accordingly with more boldnesse, gifts, and assistance than ordinary. Christ's witnesses are a terrible party ; for as few as these witnesses are, none of their opposits do gain at their hand ; *whoever hurteth them shall in this manner be killed*. Though they be despicable in sackcloth, yet *better oppose a king in his strength, and giving orders from his throne covered in cloath of state, than them*: though they may burn some and imprison others, yet their opposers will pay sickerly for it. This is not because of any worth that is in them, or for their own sake ; But 1. for His sake and for His authority that sendeth them. 2. for the event of their word, which will certainly come to passe, and that more terribly, and as certainly, as ever any temporall judgement was brought on by Moses or Elias." *Durham's Commentarie upon the Book of the Revelation*, p. 416.

[50] " These who are trusted by Christ to be keepers of the vineyard, and his ministers, ought also to be respected by the people over whom they are set ; and Christ allows this on them. Where Christ is respected and gets his due, there the keepers will be respected and get their due." *Durham's Exposition of the Song of Solomon*, pp. 450, 451. Fergusson complacently says that to affront a clergyman by not believing his statement, or " message," as he terms it, is a " dishonour done to God." *Fergusson's Exposition of the Epistles of Paul*, p. 422.

[51] " As it is true concerning vs, that necessitie lyeth vpon vs to preach, and woe will bee to vs if wee preach not ; so it is true concerning you, that a necessitie lyeth vpon you to heare, and *woe will be to you if you heare not*." *Cowper's Heaven Opened*, p. 156.

[52] The following order was promulgated by the Kirk-Session of Aberdeen on the 12th July, 1607. " The said day, in respect it wes delatit to the sessioun that thair is sindrie landvart gentillmen and vtheris cum to this towne, quha mackis thair residence thairin, and resortis not to the preching nather on Saboth nor vlk dayes ; thairfor, it is ordanit that thrie elderis of everie quarter convene with the ministrie in the sessioun hous, immediatlie efter the ending of the sermone on Tuysday nixt, and thair tak vp the names of the gentillmen and vtheris skipperis duelling in this burgh, quha kepis nocht the Kirk, nor resortis not to the hering of Godis word ; and thair names being taken vp, ordains ane off the ministeris, with a baillie, to pas vnto thame and admoneis thame to cum to the preichingis, and keip the Kirk, vthervayes to remowe thame aff the towne." *Selections from the Records of the Kirk Session, Presbytery and Synod of Aberdeen*, p. 58. It was not enough to go occasionally to church ; the attendance must be regular ; otherwise the clergy were dissatisfied, and punished the delinquents. In the Presbytery Book of Strathbogie it is recorded that, on the 29th September, 1649, " Mr. Johne Reidfurd being posed quhat diligence he had vsed to the Lady Frendraught, reported, shoe had hard three sermons, and so, as he thought, shoe intended to continow ane hearer. The bretheren, considering her long continowed contumacie and delay of her process, by *heiring a sermon now and then*, thought not *that kind of heiring satisfactorie*, quherfor Mr. Robert Watson, and Mr. Robert Irving, ver ordained to goe with Mr. Johne Reidfurd, and requyre the said Lady to subscryv the Covenant, quherby shoe might testifie her conformitie vith the Kirk of Scotland, quhilk, if shoe refused, the said Mr. Johne vas ordained to pronunce the sentence of excommunicatioun against hir before the Provinciall Assemblie, as he vold be answerable therto." *Extracts from the Presbytery Book of Strathbogie*, p. 115. Neither distance nor illness might be pleaded as a valid excuse. Under no circumstances would the preachers tolerate the affront of any one displaying an unwillingness to hear their sermons. In 1650 " compeired the Lord Oliphant, being summondit for not keeping his parish kirk of Abercherdour, vho declared his inabilitie of bodie many tymes, and the want of houses for accommodating him and his familie so farr distant from the same

Because they had adopted the Presbyterian polity, they asserted that the Almighty had never failed to punish every one who tried to supersede it ;[53] and as this was the perfection of the church, those who were blind to its merits were given over to wrath, and were indeed the slaves of Satan.[54] The clergy who held this language respecting their opponents exhausted the choicest epithets of praise on themselves, and on their own pursuits. When one of them got into the pulpit, or took a pen in his hand, he seemed as if he could not find words strong enough to express his sense of the surpassing importance of that class of which he was himself a member.[55] They alone knew the truth ; they alone were able to inform and enlighten mankind. They had their instruction direct from heaven ; they were in fact the ambassadors of Christ ; from him they received their appointment ; and since no one else could reward them, so no one else had a right to rule them.[56]

vas the onlie caus, quhilk he promised to amend in tym comming. Mr. John Reidfurd ordained to report the same to the presbytrie, and vpon his continowed absence, to processe him." *Presbytery Book of Strathbogie*, p. 149. See more on this subject in *Registers of the Presbytery of Lanark*, pp. 5, 33, 67 ; *Minutes of the Presbyteries of St. Andrews and Cupar*, pp. 67, 68, 90, 153 ; *Minutes of the Synod of Fife*, pp. 18, 55, 132 ; and *Spalding's History of the Troubles*, vol. ii. p. 57. Spalding also mentions (p. 114) that at Aberdeen, in 1643, the clergy discoursed every Tuesday, Thursday, and Saturday, in the afternoon ; on which occasions " the people is compellit to attend their Lectureis, or then cryit out against."

[53] " And it may be truly said, as the Church of Scotland hath had no detractors but such as were ignorant of her or mis-informed about her, or whom faction, partiality, prejudice, wickedness, or love of unlawful liberty did inspire : so no person or party hath endeavoured hithertil to root out Presbytery, but the Lord hath made it a burdensome stone unto them." *Naphtali*, sig. B 2 rev. " The Lord's wrath shall so meet his enemies in the teeth, wheresoever they turn, that they shall be forced to forsake their pursuing of the Church." *Dickson's Explication of the First Fifty Psalms*, p. 115.

[54] " The true children of the Kirk are indeed the excellent ones of the earth, and princes indeed, wherever they live, in comparison of all other men who are but the beastly slaves of Satan." *Dickson's Explication of the First Fifty Psalms*, p. 312. Another high authority carefully identifies " the true religion " with " the true presbyterial profession." See *An Enquiry into Church Communion by Mr. Alexander Shields, Minister of the Gospel at Saint Andrews*, p. 126. His remark applies to the " Burgess-oaths."

[55] Fergusson gives an ingenious turn to this, and says that it was their duty to praise their own profession, not for their own sake, but for the sake of others. " It is the duty of Christ's ministers to commend and magnify their office, not for gaining praise and esteem to themselves, 2 Cor. iii. 1, but that the malice of Satan and his instruments may be hereby frustrated, 2 Cor. xi. 12, who labours to bring that sacred calling into contempt ; that so it may have the less of success upon people's hearts." *Fergusson's Exposition of the Epistles of Paul*, p. 180.

[56] " Neither is there any mediate authoritie betweene the Lord and his ambassadours, in the affaires of their message : he only sendeth them ; he alone gives them to be pastors and doctors, etc. ; he alone shall judge them ; he alone shall reward them ; to him alone they must give an accompt of their dispensation ; and he himselfe alone doth immediatlie rule them by his spirit and word." *Forbes' Certaine Records touching the Estate of the Kirk*, p. 435. In reference to these amazing pretensions, the Scotch clergy were constantly terming themselves the ambassadors of the Deity ; thereby placing themselves infinitely above all other men. See, for instance, *Durham's Commentarie upon the Book of the Revelation*, pp. 86, 100, 160. *Durham's Law Unsealed*, pp. 85, 96. *Halyburton's Great Concern of Salvation*, p. 402. *Fergusson's Exposition of the Epistles of Paul*, pp. 17, 273. *Shields' Enquiry into Church Communion*, p. 72. *Binning's Sermons*, vol. ii. p. 118, vol. iii. p. 178. *Abernethy's Physicke for the Soule*, p. 122. *Monro's Sermons*, p. 207. *Gillespie's Aaron's Rod Blossoming*, pp. 240, 413. *Cowper's Heaven Opened*, p. 166. *Rutherford's Free Disputation against Pretended Liberty of Conscience*, p. 41. *Dickson's Truth's Victory over Error*, p. 274. *Gray's Great and Precious Promises*, pp. 50, 74. *Fleming's Fulfilling of the Scripture*, p. 429. *Cockburn's Jacob's Vow, or Man's Felicity and Duty*, p. 401. *Hutcheson's Exposition of the Book of Job*, pp. 461, 479.

As they were messengers sent by the Almighty, they were rightly termed angels, and it was the duty of the people to listen to their minister, as if he were really an angel who had descended upon earth.[57] His parishioners, therefore, were bound not only to acknowledge him and provide for him, but also to submit to him.[58] Indeed, no one could refuse obedience who considered who the clergy were, and what functions they performed. Besides being ambassadors and angels, they were watchmen, who spied out every danger, and whose sleepless vigilance protected the faithful.[59] They were the joy and delight of the earth. They were musicians, singing the songs of sweetness; nay, they were sirens, who sought to allure men from the evil path, and save them from perishing.[60] They were chosen arrows, stored up in the quiver of God.[61] They were burning lights and

[57] "Ministers are called Angels, because they are God's Messengers, intrusted by Him with a high and heavenly imployment; and it is a title that should put Ministers in mind of their duty, to do God's will on earth as the Angels do it in heaven, in a spiritual and heavenly way, cheerfully, willingly and readily; and it *should put people in mind of their duty, to take this word off Ministers hands, as from Angels.*" *Durham's Commentarie upon the Book of the Revelation*, p. 496. "Therefore are Ministers called Angels, and Angels, Ministers." p. 596. Cockburn says that this is the reason why "we should behave ourselves decently and reverently" in church; "for if the presence of Kings overawe us, how much more should the presence of God and Angels." *Cockburn's Jacob's Vow, or Man's Felicity and Duty*, p. 356. Another Scotch divine asserts that he and his brethren are able to instruct the angels, and free them from their ignorance. See the audacious passage in *Fergusson's Exposition of the Epistles of Paul*, p. 180: "*This may commend the ministers of the gospel not a little unto men*, and beget reverence in them towards the same, that even the blessed angels are in some sort bettered by it, and that it is therefore respected by them: for Paul commendeth his office from this, that by occasion thereof 'unto the principalities and powers, was made known the manifold wisdom of God.' Though angels be most knowing creatures, as enjoying the immediate sight and presence of God, Matt. xviii. 10, yet *they are ignorant of some things, which, by God's way of dispensing the Gospel to his church, they come to a more full knowledge of.*" After this it is a slight matter to find Monro insisting that "the people should consider our character as the most difficult and most sacred." *Monro's Sermons*, p. 202.

[58] "He is obliged to minister unto them in the gospel; and they are obliged to submit to him, strengthen him, acknowledge him, communicate to him in all good things, and to provide for him," &c. *Durham's Commentarie upon the Book of the Revelation*, p. 90. That the clergy are "rulers and governors," and that their business is "ruling and watching over the flock," is likewise affirmed in *Gillespie's Aaron's Rod Blossoming*, pp. 172, 313. Compare *The Correspondence of the Rev. Robert Wodrow*, vol. i. p. 181: "Rule over the people and speak the word;" and *Rutherford's Free Disputation against Pretended Liberty of Conscience*, p. 41: "The commanding power in the Ambassadour of Christ." See also the "reverential estimation" inculcated in *Boston's Sermons*, p. 186.

[59] "Called watchmen by a name borrowed from the practice of centinels in armies or cities." They are "Satan's greatest eye-sores." *Hutcheson's Exposition on the Minor Prophets*, vol. ii. p. 158, vol. iii. p. 208. "They being made watchmen, do thereby become the butt of Satan's malice." . . . "The Enemy's principal design is sure to be against the watchman, because he prevents the surprising of his people by Satan, at least 'tis his business to do so." *Halyburton's Great Concern of Salvation*, p. 24. Compare *Guthrie's Considerations contributing unto the Discovery of the Dangers that threaten Religion*, p. 259; *Fergusson's Exposition of the Epistles of Paul*, pp. 97, 106; *Durham's Exposition of the Song of Solomon*, pp. 278, 443; and *Wodrow's Correspondence*, vol. i. pp. 84, 244.

[60] One of the most popular of the Scotch preachers in the seventeenth century actually ranks himself, in this respect, as doing the same work as the Son of God. "Christ and his ministers are the musicians that do apply their songs to catch men's ears and hearts, if so be they may stop their course and not perish. These are blessed syrens that do so." *Binning's Sermons*, vol. iii. p. 265.

[61] Rutherford terms himself, "a chosen arrow hid in his quiver." *Howie's Biographia Scoticana*, p. 230. To read the coarse materialism contained in this and other extracts

shining torches. Without them darkness would prevail; but their presence illumined the world, and made things clear.[62] Hence they were called stars, which title also expressed the eminence of their office, and its superiority over all others.[63] To make this still more apparent, prodigies were vouchsafed, and strange lights might occasionally be seen, which, hovering round the form of the minister, confirmed his supernatural mission.[64] The profane wished to jest at these things, but they were too notorious to be denied; and there was a well-known case in which, at the death of a clergyman, a star was miraculously exhibited in the firmament, and was seen by many persons, although it was then midday.[65]

Nor was this to be regarded as a solitary occurrence. On the contrary, it usually happened that when a Scotch minister departed from this life the event was accompanied by portents, in order that the people might understand that something terrible was going on, and that they were incurring a serious, perhaps an irretrievable, loss. Sometimes the candles would be mysteriously extinguished, without any wind, and without any one touching them.[66] Sometimes, even when the clergyman was preaching, the supernatural appearance of an animal would announce his approaching end in face of the congregation, who might vainly mourn what they were unable to avert.[67] Sometimes the body of the holy man

will, I know, shock, and so far offend, many pure and refined minds, whose feelings I would not needlessly wound. But no one can understand the history of the Scotch intellect who refuses to enter into these matters; and it is for the reader to choose whether or not he will remain ignorant of what I, as an historian, am bound to disclose. His remedy is easy. He has only either to shut the book, or else to pass on at once to the next chapter.

[62] "The Lord calleth men to be preachers, and hath them in his hand as starres, holding them out sometime to one part of the world, and sometime to another, that we may communicate light to them that are sitting in darkness." *Cowper's Heaven Opened*, p. 360.

[63] "Ministers are called Stars, for these reasons: 1. To signifie and point out the eminence and dignity of the office, that it is a glorious and shineing office. 2. To point out what is the especiall end of this office; It is to give light: as the use of Stars is to give light to the world; so it's Ministers main imployment to shine and give light to others; to make the world which is a dark night, to be lightsome." *Durham's Commentarie upon the Book of the Revelation*, p. 43. See also pp. 151, 368; and *Dickson's Truth's Victory over Error*, p. 176.

[64] The Rev. James Kirkton says of the Rev. John Welsh, that some one who observed him walking, "saw clearly a strange light surround him, and heard him speak strange words about his spiritual joy." *Select Biographies*, edited by the Rev. W. K. Tweedie, vol. i. p. 12. But more than this remains to be told. The hearts of the Scotch clergy were so lifted up with pride, that they believed—horrible to relate—that they had audible and verbal communications from the Almighty God, which bystanders could hear. One of these stories, relating also to Welsh, will be found, as tradition handed it down, in *Howie's Biographia Scoticana*, p. 148. I cannot quote such blasphemy; and those who doubt my statement had better refer to the second edition of Howie's work, published at Glasgow in 1781. It may probably be met with in the British Museum.

[65] "Mr. Johne M'Birnie at Aberdeen, (but first at the South Ferrie, over aganis the Castell of Broughtie), a most zealous and painfull pastor, a great opposer of hierarchie. He was a shyning torch and a burning starre; wherefore the Lord miraculouslie made, at his death, a starre to appeare in heaven at the noonetyde of the day; whilk many yit alive testifies that they did evidentlie see it, (at Whitsunday 1609)." *Row's History of the Kirk of Scotland*, p. 421.

[66] Mr. James Stirling, minister of Barony, Glasgow, writes respecting his father, Mr. John Stirling, minister at Kilbarchan, that the "day he was burryed ther wer two great candles burning in the chamber, and they did go out most surprisingly without any wind causing them to go out." *Analecta, or Materials for a History of Remarkable Providences*, by the Rev. Robert Wodrow, vol. iii. p. 37.

[67] "This night, Glanderston told me, that it was reported for a truth at Burroustoness, that about six weeks since Mr. David Williamson was preaching in his own church in

would remain for years unchanged and undecayed ; death not having the power over it which it would have had over the corpse of a common person.[68] On other occasions, notice was given to him of his death, years before it occurred ; [69] and, to strike greater awe into the public mind, it was remarked that when one minister died, others were taken away at the same time, so that, the bereavement being more widely felt, men might, by the magnitude of the shock, be rendered sensible of the inestimable value of those preachers whose lives were happily spared.[70]

It was moreover generally understood that a minister, during his abode in this world, was miraculously watched over and protected. He was peculiarly favoured by angels, who, though they did good offices to all members of the true church, were especially kind to the clergy ; [71] and it was well known that the celebrated Rutherford, when only four years old, having fallen into a well, was pulled out by an angel, who came there for the purpose of saving his life.[72] Another clergyman, who was in the habit of over-sleeping himself, used to be roused to his duty in the morning by three mysterious knocks at his door, which, if they did not produce a proper effect, were repeated close to his bed. These knocks never failed on Sunday, and on days when he had to administer the

Edinburgh, and in the middle of the Sermon, a ratton came and sat doun on his Bible. This made him stope ; and after a little pause, he told the congregation that this was a message of God to him, and broke off his sermon, and took a formall fareweel of his people, and went home, and continoues sick." *Wodrow's Analecta*, vol. i. p. 12.

[68] "The same person" (*i.e.* the Rev. Mr. White) "adds, that some years ago, when Mr. Bruce's grave was opened, to lay in his grandchild, his body was almost fresh and uncorrupted, to the great wonder of many ; and if I right remember, the grave was again filled up, and another made. The fresh body had no noisome smell. It was then nearly eighty years after he was buried. My informer was minister of Larbert when this happened." *Wodrow's Life of Bruce*, p. 150, prefixed to *Bruce's Sermons*.

[69] "He" (John Lockhart) "tells me Mr. Robert Paton, minister at Barnweel, his father-in-lau, had a particular for-notice, seven or eight years before, of his death : That he signifyed so much to my informer." . . . "When my informer came, he did not apprehend any hazard, and signifyed so much to his father-in-lau, Mr. Paton. He answered, 'John, John, I am to dye at this time : and this is the time God warned me of, as I told you.' In eight or ten dayes he dyed. Mr. Paton was a man very much (beloved) and mighty in prayer." *Wodrow's Analecta*, vol. iii. p. 451. Compare the case of Henderson (in *Wodrow's Correspondence*, vol. iii. p. 33), where the notice was much shorter, but "all fell out as he had foretold."

[70] "Generally, I observe that Ministers' deaths are not single, but severall of them together." *Wodrow's Analecta*, vol. iii. p. 275.

[71] The Rev. William Row (in his *Continuation of Blair's Autobiography*, p. 153) says, "Without all doubt, though it cannot be proven from Scripture that every one has a tutelar angel, yet it is certain that the good angels do many good offices to the people of God, *especially to his ministers and ambassadors*, which we do not see, and do not remark or know."

[72] "Mr. James Stirling, and Mr. Robert Muir, and severall others in the company, agreed on this accompt of Mr. Rutherford. When about four years old, he was playing about his father's house, and a sister of his, somewhat older than he, with him. Mr. Rutherford fell into a well severall fathoms deep, and not full, but faced about with heuen stone, soe that it was not possible for any body to get up almost, far less a child. When he fell in, his sister ran into the house near by, and told that Samuell was fallen into the well ; upon which his father and mother ran out, and found him sitting on the grasse beside the well ; and when they asked him, Hou he gote out ? he said, after he was once at the bottome, he came up to the tope, and ther was a bonny young man pulled him out by the hand. Ther was noe body near by at the time ; and soe they concluded it was noe doubt ane angell. The Lord had much to doe with him." *Wodrow's Analecta*, vol. i. p. 57. See also vol. iii. pp. 88, 89, where this circumstance is again mentioned as "a tradition anent him" in the place of his birth.

communion ; and they lasted during the whole of his ministry, until he became old and infirm, when they entirely ceased.[73]

By the propagation of these and similar stories, in a country already prepared for their reception, the Scotch mind became imbued with a belief in miraculous interposition to an extent which would be utterly incredible if it were not attested by a host of contemporary and unimpeachable witnesses. The clergy, partly because they shared in the general delusion, and partly because they derived benefit from it, did everything they could to increase the superstition of their countrymen, and to familiarize them with notions of the supernatural world such as can only be paralleled in the monastic legends of the Middle Ages.[74] How they laboured to corrupt the national intellect, and how successful they were in that base vocation, has been hitherto known to no modern reader ; because no one has had the patience to peruse their interminable discourses, commentaries, and the other religious literature in which their sentiments are preserved. As, however, the preachers were in Scotland more influential than all other classes put together, it is only by comparing their statements with what is to be found in the general memoirs and correspondence of the time, that we can at all succeed in reconstructing the history of a period which, to the philosophic student of the human mind, is full of great though melancholy interest. I shall therefore make no apology for entering into still further details respecting these matters ; and I hope to put the reader in possession of such facts as will connect the past history of Scotland with its present state, and will enable him to understand why it is that so great a people are in many respects still struggling in darkness, simply because they still live under the shadow of that long and terrible night which for more than a century covered the land. It will also appear that their hardness and moroseness of character, their want of gaiety, and their indifference to many of the enjoyments of life, are traceable to the same cause, and are the natural product of the gloomy and ascetic opinions inculcated by their religious

[73] "Mr. William Trail, minister at ****, tells me that his father, Mr. William Trail, minister at Borthwick, used every morning, when he had publick work on his hand, to hear three knocks at his chamber dore ; and if, throu wearynes, or heaviness, he did sitt these, ther wer ordinarily three knocks at his bed-head, which he never durst sitt, but gott up to his work. This was ordinarly about three in the morning. This, at first, in his youth, frighted him ; but at lenth it turned easy to him, and he believed these knocks and awaknings proceeded from a good art. That these never failed him on Sabbaths and at Communions, when he was oblidged to rise early : That when he turned old and infirm, toward the close of his dayes, they intirely ceased and left him." *Wodrow's Analecta*, vol. ii. p. 307. This work, in four quarto volumes, is invaluable for the history of the Scotch mind ; being a vast repertory of the opinions and traditions of the clergy during the seventeenth and early part of the eighteenth century. Wodrow was a man of ability, certainly above the average ; his honesty is unimpeachable, as the jealous scrutiny which the episcopalians have made of his great work on the History of the Church of Scotland decisively proves ; and he was in the constant habit of personal and epistolary communication with the leading characters of his age. I have therefore freely used his *Analecta* ; also his *Collections upon the Lives of Ministers*, which is likewise in four quarto volumes ; and his *Correspondence*, in three thick octavo volumes. It would be difficult to find a more competent witness respecting the sentiments of his ecclesiastical brethren. It would be impossible to find a more candid one.

[74] In illustration of this, a volume might be filled with extracts from the writings of the Scotch divines of the seventeenth century. The following passage is perhaps as good as any. "Yea, it can hardly be instanced any great change, or revolution in the earth, which hath not had some such extraordinary herald going before. Can the world deny how sometimes these prodigious signes have been shaped out to point at the very nature of the stroke then imminent, by a strange resemblance to the same, such as a flaming sword in the air, the appearance of armies fighting even sometimes upon the earth, to the view of many most sober and judicious onlookers, also showers of blood, the noise of drummes, and such like, which are known usually to go before warr and commotions?" *Fleming's Fulfilling of the Scripture*, 1681, p. 216.

teachers. For in that age as in every other, the clergy, once possessed of power, showed themselves harsh and unfeeling masters. They kept the people in a worse than Egyptian bondage, inasmuch as they enslaved mind as well as body, and not only deprived men of innocent amusements, but taught them that those amusements were sinful. And so thoroughly did they do their work that, though a hundred and fifty years have elapsed since their supremacy began to wane, the imprint of their hands is everywhere discernible. The people still bear the marks of the lash; the memory of their former servitude lives among them; and they crouch before their clergy as they did of old, abandoning their rights, sacrificing their independence, and yielding up their consciences to the dictates of an intolerant and ambitious priesthood.

Of all the means of intimidation employed by the Scotch clergy, none was more efficacious than the doctrines they propounded respecting evil spirits and future punishment. On these subjects they constantly uttered the most appalling threats. The language which they used was calculated to madden men with fear, and to drive them to the depths of despair. That it often had this consequence, and produced most fatal results, we shall presently see. And what made it more effectual was that it completely harmonized with those other gloomy and ascetic notions which the clergy inculcated, and according to which, pleasures being regarded as sinful, sufferings were regarded as religious. Hence that love of inflicting pain, and that delight in horrible and revolting ideas, which characterized the Scotch mind during the seventeenth century. A few specimens of the prevailing opinions will enable the reader to understand the temper of the time, and to appreciate the resources which the Scotch clergy could wield, and the materials with which they built up the fabric of their power.

It was generally believed that the world was overrun by evil spirits, who not only went up and down the earth, but also lived in the air, and whose business it was to tempt and hurt mankind.[75] Their number was infinite, and they were to be found at all places and in all seasons. At their head was Satan himself, whose delight it was to appear in person, ensnaring or terrifying every one he met.[76] With this object, he assumed various forms. One day he would visit the earth as a black dog;[77] on another day, as a raven;[78] on another, he would be heard

[75] Durham, after mentioning "old abbacies or monasteries, or castles when walls stand and none dwelleth in them," adds, "If it be asked, If there be such a thing, as the haunting of evill spirits in these desolate places? We answer 1. That there are evill spirits rangeing up and down through the earth is certain, even though hell be their prison properly, yet have they a sort of dominion and abode both in the earth and air; partly, as a piece of their curse, this is laid on them to wander; partly as their exercise to tempt men, or bring spirituall or temporall hurt to them," &c. *Durham's Commentarie upon the Book of the Revelation*, p. 582. So, too, Hutcheson (*Exposition of the Book of Job*, p. 9): "We should remember that we sojourn in a world where Devils are, and do haunt among us;" and Fleming (*Fulfilling of the Scripture*, p. 217): "But the truth itself is sure, that such a party is at this day, encompassing the earth, and trafficking up and down there, to prove which by arguments were to light a candle to let men see that it is day, while it is known what *ordinary familiar converse many have therewith*." One of their favourite abodes was the Shetland Islands, where, in the middle of the seventeenth century, "almost every family had a Brouny or evil spirit so called." See the account given by the Rev. John Brand, in his work entitled *A Brief Description of Orkney, Zetland, Pightland-Firth, and Caithness*, pp. 111, 112, Edinburgh, 1701.

[76] "There is not one whom he assaulteth not." *Abernethy's Physicke for the Soule*, p. 101. "On the right hand and on the left." *Cowper's Heaven Opened*, p. 273. Even early in the eighteenth century the "most popular divines" in Scotland affirmed that Satan "frequently appears clothed in a corporeal substance." *Memoirs of Charles Lee Lewes, written by Himself*, vol. iii. pp. 29, 30, London, 1805.

[77] "This night James Lochheid told me, that last year, if I mistake not, at the Communion of Bafron, he was much helped all day. At night, when dark somewhat, he went out to the feilds to pray: and a terrible slavish fear came on him, that he almost lost his senses. Houever, he resolved to goe on to his duty. By (the time) he was at the

in the distance, roaring like a bull.[79] He appeared sometimes as a white man in black clothes;[80] and sometimes he came as a black man in black clothes, when it was remarked that his voice was ghastly, that he wore no shoes, and that one of his feet was cloven.[81] His stratagems were endless. For, in the opinion of divines, his cunning increased with his age; and having been studying for more than five thousand years, he had now attained to unexampled dexterity.[82] He could, and he did, seize both men and women, and carry them away through

place, his fear was off him; and lying on a knou-side, a black dogg came to his head and stood. He said he kneu it to be Satan, and shooke his hand, but found nothing, it evanishing." . . . "Lord help against his devices, and strenthen against them!" *Wodrow's Analecta*, vol. i. p. 24. The *Registers of the Presbytery of Lanark*, p. 77, contain a declaration, in 1650, that "the devill appeared like a little whelpe," and afterwards, "like a brown whelpe."

[78] The celebrated Peden was present when "there came down the appearance of a raven, and sat upon one man's head." . . . Thereupon, "going home, Mr. Peden said to his land-lord, I always thought there was Devilry among you, but I never thought that he did appear visibly among you, till now I have seen it. O, for the Lord's sake quit this way." *The Life and Death of Mr. Alexander Peden, late Minister of the Gospel at New Glenluce in Galloway*, pp. 111, 112, in vol. i. of *Walker's Biographia Presbyteriana*.

[79] "I heard a voice just before me on the other side of the hedge, and it seemed to be like the groaning of an aged man. It continued so some time. I knew no man could be there; for, on the other side of the hedge, where I heard the groaning, there was a great stank or pool. I nothing doubted but it was Satan, and I guessed his design; but still I went on to beg the child's life. At length he roared and made a noise like a bull, and that very loud. From all this I concluded that I had been provoking God some way or other in the duty, and that he was angry with me, and had let the enemy loose on me and might give him leave to tear me in pieces. This made me intreat of God, to show me wherefore he contended, and begged he would rebuke Satan. The enemy continued to make a noise like a bull, and seemed to be coming about the hedge towards the door of the summer-seat, bellowing as he came along." *Stevenson's Rare, Soul-Strengthening, and Comforting Cordial for Old and Young Christians*, p. 29. This book was published, and prepared for the press, by the Rev. William Cupples. See Mr. Cupples' letter at the beginning.

[80] In 1684, with "black cloaths, and a blue band, and white handcuffs." *Sinclair's Satan's Invisible World Discovered*, p. 8.

[81] "He observed one of the black man's feet to be cloven, and that the black man's apparel was black, and that he had a blue band about his neck, and white hand-cuffs, and that he had hoggers upon his legs without shoes; and that the black man's voice was hollow and ghastly." *Satan's Invisible World Discovered*, p. 9. "The devil appeared in the shape of a black man." p. 31. See also *Brand's Description of Orkney*, p. 126: "All in black."

[82] "The acquired knowledge of the Devill is great, hee being an advancing student, and still learning now above five thousand yeares." *Rutherford's Christ Dying and Drawing Sinners to Himselfe*, p. 204. "He knowes very well, partly by the quicknesse of his nature, and partly by long experience, being now very neere six thousand yeeres old." *Cowper's Heaven Opened*, p. 219. "Hee, being compared with vs, hath many vantages; as that he is more subtill in nature, being of greater experience, and more ancient, being now almost sixe thousand yeeres old." *Ibid.*, p. 403. "The diuell here is both diligent and cunning, and (now almost of sixe thousand yeeres) of great experience." *Abernethy's Physicke for the Soule*, p. 142. "Satan, such an ingenious and experimented spirit." *Binning's Sermons*, vol. i. p. 67. "His great sleight and cunning." *Ibid.*, p. 110. Other eulogies of his skill may be seen in *Fergusson's Exposition of the Epistles of Paul*, p. 475; and in *Fleming's Fulfilling of the Scripture*, p. 45. A "minister," whose name is not mentioned, states that he is "of an excellent substance, of great natural parts, long experience, and deep understanding." *Sinclair's Satan's Invisible World Discovered*, p. 78.

the air.[83] Usually he wore the garb of laymen, but it was said that on more than one occasion he had impudently attired himself as a minister of the gospel.[84] At all events, in one dress or other, he frequently appeared to the clergy, and tried to coax them over to his side.[85] In that, of course, he failed ; but, out of the ministry, few indeed could withstand him. He could raise storms and tempests ; he could work not only on the mind, but also on the organs of the body, making men hear and see whatever he chose.[86] Of his victims, some he prompted to

[83] In Professor Sinclair's work (*Satan's Invisible World Discovered*, p. 141), we find, in 1684, "an evident instance that the devil can transport the bodies of men and women through the air. It is true, he did not carry her far off, but not for want of skill and power." Late in the seventeenth century, it was generally believed that one of Satan's accomplices was literally "strangled in his chair by the devil, lest he should make a confession to the detriment of the service." *Crawfurd's History of the Shire of Renfrew*, part iii. p. 319.

[84] See the account of a young preacher being deceived in this way, in *Wodrow's Analecta*, vol. i. pp. 103, 104. The Rev. Robert Blair detected the cheat, and "with ane awful seriousness appearing in his countenance, began to tell the youth his hazard, and that the man whom he took for a Minister was the Divel, who had trepanned him, and brought him into his net ; advised him to be earnest with God in prayer, and likewise not to give way to dispair, for ther was yet hope." The preacher had on this occasion been so far duped as to give the devil "a written promise" to do whatever he was requested. As soon as the Rev. Mr. Blair ascertained this fact, he took the young man before the Presbytery, and narrated the circumstance to the members. "They were all strangely affected with it, and resolved unanimously to dispatch the Presbitry business presently, and to stay all night in town, and on the morrow to meet for prayer in one of the most retired churches of the Presbitry, acquainting none with their business, (but) taking the youth alongst with them, whom they keeped alwise close by them. Which was done, and after the Ministers had prayed all of them round, except Mr. Blair, who prayed last, in time of his prayer there came a violent rushing of wind upon the church, so great that they thought the church should have fallen down about their ears, and with that the youth's paper and covenant" (*i.e.* the covenant which he had signed at the request of Satan) "droops down from the roof of the church among the Ministers."

[85] "The devil strikes at them, that in them he may strike at the whole congregation." *Boston's Sermons*, p 186. Fleming (*Fulfilling of the Scripture*, p. 379) gives an account of his appearing to one of the Scotch clergy. Compare *Wodrow's Analecta*, vol. iv. p. 110. In 1624 Bruce writes, "I heard his voice as vively as ever I heard anything, not being sleeping, but waking." *Life of Bruce*, p. 8, prefixed to *Bruce's Sermons*. The only remedy was immediate resistance. "It is the duty of called ministers to go on with courage in the work of the Lord, notwithstanding of any discouragement of that kind, receiving manfully the first onset chiefly of Satan's fury, as knowing their ceding to him will make him more cruel." *Fergusson's Exposition of the Epistles of Paul*, p. 74. In the seventeenth century, the Scotch clergy often complimented each other upon having baffled him, and thereby put him in a passion. Thus, in 1626, Dickson writes to Boyd : "The devil is mad against you, he fears his kingdom." *Life of Robert Boyd, in Wodrow's Collections upon the Lives of Ministers*, vol. ii. part i. p. 238. See also pp. 165, 236.

[86] "He can delude ears, eyes, &c., either by misrepresenting external objects, or by inward disturbing of the faculties and organes, whereby men and women may, and do often, apprehend that they hear, see, &c. such and such things, which, indeed, they do not." *Durham's Commentarie upon the Book of the Revelation*, p. 128. "Raise tempests." *Binning's Sermons*, vol. i. p. 122. "His power and might, whereby through God's permission he doth raise up storms, commove the elements, destroy cattle," &c. *Fergusson's Exposition of the Epistles of Paul*, p. 264. "Hee can work curiously and strongly on the walls of bodily organs, on the shop that the understanding soule lodgeth in, and on the necessary tooles, organs, and powers of fancie, imagination, memory, humours, senses, spirits, bloud," &c. *Rutherford's Christ Dying*, p. 212. Semple, giving notice of his intention to administer the sacrament, told the congregation "that the Devil would be so envious about the good work they were to go about, that he was afraid he would be permitted to raise a storm in the air with a speat of rain, to raise the waters, designing

commit suicide,[87] others to commit murder.[88] Still, formidable as he was, no Christian was considered to have attained to a full religious experience unless he had literally seen him, talked to him, and fought with him.[89] The clergy were constantly preaching about him, and preparing their audience for an interview with their great enemy. The consequence was that the people became almost crazed with fear. Whenever the preacher mentioned Satan, the consternation was so great that the church resounded with sighs and groans.[90] The aspect of a Scotch congregation in those days is indeed hard for us to conceive. Not unfrequently the people, benumbed and stupefied with awe, were rooted to their seats by the horrible fascination exercised over them, which compelled them to listen, though they are described as gasping for breath, and with their hair standing on end.[91] Such impressions were not easily effaced. Images of terror were left on the mind, and followed the people to their homes, and in their daily pursuits. They believed that the devil was always, and literally, at hand; that he was haunting them, speaking to them, and tempting them. There was no escape. Go where they would, he was there. A sudden noise, nay, even the sight of an inanimate object, such as a stone, was capable of reviving the association of ideas, and of bringing back to the memory the language uttered from the pulpit.[92]

Nor is it strange that this should be the case. All over Scotland the sermons

to drown some of them; but it will not be within the compass of his power to drown any of you, no not so much as a dog." *Remarkable Passages of the Life and Death of Mr. John Semple, Minister of the Gospel*, pp. 168, 169, in vol. i. of *Walker's Biographia Presbyteriana*.

[87] *Sinclair's Satan's Invisible World Discovered*, p. 137. *Memoirs of the Life and Experiences of Marion Laird of Greenock, with a Preface by the Rev. Mr. Cock*, pp. 43, 44, 45, 84, 85, 172, 222, 223.

[88] "I shall next show how the murderer Satan visibly appeared to a wicked man, stirred him up to stab me, and how mercifully I was delivered therefrom." *The Autobiography of Mr. Robert Blair, Minister of St. Andrews*, p. 65. See also *Fleming's Fulfilling of the Scripture*, pp. 379, 380.

[89] "One Mr. Thomas Hogg, a very popular presbyterian preacher in the North, asked a person of great learning, in a religious conference, whether or not he had seen the Devil? It was answered him, 'That he had never seen him in any visible appearance.' 'Then, I assure you,' saith Mr. Hogg, 'that you can never be happy till you see him in that manner; that is, untill you have both a personal converse and combat with him.'" *Scotch Presbyterian Eloquence*, pp. 28, 29.

[90] "Ye go to the kirk, and when ye hear the devil or hell named in the preaching, ye sigh and make a noise." *The Last and Heavenly Speeches of John, Viscount Kenmure*, in *Select Biographies*, vol. i. p. 405.

[91] Andrew Gray, who died in 1656, used such language, "that his contemporary, the foresaid Mr. Durham, observed, That many times he caused the very hairs of their head to stand up." *Howie's Biographia Scoticana*, p. 217. James Hutcheson boasted of this sort of success. "As he expressed it, 'I was not a quarter of ane hour in upon it, till I sau a dozen of them all gasping before me.' He preached with great freedome *all day*, and fourteen or twenty dated their conversion from that sermon." *Wodrow's Analecta*, vol. i. p. 131. When Dickson preached, "many were so choaked and taken by the heart, that through terrour, the spirit in such a measure convincing them of sin, in hearing of the word they have been made to fall over, and thus carried out of the church." *Fleming's Fulfilling of the Scripture*, p. 347. There was hardly any kind of resource which these men disdained. Alexander Dunlop "entered into the ministry at Paislay, about the year 1643 or 1644." . . . "He used in the pulpit, to have a kind of a groan at the end of some sentences. Mr. Peebles called it a holy groan." *Wodrow's Analecta*, vol. iii. pp. 16, 21.

[92] A schoolmaster, recording his religious experiences (*Wodrow's Analecta*, vol. i. p. 246), says: "If any thing had given a knock, I would start and shiver, the seeing of a dogg made me affrayed, the seeing of a stone in the feild made me affrayed, and as I thought a voice in my head saying, 'It's Satan.'"

were, with hardly an exception, formed after the same plan, and directed to the same end. To excite fear was the paramount object.[93] The clergy boasted that it was their special mission to thunder out the wrath and curses of the Lord.[94] In their eyes, the Deity was not a beneficent being, but a cruel and remorseless tyrant. They declared that all mankind, a very small portion only excepted, were doomed to eternal misery. And when they came to describe what that misery was, their dark imaginations revelled and gloated at the prospect. In the pictures which they drew they reproduced and heightened the barbarous imagery of a barbarous age. They delighted in telling their hearers that they would be roasted in great fires, and hung up by their tongues.[95] They were to be lashed with scorpions, and see their companions writhing and howling around them.[96] They were to be thrown into boiling oil and scalding lead.[97] A river of fire and brimstone, broader than the earth, was prepared for them ;[98] in that they were to be immersed ; their bones, their lungs, and their liver were to boil, but never be consumed.[99] At the same time, worms

[93] Only those who are extensively read in the theological literature of that time can form an idea of this, its almost universal tendency. During about a hundred and twenty years the Scotch pulpits resounded with the most frightful denunciations. The sins of the people, the vengeance of God, the activity of Satan, and the pains of hell, were the leading topics. In this world, calamities of every kind were announced as inevitable ; they were immediately at hand ; that generation, perhaps that year, should not pass away without the worst evils which could be conceived falling on the whole country. I will merely quote the opening of a sermon which is now lying before me, and which was preached in 1682 by no less a man than Alexander Peden. "There is three or four things that I have to tell you this day ; and the first is this, A bloody sword, a bloody sword, a bloody sword, for thee, O Scotland, that shall reach the most part of you to the very heart. And the second is this, Many a mile shall ye travel in thee, O Scotland ! and shall see nothing but waste places. The third is this, The most fertile places in thee, O Scotland ! shall be waste as the mountain tops. And fourthly, The women with child in thee, O Scotland ! shall be dashed in pieces. And fifthly, There hath been many conventicles in thee, O Scotland ! but ere it be long, God shall have a conventicle in thee, that shall make thee Scotland tremble. Many a preaching hath God wared on thee, O Scotland ! but ere it be long God's judgments shall be as frequent in Scotland as these precious meetings, wherein he sent forth his faithful servants to give faithful warning in his name of their hazard in apostatizing from God, and in breaking all his noble vows. God sent out a Welsh, a Cameron, a Cargill, and a Semple to preach to thee ; but ere long God shall preach to thee by a bloody sword." *Sermons by Eminent Divines*, pp. 47, 48.

[94] To "thunder out the Lord's wrath and curse." *Durham's Commentarie upon the Book of the Revelation*, p. 191. "It is the duty of Ministers to preach judgments." *Hutcheson's Exposition on the Minor Prophets*, vol. i. p. 93. "If ministers when they threaten be not the more serious and fervent, the most terrible threatening will but little affect the most part of hearers." *Fergusson's Exposition of the Epistles of Paul*, p. 421.

[95] The clergy were not ashamed to propagate a story of a boy who, in a trance, had been mysteriously conveyed to hell, and thence permitted to revisit the earth. His account, which is carefully preserved by the Rev. Robert Wodrow (*Analecta*, vol. i. p. 51) was, that "ther wer great fires and men roasted in them, and then cast into rivers of cold water, and then into boyling water ; others hung up by the tongue."

[96] "Scortched in hell-fire and hear the howling of their fellow-prisoners, and see the ugly devils, the bloody scorpions with which Satan lasheth miserable soules." *Rutherford's Christ Dying*, pp. 491, 492.

[97] "Boiling oil, burning brimstone, scalding lead." *Sermons by Eminent Divines*, p. 362.

[98] "A river of fire and brimstone broader than the earth." *Rutherford's Religious Letters*, p. 35. "See the poor wretches lying in bundles, boiling eternally in that stream of brimstone." *Halyburton's Great Concern of Salvation*, p. 53.

[99] "Tongue, lungs, and liver, bones and all, shall boil and fry in a torturing fire." *Rutherford's Religious Letters*, p. 17. "They will be universal torments, every part of

were to prey upon them; and while these were gnawing at their bodies, they were to be surrounded by devils, mocking and making pastime of their pains.[100] Such were the first stages of suffering, and they were only the first. For the torture, besides being unceasing, was to become gradually worse. So refined was the cruelty that one hell was succeeded by another; and lest the sufferer should grow callous, he was after a time moved on, that he might undergo fresh agonies in fresh places, provision being made that the torment should not pall on the sense, but should be varied in its character, as well as eternal in its duration.[101]

All this was the work of the God of the Scotch clergy.[102] It was not only his work, it was his joy and his pride. For, according to them, hell was created before man came into the world; the Almighty, they did not scruple to say, having spent his previous leisure in preparing and completing this place of torture, so that when the human race appeared it might be ready for their reception.[103] Ample, however, as the arrangements were, they were insufficient; and hell, not being big enough to contain the countless victims incessantly poured into it, had in these latter days been enlarged.[104] There was now sufficient room. But in that vast expanse there was no void, for the whole of it reverberated with the shrieks and yells of undying agony.[105] They rent the air with horrid sound, and amid their pauses other scenes occurred, if possible still more excruciating. Loud reproaches filled the ear: children reproaching their parents, and servants reproaching their masters. Then indeed terror was rife, and abounded on every side. For while the child cursed his father, the father, consumed by remorse, felt his own guilt; and both children and fathers made hell echo with their piercing screams, writhing in convulsive agony at the torments which they suffered, and knowing that other torments more grievous still were reserved for them.[106]

the creature being tormented in that flame. When one is cast into a fiery furnace, the fire makes its way into the very bowels, and leaves no member untouched: what part then can have ease, when the damned swim in a lake of fire burning with brimstone?" *Boston's Human Nature in its Four-fold State*, p. 458.

100 "While wormes are sporting with thy bones, the devils shall make pastime of thy paines." *Abernethy's Physicke for the Soule*, p. 97. "They will have the society of devils in their torments, being shut up with them in hell." *Boston's Human Nature in its Four-fold State*, p. 442. "Their ears filled with frightful yellings of the infernal crew." *Ibid.*, p. 460.

101 This fundamental doctrine of the Scotch divines is tersely summed up in *Binning's Sermons*, vol. iii. p. 130: "You shall go out of one hell into a worse; eternity is the measure of its continuance, and the degrees of itself are answerable to its duration." The author of these sermons died in 1653.

102 And, according to them, the barbarous cruelty was the natural result of His Omniscience. It is with pain that I transcribe the following impious passage. "Consider, Who is the contriver of these torments. There have been some very exquisite torments contrived by the wit of men, the naming of which, if ye understood their nature, were enough to fill your hearts with horror; but *all these fall as far short of the torments ye are to endure, as the wisdom of man falls short of that of God.*" . . . "*Infinite wisdom has contrived that evil.*" *The Great Concern of Salvation, by the late Reverend Mr. Thomas Halyburton*, edit. Edinburgh, 1722, p. 154.

103 "Men wonder what he could be doing all that time, if we may call it time which hath no beginning, and how he was employed." . . . "Remember that which a godly man answered some wanton curious wit, who, in scorn, demanded the same of him—'He was preparing hell for curious and proud fools,' said he." *Binning's Sermons*, vol. i. p. 194.

104 "Hell hath inlarged itselfe." *Abernethy's Physicke for the Soule*, p. 146.

105 "Eternal shriekings." *Sermons by Eminent Divines*, p. 394. "Screakings and howlings." *Gray's Great and Precious Promises*, p. 20. "O! the screechs and yels that will be in hell." *Durham's Commentarie upon the Book of the Revelation*, p. 654. "The horrible scrieches of them who are burnt in it." *Cowper's Heaven Opened*, p. 175.

106 "When children and servants shall go, as it were, in sholes to the Pit, cursing their

Even now such language freezes the blood, when we consider what must have passed through the minds of those who could bring themselves to utter it. The enunciation of such ideas unfolds the character of the men, and lays bare their inmost spirit. We shudder when we think of the dark and corrupted fancy, the vindictive musings, the wild, lawless, and uncertain thoughts which must have been harboured by those who could combine and arrange the different parts of this hideous scheme. No hesitation, no compunction, no feelings of mercy, ever seem to have entered their breasts. It is evident that their notions were well matured; it is equally evident that they delighted in them. They were marked by a unity of conception, and were enforced with a freshness and vigour of language, which shows that their heart was in their work. But before this could have happened, they must have been dead to every emotion of pity and of tenderness. Yet they were the teachers of a great nation, and were in every respect the most influential persons in that nation. The people, credulous and grossly ignorant, listened and believed. We, at this distance of time, and living in another realm of thought, can form but a faint conception of the effect which these horrible conceits produced upon them. They were convinced that in this world they were incessantly pursued by the devil, and that he and other evil spirits were constantly hovering around them, in bodily and visible shape, tempting them, and luring them on to destruction. In the next world the most frightful and unheard-of punishments awaited them; while both this world and the next were governed by an avenging Deity, whose wrath it was impossible to propitiate. No wonder that, with these ideas before them, their reason should often give way, and that a religious mania should set in, under whose influence they in black despair put an end to their lives.[107]

parents and their masters who brought them there. And parents and masters of families shall be in multitudes plunged headlong in endless destruction, because they have not only murdered their own souls, but also imbrued their hands in the blood of their children and servants. O how doleful will the reckoning be amongst them at that day! When the children and servants shall upbraid their parents and masters. 'Now, now, we must to the Pit, and we have you to blame for it; your cursed example and lamentable negligence has brought us to the Pit.'" . . . "And on the other hand, how will the shrieks of parents fill every ear? 'I have damn'd myself, I have damn'd my children, I have damn'd my servants. While I fed their bodies, and clothed their backs, I have ruined their souls, and brought double damnation on myself.'" *Halyburton's Great Concern of Salvation*, pp. 527, 528. See this further worked out in *Boston's Human Nature in its Four-fold State*, pp. 378, 379: "Curses instead of salutations, and tearing of themselves, and raging against one another, instead of the wonted embraces."

[107] William Vetch, "preaching in the town of Jedburg to a great congregation, said, 'There are two thousand of you here to day, but I am sure fourscore of you will not be saved;' upon which, three of his ignorant hearers being in despair, despatch'd themselves soon after." *Scotch Presbyterian Eloquence*, p. 23. See also the life, or rather panegyric, of Vetch in *Howie's Biographia Scoticana*, where this circumstance is not denied but on the contrary is stated to be no "disparagement to him," p. 606. The frame of mind which the teachings of the clergy encouraged, and which provoked self-murder, is vividly depicted by Samuel Rutherford, the most popular of all the Scotch divines of the seventeenth century. "Oh! hee lieth down, and hell beddeth with him; hee sleepeth, and hell and hee dreame together; he riseth, and hell goeth to the fields with him; hee goes to his garden, there is hell." . . . "The man goes to his table, O! hee dare not eat, hee hath no right to the creature; to eat is sin and hell; so hell is in every dish. To live is sinne, *hee would faine chuse strangling*; every act of breathing is sin and hell. Hee goes to church, there is a dog as great as a mountaine before his eye: Here be terrors." *Rutherford's Christ Dying*, 1647, 4to, pp. 41, 42. Now listen to the confessions of two of the tortured victims of the doctrines enunciated by the clergy; victims who, after undergoing ineffable agony, were more than once, according to their own account, tempted to put an end to their lives. "The cloud lasted for two years and some months." . . . "The arrows of the Almighty did drink up my spirits; night and day his hand lay heavy upon me, so that even my bodily moisture was turned into

Little comfort, indeed, could men then gain from their religion. Not only the devil, as the author of all evil, but even He whom we recognize as the author of all good, was in the eyes of the Scotch clergy a cruel and vindictive being, moved with anger like themselves. They looked into their own hearts, and there they found the picture of their God. According to them, He was a God of terror, instead of a God of love.[108] To Him they imputed the worst passions of their own peevish and irritable nature. They ascribed to Him revenge, cunning, and a constant disposition to inflict pain. While they declared that nearly all mankind were sinners beyond the chance of redemption, and were indeed predestined to eternal ruin, they did not scruple to accuse the Deity of resorting to artifice against these unhappy victims; lying in wait for them, that He might catch them unawares.[109] The Scotch clergy taught their hearers that the Almighty was so sanguinary, and so prone to anger, that He raged even against walls and houses and senseless creatures, wreaking His fury more than ever, and scattering desolation on every side.[110] Sooner than miss His fell and malignant purpose, He would, they said, let loose avenging angels, to fall upon men and upon their families.[111] Independently of this resource, He had various

the drought of summer. When I said sometimes that my couch would ease my complaint, I was filled with tossings to the dawning of the day." . . . "Amidst all my downcastings, I had the roaring lion to grapple with, who likes well to fish in muddy waters. He strongly suggested to me that I should not eat, because I had no right to food; or if I ventured to do it, the enemy assured me that the wrath of God would go down with my morsel; and that I had forfeited a right to the divine favour, and therefore had nothing to do with any of God's creatures." . . . "However, so violent were the temptations of the strong enemy, that I frequently forgot to eat my bread, and durst not attempt it; and when, through the persuasion of my wife, I at any time did it, the enemy through the day did buffet me in a violent way, assuring me that the wrath of God had gone over with what I had taken." . . . "The enemy after all did so pursue me, that he violently suggested to my soul, that, some time or other, God would suddenly destroy me as with a thunderclap: which so filled my soul with fear and pain, that, every now and then, I looked about me, to receive the divine blow, still expecting it was a coming; yea, many a night I durst not sleep, lest I had awakened in everlasting flames." *Stevenson's Rare Cordial*, pp. 11–13. Another poor creature, after hearing one of Smiton's sermons in 1740, says, "Now, I saw myself to be a condemned criminal; but I knew not the day of my execution. I thought that there was nothing between me and hell, but the brittle thread of natural life." . . . "And in this dreadful confusion, I durst not sleep, least I had awakened in everlasting flames." . . . "And Satan violently assaulted me to take away my own life, seeing there was no mercy for me." . . . "Soon after this, I was again violently assaulted by the tempter to take away my own life; he presented to me a knife therewith to do it; no person being in the house but myself. The enemy pursued me so close, that I could not endure so much as to see the knife in my sight, but laid it away." . . . "One evening, as I was upon the street, Satan violently assaulted me to go into the sea and drown myself; it would be the easiest death. Such a fear of Satan then fell upon me, as made my joints to shake, so that it was much for me to walk home; and when I came to the door, I found nobody within; I was afraid to go into the house, lest Satan should get power over me." *Memoirs of the Life and Experiences of Marion, Laird of Greenock*, pp. 13, 14, 19, 45, 223, 224.

[108] Binning says, that "since the first rebellion" (that is, the fall of Adam), "there is nothing to be seen but the terrible countenance of an angry God." *Binning's Sermons*, vol. iii. p. 254.

[109] "He will, as it were, lie in wait to take all advantages of sinners to undo them." *Hutcheson's Exposition on the Minor Prophets*, vol. i. p. 247.

[110] "His wrath rages against walls, and houses, and senselesse creatures more now then at that time" (*i.e.* at the time when the Old Testament was written). "See what desolation he hath wrought in Ireland, what eating of horses, of infants, and of killed souldiers, hath beene in that land, and in Germany." *Rutherford's Free Disputation against Pretended Liberty of Conscience*, pp. 244, 245.

[111] "Albeit there were no earthly man to pursue Christ's enemies; yet avenging

ways whereby He could at once content Himself and plague His creatures, as was particularly shown in the devices which He employed to bring famine on a people.[112] When a country was starving, it was because God, in His anger, had smitten the soil, had stopped the clouds from yielding their moisture, and thus made the fruits of the earth to wither.[113] All the intolerable sufferings caused by a want of food, the slow deaths, the agony, the general misery, the crimes which that misery produced, the anguish of the mother as she saw her children wasting away and could give them no bread, all this was His act, and the work of His hands.[114] In His anger, He would sometimes injure the crops by making the spring so backward, and the weather so cold and rainy, as to insure a deficiency in the coming harvest.[115] Or else He would deceive men, by sending them a favourable season, and after letting them toil and sweat in the hope of an abundant supply, He would at the last moment suddenly step in, and destroy the corn just as it was fit to be reaped.[116] For the God

angels, or evil spirits shall be let forth upon them and their families to trouble them." *Dickson's Explication of the First Fifty Psalms*, p. 229.

[112] "God hath many wayes and meanes whereby to plague man, and *reach his contentments*." *Hutcheson's Exposition on the Minor Prophets*, vol. i. p. 286. "God hath variety of means whereby to plague men, and to bring upon them any affliction he intendeth against them; and particularly he hath several wayes whereby to bring on famine. He can arme all his creatures to cut off men's provision, one of them after another; he can make the change of aire, and small insects do that worke when he pleaseth." *Ibid.*, vol. i. p. 422. The same divine, in another elaborate treatise, distinctly imputes to the Deity a sensation of pleasure in injuring even the innocent. "When God sends out a scourge, of sword, famine, or pestilence, suddenly to overthrow and cut people off, not only are the wicked reached thereby (which is here supposed), but even the innocent, that is, such as are righteous and free of gross provocations; for, in any other sense, none are innocent, or free of sin, in this life. Yea, further, in trying of the innocent by these scourges, *the Lord seems to act as one delighted with it*, and little resenting the great extremities wherewith they are pressed." *Hutcheson's Exposition of the Book of Job*, 1669, folio, p. 123. Compare p. 359. "It pleaseth the Lord to exercise great variety in afflicting the children of men," &c. But after all, mere extracts can give but a faint idea of the dark and malignant spirit which pervades these writings.

[113] "The present death and famine quhilk seases vpon many, quhairby God his heavie wrath is evidentlie perceaved to be kindlit against vs." *Selections from the Minutes of the Synod of Fife*, p. 98. "Smiting of the fruits of the ground." *Hutcheson's Exposition on the Minor Prophets*, vol. i. p. 277. "Makes fruits to wither." *Ibid.*, vol. ii. p. 183. "Hee restraines the clouds, and bindeth up the wombe of heaven, in extreme drought." *Rutherford's Christ Dying*, p. 52. "Sometime hee maketh the heauen aboue as brasse, and the earth beneath as iron; so that albeit men labour and sow, yet they receiue no encrease: sometime againe hee giues in due season the first and latter raine, so that the earth renders abundance, but the Lord by blasting windes, or by the caterpiller, canker-worme and grasse-hopper doth consume them, who come out as exacters and officers sent from God to poind men in their goods." *Cowper's Heaven Opened*, p. 433.

[114] "Under the late dearth this people suffered greatly, the poor were numerous, and many, especially about the town of Kilsyth, were at the point of starving; yet, as I frequently observed to them, I could not see any one turning to *the Lord who smote them*, or crying to him because of their sins, while *they howled upon their beds for bread*." *Robe's Narratives of the Extraordinary Work of the Spirit of God*, p. 68.

[115] *Nicoll's Diary*, pp. 152, 153. Much rain in the autumn, was "the Lord's displeasure upon the land." *Minutes of the Presbyteries of Saint Andrews and Cupar*, p. 179.

[116] "Men sweat, till, sow much, and the sun and summer, and clouds, warme dewes and raines smile upon cornes and meddowes, yet God steppeth in betweene the mouth of the husbandman and the sickle, and blasteth all." *Rutherford's Christ Dying*, p. 87. Compare *Baillie's Letters*, vol. iii. p. 52, on the "continuance of very intemperate rain upon the corns," as one of the "great signs of the wrath of God."

of the Scotch Kirk was a God who tantalized His creatures as well as punished them; and when He was provoked, He would first allure men by encouraging their expectations, in order that their subsequent misery might be more poignant.[117]

Under the influence of this horrible creed, and from the unbounded sway exercised by the clergy who advocated it, the Scotch mind was thrown into such a state that, during the seventeenth and part of the eighteenth century, some of the noblest feelings of which our nature is capable, the feelings of hope, of love, and of gratitude, were set aside, and were replaced by the dictates of a servile and ignominious fear. The physical sufferings to which the human frame is liable, nay, even the very accidents to which we are casually exposed, were believed to proceed not from our ignorance, nor from our carelessness, but from the rage of the Deity. If a fire chanced to break out in Edinburgh, the greatest alarm was excited, because it was the voice of God crying out against a luxurious and dissolute city.[118] If a boil or a sore appeared on your body, that too was a divine punishment, and it was more than doubtful whether it might lawfully be cured.[119] The small-pox, being one of the most fatal as well as one of the most loathsome of all diseases, was especially sent by God; and on that account the remedy of inoculation was scouted as a profane attempt to frustrate His intentions.[120] Other disorders, which, though less terrible,

[117] "When the Lord is provoked, he can not only send an affliction, but so order it, by faire appearances of a better lot, and heightening of the sinners expectation and desire, as may make it most sad." *Hutcheson's Exposition on the Minor Prophets*, vol. iii. pp. 9, 10.

[118] In 1696 there was a fire in Edinburgh; whereupon Moncrief, in his sermon next day, "told us, 'That God's voice was crying to this city, and that he was come to the very ports, and was crying over the walls to us; that we should amend our ways, lest he should come to our city, and consume us in a terrible manner.' I cannot tell what this Dispensation of Providence wrought on me," &c. *Memoirs or Spiritual Exercises of Elizabeth Wast, written by her own Hand*, pp. 41, 42. See also, at pp. 122, 123, the account of another conflagration, where it is said, "There was much of God to be seen in this fire." Compare a curious passage in *Calderwood's History of the Kirk of Scotland*, vol. vii. pp. 455, 456.

[119] The Rev. James Fraser had a boil, and afterwards a fever. "During this sickness he miraculously allayed the pain of my boil, and speedily, and that without means, cured it; for however I bought some things to prevent it, yet, looking on it as a punishment from God, I knew not if I could be free to take the rod out of his hand, and to counterwork him." *Memoirs of the Rev. James Fraser of Brea, Minister of the Gospel at Culross, written by Himself*, in *Select Biographies*, vol. ii. p. 223. Durham declaims against "sinful shunning and shifting off suffering;" and Rutherford says, "No man should rejoice at weakness and diseases; but I think we may have a sort of gladness at boils and sores, because, without them, Christ's fingers, as a slain Lord, should never have touched our skin." *Durham's Law Unsealed*, p. 160; *Rutherford's Religious Letters*, p. 265. I do not know what effect these passages may produce upon the reader; but it makes my flesh creep to quote them. Compare *Stevenson's Rare, Soul-strengthening, and Comforting Cordial*, p. 35.

[120] It was not until late in the eighteenth century that the Scotch clergy gave up this notion. At last, even they became influenced by the ridicule to which their superstition exposed them, and which produced more effect than any argument could have done. The doctrines, however, which they and their predecessors had long inculcated, had so corrupted the popular mind, that instances will, I believe, be found even in the nineteenth century, of the Scotch deeming precautions against small-pox to be criminal, or, as they called it, flying in the face of Providence. The latest evidence I can at this moment put my hand on is in a volume published in 1797. It is stated by the Rev. John Paterson that in the parish of Auldearn, in the county of Nairn, "very few have fallen a sacrifice to the small-pox, though the people are in general averse to inoculation, from the general gloominess of their faith, which teaches them that all diseases which afflict the human frame are instances of the Divine interposition, for the punishment

were very painful, proceeded from the same source, and all owed their origin to the anger of the Almighty.[121] In everything His power was displayed, not by increasing the happiness of men, nor by adding to their comforts, but by hurting and vexing them in all possible ways. His hand, always raised against the people, would sometimes deprive them of wine by causing the vintage to fail;[122] sometimes would destroy their cattle in a storm;[123] and sometimes would even make dogs bite their legs when they least expected it.[124] Sometimes He would display His wrath by making the weather excessively dry;[125] sometimes by making it equally wet.[126] He was always punishing; always busy in increasing the general suffering, or, to use the language of the time, making the creature smart under the rod.[127] Every fresh war was the result of His special interference; it was not caused by the meddling folly or insensate ambition of statesmen, but it was the immediate work of the Deity, who was thus made responsible for all the devastations, the murders, and other crimes more horrible still which war produces.[128] In the intervals of peace, which

of sin; any interference, therefore, on their part, they deem an usurpation of the prerogative of the Almighty." *Sinclair's Statistical Account of Scotland*, vol. xix. p. 618, Edinburgh, 1797. See also vol. xiv. p. 52, Edinburgh, 1795. This is well said. No doubt so abject and so pernicious a superstition among the people was the result of "the general gloominess of their faith." But the Rev. John Paterson has forgotten to add that the gloominess of which he complains was in strict conformity with the teachings of the most able, the most energetic, and the most venerated of the Scotch clergy. Mr. Paterson renders scant justice to his countrymen, and should rather have praised the tenacity with which they adhered to the instructions they had long been accustomed to receive.

[121] The Rev. John Welsh, when suffering from a painful disorder, and also from other troubles, writes: "My douleurs ar impossible to expresse." . . . "It is the Lord's indignation." See his letter, in *Miscellany of the Wodrow Society*, vol. i. p. 558. See also *Cowper's Heaven Opened*, p. 128. A pain in one's side was the work of "the Lord" (*Memoirs of Marion Laird*, p. 95); so was a sore throat (*Wast's Memoirs*, p. 203); and so was the fever in pleurisy (*Robe's Narratives of the Extraordinary Work of the Spirit of God*, p. 66).

[122] In January, 1653, "This tyme, and mony monethis befoir, thair wes great skairshtie of wynes. In this also appered Godis justice toward this natioun for abusing of that blissing many yeiris befoir." *Nicoll's Diary*, p. 105.

[123] This idea was so deeply rooted that we actually find a public fast and humiliation ordered, on account of "this present uncouth storme of frost and snaw, quhilk hes continewit sa lang that the bestiall ar dieing thik fauld." *Records of the Kirk Session, Presbytery, and Synod of Aberdeen*, p. 82.

[124] "There was a dog bit my leg most desperately. I no sooner received this, but I saw the hand of God in it." *Wast's Memoirs*, p. 114.

[125] "The evident documentis of Goddis wrath aganes the land, be the extraordinarie drouth." *Records of the Kirk Session, Presbytery, and Synod of Aberdeen*, p. 78.

[126] "The hynous synnes of the land produced much takines of Godis wraith; namelie, in this spring tyme, for all Februar and a great pairt of Marche wer full of havie weittis." *Nicoll's Diary*, p. 152.

[127] *Halyburton's Great Concern of Salvation*, p. 85. *Fleming's Fulfilling of Scripture*, pp. 101, 149, 176. *Balfour's Annales*, vol. i. p. 169. *Boston's Sermons*, p. 52. *Boston's Human Nature in its Four-fold State*, pp. 67, 136. *Memoirs of Marion Laird*, pp. 63, 90, 113, 163. *Hutcheson's Exposition of the Book of Job*, pp. 62, 91, 140, 187, 242, 310, 449, 471, 476, 527, 528.

[128] "War is one of the sharp scourges whereby God punisheth wicked nations; and it cometh upon a people, not accidentally, but *by the especial providence of God*, who hath peace and war in his own hand." *Hutcheson's Exposition on the Minor Prophets*, vol. ii. p. 3. In 1644, "Civill war wracks Spaine, and lately wracked Italie: it is coming by appearance shortlie upon France. The just Lord, who beholds with patience the wickednesse of nations, at last *arises in furie*." . . . "The Swedish and Danish fleets, after a hott fight, are making for a new onsett: great blood is feared shall be shortly shed

at that period were very rare, He had other means of vexing mankind. The shock of an earthquake was a mark of His displeasure ;[129] a comet was a sign of coming tribulation ;[130] and when an eclipse appeared, the panic was so universal that persons of all ranks hastened to church to deprecate His wrath.[131] What they heard there would increase their fear, instead of allaying it. For the clergy taught their hearers that even so ordinary an event as thunder was meant to excite awe, and was sent for the purpose of showing to men with how terrible a master they had to deal.[132] Not to tremble at thunder was therefore a mark of impiety ; and in this respect man was unfavourably contrasted with the lower animals, since they were invariably moved by this symptom of divine power.[133]

These visitations, eclipses, comets, earthquakes, thunder, famine, pestilence, war, disease, blights in the air, failures in the crops, cold winters, dry summers, these and the like were, in the opinion of the Scotch divines, outbreaks of the anger of the Almighty against the sins of men ; and that such outbreaks were incessant is not surprising, when we consider that in the same age and according to the same creed, the most innocent and even praiseworthy actions were deemed sinful, and worthy of chastisement. The opinions held on this subject are not only curious, but extremely instructive. Besides forming an important part of the history of the human mind, they supply decisive proof of the danger of allowing a single profession to exalt itself above all other professions. For in Scotland as elsewhere, directly the clergy succeeded in occupying a more than ordinary amount of public attention, they availed themselves of that circumstance to propagate those ascetic doctrines which, while they strike at the root of human happiness, benefit no one except the class which advocates them. That class, indeed, can hardly fail to reap advantage from a policy which, by increasing the apprehensions to which the ignorance and timidity of men make them too liable, does also increase their eagerness to fly for support to their spiritual advisers. And the greater the apprehension, the greater the eagerness. Of this the Scotch clergy, who were perfect masters of their own art,

there, both by sea and land. The *anger of the Lord* against all christendome is great." *Baillie's Letters and Journals*, vol. ii. pp. 190, 223.

129 " Earthquakes, whereby God, when he is angry, overthrows and overturns very mountains." *Hutcheson's Exposition of the Book of Job*, p. 114. " The ministris and sessioun convening in the sessioun hous, considdering the fearfull erthquak that wes yisternicht, the aucht of this instant, throughout this haill citie about nine houris at evin, to be a document that God is angrie aganes the land and aganes this citie in particular, for the manifauld sinnis of the people," &c. *Records of the Kirk Session, Presbytery, and Synod of Aberdeen*, p. 64.

130 " Whatever natural causes may be adduced for those alarming appearances, the system of comets is yet so uncertain, and they have so frequently preceded desolating strokes and turns in public affairs, that they seem designed in providence to stir up sinners to seriousness. Those preachers from heaven, when God's messengers were silenced, neither prince nor prelate could stop." *Wodrow's History of the Church of Scotland*, vol. i. p. 421.

131 " People of all sortes rane to the churches to deprecat God's wrath." *Balfour's Annales*, vol. i. p. 403. This was in 1598.

132 " By it he manifests his power and shows himself terrible." *Durham's Commentarie upon the Book of the Revelation*, p. 33. Compare *Row's History of the Kirk*, p. 333 ; and a passage in *Laird's Memoirs*, p. 69, which shows how greedily their credulous hearers imbibed such notions : " There were several signal evidences that the Lord's righteous judgments were abroad in the earth ; great claps of thunder," &c.

133 " The stupidity and senselessnesse of man is greater than that of the brute creatures, which are all more moved with the thunder then the hearts of men for the most part." *Dickson's Explication of the First Fifty Psalms*, p. 193. Hutcheson makes a similar remark concerning earthquakes. " The shaking and trembling of insensible creatures, when God is angry, serves to condemn men, who are not sensible of it, nor will stoop under his hand." *Hutcheson's Exposition of the Book of Job*, p. 115.

were well aware. Under their influence a system of morals was established which, representing nearly every act as sinful, kept the people in perpetual dread, lest unwittingly they were committing some enormous offence, which would bring upon their heads a signal and overwhelming punishment.

According to this code, all the natural affections, all social pleasures, all amusements, and all the joyous instincts of the human heart were sinful, and were to be rooted out. It was sinful for a mother to wish to have sons ;[134] and, if she had any, it was sinful to be anxious about their welfare.[135] It was a sin to please yourself, or to please others ; for by adopting either course you were sure to displease God.[136] All pleasures, therefore, however slight in themselves, or however lawful they might appear, must be carefully avoided.[137] When mixing in society, we should edify the company, if the gift of edification had been bestowed upon us ; but we should by no means attempt to amuse them.[138] Cheerfulness, especially when it rose to laughter, was to be guarded against ; and we should choose for our associates grave and sorrowful men, who were not likely to indulge in so foolish a practice.[139] Smiling, provided it stopped short

[134] Lady Colsfeild "had born two or three daughters, and was sinfully anxious after a son, to heir the estate of Colsfeild." *Wodrow's Analecta*, vol. iii. p. 293.

[135] Under the influence of this terrible creed, the amiable mother of Duncan Forbes, writing to him respecting his own health and that of his brother, speaks of "my sinful, God-provoking anxiety, both for your souls and bodies." *Burton's Lives of Lovat and Forbes*, p. 274. The theological theory underlying and suggesting this was that "grace bridles these affections." *Boston's Human Nature in its Four-fold State*, p. 184. Hence its rigid application on days set apart for religious purposes. The Rev. Mr. Lyon (*History of Saint Andrews*, vol. i. p. 458) mentions that some of the Scotch clergy, in drawing up regulations for the government of a colony, inserted the following clause : "No husband shall kiss his wife, and no mother shall kiss her child on the Sabbath day."

[136] "The more you please yourselves and the world, the further you are from pleasing God." *Binning's Sermons*, vol. ii. p. 55. Elsewhere (vol. ii. p. 45) : "Amity to ourselves is enmity to God."

[137] "Pleasures are most carefully to be auoided : because they both harme and deceiue." *Abernethy's Physicke for the Soule*, p. 251. At p. 268, the same authority says, "Beate downe thy body, and bring it to subiection by abstaining, not only from vnlawfull pleasures, but also from lawfull and indifferent delights."

[138] According to *Hutcheson's Exposition of Job*, p. 6, "there is no time wherein men are more ready to miscarry, and discover any bitter root in them, then when they are about the liberal use of the creatures, and amidst occasions of mirth and cheerfulness." How this doctrine ripened cannot be better illustrated than from the sentiments entertained, so late as the early part of the eighteenth century, by Colonel Blackader, a Scotch officer, who was also an educated man, who had seen much of the world, and might to some degree be called a man of the world. In December, 1714, he went to a wedding, and, on his return home, he writes : "I was cheerful, and perhaps gave too great a swing to raillery, but I hope not light or vain in conversation. I desire always to have my speech seasoned with salt, and ministering profit to the hearers. Sitting up late, and merry enough, though I hope innocent ; but I will not justify myself." *The Life and Diary of Lieut.-Col. J. Blackader, by Andrew Crichton*, p. 453. On another occasion (p. 511), in 1720, he was at an evening party. "The young people were merry. I laid a restraint upon myself for fear of going too far, and joined but little, only so as not to show moroseness or ill-breeding. We sat late, but the conversation was innocent, and no drinking but as we pleased. However, much time is spent ; which I dare not justify. *In all things we offend.*" At p. 159 he writes, "I should always be mixing something that may edify in my discourse ;" and, says his biographer (p. 437), "Conversation, when it ceased to accomplish this object, he regarded as *degenerating into idle entertainment*, which ought to be checked rather than encouraged."

[139] "Frequent the gravest company, and the fellowship of those that are sorrowfull." *Abernethy's Physicke for the Soule*, p. 416. Compare the attacks on "too much carnal mirth and laughter," in *Durham's Law Unsealed*, p. 323 ; in *Fleming's Fulfilling of the Scripture*, p. 226 ; and in *Fergusson's Exposition of the Epistles of Paul*, p. 227. See also *Gray's Spiritual Warfare*, p. 42. Cowper savs, "Woe be unto them that now

of laughter, might occasionally be allowed; still, being a carnal pastime, it was a sin to smile on Sunday.[140] Even on week-days, those who were most imbued with religious principles hardly ever smiled, but sighed, groaned, and wept.[141] A true Christian would be careful in his movements to preserve invariable gravity, never running, but walking soberly, and not treading out in a brisk and lively manner, as unbelievers are wont to do.[142] So, too, if he wrote to a friend, he must beware lest his letter should contain anything like jocoseness; since jesting is incompatible with a holy and serious life.[143]

laugh, for assuredly they shall weepe, the end of their joy shall be endlesse mourning and gnashing of teeth, they shall shed tears abundantly with Esau, but shall find no place for mercy." *Cowper's Heaven Opened*, p. 271. Hutcheson, in a strain of unusual liberality, permits occasional laughter. He says, "There is a faculty of laughing given to men, which certainly is given for use, at least at some times; and diversions are sometime needfull for men who are serious and employed in weighty affairs." . . . "And particularly, laughter is sometime lawful for magistrates and others in publick charge, not only that they may recreate themselves, but that thereby, and by the like insinuating carriage, they may gain the affection of the people." *Hutcheson's Exposition of the Book of Job*, edit. folio, 1669, pp. 389, 390.

[140] In 1650, when Charles II. was in Scotland, "the clergy reprehended him very sharply, if he smiled on those days" (Sundays). *Clarendon's History of the Rebellion*, book xiii. p. 747, edit. Oxford, 1843.

[141] It is said of Donald Cargill, that "his very countenance was edifying to beholders; often sighing with deep groans." *A Cloud of Witnesses for the Royal Prerogatives of Jesus Christ*, p. 423. The celebrated James Durham was "a person of the utmost gravity, and scarce smiled at anything." *Howie's Biographia Scoticana*, p. 226. Of Livingston we are told "that he was a very affectionate person, and weeped much; that it was his ordinary way, and might be observed almost every Sabbath, that when he came into the pulpite he sate doun a litle, and looked first to the one end of the kirk, and then to the other; and then, ordinarly, the tear shott in his eye, and he weeped, and oftimes he began his preface and his work weeping." *Wodrow's Analecta*, vol. ii. p. 249. James Alexander "used to weep much in prayer and preaching; he was every way most savoury." *Ibid.*, vol. iii. p. 39. As to the Rev. John Carstairs, "his band in the Sabbath would have been all wett, as if it had been douked with tears, before he was done with his first prayer." p. 48. Aird, minister of Dalserf, "weeping much" (*Ibid.*, vol. iii. p. 56), "Mr. James Stirling tells me was a most fervent, affectionat, weeping preacher." p. 172; and the Rev. Alexander Dunlop was noted for what was termed "a holy groan." vol. iii. p. 21. See also, on weeping as a mark of religion, *Wast's Memoirs*, pp. 83, 84; and *Robe's Narratives of the Extraordinary Work of the Spirit of God*, pp. 21, 31, 75, 150. One passage from the most popular of the Scotch preachers I hesitate as to the propriety of quoting; but it is essential that their ideas should be known, if the history of Scotland is to be understood. Rutherford, after stating whom it is that we should seek to imitate, adds: "Christ did never laugh on earth that we read of, but he wept." *Rutherford's Christ Dying*, 1647, 4to, p. 525. I publish this with no irreverent spirit; God forbid that I should. But I will not be deterred from letting this age see the real character of a system which aimed at destroying all human happiness, exciting slavish and abject fear, and turning this glorious world into one vast theatre of woe.

[142] "Walk with a sober pace, not 'tinkling with your feet.'" *Memoirs of the Rev. James Fraser, written by Himself*, in *Select Biographies*, vol. ii. p. 280. "It is somewhat like this, or less than this, which the Lord condemneth, Isa. iii. 16, 'Walking and mincing, or tripping and making a tinkling with their feet.' What is that but disdaining the grave way of walking, to affect an art in it? as many do now in our days; and shall this be displeasing to the Lord, and not the other? seeing he loveth, and is best pleased with, the native way of carrying the body." *Durham's Law Unsealed*, p. 324. "The believer hath, or at least ought to have, and, if he be like himself, will have, a well ordered walk, and will be in his carriage stately and princely." *Durham's Exposition of the Song of Solomon*, p. 365.

[143] "At home, writing letters to a friend. My vein is inclined to jest and humour. The letter was too comical and jocose; and after I had sent it away, I had a check that.

It was moreover wrong to take pleasure in beautiful scenery; for a pious man had no concern with such matters, which were beneath him, and the admiration of which should be left to the unconverted.[144] The unregenerate might delight in these vanities, but they who were properly instructed saw Nature as she really was, and knew that as she for about five thousand years had been constantly on the move, her vigour was wellnigh spent, and her pristine energy had departed.[145] To the eye of ignorance she still seemed fair and fresh; the fact however was that she was worn out and decrepit; she was suffering from extreme old age; her frame, no longer elastic, was leaning on one side, and she soon would perish.[146] Owing to the sin of man, all things were getting worse, and nature was degenerating so fast that already the lilies were losing their whiteness, and the roses their smell.[147] The heavens were waxing old;[148] the very sun which lighted the earth was becoming feeble.[149] This universal degeneracy was sad to think of; but the profane knew it not. Their ungodly eyes were still pleased by what they saw. Such was the result of their obstinate determination to indulge the senses, all of which were evil; the eye being beyond comparison the most wicked. Hence it was especially marked out for divine punishment; and, being constantly sinning, it was afflicted with fifty-two different diseases, that is, one disease for each week in the year.[150]

it was too light, and jesting foolishly. I sent and got it back, and destroyed it. My temper goes too far that way, and I ought to check it, and be more on my guard, and study edification in everything." *Crichton's Life and Diary of Blackader*, pp. 536, 537. Even amongst young children, from eight years old and upwards, toys and games were bad: and it was a good sign when they were discarded. "Some very young, of eight and nine years of age, some twelve and thirteen. They still inclined more and more to their duty, so that they meet three times a day, in the morning, at night, and at noon. Also they have forsaken all their childish fancies and plays; so these that have been awakened are known by their countenance and conversation, their walk and behaviour." *Robe's Narratives of the Extraordinary Work of the Spirit of God*, pp. 79, 80.

144 "To the unmortified man, the world smelleth like the garden of God" . . . "the world is not to him an ill-smelled stinking corps." *Rutherford's Christ Dying*, p. 498. But those who were properly mortified knew that "the earth is but a potter's house" (*Ibid.*, p. 286); "an old thred-bare-worn case" (*Ibid.*, p. 530); a "smoky house" (*Rutherford's Religious Letters*, p. 100); a "plaistered, rotten world" (*Ibid.*, p. 132); and "an ashy and dirty earth" (*Ibid.*, p. 169). "The earth also is spotted (like the face of a woman once beautifull, but now deformed with scabs of leprosie) with thistles, thornes, and much barren wildernesse." *Cowper's Heaven Opened*, p. 255.

145 "Wearinesse and motion is laid on Moon and Sunne, and all creatures on this side of the Moon. Seas ebbe and flow, and that's trouble; winds blow, rivers move, heavens and stars these five thousand yeares, except one time, have not had sixe minutes rest." . . . "The Sunne that never rests, but moves as swiftly in the night as in the day." *Rutherford's Christ Dying*, pp. 12, 157. "This is the world's old age; it is declining; albeit it seem a fair and beautiful thing in the eyes of them who know no better, and unto them who are of yesterday and know nothing, it looks as if it had been created yesterday; yet the truth is, and a believer knows, it is near the grave." *Binning's Sermons*, vol. iii. p. 372.

146 "This then, I say, is the state all things ye see are in,—it is their old age. The creation now is an old rotten house that is all dropping through and leaning to the one side." *Binning's Sermons*, vol. iii. p. 398.

147 "The lilies and roses, which, no doubt, had more sweetnesse of beauty and smell, before the sin of man made them vanity-sick." *Rutherford's Christ Dying*, p. 185.

148 "The heavens that are supposed to be incorruptible, yet they wax old as doth a garment." *Binning's Sermons*, vol. i. p. 95.

149 "The neerer the sun drawes to the end of his daily course, the lesse is his strength, for we see the Sunne in the evening decayes in heat; so it is, the longer by reuolution he turnes about in his sphere, he waxes alway the weaker; and, to vse the similitude of the holy spirit, as a garment the older it groweth becomes the lesse beautifull." *Cowper's Heaven Opened*, p. 255.

150 "It is so delicate by nature, that since it was the first sense that offended, it is

On this account it was improper to care for beauty of any kind ; or, to speak more accurately, there was no real beauty. The world afforded nothing worth looking at, save and except the Scotch Kirk, which was incomparably the most beautiful thing under heaven.[151] To look at that was a lawful enjoyment, but every other pleasure was sinful. To write poetry, for instance, was a grievous offence, and worthy of especial condemnation.[152] To listen to music was equally wrong ; for men had no right to disport themselves in such idle recreation. Hence the clergy forbade music to be introduced even during the festivities of a marriage ;[153] neither would they permit, on any occasion, the national entertainment of pipers.[154] Indeed, it was sinful to look at any exhibition in the streets, even though you only looked at it from your own window.[155] Dancing was so extremely sinful that an edict expressly prohibiting it was enacted by the General Assembly, and read in every church in Edinburgh.[156] New Year's Eve had long been a period of rejoicing in Scotland, as in other parts of Europe. The Church laid her hands on this also, and ordered that no one should sing the songs usual on that day, or should admit such singers into his own private house.[157]

At the christening of a child the Scotch were accustomed to assemble their relations, including their distant cousins, in whom, then as now, they much

aboue all the rest made subject (as a condigne punishment) to as many maladies, as there are weekes in a yeere." *Abernethy's Physicke for the Soule*, p. 501. The Scotch divines were extremely displeased with our eyes. Rutherford contemptuously calls them "two clay windows." *Rutherford's Christ Dying*, p. 570. Gray, going still further, says, "these cursed eyes of ours." *Gray's Great and Precious Promises*, p. 53.

[151] "The true visible Kirk where God's ordinances are set up, as he hath appointed, where his word is purely preached, is the most beautifull thing under heaven." *Dickson's Explication of the First Fifty Psalms*, p. 341.

[152] I have one very late, and on that account very curious, instance of the diffusion of this feeling in Scotland. In 1767 a vacancy occurred in the mastership of the grammar-school of Greenock. It was offered to John Wilson, the author of "Clyde." But, says his biographer, "the magistrates and minister of Greenock thought fit, before they would admit Mr. Wilson to the superintendence of the grammar school, to stipulate that he should abandon 'the profane and unprofitable art of poem-making.'" *Lives of Eminent Scotsmen by the Society of Ancient Scots*, 1821, vol. v. p. 169.

[153] "Sept. 22, 1649.—The quhilk day the Sessioune caused mak this act, that ther sould be no pypers at brydels, and who ever sould have a pyper playing at their brydell on their mariage day, sall loose their consigned money, and be farder punisched as the Sessioune thinks fitt." *Extracts from the Registers of the Presbytery of Glasgow, and of the Kirk Sessions of the Parishes of Cambusnethan Humbie and Stirling*, p. 34. This curious volume is a quarto, and without date ; unless, indeed, one of the title-pages is wanting in my copy.

[154] See the Minutes of the Kirk Session of Glasgow, in *Wodrow's Collections upon the Lives of Ministers*, vol. ii. part ii. p. 76 ; also the case of "Mure, pyper," in *Selections from the Minutes of the Presbyteries of Saint Andrews and Cupar*, p. 72.

[155] This notion lingered on, probably, to the beginning of this century ; certainly to late in the last. In a work published in Scotland in 1836, it is stated that a clergyman was still alive who was "severely censured," merely because, when Punch was performing, "the servant was sent out to the showman to request him to come below the windows of her master's house, that the clergyman and his wife might enjoy the sight." *Traditions of Perth by George Penny*, Perth, 1836, p. 124.

[156] "17 Feb. 1650. Ane act of the commissioun of the Generall Assemblie wes red in all the Churches of Edinburgh dischargeing promiscuous dansing." *Nicoll's Diary*, p. 3. See also *Acts of the General Assembly of the Church of Scotland*, 1638–1842, p. 201 ; *Register of the Kirk Session of Cambusnethan*, p. 35 ; *Minutes of the Presbyteries of St. Andrews and Cupar*, pp. 55, 181 ; *Minutes of the Synod of Fife*, pp. 150, 169, 175 ; and a choice passage in *A Collection of Sermons by Eminent Divines*, p. 51.

[157] See *Selections from the Records of the Kirk Session, Presbytery, and Synod of Aberdeen*, pp. 77, 78, forbidding any one to "giwe ony meatt or drink to these sangsteris or lat thame within thair houss." The singers were to be "put in prisoun."

abounded. But this caused pleasure, and pleasure was sinful. It was therefore forbidden; the number of guests was limited; and the strictest supervision was exercised by the clergy, to prevent the possibility of any one being improperly happy on such occasions.[158]

Not only at baptisms, but also at marriages, the same spirit was displayed. In every country it has been usual to make merry at marriages; partly from a natural feeling, and partly, perhaps, from a notion that a contract so often productive of misery might at all events begin with mirth. The Scotch clergy, however, thought otherwise. At the weddings of the poor they would allow no rejoicing;[159] and at the weddings of the rich it was the custom for one of them to go for the express purpose of preventing an excess of gaiety. A better precaution could hardly be devised; but they did not trust exclusively to it. To check the lusts of the flesh they furthermore took into account the cookery, the choice of the meats, and the number of the dishes. They were in fact so solicitous on these points, and so anxious that the nuptial feast should not be too attractive, that they fixed its cost, and would not allow any person to exceed the sum which they thought proper to name.[160]

Nothing escaped their vigilance. For in their opinion even the best man was at his best time so full of turpitude that his actions could not fail to be wicked.[161] He never passed a day without sinning, and the smallest sin deserved eternal wrath.[162] Indeed, everything he did was sinful, no matter how pure

[158] In 1643 the Presbytery of St. Andrews ordered that "because of the great abuse that is likewayes among them by conveening multitudes at baptismes and contracts, the ministers and sessions are appointed to take strict order for restraineing these abuses, that in number they exceid not sixe or seven. As also ordaines that the hostlers quho mak such feists salbe censured by the sessions." *Minutes of the Presbyteries of St. Andrews and Cupar*, p. 11. See also *Records of the Kirk Session, Presbytery, and Synod of Aberdeen*, pp. 109, 110, complaining of the custom "that everie base servile man in the towne, when he hes a barne to be baptesed, invitis tuelff or sextene persones to be his gossopes and godfatheris to his barne," &c.; and enacting "that it shall not be lesume to any inhabitant within this burt quhasoever, to invite any ma persones to be godfatheris to thair barne in ony tyme cumming bot tua or four at the most, lyk as the Kirk officier is expresslie commandit and prohibitt that from hence furth he tak vp no ma names to be godfatheris, nor giwe any ma vp to the redar bot four at the most, vnder all hiest censure he may incur be the contrarie, and this ordinance to be intimat out of pulpitt, that the people pretend no ignorance thairof."

[159] They forbade music and dancing; and they ordered that not more than twenty-four persons should be present. See the enactment, in 1647, respecting "Pennie bryddells," in *Minutes of the Presbyteries of St. Andrews and Cupar*, p. 117. In 1650, "The Presbyterie being sadly weghted with the report of the continwance, and exhorbitant and unnecessarly numerous confluences of people at pennie brydles, and of inexpedient and wnlawfull pypeing and dancing at the same, so scandalous and sinfull in this tyme of our Churches lamentable conditioun; and being apprehensive that ministers and Kirk Sessiouns have not bein so vigilant and active (as neid werre), for repressing of these disorders, doe therfor most seriously recommend to ministers and Kirk Sessiouns to represse the same." *Ibid.*, pp. 169, 170. See, further, *Registers of the Presbytery of Lanark*, p. 29; and *Extracts from the Presbytery Book of Strathbogie*, pp. 4, 144.

[160] See two curious instances of limitation of price, in *Irving's History of Dumbartonshire*, p. 567; and in *Wodrow's Collections upon the Lives of Ministers*, vol. ii. part ii. p. 34.

[161] "What a vile, haughty, and base creature he is—how defiled and desperately wicked his nature—how abominable his actions; in a word, what a compound of darkness and wickedness he is—a heap of defiled dust, and a mass of confusion—a sink of impiety and iniquity, *even the best of mankind*, those of the rarest and most refined extraction, *take them at their best estate*." *Binning's Sermons*, vol. ii. p. 302. Compare *Boston's Human Nature in its Four-fold State*, pp. 26, 27.

[162] "The least sin cannot but deserve God's wrath and curse eternally." *Dickson's Truth's Victory over Error*, p. 71. "All men, even the regenerate, sin daily." *Ibid.*, p. 153.

his motives.[163] Man had been gradually falling lower and lower, and had now sunk to a point of debasement which made him inferior to the beasts that perish.[164] Even before he was born, and while he was yet in his mother's womb, his guilt began.[165] And when he grew up, his crimes multiplied thick and fast ; one of the most heinous of them being the practice of teaching children new words,—a horrible custom, justly visited by divine wrath.[166] This, however, was but one of a series of innumerable and incessant offences ; so that the only wonder was that the earth could restrain herself at the hideous spectacle which man presented, and that she did not open her mouth, as of old, and swallow him even in the midst of his wickedness.[167] For it was certain that in the whole creation there was nothing so deformed and monstrous as he.[168]

Such being the case, it behoved the clergy to come forward, and to guard men against their own vices, by controlling their daily actions, and forcing them to a right conduct. This they did vigorously. Aided by the elders, who were their tools and the creatures of their power, they, all over Scotland, organized themselves into legislative bodies, and in the midst of their little senate they enacted laws which the people were bound to obey. If they refused, woe be to them. They became unruly sons of the Church, and were liable to be imprisoned, to be fined, or to be whipped,[169] or to be branded with a hot iron,[170] or to do penance before the whole congregation, humbling themselves, barefooted, and with their hair cut on one side,[171] while the minister, under pretence

[163] " Our best works have such a mixture of corruption and sin in them, that they deserve his curse and wrath." *Ibid.*, p. 130.

[164] " But now, falling away from God, hee hath also so farre degenerated from his owne kind, that he is become inferiour to the beasts." *Cowper's Heaven Opened*, p. 251. " O ! is not man become so brutish and ignorant, that he may be sent unto the beasts of the field to be instructed of that which is his duty ? " *Gray's Spiritual Warfare*, p. 28. " Men are naturally more brutish than beasts themselves." *Boston's Human Nature in its Four-fold State*, p. 58. " Worse than the beast of the field." *Halyburton's Great Concern of Salvation*, p. 71.

[165] " Infants, even in their mother's belly, have in themselves sufficient guilt to deserve such judgments ; " *i.e.* when women with child are " ript up." *Hutcheson's Exposition on the Minor Prophets*, vol. i. p. 255.

[166] " And in our speech, our Scripture and old Scots names are gone out of request ; instead of *Father* and *Mother*, *Mamma* and *Papa*, training children to speak nonsense, and what they do not understand. These few instances, amongst many that might be given, are additional causes of God's wrath." *The Life and Death of Mr. Alexander Peden, late Minister of the Gospel at New Glenluce, in Galloway*, in *Walker's Biographia Presbyteriana*, vol. i. p. 140.

[167] " Yea, if the Lord did not restraine her, shee would open her mouth and swallow the wicked, as she did Corah, Dathan, and Abiram." *Cowper's Heaven Opened*, p. 257. Compare *Hutcheson's Exposition on the Minor Prophets*, vol. i. p. 507.

[168] " There is nothing so monstrous, so deformed in the world, as man." *Binning's Sermons*, vol. i. p. 234. " There is not in all the creation such a miserable creature as man." *Ibid.*, vol. iii. p. 321. " Nothing so miserable." *Abernethy's Physicke for the Soule*, p. 37.

[169] " December 17th, 1635. Mention made of a correction house, which the Session ordeans persons to be taken to, both men and women, and appoints them to be whipt every day during the Session's will." *Wodrow's Collections upon the Lives of Ministers*, vol. ii. part ii. p. 67.

[170] On the 22nd October, 1648, the Kirk Session of Dunfermline ordered that a certain Janet Robertson " shall be cartit and scourged through the town, and markit with an hot iron." *Chalmers' History of Dunfermline*, p. 437.

[171] " As they punish by pecuniary fines, so corporally too, by imprisoning the persons of the delinquents, using them disgracefully, carting them through cities, making them stand in Iogges, as they call them, pillaries (which in the country churches are fixed to the two sides of the main door of the Parish Church), cutting the halfe of their hair, shaving their beards, &c., and it is more than ordinary, by their ' original ' and ' proper power,' to banish them out of the bounds and limits of the parish, or presbytery, as they list to order it." *Presbytery Displayd*, p. 4.

of rebuking them, enjoyed his triumph.[172] All this was natural enough. For the clergy were the delegates of heaven, and the interpreters of its will. They, therefore, were the best judges of what men ought to do ; and any one whom they censured was bound to submit with humility and repentance.[173]

The arbitrary and irresponsible tribunals which now sprung up all over Scotland united the executive authority with the legislative, and exercised both functions at the same time. Declaring that certain acts ought not to be committed, they took the law into their own hands, and punished those who had committed them. According to the principles of this new jurisprudence, of which the clergy were the authors, it became a sin for any Scotchman to travel in a Catholic country.[174] It was a sin for any Scotch innkeeper to admit a Catholic into his inn.[175] It was a sin for any Scotch town to hold a market either on Saturday or on Monday, because both days were near Sunday.[176] It was a sin for a Scotch woman to wait at a tavern ; [177] it was a sin for her to live alone ; [178] it was also a sin for her to live with unmarried sisters.[179] It was a

[172] The Scotch clergy of the seventeenth century were not much given to joking but on one of these occasions a preacher is said to have hazarded a pun. A woman, named Ann Cantly, being made to do penance, "Here" (said the minister), "Here is one upon the stool of repentance, they call her *Cantly* ; she saith herself, she is an honest woman, but I trow *scantly*." *Scotch Presbyterian Eloquence*, p. 125. From what I have read of Scotch theology, I can bear testimony to the accuracy of this book, so far as its general character is concerned. Indeed, the author, through fear of being entirely discredited, has often rather understated his case.

[173] As Durham says, in his *Exposition of the Song of Solomon*, p. 451, "It is no burden to an honest believer to acknowledge Christ's ministers, to obey their doctrine, and submit to their censures."

[174] A man named Alexander Laurie was brought before the Kirk Session of Perth, "and being inquired by the minister if, in his last being out of this country, he had been in Spain, answered that he was in Portugal, but was never present at mass, neither gave reverence to any procession, and that he was never demanded by any concerning his religion. The said Alexander being removed and censured, it was thought good by the (Kirk) Session that he should be admonished not to travel in these parts again, except that they were otherwise reformed in religion." *Extracts from the Kirk-Session Register of Perth*, in *The Spottiswoode Miscellany*, vol. ii. p. 274. Still earlier, that is in 1592, the clergy attempted to interfere even with commerce, "allegeing that the marchands could not mak vayage in Spayne without danger of thair sawlis, and tharefore willit thayme in the nayme of God to absteyne." *The Historie of King James the Sext*, p. 254.

[175] See the case of Patrick Stewart, and Mr. Lawson's note upon it, in *Lawson's Book of Perth*, p. 238. In this instance, the "Roman Catholic gentleman" had been excommunicated, which made matters still worse.

[176] The Presbytery of Edinburgh, "by their transcendent sole authority, discharged any market to be kept on Monday ; the reason was, because it occasioned the travelling of men and horse the Lord's-day before, which prophaned the Sabbath." *Presbytery Displayd*, p. 10. In 1650 Saturday was also taken in by another ecclesiastical senate. "The Presbyterie doe appoint the severall brethren in burghes to deale with such as have not changed ther Mondayes and Satterdayes mercats to other dayes of the weeke, that they may doe the same *primo quoque tempore*." *Minutes of the Presbyteries of St. Andrews and Cupar*, p. 53.

[177] In 1650, "For 'the down-bearing of sin,' women were not allowed to act as waiters in taverns, but 'allenarly men-servands and boys.'" *Chambers' Annals*, vol. ii. p. 196. This order "wes red and publictlie intimat in all the kirkis of Edinburgh." *Nicoll's Diary*, p. 5.

[178] "Forsameikle as dilatation being made, that Janet Watson holds an house by herself, where *she may give occasion of slander*, therefore Patrick Pitcairn, elder, is ordained to admonish her in the session's name, either to marry, or then pass to service, otherwise that she will not be suffered to dwell by herself." *Kirk-Session Records of Perth*, in *The Chronicle of Perth*, p. 86.

[179] "Ordains the two sisters, Elspith and Janet Stewart, that they be not found in

sin to go from one town to another on Sunday, however pressing the business might be.[180] It was a sin to visit your friend on Sunday ;[181] it was likewise sinful either to have your garden watered[182] or your beard shaved.[183] Such things were not to be tolerated in a Christian land. No one, on Sunday, should pay attention to his health, or think of his body at all. On that day, horse-exercise was sinful ;[184] so was walking in the fields, or in the meadows, or in the streets, or enjoying the fine weather by sitting at the door of your own house.[185] To go to sleep on Sunday, before the duties of the day were over, was also sinful, and deserved church censure.[186] Bathing, being pleasant as well as wholesome, was a particularly grievous offence ; and no man could be allowed to swim on Sunday.[187] It was in fact doubtful whether swimming

the house again with their sister, but every one of them shall go to service, or where they may be best entertained without slander, under the penalty of warding their persons and banishment of the town." *Kirk-Session Register*, in *Lawson's Book of Perth*, p. 169.

180 " Compeirit William Kinneir, and confest his travelling on the Sabbath day, which he declairit was out of meer necessitie, haveing two watters to croce, and ane tempestuos day, quhilk moowit him to fear that he wold not get the watters crost, and so his credit might faill. He was sharpelie admonished ; and promist newer to doe the lyke again." *Selections from the Records of the Kirk-Session of Aberdeen*, p 136.

181 " Compearit Thomas Gray, and confest that one Sunday in the morning he went to Culter to visit a friend, and stayed thair all night. The sessioune warnit him, *apud acta*, to the next day, and appointed Patrick Gray, his master, to be cited to the next day, to give furder informatioune in the matter. (Sharply rebuked before the pulpit.) " *Selections from the Records of the Kirk-Session of Aberdeen*, p. 146.

182 " It was reported that Margaret Brotherstone did water her kaill wpon the Sabbath day, and thairwpon was ordained to be cited." . . . " Compeired Margaret Brotherstone, and confessed her breach of Sabbath in watering of her kaill, and thairwpon ordained to give evidence in publick of her repentance the next Lord's day." *Extracts from the Register of the Kirk-Session of Humbie*, p. 42.

183 Even so late as the middle of the eighteenth century, " clergymen were sometimes libelled " . . . " for shaving " on Sunday. *Sinclair's Statistical Account of Scotland*, vol. xvi. p. 34, Edinburgh, 1795. At an earlier period, no one might be shaved on that day. See *The Spottiswoode Miscellany*, vol. ii. p. 276 ; and *Lawson's Book of Perth*, pp. 224, 225.

184 " Compeired John Gordon of Avachie, and confessed that he had transgressed in travailing on the Sabbath day with horse, going for a milston. Referred to the session of Kinor for censure." *Extracts from the Presbytery Book of Strathbogie*, p. 236. See also the case mentioned in *Letters from a Gentleman in the North of Scotland*, vol. i. p. 172 ; " This riding on horseback of a Sunday was deemed a great scandal."

185 In 1647 the punishment was ordered of whoever was guilty of " sitting or walking idle upon the streetes and feildes " on Sunday. *Selections from the Minutes of the Synod of Fife*, p. 152. In 1742 " sitting idle at their doors " and " sitting about doors " was profane. *Robe's Narratives of the Extraordinary Work of the Spirit of God*, pp. 109, 110. In 1756, at Perth, " to stroll about the fields, or even to walk upon the inches, was looked upon as extremely sinful, and an intolerable violation of the fourth commandment." *Penny's Traditions of Perth*, p. 36.

186 In 1656, " Cite Issobell Balfort, servand to William Gordone, tailyeor, beeing found sleeping at the Loche side on the Lord's day in tyme of sermon." *Selections from the Records of the Kirk-Session of Aberdeen*, p. 137. It was a sin even for children to feel tired of the interminable sermons which they were forced to hear. Halyburton, addressing the young people of his congregation, says, " Have not you been glad when the Lord's day was over ; or, at least, *when the preaching was done*, that ye might get your liberty ? Has it not been a burden to you, to sit so long in the church ? Well, *this is a great sin*." See this noticeable passage in *Halyburton's Great Concern of Salvation*, p. 100.

187 In 1719 the Presbytery of Edinburgh indignantly declares, " Yea, some have arrived at that height of impiety, as not to be ashamed of washing in waters and swimming in rivers upon the holy Sabbath." *Register of Presbytery of Edinburgh, 29th April, 1719*, in *Arnot's History of Edinburgh*, p. 204.

was lawful for a Christian at any time, even on week-days, and it was certain that God had on one occasion shown His disapproval by taking away the life of a boy while he was indulging in that carnal practice.[188]

That it was a sin to cleanse one's body might indeed have been taken for granted; seeing that the Scotch clergy looked on all comforts as sinful in themselves, merely because they were comforts.[189] The great object of life was to be in a state of constant affliction.[190] Whatever pleased the senses was to be suspected.[191] A Christian must beware of enjoying his dinner; for none but the ungodly relished their food.[192] By a parity of reasoning, it was wrong for a man to wish to advance himself in life, or in any way to better his condition.[193] Either to make money or to save it was unsuited to Christians; and even to possess much of it was objectionable, because it not only ministered to human pleasures but encouraged those habits of foresight and of provision for the future which are incompatible with complete resignation to the Divine will. To wish for more than was necessary to keep oneself alive was a sin as well as a folly, and was a violation of the subjection we owe to God.[194] That

[188] So late as 1691, the Kirk-Session of Glasgow attempted to prevent all boys from swimming, whatever the day might be. But as the Church was then on the decline, it was necessary to appeal to the civil authority for help. What the result was I have not been able to ascertain. There is however a curious notice in *Wodrow's Collections upon the Lives of Ministers*, vol. ii. part ii. p. 77, stating that on "August 6th, 1691, the Session recommends it to the magistrates to think on some overtures for discharging boyes from swimming, in regard one was lately lost." I have met with other evidence respecting this; but I cannot remember the passages.

[189] The Rev. James Fraser says, "The world is a dangerous thing and a great evil, and the comforts of it a hell." *Select Biographies*, vol. ii. p. 220. Compare *Gray's Spiritual Warfare*, p. 22.

[190] "It is good to be continually afflicted here." *Select Biographies*, vol. ii. p. 220. Gray, advocating the same doctrine, sums up his remarks by a suggestion, that, "I think David had never so sweet a time as then, when he was pursued as a partridge by his son Absalom." *Gray's Great and Precious Promises*, p. 14.

[191] "Suspect that which pleaseth the senses." *Abernethy's Physicke for the Soule*, p. 63.

[192] Durham, in his long catalogue of sins, mentions as one, "the preparing of meat studiously, that is, when it is too riotously dressed, for pleasing men's carnal appetite and taste, or palate, by the fineness of it, and other curiosities of that kind." *Durham's Law Unsealed*, p. 333. See also p. 48, on "palate-pleasers;" and Dickson's opinion of the "rarest dishes and best meats." *Dickson's Explication of the Psalms*, p. 84. According to another of the Scotch divines, whoever makes one good meal and has enough left for a second, is in imminent peril. "He that is full, and hath enough to make him fuller, will easily deny God, and be exalted against him: his table shall be a snare to his body, and a snare to his soule." *Abernethy's Physicke for the Soule*, p. 421.

[193] For, says Abernethy (*Physicke for the Soule*, p. 488), "men are loth to lend their eare to the Word, when they abound in prosperity." So, too, Hutcheson, in his *Exposition of the Book of Job*, p. 387: "Such is the weakness even of godly men, that they can hardly live in a prosperous condition, and not be overtaken with some security, carnal confidence, or other miscarriage."

[194] See this theory worked out in *Cockburn's Jacob's Vow, or Man's Felicity and Duty*, pp. 71–75. He says, "And certainly to crave and be desirous of more than what is competent for the maintenance and support of our lives, is both inconsistent with that dependence and subjection we owe to God, and doth also bespeak a great deal of vanity, folly, and inconsiderateness." Boston, striking at the very foundation of that practice of providing for the future which is the first and most important maxim in all civil wisdom, and which peculiarly distinguishes civilized nations from barbarians, asks his hearers, "Why should men rack their heads with cares how to provide for to-morrow, while they know not if they shall then need anything?" *Boston's Human Nature in its Four-fold State*, p. 300. Hutcheson thinks that those who are guilty of such impious prudence deserve to be starved. "When men are not content with food and rayment,

it was contrary to His desire was moreover evident from the fact that He bestowed wealth liberally upon misers and covetous men ; a remarkable circumstance, which, in the opinion of Scotch divines, proved that He was no lover of riches, otherwise He would not give them to such base and sordid persons.[195]

To be poor, dirty, and hungry, to pass through life in misery, and to leave it with fear, to be plagued with boils, and sores, and diseases of every kind, to be always sighing and groaning, to have the face streaming with tears and the chest heaving with sobs, in a word, to suffer constant affliction, and to be tormented in all possible ways ; to undergo these things was deemed a proof of goodness, just as the contrary was a proof of evil. It mattered not what a man liked ; the mere fact of his liking it made it sinful. Whatever was natural was wrong. The clergy deprived the people of their holidays, their amusements, their shows, their games, and their sports ; they repressed every appearance of joy, they forbade all merriment, they stopped all festivities, they choked up every avenue by which pleasure could enter, and they spread over the country an universal gloom.[196] Then, truly, did darkness sit on the land. Men in their daily actions and in their very looks became troubled, melancholy, and ascetic. Their countenance soured, and was downcast. Not only their opinions, but their gait, their demeanour, their voice, their general aspect, were influenced by that deadly blight which nipped all that was genial and warm. The way of life fell into the sear and yellow leaf ; its tints gradually deepened ; its bloom faded, and passed off ; its spring, its freshness, and its beauty were gone ; joy and love either disappeared or were forced to hide themselves in obscure corners, until at length the fairest and most endearing parts of our nature, being constantly repressed, ceased to bear fruit, and seemed to be withered into perpetual sterility.

Thus it was that the national character of the Scotch was in the seventeenth century dwarfed and mutilated. With nations, as with individuals, the harmony and free development of life can only be attained by exercising its principal functions boldly and without fear. Those functions are of two kinds ; one set of them increasing the happiness of the mind, another set increasing the happiness of the body. If we could suppose a man completely perfect, we should take for granted that he would unite these two forms of pleasure in the highest degree, and would extract, both from body and mind, every enjoyment consistent with his own happiness and with the happiness of others. But

but would still heap up more, it is just with God to leave them not so much as bread and to suffer men to have an evil eye upon them, and to pluck at them, even so long as they have meat." *Hutcheson's Exposition of the Book of Job*, p. 296. Binning, going still further, threatens eternal ruin. "Ye may have things necessary here—food and raiment ; and if ye seek more, if ye will be rich, and will have superfluities, then ye shall fall into many temptations, snares, and hurtful lusts which shall drown you in perdition." *Binning's Sermons*, vol. iii. p. 355.

[195] "If God loved riches well, do ye think he would give them so liberally, and heap them up upon some base covetous wretches ? Surely no." *Binning's Sermons*, vol. iii. p. 366. Gray, in his zeal against wealth, propounds another doctrine, which I do not remember to have seen elsewhere. He says, "All that the owner of riches hath is the seeing of them ; which a man, who is a passer by, may likeways have, though he be not possessor of them." *Gray's Spiritual Warfare*, p. 128. I hope that the reader will not suspect me of having maliciously invented any of these passages. The books from which they are quoted are, with only two or three exceptions, all in my library, and may be examined by persons who are curious in such matters.

[196] "The absence of external appearances of joy in Scotland, in contrast with the frequent holidayings and merry-makings of the continent, has been much remarked upon. We find in the records of ecclesiastical discipline clear traces of the process by which this distinction was brought about. To the puritan kirk of the sixteenth and seventeenth centuries, every outward demonstration of natural good spirits was a sort of sin, to be as far as possible repressed." . . . "The whole sunshine of life was, as it were, squeezed out of the community." *Chambers' Annals of Scotland*, vol. i. p. 336, vol. ii. p. 156.

as no such character is to be found, it invariably occurs that even the wisest of us are unable to hold the balance; we therefore err, some in over-indulging the body, some in over-indulging the mind. Comparing one set of indulgences with the other, there can be no doubt that the intellectual pleasures are in many respects superior to the physical; they are more numerous, more varied, more permanent, and more ennobling; they are less liable to cause satiety in the individual, and they produce more good to the species. But for one person who can enjoy intellectual pleasures there are at least a hundred who can enjoy physical pleasures. The happiness derived from gratifying the senses being thus diffused over a wider area, and satisfying at any given moment a greater number of persons than the other form of happiness is capable of, does on that account possess an importance which many who call themselves philosophers are unwilling to recognize. Too often have philosophic and speculative thinkers, by a foolish denunciation of such pleasures, done all in their power to curtail the quantity of happiness of which humanity is susceptible. Forgetting that we have bodies as well as minds, and forgetting, too, that in an immense majority of instances the body is more active than the mind, that it is more powerful, that it plays a more conspicuous part, and is fitted for greater achievements, such writers commit the enormous error of despising that class of actions to which ninety-nine men out of every hundred are most prone, and for which they are best fitted. And for committing this error they pay the penalty of finding their books unread, their systems disregarded, and their scheme of life adopted, perhaps, by a small class of solitary students, but shut out from that great world of reality, for which it is unsuited, and in which it would produce the most serious mischief.

If, then, we review the history of opinion in connexion with the history of action, we may probably say that the ascetic notions of philosophers, such, for instance, as the doctrines of the Stoics, and similar theories of mortification, have not worked the harm which might have been expected, and have not succeeded in abridging to any perceptible extent the substantial happiness of mankind. There are, I apprehend, two reasons why they have failed. In the first place, these philosophers have with hardly an exception had little real acquaintance with human nature, and have therefore been unable to touch those chords, and appeal to those hidden motives, by influencing which one man gains over another to his side. And in the second place, they, fortunately for us, have never possessed authority, and have therefore been unable either to enforce their doctrine by penalties, or to recommend it by rewards.

But though philosophers have failed in their effort to lessen the pleasures of mankind, there is another body of men who, in making the same attempt, have met with far greater success. I mean, of course, the theologians, who, considered as a class, have in every country and in every age deliberately opposed themselves to gratifications which are essential to the happiness of an overwhelming majority of the human race. Raising up a God of their own creation, whom they hold out as a lover of penance, of sacrifice, and of mortification, they under this pretence forbid enjoyments which are not only innocent but praiseworthy. For every enjoyment by which no one is injured, is innocent; and every innocent enjoyment is praiseworthy, because it assists in diffusing that spirit of content and of satisfaction which is favourable to the practice of benevolence towards others. The theologians, however, for reasons which I have already stated, cultivate an opposite spirit, and, whenever they have possessed power they have always prohibited a large number of pleasurable actions, on the ground that such actions are offensive to the Deity. That they have no warrant for this, and that they are simply indulging in peremptory assertions on subjects respecting which we have no trustworthy information, is well known to those who, impartially, and without preconceived bias, have studied their arguments, and the evidence which they adduce. On this, however, I need not dilate; for inasmuch as men are, almost every year, and certainly every generation, becoming more accustomed to close and accurate reasoning, just in the same proportion is the conviction spreading that theologians proceed from arbitrary assumptions, for which they have no proof, except by appealing to

other assumptions, equally arbitrary and equally unproven. Their whole system reposes upon fear, and upon fear of the worst kind ; since, according to them, the Great Author of our being has used His omnipotence in so cruel a manner as to endow His creatures with tastes, instincts, and desires, which He not only forbids them to gratify, but which, if they do gratify, shall bring on themselves eternal punishment.

What the theologians are to the closet, that are the priests to the pulpit. The theologians work upon the studious, who read ; the clergy act upon the idle, who listen. Seeing, however, that the same man often performs both offices, and seeing too that the spirit and tendency of each office are the same, we may for practical purposes consider the two classes as identical ; and, putting them together, and treating them as a whole, it must be admitted by whoever will take a comprehensive view of what they have actually done, that they have been not only the most bitter foes of human happiness, but also the most successful ones. In their high and palmy days, when they reigned supreme, when credulity was universal and doubt unknown, they afflicted mankind in every possible way ; enjoining fasts, and penances, and pilgrimages, teaching their simple and ignorant victims every kind of austerity, teaching them to flog their own bodies, to tear their own flesh, and to mortify the most natural of their appetites. This was the state of Europe in the Middle Ages. It is still the state of every part of the world where the priesthood are uncontrolled. Such ascetic and self-tormenting observances are the inevitable issue of the theological spirit, if that spirit is unchecked. Now, and owing to the rapid march of our knowledge, it is constantly losing ground, because the scientific and secular spirit is encroaching on its domain. Therefore in our time, and especially in our country, its most repulsive features are disguised, and it is forced to mask its native ugliness. Among our clergy, a habit of grave and decent compromise has taken the place of that bold and fiery war which their predecessors waged against a sensual and benighted world. Their threats have perceptibly diminished. They now allow us a little pleasure, a little luxury, a little happiness. They no longer tell us to mortify every appetite, and to forego every comfort. The language of power has departed from them. Here and there we find vestiges of the ancient spirit ; but this is only among uneducated men, addressing an ignorant audience. The superior clergy, who have a character to lose, are grown cautious ; and whatever their private opinion may be, they rarely venture on those terrific denunciations with which their pulpits once resounded, and which in times of yore made the people shrink with fear, and humbled every one except him by whom the denunciation was uttered.

Still, though much of this has vanished, enough remains to show what the theological spirit is, and to justify a belief that nothing but the pressure of public opinion prevents it from breaking out into its former extravagance. Many of the clergy persist in attacking the pleasures of the world, forgetting that not only the world, but all which the world contains, is the work of the Almighty, and that the instincts and desires which they stigmatize as unholy are part of His gifts to man. They have yet to learn that our appetities, being as much a portion of ourselves as any other quality we possess, ought to be indulged, otherwise the whole individual is not developed. If a man suppresses part of himself, he becomes maimed and shorn. The proper limit to self-indulgence is that he shall neither hurt himself nor hurt others. Short of this, everything is lawful. It is more than lawful ; it is necessary. He who abstains from safe and moderate gratification of the senses lets some of his essential faculties fall into abeyance, and must on that account be deemed imperfect and unfinished. Such an one is incomplete ; he is crippled ; he has never reached his full stature. He may be a monk ; he may be a saint ; but a man he is not. And now, more than ever, do we want true and genuine men. No previous age has had so much work to do, and to accomplish that work we need robust and vigorous natures, whose every function has been freely exercised without let or hindrance.* Never before was the practice of life so arduous ; never were the

[* Buckle here somewhat overshoots his own mark. The very principle of harming

problems presented to the human mind so numerous, or so complicated. Every addition to our knowledge, every fresh idea, opens up new difficulties, and gives birth to new combinations. Under this accumulated pressure we shall assuredly sink, if we imitate the credulity of our forefathers, who allowed their energies to be cramped and weakened by those pernicious notions which the clergy, partly from ignorance, and partly from interest, have in every age palmed on the people, and have thereby diminished the national happiness, and retarded the march of national prosperity.

In the same way, we constantly hear of the evils of wealth, and of the sinfulness of loving money; although it is certain that, after the love of knowledge, there is no one passion which has done so much good to mankind as the love of money. It is to the love of money that we owe all trade and commerce; in other words, the possession of every comfort and luxury which our own country is unable to supply. Trade and commerce have made us familiar with the productions of many lands, have awakened curiosity, have widened our ideas by bringing us in contact with nations of various manners, speech, and thought, have supplied an outlet for energies which would otherwise have been pent up and wasted, have accustomed men to habits of enterprise, forethought and calculation, have moreover communicated to us many arts of great utility, and have put us in possession of some of the most valuable remedies with which we are acquainted, either to save life or to lessen pain. These things we owe to the love of money. If theologians could succeed in their desire to destroy that love, all these things would cease, and we should relapse into comparative barbarism. The love of money, like all our appetites, is liable to abuse; but to declaim against it as evil in itself, and above all to represent it as a feeling the indulgence of which provokes the wrath of God, is to betray an ignorance natural, perhaps, in former ages, but shameful in our time, particularly when it proceeds from men who give themselves out as public teachers, and profess that it is their mission to enlighten the world.

Injurious, however, as all this is to the best interests of society, it is nothing in comparison with the doctrines formerly advocated by the Scotch divines. What their ideas were I have shown from their own sermons, the reading of which has been the most painful literary task I ever undertook, since, in addition to the narrowness and the dogmatism which even the best of such compositions contain, there is in these productions a hardness of heart, an austerity of temper, a want of sympathy with human happiness, and a hatred of human nature, such as have rarely been exhibited in any age, and, I rejoice to think, have never been exhibited in any other Protestant country. These things I have resuscitated from the oblivion in which they had long been buried, partly because it was necessary to do so in order to understand the history of the Scotch mind, and partly because I desired to show what the tendency of theologians is, when that tendency is uncontrolled. Protestants, generally, are too apt to suppose that there is something in their creed which protects them against those hurtful extravagances which have been and to a certain extent still are practised in the Catholic Church. Never was a greater mistake. There is but one protection against the tyranny of any class; and that is, to give that class very little power. Whatever the pretensions of any body of men may be, however smooth their language, and however plausible their claims, they are sure to abuse power, if much of it is conferred on them. The entire history of the world affords no instance to the contrary. In Catholic countries, France alone excepted, the clergy have more authority than in Protestant countries. Therefore in Catholic countries they do more harm than in Protestant countries, and their peculiar views are developed with greater freedom. The difference depends not on the nature of the creed, but on the power of the class. This is very apparent in Scotland, where the clergy, being supreme, did, Protestants though they were, imitate the ascetic, the unsocial, and the cruel doctrines which in the Catholic

neither ourselves nor others is a "let or hindrance." Of course he had in mind superstitious and supererogatory hindrances.—Ed.]

Church gave rise to convents, fastings, scourgings, and all the other appliances of an uncouth and ungenial superstition.

Indeed the Scotch divines, in some of their theories, went beyond any section of the Catholic Church, except the Spanish. They sought to destroy not only human pleasures, but also human affections. They held that our affections are necessarily connected with our lusts, and that we must therefore wean ourselves from them as earthly vanities.[197] A Christian had no business with love or sympathy. He had his own soul to attend to, and that was enough for him. Let him look to himself. On Sunday, in particular, he must never think of benefiting others; and the Scotch clergy did not hesitate to teach the people that on that day it was sinful to save a vessel in distress, and that it was a proof of religion to leave ship and crew to perish.[198] They might go; none but their wives and children would suffer, and that was nothing in comparison with breaking the Sabbath. So, too, did the clergy teach that on no occasion must food or shelter be given to a starving man, unless his opinions were orthodox.[199] What need for him to live? Indeed they taught that it was a sin to tolerate his notions at all, and that the proper course was to visit him with sharp and immediate punishment.[200] Going yet further, they broke the domestic ties, and set parents against their offspring. They taught the father to smite the unbelieving child, and to slay his own boy sooner than allow him to propagate error.[201] As if this were not enough, they tried to extirpate another affection

[197] "A Christian should mortifie his affections, which are his predominant lusts, to which our affections are so much joined, and our soul doth so much go out after." *Gray's Spiritual Warfare*, p. 29. "That blessed work of weaning of affections from all things that are here." *Gray's Great and Precious Promises*, p. 86.

[198] "One of our more northern ministers, whose parish lies along the coast between Spey and Findorn, made some fishermen do penance for sabbath-breaking, in going out to sea, though purely with endeavour to save a vessel in distress by a storm." *Letters from a Gentleman in the North of Scotland*, vol. i. p. 173.

[199] "The master of a family may, and ought to, deny an act of humanity or hospitality to strangers that are false teachers." *Rutherford's Free Disputation against Pretended Liberty of Conscience*, p. 176. "The Holy Ghost forbiddeth the master of every Christian family to owne a hereticke as a guest." *Ibid.*, p. 219. See also p. 235.

[200] "We hold that tolleration of all religions is not farre from blasphemy." *Rutherford's Free Disputation against Pretended Liberty of Conscience*, p. 20. "If wolves be permitted to teach what is right in their own erroneous conscience, and there be no 'Magistrate to put them to shame,' Judg. xviii. 7, and no King to punish them, then godlinesse and all that concernes the first Table of the Law must be marred." *Ibid.*, p. 230. "Wilde and atheisticall liberty of conscience." p. 337. "Cursed toleration." p. 400. See also, in the same work (pp. 110, 244), Rutherford's remarks on the murder of Servetus. In 1645 Baillie, who was then in London, writes, "The Independents here plead for a tolleration both for themselfes and other sects. My Dissuasive is come in time to doe service here. We hope God will assist us to remonstrate the wickedness of such an tolleration." And on account of the Independents wishing to show common charity towards persons who differed in opinions from themselves, Baillie writes next year (1646), "The Independents has the least zeale to the truth of God of any men we know." *Baillie's Letters and Journals*, vol. ii. pp. 328, 361. Blair, who was in London in 1649, was sorely vexed with "the most illegal, irreligious, and wicked proceedings and actings of the sectarian army;" one of their crimes being the attempt "to ruin religion by their toleration." *Continuation of the Autobiography of Mr. Robert Blair, Minister of St. Andrews*, p. 213. For other evidence of this persecuting spirit, see *Dickson's Truth's Victory over Error*, pp. 159, 163, 199–202; *Abernethy's Physicke for the Soule*, p. 215; *Durham's Exposition of the Song of Solomon*, p. 147; *Durham's Commentarie upon the Book of the Revelation*, pp. 141, 143, 330; and *Shields' Hind Let Loose*, p. 168.

[201] "A third benefit (which is a branch of the former), is zeal in the godly against false teachers, who shall be so tender of the truth and glory of God, and the safety of the Church (all which are endangered by error), that it shall overcome natural affection in them; so that parents shall not *spare their own children*, being seducers, but shall

even more sacred and more devoted still. They laid their rude and merciless hands on the holiest passion of which our nature is capable, the love of a mother for her son. Into that sanctuary they dared to intrude; into that they thrust their gaunt and ungentle forms. If a mother held opinions of which they disapproved, they did not scruple to invade her household, take away her children, and forbid her to hold communication with them.[202] Or if, perchance, her son had incurred their displeasure, they were not satisfied with forcible separation, but they laboured to corrupt her heart, and harden it against her child, so that she might be privy to the act. In one of these cases, mentioned in the records of the church of Glasgow, the Kirk-Session of that town summoned before them a woman, merely because she had received into her house her own son, after the clergy had excommunicated him. So effectually did they work upon her mind that they induced her to promise not only that she would shut her door against her child, but that she would aid in bringing him to punishment. She had sinned in loving him; she had sinned even in giving him shelter; but, says the record, "she promised not to do it again, and to tell the magistrates when he comes next to her." [203]

She promised not to do it again. She promised to forget him whom she had borne of her womb and suckled at her breast. She promised to forget her boy who had ofttimes crept to her knees, who had slept in her bosom, and whose tender frame she had watched over and nursed. All the dearest associations of the past, all that the most exquisite form of human affection can give or receive, all that delights the memory, all that brightens the prospect of life, all vanished, all passed away from the mind of this poor woman, at the bidding of her spiritual masters. At one fell swoop all were gone. So potent were the arts of these men, that they persuaded the mother to conspire against her son, that she might deliver him up to them. They defiled her nature by purging it of its love. From that day her soul was polluted. She was lost to herself, as well as lost to her son. To hear of such things is enough to make one's blood surge again, and raise a tempest in our inmost nature. But to have seen them, to have lived in the midst of them, and yet not to have rebelled against them, is to us utterly inconceivable, and proves * in how complete a thraldom the Scotch were held, and how thoroughly their minds as well as their bodies were enslaved.

What more need I say? What further evidence need I bring to elucidate the real character of one of the most detestable tyrannies ever seen on the earth? When the Scotch Kirk was at the height of its power, we may search history in vain for any institution which can compete with it, except the Spanish Inquisition. Between these two there is a close and intimate analogy. Both were intolerant, both were cruel, both made war upon the finest parts of human nature, and both destroyed every vestige of religious freedom. One difference however there was, of vast importance. In political matters, the Church, which was servile in Spain, was rebellious in Scotland. Hence, the Scotch always had one direction in which they could speak and act with unrestrained liberty.† In politics

either by an heroick act (such as was in Phinehas, Numb. xxv. 8), *themselves judge him worthy to die, and give sentence and execute it*, or cause him to be punished, by bringing him to the Magistrate," &c. . . . "The toleration of a false religion in doctrine or worship, and the exemption of the erroneous from civil punishment, is no more lawful under the New Testament than it was under the Old." *An Exposition of the Prophecie of Zechariah*, in *Hutcheson's Exposition on the Minor Prophets*, vol. iii. p. 203, 8vo, 1654.

[202] *Selections from the Registers of the Presbytery of Lanark*, pp. x. 33, 56, 63, 65, 73.

[203] I copy the exact words from *Wodrow's Collections upon the Lives of Ministers of the Church of Scotland*, vol. ii. part ii. p. 71. An order had been previously obtained from the government, "requiring the magistrates to expell furth of the Toun all excommunicated persons."

[* Hiatus in the text. Read "and their toleration of such things proves."—Ed.]

[† This is not the complete account of the case. English books could circulate in Scotland. Thus there was always some little nourishment for the intellectual life of the better minds.—Ed.]

they found their vent. There the mind was free. And this was their salvation. This saved them from the fate of Spain, by securing to them the exercise of those faculties which otherwise would have lain dormant, if indeed they had not been entirely destroyed by that long and enfeebling servitude in which their clergy retained them, and from which, but for this favourable circumstance, no escape would have been open.

CHAPTER VI

An Examination of the Scotch Intellect during the Eighteenth Century

To complete the history and analysis of the Scotch mind I have now to examine the peculiar intellectual movement which appeared in the eighteenth century, and which for several reasons deserves careful attention. It was essentially a reaction against that theological spirit which predominated during the seventeenth century. Such a reaction would hardly have been possible except for the fact which I have already noticed, namely, that the political activity which produced the rebellion against the Stuarts saved the Scotch mind from stagnating, and prevented that deep slumber into which the progress of superstition would naturally have thrown it. The long and stubborn conflict with a despotic government kept alive a certain alertness and vigour of understanding, which survived the struggle that gave it birth. When the contest was ended, and peace was restored, the faculties which for three generations had been exercised in resisting the executive authority, sought other employment, and found another field in which they could disport themselves. Hence it was that the boldness which in the seventeenth century was practical, became in the eighteenth century speculative, and produced a literature which attempted to unsettle former opinions, and to disturb the ancient landmarks of the human mind. The movement was revolutionary, and bore the same relation to ecclesiastical tyranny which the previous movement had borne to political tyranny. But this new rebellion had one striking characteristic. In nearly every other country, when the intellect has fairly arrayed itself against the exclusive pretensions of the Church, it has happened that the secular philosophy which has been engendered has been an inductive philosophy, taking for its basis individual and specific experience, and seeking by that means to overthrow the general and traditional notions on which all church power is founded. The plan has been to refuse to accept principles which could not be substantiated by facts ; while the opposite and theological plan is to force the facts to yield to the principles. In the former case, experience precedes theory ; in the latter case, theory precedes experience, and controls it. In theology certain principles are taken for granted ; and it being deemed impious to question them, all that remains for us is to reason from them downwards. This is the deductive method. On the other hand, the inductive method will concede nothing, but insists upon reasoning upwards,* and demands that we shall have the liberty of ascertaining the principles for ourselves. In a complete scheme of our knowledge, and when all our resources are fully developed and marshalled into order, as they must eventually be, the two methods will be, not hostile, but supplementary, and will be combined into

[* In this and subsequent passages Buckle assumes that there is a clear and undisputed antithesis between "induction" and "deduction," though in the closing chapter he admits that probably "all deduction is preceded by induction." Beyond this, however, there is the difficulty that the term Induction is used in several senses, even Mill so extending it as to make it trench on deduction. See *Cairnes' Character and Logical Method of Political Economy*, ed. 1875, pp. 60–62. For the strict definition of induction see Bain, *Logic*, Pt. II. *Induction*, ch. i. Compare also Buckle's own remarks in his essay on *Mill on Liberty* (*Misc. Works*, abridged ed. i. 95 seq.).—Ed.]

a single system. At present, however, we are very far from such a result ; * and not only is every mind more prone to one method than to another, but we find, historically, that different ages and different countries have been characterized by the extent to which one of these two schemes has predominated ; and we also find that a study of this antagonism is the surest way of understanding the intellectual condition of any period.

That the inductive philosophy is even more marked by its secular tendencies than by its scientific ones, will be evident to whoever observes the epochs in which it has been most active, and has possessed most adherents. Of this the history of the French mind in the eighteenth century affords a good instance, where, after the death of Louis XIV., we may clearly trace the connexion between the growth of the inductive method and the subsequent overthrow of the Gallican church. In England, too, the rise of the Baconian philosophy, with its determination to subordinate ancient principles to modern experience, was the heaviest blow which has ever been inflicted on the theologians, whose method is to begin not with experience but with principles which are said to be inscrutable, and which we are bound to believe without further difficulty. And I need hardly remind the reader that scarcely was that philosophy established among us, when it produced those bold inquiries which quickly ended in the downfall of the English Church under Charles I.† From that terrible defeat our clergy did for a time partly rally ; but as their apparent success in the reign of Charles II. was owing to political changes, and not to social ones, they were unable to recover their hold over society, and, unless the nation should retrograde, there is no possibility that they ever should recover it. Over the inferior order of minds they still wield great influence ; but the Baconian philosophy, by bringing their favourite method into disrepute, has sapped the very base of their system. From the moment that their mode of investigation was discredited, the secret of their power was gone. From the moment that men began to insist on inquiring into the validity of first principles, instead of accepting them without inquiry and humbly submitting to them as matters of faith and of necessary belief ; from that moment, the theologians, driven from one post to another, and constantly receding before the pressure of advancing knowledge, have been forced to abandon entrenchment after entrenchment, until what they have retained of their former territory is hardly worth the struggle. As a last resource, they at the close of the eighteenth century determined to use the weapons of their opponents ; and Paley and his successors, enlarging the scheme which Ray and Derham had feebly sketched, endeavoured by a skilful employment of the inductive method to compensate their party for the failure of the deductive one. But their project, though ably conceived, has come to naught. It is now generally admitted that nothing can be made of it, and that it is impossible to establish the old theological premisses by a chain of inductive reasoning. Respecting this, the most eminent philosophers agree with the most eminent theologians ; and since the time of Kant in Germany, and of Coleridge in England, none of our ablest men, even among divines themselves, have recurred to a plan which Paley indeed pursued with vigour, but of which our Bridgewater Treatises, our Prize-Essays, and such schoolboy productions, are poor and barren imitations.[1] No great thinkers now follow this course in matters

[1] Of course I say this merely in reference to their theological bearings. Some of the Bridgewater Treatises, such as Bell's, Buckland's, and Prout's, had great scientific merit

[* See, however, the contrary admissions below, above, *note* 150, beginning of par.—Ed.]

[† This is perhaps the worst grounded of Buckle's theses concerning the Rebellion. There is not the slightest ground for ascribing it in any measure whatever to the influence of the Baconian philosophy, which was probably even less known among the Parliamentary party than among the royalists. His first notable disciple was Hobbes. It is true that Bacon before Hobbes desired to subject the Church to the State ; but it was not at his fountain that the rebels drank. The early members of the Royal Society, who greatly admired his work, were quietists, shunning political and religious controversy. Bacon had been a supporter of the royal prerogative.—Ed.]

of religion. On the contrary, they prefer the safer as well as the more philosophic method of dealing with these subjects on transcendental grounds, frankly confessing that they elude the grasp of that inductive philosophy which in the department of science has achieved such signal triumphs.

The opposition of these two methods, and the inapplicability of the inductive method to theological pursuits being thus apparent, it is not strange that the Scotch should have adopted one of the methods with great zeal, and to the almost complete exclusion of the other. Scotland, being essentially theological, followed the theological plan. The intellectual history of that country in the seventeenth century is almost entirely the history of theology. With the single exception of Napier, who was born in the middle of the sixteenth century, all the most vigorous thinkers were divines. In physical science scarcely anything was done.[2] There was no poetry, no drama, no original philosophy, no fine compositions, no secular literature, now worth reading.[3] The only men of real in-

at the time of their appearance, and may even now be studied with advantage; but the religious portion of them is pitiable, and shows either that their heart was not in their work, or else that the subject was too wide for them. At all events, it is to be hoped that we shall never again see men of equal eminence hiring themselves out as paid advocates, and receiving fees to support particular opinions. It is truly disgraceful that such great speculative questions, instead of being subjected to fair and disinterested argument, with a view of eliciting the truth, should be turned into a pecuniary transaction, in which any one of much money and little wit can bribe as many persons as he likes to prejudice the public ear in favour of his own theories.

[2] "It is humiliating to have to remark, that the notices of comets which we derive from Scotch writers down to this time (1682) contain nothing but accounts of the popular fancies regarding them. Practical astronomy seems to have then been unknown in our country; and hence, while in other lands men were carefully observing, computing, and approaching to just conclusions regarding these illustrious strangers of the sky, our diarists could only tell us how many *yards* long they seemed to be, what *effects* were apprehended from them in the way of war and pestilence, and how certain pious divines 'improved' them for spiritual edification. Early in this century Scotland had produced one great philosopher, who had supplied his craft with the mathematical instrument by which complex problems, such as the movement of comets, were alone to be solved. It might have been expected that the country of Napier, seventy years after his time, would have had many sons capable of applying his key to such mysteries of nature. But no one had arisen—nor did any rise for fifty years onward, when at length Colin Maclaurin unfolded in the Edinburgh University the sublime philosophy of Newton. There could not be a more expressive signification of the character of the seventeenth century in Scotland. Our unhappy contentions about external religious matters had absorbed the whole genius of the people, rendering to us the age of Cowley, of Waller, and of Milton, as barren of elegant literature as that of Horrocks, of Halley, and of Newton, was of science." *Chambers' Domestic Annals of Scotland*, vol. ii. pp. 444, 445.

[3] "Thus, during the whole seventeenth century, the English were gradually refining their language and their taste; in Scotland, the former was much debased and the latter almost entirely lost." *History of Scotland*, book viii., in *Robertson's Works*, p. 260.

"But the taste and science, the genius and the learning of the age, were absorbed in the gulph of religious controversy. At a time when the learning of Selden and the genius of Milton conspired to adorn England, the Scots were reduced to such writers as Baillie, Rutherford, Guthrie, and the two Gillespies." *Laing's History of Scotland*, vol. iii. p. 510. "From the Restoration down to the Union, the only author of eminence whom Scotland produced was Burnet." *Ibid.*, vol. iv. p. 406.

"The seventeenth century, fatal to the good taste of Italy, threw a total night over Scotland." . . . "Not one writer who does the least credit to the nation flourished during the century from 1615 to 1715, excepting Burnet, whose name would indeed honour the brightest period. In particular, no poet whose works merit preservation arose. By a singular fatality, the century which stands highest in English history and genius is one of the darkest in those of Scotland." *Ancient Scotish Poems, edited by John Pinkerton*, vol. i. pp. iii. iv., London, 1786.

fluence were the clergy. They governed the nation,* and the pulpit was the chief engine of their power. From the pulpit they moved all classes and all sorts of intellects; the highest as well as the lowest.† There they instructed them and threatened them; saying whatever they liked, and knowing that what they said would be believed.[4] But all their sermons, and all their controversial writings, are eminently deductive; not one of them attempts an inductive argument. The bare idea of such a thing never entered their heads. They assumed the truth of their own religious and moral notions, most of which they had borrowed from antiquity; they made those notions the major premisses of their syllogisms, and from them they reasoned downwards, till they obtained their conclusions. They never suspected that premisses taken from ancient times might be the result of the inductions of those times, and that, as knowledge advanced, the inductions might need revising. They assumed that God has given to us first principles, and that He, having revealed them, it would ill become us to scrutinize them. That He had revealed them, they took for granted, and deemed it unnecessary to prove.[5] Their method being thus entirely deductive, all they were concerned with was to beware that no error crept in between the premisses and the conclusions. And this part of their task they accomplished with great ability. They were acute dialecticians, and rarely blundered in what is termed the formal part of logic. In dealing with their premisses after they obtained them, they were extremely skilful; how they obtained them, they were very heedless. That was a point they never examined with anything approaching to impartiality. According to their method, all that was requisite was to draw inferences from what had been supernaturally communicated. On the other hand the inductive method would have taught them that the first question was, whether or not they had been supernaturally communicated? They, as deductive reasoners, assumed the very preliminaries which inductive reasoners would have disputed.‡ They proceeded from generals to particulars, instead of from particulars to generals. And they would not allow either themselves or others to sift the general propositions, which were to cover and control the particular facts. It was enough for them that the wider propositions were already established, and were to be treated according to the rules of the old and syllogistic logic. Indeed, they were so convinced

[4] Ray, who visited Scotland in 1661, could not suppress a little professional envy when he saw how much higher ecclesiastics were rated there than in England. He says, "The people here frequent their churches much better than in England, and have their ministers in more esteem and veneration." *Ray's Memorials, edited by Dr. Lankester for the Ray Society*, p. 161.

[5] "Believing ignorance is much better than rash and presumptuous knowledge. Ask not a reason of these things, but rather adore and tremble at the mystery and majesty of them." *Binning's Sermons*, vol. i. p. 143. Even Biblical criticism was prohibited; and Dickson says of the different books of the Bible, "We are not to trouble ourselves about the name of the writer or time of writing of any part thereof, especially because God of set purpose concealeth the name sundry times of the writer, and the time when it was written." *Dickson's Explication of the Psalms*, p. 291.

[* That is, the minds of the people. It has been shown in a previous chapter that the Government after the Restoration stood for absolutism and Episcopalianism.—Ed.]

[† Burton, on the contrary, writes that "the higher orders have always in Scotland but scantily partaken in the religious fervour so abundant among the humbler body of the people" (*History of Scotland*, vii. 425); and Buckle in his own MSS. had transcribed testimony to the same effect (*Misc. Works*, abridged ed. ii. 234).—Ed.]

[‡ As did all theologians till sceptics attacked them. On this point the English theologians were in the same case. However inductive, they never "disputed" their own creed. Strictly speaking, as Buckle virtually admits a few sentences earlier, orthodoxy sets out not with a deduction but with an imperfect induction, inasmuch as it reasons from the contents of the Bible to its inspired authority. That being taken as granted, the deduction follows, as on a scientific principle.—Ed.]

of the impropriety of the inductive method that they did not hesitate to assert that it was by means of the syllogism that the Deity communicated His wishes to man.[6]

It was naturally to be expected that the clergy holding these views respecting the best means of arriving at truth, should do all in their power to bring over the nation to their side, and should labour to make their own method of investigation entirely supersede the opposite method. Nor was this a very difficult task. The prevailing credulity was one great point in their favour, inasmuch as it made men more willing to accept propositions than to scrutinize them. When the propositions were accepted, nothing was left but to reason from them; and the most active intellects in Scotland, being constantly engaged in this process, acquired complete mastery over it, and the dexterity they displayed increased its repute. Besides this, the clergy, who were its zealous champions, had monopolized all the sources of education, both public and private. In no other Protestant country have they exercised such control over the universities; not only the doctrines taught, but also the mode of teaching them, being in Scotland placed under the supervision of the Church.[7] This power they of course used to propagate their own plan of obtaining truth; and as long as their power remained undiminished, it was hardly possible that the opposite or inductive plan should gain a hearing. Over grammar-schools the clergy possessed an authority fully equal to that which they had in the universities.[8] They also appointed and removed, at their own pleasure, teachers of every grade, from village schoolmasters to tutors in private families.[9] In this way each generation, as it arose, was brought under their influence, and made subject to their notions. Taking the mind of Scotland while it was young and flexible, they bent it to their own method. Hence that method became supreme; it reigned everywhere; not a voice was lifted up against it; and no one had an idea that there was more than one path by which truth could be reached, or that

[6] "Christ from heaven proposeth a syllogism to Saul's fury." *Rutherford's Christ Dying*, p. 180. "The conclusion of a practical syllogism, whereby the believer concludeth from the gospel that he shall be saved." *Durham's Law Unsealed*, p. 97. "All assurance is by practical syllogism, the first whereof must needs be a Scripture truth." *Gray's Precious Promises*, p. 139. [This does not involve alleging "impropriety" in the inductive method. A syllogism proceeds upon data which may be inductively reached. If the "first" be a text, it is none the less a supposed datum of experience, and the "second" may be any fact of observation.—ED.]

[7] Bower (*History of the University of Edinburgh*, vol. i. p. 217) says, "The history of the universities and of the church is in modern Europe, and perhaps in every other civilized portion of the globe, very nearly connected. They are more nearly connected in Scotland than in any other civilized country called Protestant; because the General Assembly have the legal power of inquiring into the economy of the institutions, both as it respects the mode of teaching, and the doctrines, whether religious, moral, or physical, which are taught." Spalding, under the year 1639, gives an instance of the power of the General Assembly in "the College of Old Aberdeen." *Spalding's History of the Troubles*, vol. i. p. 178. See also, on the authority exercised by the General Assembly over the universities, a curious little book, called *The Government and Order of the Church of Scotland*, Edinburgh, 1690, p. 25. [These writers do not seem to have considered the case of New England.—ED.]

[8] In 1632 the "ministers" of Perth were greatly displeased because John Row was made master of the grammar-school without their consent. *The Chronicle of Perth*, p. 33, where it is stated that, consequently, "thair wes much outcrying in the pulpett."

[9] See, for instance, *Minutes of the Presbyteries of St. Andrews and Cupar*, pp. 66, 83, 84, 118. One of the entries is, that in January, 1648, "The Presbyterie ordained that all young students, who waittes on noblemen or gentlemen within thir bounds, aither to teach ther children, or catechise and pray in ther families, to frequent the Presbyterie, that the brether may cognosce what they ar reading, and what proficiencie they make in ther studies, and to know also ther behaviour in the said families, and of their affectione to the Covenant and present religione." p. 118. Compare *Selections from the Registers of the Presbytery of Lanark*, pp. 56, 65.

the human understanding was of any use, except to deal deductively with premisses which were not to be inductively examined.

The inductive or analytic spirit * being thus unknown, and the deductive or synthetic spirit being alone favoured, it happened that when, early in the eighteenth century, the circumstances already mentioned gave rise to a great intellectual movement, that movement, though new in its results, was not new in the method by which the results were obtained. A secular philosophy was indeed established, and the ablest men, instead of being theological, became scientific. But so completely had the theological plan occupied Scotland, that even philosophers were unable to escape from its method, and, as I am about to show, the inductive method exercised no influence over them.† This most curious fact is the key to the history of Scotland in the eighteenth century, and explains many events which would otherwise appear incompatible with each other. It also suggests an analogy with Germany, where the deductive method has for a long period been equally prevalent, owing to precisely the same causes. In both countries the secular movement of the eighteenth century was unable to become inductive ; and this intellectual affinity between two such otherwise different nations is, I have no doubt, the principal reason why the Scotch and German philosophies have so remarkably acted and reacted upon each other ; Kant and Hamilton being the most finished specimens of their intercourse. To this England forms a complete contrast. For more than a hundred and fifty years after the death of Bacon, the greatest English thinkers, Newton and Harvey excepted,‡ were eminently inductive ; nor was it until the nineteenth century that signs were clearly exhibited of a counter-movement, and an attempt was made to return in some degree to the deductive method.[10] This we are in many respects justified in doing, because in the progress of our knowledge we have by a long course of induction arrived at several conclusions which we may safely treat deductively ; that is to say, we may make them the major premisses of new arguments. The same process has been seen in France, where the exclusively inductive philosophy of the eighteenth century || preceded

[10] This I have already touched upon (above, p. 501). Hereafter, and in my special history of the English mind, I shall examine it carefully and in detail. The revival of the old logic is a great symptom of it. Works like those of Whately, De Morgan, and Mansel, could not have been produced in the eighteenth century, or, at all events, if by some extraordinary combination of events they had been produced, they would have found no readers. As it is, they have exercised a very extensive and very salutary influence ; and although Archbishop Whately was not well acquainted with the history of formal logic, his exposition of its ordinary processes is so admirably clear that he has probably contributed more than any other man towards impressing his contemporaries with a sense of the value of deductive reasoning. He has however not done sufficient justice to the opposite school, and has indeed fallen into the old academical error of supposing that all reasoning is by syllogism. We might just as well say that all movement is by descent.

[* This definition will hardly hold good. Analysis may be carried on deductively ; and many of the Scottish writers of the eighteenth century are much given to it. Hume's philosophy is at many points an analysis of experience.—Ed.]

[† This specific statement is probably an error. Secular thinkers, such as Kames, Smith, Hume, Ferguson, and the other historians, must have been *influenced* by inductive processes, though what they undertook to do as reasoners was to argue their problems on deductive lines. Parts of Hume's philosophic argument are inductive, though he usually gives prominence to his deductions. See Buckle's own words, above, p. 143. —Ed.]

[‡ Even these must often have reasoned inductively. Harvey certainly made autopsies, and even experiments on animals, though he seems to have profited little by the latter. See the citations, as distinct from the arguments, of Mr. S. Paget, *Experiments on Animals*, 1900, pp. 6–10.—Ed.]

[|| If this be accurate, the Scottish thinkers were certainly " influenced " by the inductive method ; for they were all influenced by their French contemporaries. See *Carlyle's Essay on Burns*, 1869 ed. of *Miscellanies*, ii. 37–38.—Ed.]

a partial resuscitation of deductive philosophy in the nineteenth century. In Scotland, however, there have been no such vicissitudes. In that country men have always been deductive; even the most original thinkers being unable to liberate themselves from the universal tendency, and being forced to accept a method which time had consecrated, and which was interwoven with all the associations of the national mind.

To understand the investigation into which we are about to enter, the reader must firmly seize, and keep before his eyes, the essential difference between deduction, which reasons from principles, and induction, which reasons to principles. He must remember that induction proceeds from the smaller to the greater; deduction from the greater to the smaller. Induction is from particulars to generals, and from the senses to the ideas; deduction is from generals to particulars, and from the ideas to the senses. By induction we rise from the concrete to the abstract; by deduction we descend from the abstract to the concrete. Accompanying this distinction there are certain qualities of mind which, with extremely few exceptions, characterize the age, nation, or individual in which one of these methods is predominant. The inductive philosopher is naturally cautious, patient, and somewhat creeping; while the deductive philosopher is more remarkable for boldness, dexterity, and often rashness. The deductive thinker invariably assumes certain premisses, which are quite different from the hypotheses essential to the best induction. These premisses are sometimes borrowed from antiquity; sometimes they are taken from the notions which happen to prevail in the surrounding society; sometimes they are the result of a man's own peculiar organization; and sometimes, as we shall presently see, they are deliberately invented with the object of arriving not at truth, but at an approximation to truth. Finally, and to sum up the whole, we may say that a deductive habit, being essentially synthetic, always tends to multiply original principles or laws; while the tendency of an inductive habit is to diminish those laws by gradual and successive analysis.*

These being the two fundamental divisions of human inquiry, it is surely a most remarkable fact in the history of Scotland that during the eighteenth century all the great thinkers belonged to the former division, and that in the very few instances of induction which their works contain, it is evident, from the steps they subsequently took, that they regarded such inductions as unimportant in themselves, and as only valuable in so far as they supplied the premisses for another and deductive investigation. As the various departments of our knowledge have never yet been co-ordinated and treated as a whole, probably no one is aware of the universality of this movement in Scotland, and of the extent to which it pervaded every science, and governed every phase of thought. To prove, therefore, the force with which it acted, I now purpose to examine its working in all the principal forms of speculation, whether physical or moral, and to show that in each the same method was adopted. In doing this I must for the sake of clearness proceed according to a natural arrangement of the different topics; but I will, whenever it is possible, also follow the chronological order in which the Scotch mind unfolded itself; so that we may understand not only the character of that remarkable literature, but likewise the steps of its growth, and the astonishing vigour with which it emancipated itself from the shackles which superstition had imposed.

The beginning of the great secular philosophy of Scotland is undoubtedly due to Francis Hutcheson.[11] This eminent man, though born in Ireland, was of

[11] See a letter from Sir James Mackintosh to Parr, in *Mackintosh's Memoirs*, London,

[* This creates a difficulty for Buckle's thesis. It cannot be maintained that Hume and Smith "multiplied original principles" in their reasonings. It would have been more accurate to speak of *à priori* and *à posteriori* methods. If we take the theory of planetary angels, or deities of the elements, as a sample of spontaneous induction, and Newton's law of gravitation as a sample of deduction, the facts are not as Buckle says. —Ed.]

Scotch family, and was educated in the University of Glasgow, where he received the appointment of Professor of Philosophy in the year 1729.[12] By his lectures, and by his works, he diffused a taste for bold inquiries into subjects of the deepest importance, but concerning which it had previously been supposed nothing fresh was to be learned; the Scotch having hitherto been taught that all truths respecting our own nature which were essential to be known, had been already revealed. Hutcheson, however, did not fear to construct a system of morals according to a plan entirely secular, and no example of which had been exhibited in Scotland before his time. The principles from which he started were not theological, but metaphysical.* They were collected from what he deemed the natural constitution of the mind, instead of being collected as heretofore from what had been supernaturally communicated. He therefore shifted the field of study. Though he was a firm believer in revelation, he held that the best rules of conduct could be ascertained without its assistance, and could be arrived at by the unaided wit of man; and that, when arrived at, they were in their aggregate to be respected as the Law of Nature.[13] This confidence in the power of the human understanding was altogether new in Scotland,† and its appearance forms an epoch in the national literature. Previously, men had been taught that the understanding was a rash and foolish thing, which ought to be repressed, and which was unfit to cope with the problems presented to it.[14] Hutcheson, however, held that it was quite able to deal with them, but that to do so it must be free and unfettered. Hence he strenuously advocated that right of private judgment which the Scotch Kirk had not only assailed, but had almost destroyed. He insisted that each person had a right to form his opinion according to the evidence he possessed, and that, this right being inalien-

1835, vol. i. p. 334. "To Hutcheson the taste for speculation in Scotland, and all the philosophical opinions (except the Berkleian Humism) may be traced." M. Cousin (*Histoire de la Philosophie*, première série, vol. iv. p. 35, Paris, 1846) observes, that before Hutcheson "il n'avait paru en Ecosse ni un écrivain ni un professeur de philosophie un peu remarquable."

[12] *Tytler's Memoirs of Kames*, Edinburgh, 1814, vol. i. p. 223. *Hutcheson's Moral Philosophy*, vol. i. p. iii., London, 1755, 4to.

[13] "The intention of Moral Philosophy is to direct men to that course of action which tends most effectually to promote their greatest happiness and perfection; as far as it can be done by observations and conclusions discoverable from the constitution of nature, without any aids of supernatural revelation: these maxims or rules of conduct are therefore reputed as laws of nature, and the system or collection of them is called the LAW OF NATURE." *Hutcheson's Moral Philosophy*, vol. i. p. 1.

[14] "The natural understanding is the most whorish thing in the world." . . . "The understanding, even in the search of truth amongst the creatures, is a rash, precipitate, and unquiet thing." *Rutherford's Christ Dying*, p. 181. "Innocent Adam," indeed, says Boston, "Innocent Adam had a stock of gracious abilities, whereby he might have, by the force of moral considerations, brought himself to perform duty aright. But where is that with us?" *Boston's Sermons*, p. 65.

[* In that case, the "deductive" method must be ascribed to a popular English thinker, for Hutcheson as a moralist was certainly a disciple of Shaftesbury. See the editor's introduction to *Shaftesbury's Characteristics*, 1900, pp. xiv., xxxvii. Buckle himself noted in his Commonplace Book (*Miscellaneous and Posthumous Works*, abridged ed. 1885, i. 277), that Shaftesbury "followed the deductive method." But Prof. Sidgwick pronounces Shaftesbury "the first moralist who distinctly takes psychological experience as the basis of ethics," adding that "the substance of Shaftesbury's main arguments was adopted by Butler." (*Outlines of the History of Ethics*, 3rd ed. p. 100). —ED.]

[† That is, in Scottish literature. Hobbes had however been read by many in Scotland, as had Spinoza. See *Halyburton's Natural Religion Insufficient*, Edinburgh, 1714, p. 31.—ED.]

able, none but weak minds would abstain from exercising it.[15] Every one was to judge according to his own light, and nothing could be gained by inducing men to profess sentiments contrary to their convictions.[16] So far, however, was this from being understood, that we found all the little sects quarrelling among themselves, and abusing each other, merely because their views were different. It was strange to hear how the professors of one creed would stigmatize the professors of other creeds as idolatrous, and would demand that penalties should be inflicted on them. In point of fact, all had much that was good; and their only real evil was this love of persecution.[17] But the vulgar deemed every one a heretic who did not believe what they believed; and this way of thinking had been too much countenanced by the clergy, many of whom felt their vanity offended at the idea of laymen pretending to be wiser than their spiritual teachers, and venturing to disagree with what they said.[18]

Such large views of liberty were far in advance of the country in which they were propounded, and could exercise no influence, except over a few thinking men. These and similar doctrines were, however, repeated by Hutcheson in his lectures every year.[19] And strange indeed they must have seemed. To those who received them, they were utterly subversive of the prevailing theological spirit, which regarded toleration as impious, and which, seeking to confine the human mind within the limits of foregone conclusions, deemed it a duty to chastise those who overstepped them. In opposition to this, Hutcheson let in the elements of inquiry, of discussion, and of doubt. There is also another point in which his philosophy is memorable, as the beginning of the great rebellion

[15] "A like natural right every intelligent being has about his own opinions, speculative or practical, to judge according to the evidence that appears to him. This right appears from the very constitution of the rational mind, which can assent or dissent solely according to the evidence presented, and naturally desires knowledge. The same considerations show this right to be unalienable: it cannot be subjected to the will of another: though where there is a previous judgment formed concerning the superior wisdom of another, or his infallibility, the opinion of this other, to a weak mind, may become sufficient evidence. As to opinions about the Deity, religion, and virtue, this right is further confirmed by all the noblest desires of the soul; as there can be no virtue, but rather impiety, in not adhering to the opinions we think just, and in professing the contrary." *Hutcheson's Moral Philosophy*, vol. i. pp. 295, 296. See also vol. ii. p. 311 "Every rational creature has a right to judge for itself in these matters: and as men must assent according to the evidence that appears to them, and cannot command their own assent in opposition to it, this right is plainly unalienable."

[16] "Thus no man can really change his sentiments, judgments, and inward affections, at the pleasure of another, nor can it tend to any good to make him profess what is contrary to his heart." *Hutcheson's Moral Philosophy*, vol. i. pp. 261, 262.

[17] "Arians and Socinians are idolaters and denyers of God, say the orthodox. They retort upon the orthodox, that they are Tritheists; and so do other sects; and thus they spirit up magistrates to persecute. While yet it is plain that in all these sects there are all the same motives to all social virtues from a belief of a moral providence, the same acknowledgments that the goodness of God is the source of all the good we enjoy or hope for, and the same gratitude and resignation to him recommended. Nor do any of their schemes excite men to vices, except that horrid tenet, too common to most of them, the right of persecuting." *Hutcheson's Moral Philosophy*, vol. ii. p. 316. See also vol. i. p. 160; and *Hutcheson's Inquiry into our Ideas of Beauty and Virtue*, London, 1738, p. 283.

[18] "We all know the notions entertained by the vulgar concerning all hereticks; we know the pride of schoolmen and many ecclesiasticks; how it galls their insolent vanity that any man should assume to himself to be wiser than they in tenets of religion by differing from them." *Hutcheson's Moral Philosophy*, vol. i. p. 167.

[19] "As he had occasion every year in the course of his lectures to explain the origin of government, and compare the different forms of it, he took peculiar care, while on that subject, to inculcate the importance of civil and religious liberty to the happiness of mankind." *Leechman's Life of Hutcheson*, p. xxxv., prefixed to *Hutcheson's Moral Philosophy*

of the Scotch intellect. We saw in the last chapter how successfully the teachers of the people had inculcated doctrines of the darkest asceticism, and how naturally those doctrines had arisen out of the enormous authority possessed by the Church. Against such notions Hutcheson set his face strenuously. He rightly supposed that an admiration of every kind of beauty, so far from being sinful, is essential to a complete and well-balanced mind; and the most original part of his philosophy consists of the inquiries which he made into the working and origin of our ideas on that subject. Hitherto, the Scotch had been taught that the emotions which beauty excites were owing to the corruption of our nature, and ought to be repressed. Hutcheson on the other hand insisted that they were good in themselves; that they were part of the general scheme of human affairs, and that they deserved a special and scientific study.[20] And with such skill did he investigate them that, in the opinion of one of the highest living authorities, he is the originator of all subsequent inquiries into these matters; his being the first attempt to deal with the subject of beauty in a broad and comprehensive spirit.[21]

Not only in speculative views, but also in practical recommendations, Hutcheson displayed the same tendency; everywhere endeavouring to break down that gloomy fabric which superstition had built up.[22] His predecessors, and indeed nearly all his contemporaries who exercised much influence, represented pleasure as immoral, and opposed themselves to the fine arts, which they considered dangerous, as ministering to our pleasures, and thereby distracting our minds from serious concerns. Hutcheson, however, declared that the fine arts were to be cherished; for, he said, they are not only agreeable, but also reputable, and to employ our time with them is honourable.[23] That such is the case is obvious enough to us, but it was long indeed since similar language had been heard in Scotland from a great public teacher,* and it was completely opposed to the prevailing notions. But Hutcheson went even further. Not content

[20] "The ideas of beauty and harmony, like other sensible ideas, are necessarily pleasant to us, as well as immediately so." *Hutcheson's Inquiry into our Ideas of Beauty and Virtue*, p. 11. "Our sense of beauty seems designed to give us positive pleasure." p. 71. "Beauty gives a favourable presumption of good moral dispositions." p. 257. "But it is plain we have not in our power the modelling of our senses or desires, to form them for a private interest; they are fixed for us by the Author of our nature, subservient to the interest of the system; so that each individual is made, previously to his own choice, a member of a great body, and affected with the fortunes of the whole; or at least of many parts of it; nor can he break himself off at pleasure." *Hutcheson's Essay on the Passions*, pp. 105, 106.

[21] "Fille de la scholastique, la philosophie moderne est demeurée longtemps étrangère aux grâces, et les *Recherches* d'Hutcheson présentent, je crois, le premier traité spécial sur le beau, écrit par un moderne. Elles ont paru en 1725. Cette date est presque celle de l'avénement de l'esthétique dans la philosophie européenne. L'ouvrage du père André, en France, est de 1741, celui de Baumgarten, en Allemagne, est de 1750. Ce n'est pas un petit honneur à Hutcheson d'avoir le premier soumis l'idée du beau à une analyse méthodique et régulière." *Cousin, Histoire de la Philosophie*, première série, vol. iv. p. 84.

[22] In his *Inquiry into Beauty and Virtue*, p. 107, he so completely opposed the prevailing notions as to assert that "our perception of pleasure is necessary, and nothing is advantageous or naturally good to us but what is apt to raise pleasure mediately, or immediately." Compare what he says at p. 91 respecting "superstitious prejudices against actions apprehended as offensive to the Deity."

[23] "Hence a taste for the ingenious arts of musick, sculpture, painting, and even for the manly diversions, is reputable." *Hutcheson's Moral Philosophy*, vol. i. p. 83. At p. 129 he says, that in them "our time is agreeably and honourably employed." See also vol. ii. p. 115.

[* It had never been heard at all—save in so far as Shaftesbury's *Characteristics* or the writings of the French critics were there read.—Ed.]

with raising his voice in favour of wealth,[24] which the Scotch clergy stigmatized as one of the most pernicious and carnal of all things, he fearlessly asserted that all our natural appetites are lawful, and that the gratification of them is consistent with the highest virtue.[25] In his eyes they were lawful because they were natural; while according to the theological theory their being natural made them unlawful. And here lies the fundamental difference between the practical views of Hutcheson and those previously received. He, like every great thinker since the seventeenth century, loved human nature, and respected it; but he neither loved nor respected those who unduly trammelled it, and thereby weakened its vigour, as well as impaired its beauty. He placed more confidence in mankind than in the rulers of mankind. The Scotch divines who preceded him were the libellers of their species; they calumniated the whole human race. According to them, there was nothing in us but sin and corruption; and therefore all our desires were to be checked. It is the peculiar glory of Hutcheson that he was the first man in Scotland who publicly combated these degrading notions. With a noble and lofty aim did he undertake his task. Venerating the human mind, he was bent on vindicating its dignity against those who disputed its titles. Unhappily he could not succeed; the prejudices of his time were too strong. Still, he did all that was in his power. He opposed the tide which he was unable to stem; he attacked what it was impossible to destroy; and he cast from his philosophy, with vehement scorn, those base prejudices which, by aspersing all that is great and magnanimous, had long blinded the eyes of their contemporaries, and by bringing into fresh prominence the old and mischievous dogma of moral degeneracy, had represented our nature as a compound of vices, and had been unable to see how many virtues we really possess, how much of the spirit of self-sacrifice and of free disinterested benevolence has always existed; how much of good even the worst of us retain; and how, among the ordinary and average characters of whom the world is composed, the desire of benefiting others is more frequent than the desire of hurting them, kindness is more common than cruelty, and the number of good deeds does, on the whole, far outweigh the number of bad ones.[26]

[24] "Wealth and power are truly useful, not only for the natural conveniences or pleasures of life, but as a fund for good offices." *Hutcheson's Moral Philosophy*, vol. i. p. 104. Compare *Hutcheson on Beauty and Virtue*, pp. 93–95; and his *Essay on the Passions and Affections*, pp. 8, 9, 99. "How weak also are the reasonings of some recluse moralists, who condemn in general all pursuits of wealth or power, as below a perfectly virtuous character; since wealth and power are the most effectual means, and the most powerful instruments, even of the greatest virtues and most generous actions."

[25] "The chief happiness of any being must consist in the full enjoyment of all the gratifications its nature desires and is capable of." *Hutcheson's Moral Philosophy*, vol. i. p. 100. "The highest sensual enjoyments may be experienced by those who employ both mind and body vigorously in social virtuous offices, and allow all the natural appetites to recur in their due seasons." p. 121. "Nay, as in fact it is for the good of the system that every desire and sense natural to us, even those of the lowest kinds, should be gratified as far as their gratification is consistent with the nobler enjoyments, and in a just subordination to them; there seems a natural notion of *right* to attend them all." pp. 254, 255.

[26] "'Tis pleasant to observe how those authors who paint out our nature as a compound of sensuality, selfishness, and cunning, forget themselves on this subject in their descriptions of youth, when the natural temper is less disguised than in the subsequent parts of life. 'Tis made up of many keen, inconstant passions, many of them generous; 'tis fond of present pleasure, but 'tis also profusely kind and liberal to favourites; careless about distant interests of its own; full of confidence in others; studious of praise for kindness and generosity; prone to friendships, and void of suspicion." *Hutcheson's Moral Philosophy*, vol. ii. p. 11. "Men are often subject to anger, and upon sudden provocations do injuries to each other, and that only from self love without malice; but the greatest part of their lives is employed in offices of natural affection, friendship, innocent self love, or love of a country." *Hutcheson's Essay on the Passions*, pp. 97, 98.

Thus much as to the tendency of Hutcheson's philosophy.[27] We have now to ascertain his method, that is to say, the plan which he adopted in order to obtain his results. This is a very important part of our present inquiry; and we shall find that in the study of moral philosophy, as in the study of all subjects not yet raised to sciences, there are not only two methods, but that each method leads to different consequences. If we proceed by induction we arrive at one conclusion; if we proceed by deduction we arrive at another. This difference in the results is always a proof that the subject in which the difference exists is not yet capable of scientific treatment, and that some preliminary difficulties have to be removed before it can pass from the empirical stage into the scientific one. As soon as those difficulties are got rid of, the results obtained by induction will correspond with those obtained by deduction; supposing, of course, that both lines of argument are fairly managed. In such case, it will be of no importance whether we reason from particulars to generals or from generals to particulars. Either plan will yield the same consequences, and this agreement between the consequences proves that our investigation is, properly speaking, scientific. Thus for instance in chemistry, if by reasoning deductively from general principles we could always predict what would happen when we united two or more elements, even supposing those elements were new to us; and if, by reasoning inductively from each element, we could arrive at the same conclusion, one process would corroborate the other, and by their mutual verification the science would be complete. In chemistry we cannot do this; therefore chemistry is not yet a science, although, since the introduction into it by Dalton of the ideas of weight and number, there is every prospect of its becoming one. On the other hand, astronomy is a science, because, by employing the deductive weapon of mathematics we can compute the motions and perturbations of bodies; and on our employing the inductive weapon of observation, the telescope reveals to us the accuracy of our previous and as it were foregone inferences. The fact agrees with the idea; the particular event confirms the general principle; the principle explains the event; and their unanimity authorizes us to believe that we must be right, since, proceed as we may, the conclusion is the same; and the inductive plan, of striking averages, harmonizes with the deductive plan, of reasoning from ideas.

And at p. 165: "There are no doubt many furious starts of passion, in which malice may seem to have place in our constitution; but how seldom and how short, in comparison of years spent in fixed kind pursuits of the good of a family, a party, a country?" . . . "Here men are apt to let their imaginations run out upon all the robberies, piracies murders, perjuries, frauds, massacres, assassinations, they have ever either heard of, or read in history; thence concluding all mankind to be very wicked; as if a court of justice were the proper place for making an estimate of the morals of mankind, or an hospital of the heathfulness of a climate. Ought they not to consider that the number of honest citizens and farmers far surpasses that of all sorts of criminals in any state; and that the innocent or kind actions of even criminals themselves surpass their crimes in numbers? That it is the rarity of crimes, in comparison of innocent or good actions, which engages our attention to them, and makes them be recorded in history; while incomparably more honest, generous, domestic actions are overlooked, only because they are so common; as one great danger, or one month's sickness, shall become a frequently repeated story during a long life of health and safety."

[27] In 1731 Wodrow, who was the last really great specimen of the old Presbyterian divines, and who was not a little shocked at the changes he saw going on around him, writes: "When Dr. Calamy heard of Mr. Hutcheson's being called to Glasgow, he smiled, and said, I think to Thomas Randy, that he was not for Scotland, as he thought from his book; and that he would be reckoned there as unorthodox as Mr. Simson. The Doctor has a strange way of fishing out privat storyes and things that pass in Scotland." *Wodrow's Analecta*, vol. iv. p. 227. It is interesting to compare with this the remarks which that worldly-minded clergyman, the Rev. Alexander Carlyle, has made upon Hutcheson. See *Carlyle's Autobiography*, Edinburgh, 1860, 2nd edit. pp. 82–85. [If Wodrow was thus "shocked," it can hardly be said that such teaching as Hutcheson's "could not succeed."—Ed.]

But in the study of morals there is no such harmony. Partly from the force of prejudice, and partly from the complexity of the subject, all attempts at a scientific investigation of morals have failed. It is not therefore surprising that in this field the inductive inquirer arrives at one conclusion, and the deductive inquirer at another. The inductive inquirer endeavours to attain his object by observing the actions of men, and subjecting them to analysis, in order to learn the principles which regulate them. The deductive inquirer, beginning at the other end, assumes certain principles as original, and reasons from them to the facts which actually appear in the world. The former proceeds from the concrete to the abstract; the latter from the abstract to the concrete. The inductive moralist looks at the history of past society, or at the condition of the present, and takes for granted that the first step is to assemble the facts, and then to generalize them. The deductive inquirer, using the facts rather to illustrate his principles than to suggest them, appeals in the first place not to external facts but to internal ideas, and he makes those ideas the major premiss of a syllogistic argument. Both parties agree that we have the power of judging some actions to be right, and others to be wrong. But as to how we get that power, and as to what that power is, they are at utter variance. The inductive philosopher says that its object is happiness, that we get it by association, and that it is due to the action and reaction of social causes, which are susceptible of analysis. The deductive philosopher says that this power of distinguishing between right and wrong aims not at happiness, but at truth; that it is inherent, that it cannot be analyzed, that it is a primary conviction, and that we may assume it and reason from it, but can never hope to explain it by reasoning to it.

It requires but a slight acquaintance with the works of Hutcheson to see that he belongs to the latter of these two schools. He assumes that all men have what he terms a moral faculty, which, being an original principle, does not admit of analysis.[28] He further assumes that the business of this faculty is to regulate all our powers.[29] From these two assumptions he reasons downwards to the visible facts of our conduct, and deductively constructs the general scheme of life. His plan being entirely synthetic, he depreciates the analytic method, and complains of it as an artful attempt to diminish the number of our perceptive powers.[30] The truth is that every such diminution would have taken away some of his original principles, and would thereby have prevented him from using them as the major premisses of separate arguments. And if you deprive a deductive reasoner of his major premisses, you leave him nothing on which to stand. Hutcheson, therefore, like all the philosophers of his school, was extremely jealous of the invasions of the inductive spirit, with its constant tendency to attack convictions supposed to be primary, and seek to resolve them into their elements. He repulsed such encroachments upon his major premisses, because the power and beauty of his method were displayed in reasoning from the premisses, and not in reasoning to them. According to him, the moral faculty, and the authority which it exercised, were impervious to analysis; it was impossible to track them higher, or to resolve them into simpler constituents * and it was in vain that many attempted to refer them to circumstances external to themselves, such as education, custom, or the association of ideas.[31]

[28] In his *Moral Philosophy*, vol. i. p. 52, he calls it "an original determination or sense in our nature, not capable of being referred to other powers of perception." [Here following the "inductive" Shaftesbury.—Ed.]

[29] "This moral sense from its very nature appears to be designed for regulating and controlling all our powers." *Hutcheson's Moral Philosophy*, vol. i. p. 61.

[30] See, in his *Moral Philosophy*, vol. i. p. 79, his complaint against those who "would reduce all our perceptive powers to a very small number, by one artful reference or another."

[31] "'Tis in vain here to alledge instruction, education, custom, or association of ideas,

[* There can be no "simpler constituent" than a primary bias or appetite. Hume here reinforces Hutcheson.—Ed.]

Hence, the judgments which men pass upon the conduct of others, or of themselves, are in their origin altogether inexplicable ; each judgment being merely a different form of one great moral faculty. Inasmuch, however, as that faculty escapes observation, and is only known by its results, it is evident that for all purposes of reasoning the judgments must be deemed primary, and arguments are to be constructed from them, as if they were the ultimate and highest conditions of our nature. In this way Hutcheson was led to that love of multiplying original principles which Sir James Mackintosh has justly noticed as a characteristic of his philosophy, and, after him, of the Scotch philosophy in general ; [32] though the distinguished author of this remark has failed to perceive that such characteristic was but a single part of a far larger scheme, and was intimately connected with those habits of deductive thought which a long train of preceding circumstances had indelibly imprinted on the Scotch mind.

In Hutcheson the tendency was so strong as to make him believe that by arguing from a certain number of original principles he could construct the theory and explain the march of human affairs, with little or no aid from the experience of the past, or indeed of the present. His views, for instance, respecting the nature and objects of legislation, criminal as well as civil, might have been written by a recluse who had never quitted his hermitage, and whose purity was still unsoiled by the realities of the world. Starting from the so-called nature of things, his first steps were ideal, and from them he sought to advance to the actual. In his account of the duties of life, as they existed before the power of government was consolidated, he quotes no evidence to show what really happened among barbarous tribes who were in that state ; but he contents himself with deductive inferences from the principles he had previously laid down.[33] Difficult questions relating to the laws of property are treated in the same manner ; that is to say, the conclusions respecting them are arrived at on speculative grounds, and not by comparing how the different enactments have worked in different countries.[34] Experience is either shut out, or made subordinate to theory ; and facts are adduced to illustrate the inference, but not to suggest it. So, too, the proper relation between the people and their rulers, and the amount of liberty which the people should possess, instead of being inductively generalized from an historical inquiry into the circumstances which had produced most happiness, might in the opinion of Hutcheson be ascertained by reasoning from the nature of government, and from the ends for which it was instituted.[35]

The next great attempt to study the actions of men scientifically, and to generalize the principles of their conduct without the intervention of supernatural ideas, was made by Adam Smith, who in 1759 published his *Theory of Moral*

as the original of moral approbation." *Hutcheson's Moral Philosophy*, vol. i. p. 57. Compare his work on *Beauty and Virtue*, p. 84. [Here Hutcheson is surely quite right. The point of the sentence lies in " the original." It does not deny that instruction and custom *modify* or *determine* moral judgments.—Ed.]

[32] " To him may also be ascribed that proneness to multiply ultimate and original principles in human nature, which characterized the Scottish School till the second extinction of a passion for metaphysical speculation in Scotland." *Mackintosh's Dissertation on Ethical Philosophy*, edit. Whewell, Edinburgh, 1837, p. 208. [Mackintosh, however, notes that Hutcheson develops Shaftesbury and coincides with Butler.—Ed.]

[33] See his ingenious chapter, entitled " A deduction of the more special laws of nature and duties of life, previous to civil government and other adventitious states." *Moral Philosophy*, vol. i. p. 227 ; and compare vol. ii. pp. 294–309, " How civil power is acquired."

[34] See, for example, his remarks on " the right of possession." *Moral Philosophy*, vol. i. p. 344 ; on " rights by mortgage," p. 350 ; and on inheritance, p. 356.

[35] In his *Moral Philosophy*, vol. ii. pp. 346, 347, he sums up a long argument on " the nature of civil laws," by saying : " Thus the general duties of magistrates and subjects are discoverable from the nature of the trust committed to them, and the end of all civil power."

Sentiments, and in 1776 his *Wealth of Nations*. To understand the philosophy of this, by far the greatest of all the Scotch thinkers,* both works must be taken together, and considered as one; since they are in reality the two divisions of a single subject. In the *Moral Sentiments* he investigates the sympathetic part of human nature; in the *Wealth of Nations* he investigates its selfish part. And as all of us are sympathetic as well as selfish; in other words, as all of us look without as well as within, and as this classification is a primary and exhaustive division of our motives to action, it is evident that if Adam Smith had completely accomplished his vast design he would at once have raised the study of human nature to a science, leaving nothing for subsequent inquirers except to ascertain the minor springs of affairs, all of which would find their place in this general scheme, and be deemed subordinate to it. In his attempt to perform this prodigious task, and to traverse the enormous field which he saw lying before him, he soon perceived that an inductive investigation was impossible, because it would require the labour of many lives even to assemble the materials from which the generalization was to be made. Moved by this reflection, and, probably, moved still more by the intellectual habits which prevailed around him, he resolved on adopting the deductive method instead of the inductive; but in seeking for the premisses from which he was to reason, and on which his structure was to be built, he resorted to a peculiar artifice, which is perfectly valid, and which he had an undoubted right to employ, though, to make it available, it requires such delicate tact, and involves so many refinements, that extremely few writers have used it with effect on social questions, either before or since.

The plan to which I allude is that when any subject becomes unmanageable by the inductive method, whether from the impossibility of experimenting upon it, or from its extreme natural complexity, or from the presence of immense and bewildering details collected around it, we may in all such cases make an imaginary separation of inseparable facts, and reason upon trains of events which have no real and independent existence, and which are nowhere to be found except in the mind of the inquirer. A result obtained in this way cannot be strictly true; but if we have reasoned accurately it will be as near truth as were the premisses from which we started. To make it perfectly true we must confront it with other results, which we have arrived at in a similar way, and from the same subject. These separate inferences may eventually be co-ordinated into a single system; so that, while each inference contains only an imperfect truth, the whole of the inferences, when put together, will contain perfect truth.

Such hypothetical arguments are evidently based upon an intentional suppression of facts; and the artifice is necessary, because without the suppression the facts would be unmanageable. Each argument leads to a conclusion which approximates to truth; hence, whenever the premisses are so comprehensive as almost to exhaust the facts to which they refer, the conclusion will be so near to complete truth as to be of the greatest value, even before it is co-ordinated with other conclusions drawn from the same department of inquiry.

Geometry exhibits the most perfect example of this logical stratagem. The object of the geometrician is to generalize the laws of space; in other words, to ascertain the necessary and universal relations of its various parts. Inasmuch, however, as space would have no parts unless it were divided, the geometrician is forced to assume such a division; and he takes the simplest possible form of it, a division by lines. Now, a line considered as a fact, that is, as it is found in the actual world, must always have two qualities, length and breadth. However slight these qualities may be, every line has them both. But if the geometrician took both into consideration he would find himself in the presence of a problem too complicated for the resources of the human understanding to deal with; or, at all events, too complicated for the present resources of our knowledge. He therefore by a scientific artifice deliberately strikes off one

[* Few if any philosophers to-day will thus set Smith "far," or even at all, above Hume.—ED.]

of these qualities, and asserts that a line is length without breadth. He knows that the assertion is false, but he also knows that it is necessary. For, if you deny it, he can prove nothing. If you insist upon his letting into his premisses the idea of breadth,* he is unable to proceed, and the whole fabric of geometry falls to the ground. Since, however, the breadth of the faintest line is so slight as to be incapable of measurement, except by an instrument used under the microscope, it follows that the assumption that there can be lines without breadth is so nearly true, that our senses, when unassisted by art, cannot detect the error. Formerly, and until the invention of the micrometer in the seventeenth century, it was impossible to detect it at all. Hence the conclusions of the geometrician approximate so closely to truth, that we are justified in accepting them as true. The flaw is too minute to be perceived. But that there is a flaw appears to me certain. It appears certain that whenever something is kept back in the premisses, something must be wanting in the conclusion. In all such cases the field of inquiry has not been entirely covered ; and part of the preliminary facts being suppressed, it must, I think, be admitted that complete truth is unattainable, and that no problem in geometry has yet been exhaustively solved.[36]

Still, the amazing triumphs effected in this branch of mathematics show how powerful a weapon that form of deduction is which proceeds by an artificial separation of facts, in themselves inseparable. So little, however, is the philosophy of the method understood, that when, late in the eighteenth century, political economy assumed a scientific form, many persons who were otherwise well instructed reproached its cultivators with their hard-heartedness ; such objectors being unable to see that the science could not be constructed if it were necessary to take in the whole range of generous and benevolent affections. The political economist aims at discovering the laws of wealth, which are far too complicated to be studied under every aspect. He therefore selects one of those aspects, and generalizes the laws as they are exhibited in the selfish parts of human nature. And he is right in doing so, simply because men in the pursuit of wealth consider their own gratification oftener than the gratification of others. Hence he, like the geometrician, blots out one part of his premisses in order that he may manipulate the remaining part with greater ease. But we must always remember that political economy, though a profound and beautiful science, is only a science of one department of life, and is founded upon a suppression of some of the facts in which all large societies abound. It suppresses, or, what comes to the same thing, it ignores, many high and magnanimous feelings which we could ill afford to lose. We are not therefore to allow its conclusions to override all other conclusions. We may accept them in science, and yet reject them in practice. Thus the political economist, when confining himself to his own department, says with good reason that it is both absurd and mischievous for government to undertake to supply the working-classes with employment. This assertion he, as a political economist, can prove ; and yet, notwithstanding its scientific truth, it may be practically right for a government to do the exact opposite. It may be right for a government to supply the employment, when the people are so ignorant as to demand it, and when, at the same time, they are so powerful as to plunge the country into anarchy if the demand is refused. Here the view of the politician takes in all the premisses of which the political economist had only taken in a portion. In the same way, as a

[36] That is, so far as the facts are concerned. Geometry, considered in the most elevated manner, rests on ideas, and from that point of view is impregnable, unless the axioms can be overthrown. But if geometricians will insist on having definitions as well as axioms, they gain, no doubt, increased clearness, but they lose something in accuracy. I apprehend that, without definitions, geometry could not be a science of space, but would be a science of magnitudes, ideally conceived, and consequently as pure as ratiocination could make it. This does not touch the question as to the empirical origin of the axioms.

[* *i.e.* breadth of lines.—Ed.]

matter of economic science, it is wrong for any one to relieve the poor; since nothing is better established than that to relieve poverty increases it, by encouraging improvidence. But in spite of this, the antagonistic principle of sympathy will come into play, and will in some minds operate with such force as to make it advisable that he who feels it should give alms, because, if he abstains from giving them, the violence which he does to his own nature may inflict more mischief on himself than his bestowal of charity would inflict on the general interests of society.

It will not, I hope, be considered that in these remarks I have digressed from the main argument of the present chapter, since, although in making them I have aimed at clearing up a general question respecting the nature of scientific proof, I have only done so with the more particular object of illustrating the philosophy of Adam Smith, and of explaining the method which that most profound and original thinker pursued. We shall now be able to see how entirely his plan was deductive, and what a peculiar form of deduction it was. In his two great works he first lays down certain ideas, and from them he marches on to the facts of the external world. And in each work he reasons from only part of his premisses; supplying the other part in the other work. None of us is exclusively selfish, and none of us is exclusively sympathetic. But Adam Smith separates in speculation qualities which are inseparable in reality. In his *Moral Sentiments* he ascribes our actions to sympathy; in his *Wealth of Nations* he ascribes them to selfishness. A short view of these two works will prove the existence of this fundamental difference, and will enable us to perceive that each is supplementary to the other; so that, in order to understand either, it is necessary to study both.

In the *Theory of Moral Sentiments* Adam Smith lays down one great principle from which he reasons, and to which all the others are subordinate. This principle is that the rules which we prescribe to ourselves, and which govern our conduct, are solely arrived at by observing the conduct of others.[37] We judge ourselves, because we had previously judged them. Our notions are obtained from without, and not from within. If therefore we lived entirely alone, we could have no idea of merit or demerit, and it would be impossible for us to form an opinion as to whether our sentiments were right or wrong.[38] To acquire this knowledge we must look abroad. Inasmuch, however, as we have no direct experience of what other persons actually feel, we can only gain the information by conceiving what we should feel if we were in their place.[39] Hence all men

[37] "Our continual observations upon the conduct of others insensibly lead us to form to ourselves certain general rules concerning what is fit and proper either to be done or to be avoided." . . . "It is thus that the general rules of morality are formed. They are ultimately founded upon experience of what, in particular instances, our moral faculties, our natural sense of merit and propriety, approve or disapprove of. We do not originally approve or condemn particular actions because upon examination they appear to be agreeable or inconsistent with a certain general rule. The general rule, on the contrary, is formed by finding from experience that all actions of a certain kind, or circumstanced in a certain manner, are approved of or disapproved of." *Smith's Theory of Moral Sentiments*, vol. i. pp. 219, 220. At p. 153: "We either approve or disapprove of our own conduct, according as we feel that, when we place ourselves in the situation of another man, and view it, as it were, with his eyes and from his station, we either can or cannot entirely enter into and sympathize with the sentiments and motives which influenced it."

[38] "Were it possible that a human creature could grow up to manhood in some solitary place, without any communication with his own species, he could no more think of his own character, of the propriety or demerit of his own sentiments and conduct, of the beauty or deformity of his own mind, than of the beauty or deformity of his own face." *Moral Sentiments*, vol. i. p. 154. "Our first moral criticisms are exercised upon the characters and conduct of other people." p. 156.

[39] "As we have no immediate experience of what other men feel, we can form no idea of the manner in which they are affected, but by conceiving what we ourselves should feel in the like situation." *Moral Sentiments*, vol. i. p. 2.

are in imagination constantly changing situations with others; and though the change is ideal, and lasts but for a moment, it is the foundation of that great and universal impulse which is called Sympathy.[40]

By proceeding from these premisses, a vast number of social phenomena may be explained. We naturally sympathize with joy more than with sorrow.[41] Hence that admiration for prosperous and successful persons which is quite independent of any benefit we expect from them; and hence, too, the existence of different ranks and of social distinctions, all of which emanate from the same source.[42] Hence, also, the feeling of loyalty, which is a product, not of reason, nor of fear, nor of a sense of public convenience, but rather of sympathy with those above us, begetting an extraordinary compassion for even their ordinary sufferings.[43] Custom and fashion play a great part in the world, but they owe their origin entirely to sympathy;[44] and so do the various systems of philosophy which have flourished at different times, the disagreement between which depends on the fact that each philosopher has sympathized with different ideas, some sympathizing with the notion of fitness or congruity, some with that of prudence, some with that of benevolence, and every one developing the conception paramount in his own mind.[45] To sympathy, again, we must ascribe the establishment of rewards and punishments, and the whole of our criminal laws, none of which would have existed but for our disposition to sympathize with those who either do good or suffer harm; for the circumstance of society being protected by penal laws, is a subsequent and subordinate discovery, which confirms our sense of their propriety, but did not suggest it.[46] The same principle causes the difference of character exhibited by different classes, such as the irritability of poets, compared with the coolness of mathematicians;[47] it likewise causes that social difference between the sexes which makes men more remarkable for generosity, and women for humanity.[48] All these results illustrate the workings

[40] "That imaginary change of situation upon which their sympathy is founded is but momentary." *Moral Sentiments*, vol. i. p. 21. Compare vol. ii. p. 206.

[41] "I will venture to affirm that, when there is no envy in the case, our propensity to sympathize with joy is much stronger than our propensity to sympathize with sorrow." *Moral Sentiments*, vol. i. p. 58. "It is because mankind are disposed to sympathize more entirely with our joy than with our sorrow, that we make parade of our riches, and conceal our poverty." p. 65.

[42] "Upon this disposition of mankind to go along with all the passions of the rich and the powerful, is founded the distinction of ranks, and the order of society. Our obsequiousness to our superiors more frequently arises from our admiration for the advantages of their situation, than from any private expectations of benefit from their good will." *Moral Sentiments*, vol. i. p. 69. See also vol. ii. p. 72.

[43] See the striking remarks in *Moral Sentiments*, vol. i. pp. 70–72.

[44] *Moral Sentiments*, vol. ii. pp. 23, seq.

[45] *Moral Sentiments*, vol. ii. pp. 131–244. This sketch of the different systems of philosophy is perhaps the ablest part of the book, notwithstanding two or three errors which it contains.

[46] *Moral Sentiments*, vol. i. pp. 89, 92, 115, 116. The utmost which he will concede to the notion of social convenience is that "we frequently have occasion to confirm our natural sense of the propriety and fitness of punishment, by reflecting how necessary it is for preserving the order of society." p. 122.

[47] *Moral Sentiments*, vol. i. pp. 172–174.

[48] "Humanity is the virtue of a woman, generosity of a man. The fair sex, who have commonly much more tenderness than ours, have seldom so much generosity." *Moral Sentiments*, vol. ii. p. 19. Sufficient facts have not yet been collected to enable us to test the truth of this remark, and the loose experience of individual observers is worth very little on so wide a subject. Still, I venture to doubt the truth of Adam Smith's distinction. I suspect that women are on the whole more generous than men, as well as more tender. But to establish a proposition of this sort would require the most extensive research, made by a careful and analytic mind; and at present there is not even any tolerably good work on the mental characteristics which distinguish the sexes, and there never will be one until physiology is united with biography.

of sympathy, and are the remote, but still the direct, operations of that principle. Indeed, we can trace to it some of the minutest divisions of character; pride and vanity, for instance, being dependent on it, although those two passions are often confused together, and are sometimes strangely blended in the same mind.[49]

Sympathy, then, is the mainspring of human conduct. It arises not so much from witnessing the passions of other persons as from witnessing the situation which excites those passions.[50] To this single process we are indebted not only for the highest principles, but also for the deepest emotions. For the greatest affection of which we are capable is merely sympathy fixed into habit; and the love which exists between the nearest relations is not inherent, but is derived from this mighty and controlling principle, which governs the whole course of affairs.[51]

By this bold hypothesis Adam Smith, at one stroke, so narrowed the field of inquiry as to exclude from it all considerations of selfishness as a primary principle, and only to admit its great antagonist, sympathy. The existence of the antagonism he distinctly recognizes. For he will not allow that sympathy is in any way to be deemed a selfish principle.[52] Although he knew that it is pleasurable, and that all pleasure contains an element of selfishness, it did not suit the method of his philosophy to subject the principle of sympathy to such an inductive analysis as would reveal its elements. His business was to reason from it, and not to it. Concentrating his energy upon the deductive process, and displaying that dialectic skill which is natural to his countrymen, and of which he himself was one of the most consummate masters the world has ever seen, he constructed a system of philosophy, imperfect indeed, because the premisses were imperfect, but approaching truth as closely as it was possible for any one to do who abstained from giving due consideration to the selfish part of human nature. Into the workings of its sympathetic part he looked with a minuteness, and he reasoned from it with a subtlety, which make his work the most important that has ever been written on this interesting subject. But, inasmuch as his plan involved a deliberate suppression of preliminary and essential facts, the results which he obtained do not strictly correspond to those which are actually observed in the world.[53] This, however, as I have shown, is not a valid objection; since such discrepancy between the ideal and the actual, or between the abstract and the concrete, is the necessary consequence of that still early condition of our knowledge which forces us to study complicated questions piecemeal, and to raise them to sciences by separate and fragmentary investigations.

[49] *Moral Sentiments*, vol. ii. pp. 115–122.

[50] "Sympathy, therefore, does not arise so much from the view of the passion as from that of the situation which excites it." *Moral Sentiments*, vol. i. p. 6.

[51] "What is called affection is in reality nothing but habitual sympathy." *Moral Sentiments*, vol. ii. p. 63. "In some tragedies and romances we meet with many beautiful and interesting scenes, founded upon what is called the force of blood, or upon the wonderful affection which near relations are supposed to conceive for one another, even before they know that they have any such connexion. This force of blood, however, I am afraid, exists nowhere but in tragedies and romances." p. 66.

[52] "Sympathy, however, cannot in any sense be regarded as a selfish principle." *Moral Sentiments*, vol. ii. p. 206. In vol. i. p. 9, he complains of "those who are fond of deducing all our sentiments from certain refinements of self-love."

[53] This is noticed by Sir James Mackintosh, whose sketch of Adam Smith is hasty and somewhat superficial, but who, nevertheless, truly observes that Smith "has exposed himself to objections founded on experience, to which it is impossible to attempt any answer." *Mackintosh's Dissertation on Ethical Philosophy*, pp. 239, 240. See also a letter from Hume to Adam Smith, in *Burton's Life and Correspondence of Hume*, vol. ii. p. 60. [It is probable that Smith did not "deliberately" suppress the facts mentioned by Hume, but had overlooked them. Nor was it essential to his theory that he should ignore them.—Ed.]

That Adam Smith saw this necessity, and that his seeing it was the cause of the method he pursued, is evident from the fact that in his next great work he followed the same plan, and though he argued from new premisses, he carefully avoided arguing from any of the old ones. Convinced that, in his theory of morals, he had reasoned as accurately as possible from the principles supplied by sympathy, his capacious and insatiable mind, deeming that nothing had been done while aught remained to do, urged him to pass on to the opposite passion of selfishness, and treat it in the same manner, so that the whole domain of thought might be covered. This he did in his *Wealth of Nations*, which, though even a greater work than his *Moral Sentiments*, is equally one-sided, in reference to the principles which it assumes. It assumes that selfishness is the main regulator of human affairs, just as his previous work had assumed sympathy to be so. Between the two works there elapsed an interval of seventeen years; the *Wealth of Nations* not being published till 1776. But what shows that to their author both were part of a single scheme, is the notable circumstance that so early as 1753 he had laid down the principles which his later work contains.[54] This was while his former work was still in meditation, and before it had seen the light. It is therefore clear that the study which he made, first of one passion, and then of its opposite, was not a capricious or accidental arrangement, but was the consequence of that vast idea which presided over all his labours, and which, when they are rightly understood, gives to them a magnificent unity. And a glorious object of ambition it was. His aspiring and comprehensive genius, sweeping the distant horizon, and taking in the intermediate space at a glance, sought to traverse the whole ground in two separate and independent directions, indulging the hope that by supplying in one line of argument the premisses which were wanting in the other, their opposite conclusions would be compensatory rather than hostile, and would serve as a broad and permanent basis on which one great science of human nature might be safely built.

The *Wealth of Nations* is, as I have elsewhere observed,[55] probably the most important book which has ever been written, whether we consider the amount of original thought which it contains, or its practical influence. Its practical recommendations were extremely favourable to those doctrines of freedom which the eighteenth century ushered in; and this secured to them an attention which otherwise they would not have received. While, therefore, the *Wealth of Nations* was the proximate cause of a great change in legislation,[56] a deeper analysis will show that the success of the book, and consequently the alteration of the laws, depended upon the operation of more remote and general causes.* It must also be confessed that those same causes predisposed the mind of Adam Smith to the doctrines of liberty, and gave him a sort of prejudice in favour of conclusions which limited the interference of the legislator. Thus much he borrowed from his age; but one thing he did not borrow. His wide and organizing mind was all his own. This would have made him great under any circumstances; to make him powerful required a peculiar conjunction of events,

[54] "Mr. Smith's political lectures, comprehending the fundamental principles of his 'Inquiry,' were delivered at Glasgow as early as the year 1752 or 1753." *Dugald Stewart's Life of Adam Smith*, p. lxxviii., prefixed to *Smith's Posthumous Essays*, London, 4to, 1795.

[55] Above, p. 122.

[56] "Perhaps the only book which produced an immediate, general, and irrevocable change in some of the most important parts of the legislation of all civilized states." *Mackintosh's Ethical Philosophy*, p. 232. But this is too strongly expressed, as the economical history of France and Germany decisively proves. [Mackintosh was probably thinking of the general abandonment of the bullion delusion. On the continent, however, that was largely due to Montesquieu and the Physiocrats.—ED.]

[* On that view, deduction must clearly be made from the "importance" above ascribed to the book. If general causes were so influential. the work might have been done without Smith.—ED.]

That conjunction he enjoyed, and he turned it to good account. The influence of his contemporaries was enough to make him liberal; his own capacity was enough to make him comprehensive. He had, in a most remarkable degree, that exuberance of thought which is one of the highest forms of genius, but which leads those who possess it into distant excursions, which, though they have one common aim, are often stigmatized as digressions, simply because they who criticize are unable to discern the great principle which pervades the whole, and unites the various parts into a single scheme. This has been especially the case with Adam Smith, whose immortal work has often been exposed to such shallow objections. And certainly the *Wealth of Nations* displays a breadth of treatment which those who cannot sympathize with it are very likely to ridicule. The phenomena not only of wealth, but also of society in general, classified and arranged under their various forms; the origin of the division of labour, and the consequences which that division has produced; the circumstances which gave rise to the invention of money, and to the subsequent changes in its value; the history of those changes traced in different ages, and the history of the relations which the precious metals bear to each other; an examination of the connexion between wages and profits, and of the laws which govern the rise and fall of both; another examination of the way in which these are concerned on the one hand with the rent of land, and on the other hand with the price of commodities; an inquiry into the reason why profits vary in different trades, and at different times; a succinct but comprehensive view of the progress of towns in Europe since the fall of the Roman Empire; the fluctuations, during several centuries, in the prices of the food of the people, and a statement of how it is that in different stages of society the relative cost of land and of meat varies; the history of corporation laws and of municipal enactments, and their bearing on the four great classes of apprentices, manufacturers, merchants, and landlords; an account of the immense power and riches formerly enjoyed by the clergy, and of the manner in which, as society advances, they gradually lose their exclusive privileges; the nature of religious dissent, and the reason why the clergy of the Established Church can never contend with it on terms of equality, and therefore call on the State to help them, and wish to persecute when they cannot persuade; why some sects profess more ascetic principles, and others more luxurious ones; how it was that, during the feudal times, the nobles acquired their power, and how that power has ever since been gradually diminishing; how the rights of territorial jurisdiction originated, and how they died away; how the sovereigns of Europe obtained their revenue, what the sources of it are, and what classes are most heavily taxed in order to supply it; the cause of certain virtues, such as hospitality, flourishing in barbarous ages, and decaying in civilized ones; the influence of inventions and discoveries in altering the distribution of power among the various classes of society; a bold and masterly sketch of the peculiar sort of advantages which Europe derived from the discovery of America and of the passage round the Cape; the origin of universities, their degeneracy from their original plan, the corruption which has gradually crept over them, and the reason why they are so unwilling to adopt improvements, and to keep pace with the wants of the age; a comparison between public and private education, and an estimate of their relative advantages;—these, and a vast number of other subjects, respecting the structure and development of society, such as the feudal system, slavery, emancipation of serfs, origin of standing armies and of mercenary troops, effects produced by tithes, laws of primogeniture, sumptuary laws, international treaties concerning trade, rise of European banks, national debts, influence of dramatic representations over opinions, influence of foreign travels over opinions, colonies, poor-laws,—all topics of a miscellaneous character, and many of them diverging from each other,—all are fused into one great system, and irradiated by the splendour of one great genius. Into that dense and disorderly mass did Adam Smith introduce symmetry, method, and law. At his touch anarchy disappeared, and darkness was succeeded by light. Much, of course, he took from his predecessors, though nothing like so much as is commonly supposed. On this sort of borrowing the best and strongest of us are dependent. But after making every possible allowance

for what he gathered from others, we must honestly say that no single man ever took so great a step upon so important a subject, and that no single work which is now preserved contains so many views which were novel at the time, but which subsequent experience has ratified. What, however, for our present purpose is most important to observe, is that he obtained these results by arguing from principles which the selfish part of human nature exclusively supplied, and that he omitted those sympathetic feelings of which every human being possesses at least some share, but which he could not take into consideration without producing a problem, the number of whose complications it would have been hopeless to unravel.

To avoid, therefore, being baffled, he simplified the problem by erasing from his view of human nature those premisses which he had already handled in his *Theory of Moral Sentiments*. At the beginning of the *Wealth of Nations* he lays down two propositions : 1st, that all wealth is derived not from land but from labour ; and 2nd, that the amount of the wealth depends partly on the skill with which the labour is conducted, and partly on the proportion between the number of those who labour and the number of those who do not labour. The rest of the work is an application of these principles, to explain the growth and mechanism of society. In applying them, he everywhere assumes that the great moving power of all men, all interests, and all classes, in all ages, and in all countries, is selfishness. The opposite power of sympathy he entirely shuts out ; and I hardly remember an instance in which even the word occurs in the whole course of his work. Its fundamental assumption is that each man exclusively follows his own interest, or what he deems to be his own interest. And one of the peculiar features of his book is to show that, considering society as a whole, it nearly always happens that men, in promoting their own interest, will unintentionally promote the interest of others. Hence the great practical lesson is not to restrain selfishness, but to enlighten it ; because there is a provision in the nature of things by which the selfishness of the individual accelerates the progress of the community. According to this view, the prosperity of a country depends on the amount of its capital ; the amount of its capital depends on the habit of saving, that is, on parsimony, as opposed to generosity ; while the habit of saving is in its turn governed by the desire we all feel of bettering our condition,—a desire so inherent in our nature, that it comes with us from the womb, and only leaves us in the grave.[57]

This constant effort of every man to better his own condition is so salutary, as well as so powerful, that it is often capable of securing the progress of society, in spite of the folly and extravagance of the rulers of mankind.[58] If it were not

[57] " Parsimony, and not industry, is the immediate cause of the increase of capital. Industry, indeed, provides the subject which parsimony accumulates ; but whatever industry might acquire, if parsimony did not save and store up, the capital would never be the greater." . . . " But the principle which prompts to save, is the desire of bettering our condition ; a desire which, though generally calm and dispassionate, comes with us from the womb, and never leaves us till we go into the grave." *Smith's Wealth of Nations*, book ii. chap. iii. pp. 138, 140, edit. Edinburgh, 1839. [Capital in this sense is merely money or money-credit—an imperfect definition.—Ed.]

[58] " The uniform, constant, and uninterrupted effort of every man to better his condition, the principle from which public and national as well as private opulence is originally derived, is frequently powerful enough to maintain the natural progress of things towards improvement, in spite both of the extravagance of government and of the greatest errors of administration. Like the unknown principle of animal life, it frequently restores health and vigour to the constitution, in spite not only of the disease, but of the absurd prescriptions of the doctor." *Wealth of Nations*, book ii. chap. iii. p. 141. " The natural effort of every individual to better his own condition, when suffered to exert itself with freedom and security, is so powerful a principle, that it is alone, and without any assistance, not only capable of carrying on the society to wealth and prosperity, but of surmounting a hundred impertinent obstructions with which the folly of human laws too often encumbers its operations." Book iv. chap. v. p. 221.

for this propensity, improvement would be impossible. For human institutions are constantly stopping our advance, by thwarting our natural inclinations.[59] And no wonder that this should be the case, seeing that the men who are at the head of affairs, and by whom the institutions are contrived, have perhaps a certain rough and practical sagacity, but being from the narrowness of their understandings incapable of large views, their councils are determined by those mere casual fluctuations which alone they are able to perceive.[60] They do not see that we have prospered, not on account of their enactments, but in the teeth of them; and that the real cause of our prosperity is the fact that we enjoy undisturbed the fruit of our own labour.[61] Whenever this right is tolerably secure, every man will be bent on procuring for himself either present enjoyment or future profit; and if he does not aim at one of these objects, he is void of common understanding.[62] If he possess capital, he will probably aim at both, but in doing so he will never consider the interest of others; his sole motive will be his own private profit.[63] And it is well that such should be the case. For by thus pursuing his personal interest he aids society more than if his views were generous and exalted. Some people affect to carry on trade for the good of others; but this is mere affectation, though, to say the truth, it is an affectation not very common among merchants, and many words are not needed to dissuade them from so foolish a practice.[64]

In this way Adam Smith completely changes the premisses which he had assumed in his earlier work. Here he makes men naturally selfish; formerly he had made them naturally sympathetic.[65] Here he represents them as pursuing wealth for sordid objects, and for the narrowest personal pleasures; formerly he represented them as pursuing it out of regard to the sentiments of others, and for the sake of obtaining their sympathy.[66] In the *Wealth of Nations* we hear no more of this conciliatory and sympathetic spirit; such amiable maxims are altogether forgotten, and the affairs of the world are regulated by different principles. It now appears that benevolence and affection have no influence over our actions. Indeed, Adam Smith will hardly admit common

[59] See an admirable passage, p. 156, too long to quote, beginning, "If human institutions had never thwarted those natural inclinations," etc.

[60] "That insidious and crafty animal, vulgarly called a statesman or politician, whose councils are directed by the momentary fluctuations of affairs." *Wealth of Nations*, book iv. chap. ii. p. 190.

[61] "That security which the laws in Great Britain give to every man, that he shall enjoy the fruits of his own labour, is alone sufficient to make any country flourish, notwithstanding these and twenty other absurd regulations of commerce." *Wealth of Nations*, book iv. chap. v. p. 221.

[62] "In all countries where there is a tolerable security, every man of common understanding will endeavour to employ whatever stock he can command, in procuring either present enjoyment or future profit." *Wealth of Nations*, book ii. chap. i. p. 115.

[63] "The consideration of his own private profit is the sole motive which determines the owner of any capital to employ it either in agriculture, in manufactures, or in some particular branch of the wholesale or retail trade." *Wealth of Nations*, book ii. chap. v. p. 154.

[64] "By pursuing his own interest, he frequently promotes that of the society more effectually than when he really intends to promote it. I have never known much good done by those who affected to trade for the public good. It is an affectation, indeed, not very common among merchants, and very few words need be employed in dissuading them from it." *Wealth of Nations*, book iv. chap. ii. p. 184.

[65] In this *Theory of Moral Sentiments*, vol. i. p. 21, he says that mankind are "naturally sympathetic."

[66] "Nay, it is chiefly for this regard to the sentiments of mankind that we pursue riches and avoid poverty." *Theory of Moral Sentiments*, vol. i. p. 66. "To become the natural object of the joyous congratulations and sympathetic attentions of mankind is, in this manner, the circumstance which gives to prosperity all its dazzling splendour." p. 78.

humanity into his theory of motives. If a people emancipate their slaves, it is a proof not that the people are acted on by high moral considerations, nor that their sympathy is excited by the cruelty inflicted on these unhappy creatures. Nothing of the sort. Such inducements to conduct are imaginary, and exercise no real sway. All that the emancipation proves is that the slaves were few in number, and therefore small in value. Otherwise, they would not have been emancipated.[67]

So, too, while in his former work he had ascribed the different systems of morals to the power of sympathy he in this work ascribes them entirely to the power of selfishness. He observes that among the lower ranks of society dissipation is more fatal to individuals than it is among the higher ranks. The extravagance which dissipation produces may injure the fortune of a wealthy man, but the injury is usually capable of being repaired, or at all events he can indulge his vices for years without completely destroying his fortune, and without bringing himself to utter ruin. To the labourer, a similar indulgence would be fatal in a single week; it would not merely reduce him to beggary, and perhaps send him to jail, but it would destroy his future prospects by taking away that character for sobriety and regularity on which his employment depends. Hence the better class of common people, guided by their interest, look with aversion on excesses which they know to be fatal; while the upper ranks, finding that a moderate amount of vice hurts neither their purse nor their reputation, consider such licence to be one of the advantages which their fortune confers, and they value, as one of the privileges belonging to their station, the liberty of indulging themselves without being censured. Therefore it is that they who dissent from the Established Church have a purer system of morals, or at all events an austerer one, than they who agree with it. For new religious sects usually begin among the common people, the thinking part of whom are by their interest driven to strict views of the duties of life. Consequently the advocates of the new opinion profess a similar strictness, seeing that it is the surest means of increasing their proselytes. Thus it is that sectaries and heretics, governed by interest rather than by principle, adopt a code of morals which is suited to their own purpose, and the rigidity of which is strongly contrasted with the laxer code of more orthodox believers.[68] Owing to the

[67] "The late resolution of the Quakers in Pennsylvania, to set at liberty all their negro slaves, may satisfy us that their number cannot be very great. Had they made any considerable part of their property, such a resolution could never have been agreed to." *Wealth of Nations*, book iii. chap. ii. p. 159.

[68] "In every civilized society, in every society where the distinction of ranks has once been completely established, there have been always two different schemes or systems of morality current at the same time; of which the one may be called the strict or austere; the other the liberal, or, if you will, the loose system. The former is generally revered and admired by the common people; the latter is commonly more esteemed and adopted by what are called the people of fashion. The degree of disapprobation with which we ought to mark the vices of levity, the vices which are apt to arise from great prosperity, and from the excess of gaiety and good humour, seems to constitute the principal distinction between those two opposite schemes or systems. In the liberal or loose system, luxury, wanton and even disorderly mirth, the pursuit of pleasure to some degree of intemperance, the breach of chastity, at least in one of the two sexes, provided they are not accompanied with gross indecency, and do not lead to falsehood and injustice, are generally treated with a good deal of indulgence, and are easily either excused or pardoned altogether. In the austere system, on the contrary, these excesses are regarded with the utmost abhorrence and detestation. The vices of levity are always ruinous to the common people, and a single week's thoughtlessness and dissipation is often sufficient to undo a poor workman for ever, and to drive him, through despair, upon committing the most enormous crimes. The wiser and better sort of the common people, therefore, have always the utmost abhorrence and detestation of such excesses, which their experience tells them are so immediately fatal to people of their condition. The disorder and extravagance of several years, on the contrary, will not always ruin

operation of the same principle, we also find that among the orthodox themselves the clergy embrace a stricter system of morals in countries where church benefices are nearly equal than they do in countries where the benefices are very unequal. This is because, when all the benefices are nearly equal, none can be very rich, and consequently even the most conspicuous among the clergy will have but small incomes. But a man who has little to spend can have no influence unless his morals are exemplary. Having no wealth to give him weight, the vices of levity would make him ridiculous. To avoid contempt, and also to avoid the expense which a looseness of conduct occasions, and which his narrow circumstances cannot afford, he has but one remedy, and that remedy he adopts. He retains his influence, and saves his pocket, by protesting against pleasures which he cannot conveniently enjoy; in this as in all other cases pursuing that plan of life which his own interest urges him to follow.[69]

In these striking generalizations, which, though they contain a large amount of truth, are far from containing the whole truth, no room is left for the magnanimous parts of our nature to act; but the system of morals prevailing at any one time or in any one class is solely ascribed to the dictates of unalloyed selfishness. Adam Smith, by reasoning from this principle, with that exquisite subtlety which characterized his mind, explains many other circumstances which society presents, and which at first sight appear incongruous. According to the old notions, which indeed are not yet quite extinct, those who received wages were under a personal obligation to those who paid them; that is to say, they were under a moral obligation, over and above the obligation of performing certain services. It was believed that a master could not only select what servants he chose, but could pay them what he chose; or, at all events, that it was the will of the masters, considered as a body, which fixed the usual and average rate of wages.[70] The lower classes were therefore much indebted to

a man of fashion; and people of that rank are very apt to consider the power of indulging in some degree of excess as one of the advantages of their fortune; and the liberty of doing so without censure or reproach, as one of the privileges which belong to their station. In people of their own station, therefore, they regard such excesses with but a small degree of disapprobation, and censure them either very slightly or not at all.

"Almost all religious sects have begun among the common people, from whom they have generally drawn their earliest as well as their most numerous proselytes. The austere system of morality has accordingly been adopted by those sects almost constantly, or with very few exceptions; for there have been some. It was the system by which they could best recommend themselves to that order of people to whom they first proposed their plan of reformation upon what had been before established. Many of them, perhaps the greater part of them, had even endeavoured to gain credit by refining upon this austere system, and by carrying it to some degree of folly and extravagance; and this excessive rigour has frequently recommended them, more than anything else, to the respect and veneration of the common people." . . . "In little religious sects, accordingly, the morals of the common people have been almost always remarkably regular and orderly; generally much more so than in the established church. The morals of those little sects, indeed, have frequently been rather disagreeably rigorous and unsocial." *Wealth of Nations*, book v. chap. i. pp. 332, 333.

[69] "Where the church benefices are all nearly equal, none of them can be very great; and this mediocrity of benefice, though it may no doubt be carried too far, has however some very agreeable effects. Nothing but exemplary morals can give dignity to a man of small fortune. The vices of levity and vanity necessarily render him ridiculous, and are, besides, almost as ruinous to him as they are to the common people. In his own conduct, therefore, he is obliged to follow that system of morals which the common people respect the most. He gains their esteem and affection by that plan of life which his own interest and situation would lead him to follow." *Wealth of Nations*, book v. chap. i. p. 340.

[70] Besides the evidence supplied by economical treatises, the laws in our statute-book respecting wages show the general conviction that their rate could be fixed by the upper classes.

the higher ones for giving them so much as they did ; and it was incumbent upon all persons who received wages to take them with humble thankfulness, and with a feeling of gratitude, on account of the favour bestowed upon them by the generosity of their superiors.

This doctrine, so convenient to the upper classes of society, and so natural to the universal ignorance which formerly prevailed on these matters, began to be shaken by the speculative thinkers of the seventeenth century ; but it was reserved for the eighteenth century to overthrow it, by letting in the great idea of necessity, and proving that the rate of wages established in a country was the inevitable consequence of the circumstances in which that country was placed, and had no connexion with the wishes of any individual, or indeed with the wishes of any class.* To all instructed persons this is now a familiar truth. Its discovery has excluded the notion of gratitude from the pecuniary relation between employers and employed, and has made known that servants or workmen who receive wages have no more reason to be grateful than those who pay them. For no choice having been exercised in fixing the wages, no favour can be conferred in their payment. The whole process is compulsory, and is the result of what had previously happened. Scarcely had the eighteenth century passed away when this most important discovery was completed. It was decisively proved that the reward of labour depends solely on two things : namely, the magnitude of that national fund out of which all labour is paid, and the number of the labourers among whom the fund is to be divided.†

This vast step in our knowledge is due mainly, though not entirely, to Malthus, whose work on Population, besides marking an epoch in the history of speculative thought, has already produced considerable practical results, and will probably give rise to others more considerable still. It was published in 1798 ; so that Adam Smith, who died in 1790, missed what to him would have been the intense pleasure of seeing how in it his own views were expanded rather than corrected. Indeed it is certain that without Smith there would have been no Malthus ; that is, unless Smith had laid the foundation Malthus could not have raised the superstructure. It was Adam Smith who, far more than any other man, introduced the conception of uniform and necessary sequence into the apparently capricious phenomena of wealth, and who studied those phenomena by the aid of principles of which selfishness alone supplied the data. According to his view, the employers of labour have, as employers, no benevolence, no sympathy, no virtue of any kind. Their sole aim is their own selfish interest. They are constantly engaged in a tacit, if not in an open, combination to prevent the lower ranks from being benefited by a rise of wages ; and they sometimes combine for the purpose even of depressing those wages below their actual rate.[71] Having no bowels, they think only of themselves. The idea of their wishing to mitigate the inequalities of fortune is to be exploded as one of the chimeras of that

[71] "We rarely hear, it has been said, of the combinations of masters, though frequently of those of workmen. But whoever imagines, upon this account, that masters rarely combine, is as ignorant of the world as of the subject. Masters are always and everywhere in a sort of tacit, but constant and uniform, combination, not to raise the wages of labour above their actual rate. To violate this combination is everywhere a most unpopular action, and a sort of reproach to a master among his neighbours and equals. We seldom, indeed, hear of this combination, because it is the usual, and, one may say, the natural state of things which nobody ever hears of. Masters, too, sometimes enter into particular combinations to sink the wages of labour even below this rate." *Wealth of Nations*, book i. chap. viii. p. 28.

[* On the contrary, Ricardo admitted that the standard of comfort of the workers does affect wages, and that wages vary with that standard (*Principles of Polit. Econ.* 2nd ed. pp. 90, 91). The expression "no connexion with the wishes" is an extravagance.—Ed.]

[† As before noted, this formula is now abandoned by economists, there being no fixed or fixable "fund" applicable to wage-paying.—Ed.]

protective spirit which imagined that society could not go on unless the richer classes relieved the poorer ones and sympathized with their troubles. This antiquated notion is further rebutted by the fact that wages are always higher in summer than in winter, although the expenses which a labourer incurs in winter being heavier than in summer, he ought, on principles of common humanity, to receive more money during the more expensive season.[72] In the same way, in years of scarcity, the dearness of food causes many persons to go to service, in order to support their families. The masters, instead of charitably paying such servants more on account of the unfortunate position in which they are placed, avail themselves of that position to pay them less. They make better terms for themselves ; they lower wages just at the moment when sympathy for misfortune would have raised them ; and as they find that their servants, besides being worse remunerated, are by poverty made more submissive, they consider that scarcity is a blessing, and that dear years are to be commended as more favourable to industry than cheap ones.[73]

Adam Smith, therefore, though he failed in grasping the remote cause of the rate of wages, clearly saw that the proximate cause was not the generosity of human nature, but its selfishness, and that the question was one of supply and demand ; each side striving to extract as much as possible from the other.[74] By the aid of the same principle he explained another curious fact, namely, the extravagant rewards bestowed on some of the most despicable classes of society, such, for instance, as opera-dancers, who always receive enormous pay for insignificant services.* He observes that one of the reasons why we pay them so highly is because we despise them. If to be a public dancer were a creditable occupation, more persons would be brought up to it, and the supply of public dancers becoming greater, competition would lower their wages. As it is, we look on them disdainfully. By way of compensating the disdain, we have to bribe them largely to induce them to follow their pursuit.[75] Here we see that the reward which one class bestows on another, instead of being

[72] " First, in almost every part of Great Britain, there is a distinction, even in the lowest species of labour, between summer and winter wages. Summer wages are always highest. But, on account of the extraordinary expense of fuel, the maintenance of a family is most expensive in winter. Wages, therefore, being highest when this expense is lowest, it seems evident that they are not regulated by what is necessary for this expense, but by the quantity and supposed value of the work." *Wealth of Nations*, book i. chap. viii. p. 31.

[73] " In years of scarcity, the difficulty and uncertainty of subsistence make all such people eager to return to service. But the high price of provisions, by diminishing the funds destined for the maintenance of servants, disposes masters rather to diminish than to increase the number of those they have." . . . " Masters of all sorts, therefore, frequently make better bargains with their servants in dear than in cheap years, and find them more humble and dependent in the former than in the latter. They naturally, therefore, commend the former as more favourable to industry." *Wealth of Nations*, book i. chap. viii. p. 35.

[74] " The workmen desire to get as much, the masters to give as little, as possible. The former are disposed to combine in order to raise, the latter in order to lower, the wages of labour." *Wealth of Nations*, b. i. c. viii. p. 27.

[75] " It seems absurd at first sight, that we should despise their persons, and yet reward their talents with the most profuse liberality. While we do the one, however, we must of necessity do the other. Should the public opinion, or prejudice, ever alter with regard to such occupations, their pecuniary recompense would quickly diminish. More people would apply to them, and the competition would quickly reduce the price of their labour. Such talents, though far from being common, are by no means so rare as imagined. Many people possess them in great perfection, who disdain to make this use of them ; and many more are capable of acquiring them, if anything could be made honourably by

[* The term " despicable," as Buckle would probably have admitted, is unwarrantable ; and opera dancers certainly do not " always receive enormous pay."—Ed.]

increased by sympathy, is increased by scorn; so that the more we contemn the tastes and the way of life of our fellow creatures, the more liberal we are in recompensing them.*

Passing to another and somewhat different class, Adam Smith threw new light on the cause of that hospitality for which the clergy were famous during the Middle Ages, and for the magnificence of which they have received great praise. He shows that, although they undoubtedly relieved a large amount of distress, this is not to be ascribed to them as a merit, since it resulted from the peculiarity of their position, and since, moreover, they did it for their own advantage. In the Middle Ages the clergy possessed enormous wealth, and their revenues were mostly paid, not in money, but in kind, such as corn, wine, and cattle. Trade and manufactures being hardly known, the clergy could find no use for these commodities except to feed other people. By employing them in that way, they benefited themselves in the most effectual manner. They gained a reputation for extensive charity; they increased their influence; they multiplied the number of their adherents; and they not only advanced themselves to temporal power, but they secured to their spiritual threats a respect which, without this contrivance, it would have been impossible for them to obtain.[76]

The reader will now be able to understand the nature of that method of investigation which is adopted in the *Wealth of Nations*, and of which I have given more instances than I should otherwise have done, partly because the question of philosophic method lies at the very root of our knowledge, and partly because no attempt has hitherto been made to analyze the intellect of Adam Smith by considering his two great works as the opposite, but yet the compensatory, parts of a single scheme. And as he is by far the greatest thinker Scotland has produced, I need hardly apologize, in a history of the Scotch mind, for devoting so much attention to his system, and endeavouring to examine it at its base. But, having done so, it would be a needless prolixity to treat with equal fulness the productions of those other eminent Scotchmen who lived at the same time, and nearly all of whom pursued a method essentially, though not entirely, the same; that is to say, they preferred the deductive process of reasoning from principles, to the inductive process of reasoning to them. In that peculiar form of deduction which consists in a deliberate suppression of part of the principles, Adam Smith stands alone. For though others attempted to follow that plan, they did so irregularly and at intervals,

them." *Wealth of Nations*, book i. chap. x. p. 44. [Buckle does not ask whether Smith is here deductive or inductive. If deductive, his statistical statement is worthless. But his phrases "far from common" and "many people" show he had no clear basis for an induction. His theory is in fact unsound, as the painful case of prostitutes sufficiently shows. Fine dancing *is* a rare accomplishment.—Ed.]

[76] "Over and above the rents of those estates, the clergy possessed in the tithes a very large portion of the rents of all the other estates in every kingdom of Europe. The revenues arising from both those species of rents were, the greater part of them, paid in kind, in corn, wine, cattle, poultry, etc. The quantity exceeded greatly what the clergy could themselves consume; and there were neither arts nor manufactures for the produce of which they could exchange the surplus. The clergy could derive advantage from this immense surplus in no other way than by employing it, as the great barons employed the like surplus of their revenues, in the most profuse hospitality, and in the most extensive charity. Both the hospitality and the charity of the ancient clergy, accordingly, are said to have been very great." . . . "The hospitality and charity of the clergy, too, not only gave them the command of a great temporal force, but increased very much the weight of their spiritual weapons. Those virtues procured them the highest respect and veneration among all the inferior ranks of people, of whom many were constantly, and almost all occasionally, fed by them." *Wealth of Nations*, book v. chap. i. p. 336.

[* This is an obvious over-statement even of Smith's position. On this view, ragpickers would be highly rewarded.—Ed.]

and did not, like him, see the importance of keeping close to their method, and of invariably abstaining from letting into the premisses of their arguments considerations which would complicate the problem that they wished to solve.

Among the contemporaries of Adam Smith, one of the first, in eminence as well as in reputation, is David Hume. His views respecting political economy were published in 1752,[77] that is, the very year in which Adam Smith taught the principles subsequently unfolded in the *Wealth of Nations*. But Hume, though a most accomplished reasoner, as well as a profound and fearless thinker, had not the comprehensiveness of Adam Smith, nor had he that invaluable quality of imagination without which no one can so transport himself into past ages as to realize the long and progressive movements of society, always fluctuating, yet on the whole steadily advancing. How unimaginative he was, appears not only from the sentiments he expressed, but likewise from many traits in his private life.[78] It appears also in the very colour and mechanism of his language; that beautiful and chiselled style in which he habitually wrote, polished as marble, but cold as marble too, and wanting that fiery enthusiasm and those bursts of tempestuous eloquence which ever and anon great objects naturally inspire, and which rouse men to their inmost depths. This it was which in his *History of England*,—that exquisite production of art, which, in spite of its errors, will be admired as long as taste remains among us,*— prevented him from sympathizing with those bold and generous natures who, in the seventeenth century, risked their all to preserve the liberty of their country. His imagination was not strong enough to picture the whole of that great century, with its vast discoveries, its longings after the unknown, its splendid literature, and, what was better than all these, its stern determination to vindicate freedom, and to put down tyranny. His clear and powerful understanding saw these things separately, and in their various parts, but could not fuse them into a single form, because he lacked that peculiar faculty which assimilates the past to the present, and enables the mind to discern both with almost equal ease. That Great Rebellion which he ascribed to the spirit of faction, and the leaders of which he turned into ridicule, was but the continuation of a movement which can be clearly traced to the twelfth century, and of which such events as the invention of printing, and the establishment of the Reformation, were merely successive symptoms. For all this Hume cared nothing. In regard to philosophy, and in regard to the purely speculative parts of religious doctrines, his penetrating genius enabled him to perceive that nothing could be done, except by a spirit of fearless and unrestrained liberty. But this was the liberty of his own class; the liberty of thinkers, and not of actors.† His absence of imagination prevented him from extending the range of his sympathy beyond the intellectual classes—that is, beyond the classes of whose feelings he was directly cognizant. It would therefore appear that his political errors were due, not as is commonly said, to his want of research, but rather to the coldness of his temperament.[79] It was this which made him stop where he did,

[77] *Burton's Life of Hume*, vol. i. p. 354.

[78] See Mr. Burton's valuable *Life of Hume*, Edinburgh, 1846, vol. i. pp. 58, 267, vol. ii. pp. 14, 134.

[79] What confirms me in this view is the fact that the older Hume grew, and the more he read on history, the more he became imbued with these errors; which would not have been the case if the errors had, as many of his critics say, been the result of an insufficient acquaintance with the evidence. Mr. Burton, by comparing the different editions of his *History of England*, has shown that he gradually became less favourable to popular liberty; softening or erasing, in later editions, those expressions which seemed favourable to freedom. *Burton's Life of Hume*, vol. ii. pp. 74–77. See also pp. 144, 434. In his *Own Life*, p. xi. (in vol. i. of *Hume's Works*, Edinb. 1826), he says: "In above a hundred

[* It is to be feared that present-day taste does not ratify Buckle's verdict, in which he coincides with—of all men—Alison.—Ed.]

[† It is but fair to note that Hume, like Hobbes, was hostile to the Puritan spirit precisely because it restricted liberty of speech and action.—Ed.]

and which gave to his works the singular appearance of a profound and original thinker, in the middle of the eighteenth century, advocating practical doctrines so illiberal that if enforced they would lead to despotism, and yet at the same time advocating speculative doctrines so fearless and enlightened that they were not only far in advance of his own age, but have in some degree outstripped even the age in which we live.

Among his speculative views, the most important are his theory of causation as discarding the idea of power, and his theory of the laws of association. Neither of these theories are in their primary conception quite original, but his treatment made them as valuable as if they had been entirely his own. His theory of miracles, in connexion, on the one hand, with the principles of evidence, and on the other hand with the laws of causation, is worked out with consummate skill, and, after having received the modifications subsequently imposed by Brown, has now become the foundation on which the best inquirers into these matters take their stand.[80] His work on the principles of morals, by generalizing the laws of expediency, prepared the way for Bentham, who afterwards incorporated with them an estimate of the more remote consequences of human actions; Hume having chiefly confined himself to their more immediate consequences. The doctrine of utility was common to both; but while Hume applied it mainly to the individual, Bentham applied it to the surrounding society. Though Bentham was more conprehensive, yet Hume, having come first, was more original. The praise of originality must also be accorded to his economical theories, in which he advocated those principles of free trade which politicians began to adopt many years after his death.[81] In opposition

alterations, which farther study, reading, or reflection, engaged me to make in the reigns of the two first Stuarts, I have made all of them invariably to the Tory side." In one of his essays, he observes (*Philosophical Works*, vol. iv. p. 172) that "there is no enthusiasm among philosophers;" a remark perfectly true, so far as he was concerned, but very unjust towards the class of men to whom it refers.

[80] Brown, in his great work,—one of the greatest which this century has produced,—candidly confesses that his own book is "chiefly reflective of the lights, which he" (Hume) "has given." *Brown's Inquiry into the Relation of Cause and Effect*, London, 1835, p. 253. See also p. vii. [Here again Buckle's eulogy is not endorsed by later students.—Ed.]

[81] While the politicians of his own time despised his views, the politicians of our time seem inclined to overrate them. Lord Brougham, for instance, in his *Life of Hume*, says, of his political economy, "Mr. Hume is, beyond all doubt, the author of the modern doctrines which now rule the world of science." *Brougham's Works*, Glasgow, 1856, vol. ii. p. 176. But so far from this being the case, the science of political economy has since the time of Hume received such additions that if that illustrious philosopher were to rise from the dead, he would hardly be able to recognize it. To him, many of its largest and most fundamental principles were entirely unknown. Hume knew nothing of the causes which govern the accumulation of wealth, and compel that accumulation to proceed with different speed in different states of society; a fruitful and important study almost entirely neglected until entered upon by Rae. Neither did Hume know anything of the law of the ratio between population and wages; nor of the ratio between wages and profits. He even supposes (*Philosophical Works*, vol. iii. p. 299, Edinburgh, 1826) that it is possible for the labouring classes by combination "to heighten their wages;" and again (p. 319) that the richer a nation is, and the more trade it has, the easier it will be for a poor country to undersell its manufactures, because the poor nation enjoys the advantage of a "low price of labour." Elsewhere, he asserts that coin can be depreciated without raising prices, and that a country, by taxing a foreign commodity, could increase its own population. "Were all our money, for instance, re-coined, and a penny's worth of silver taken from every shilling, the new shilling would probably purchase everything that could have been bought by the old; the prices of everything would thereby be insensibly diminished; foreign trade enlivened; and domestic industry, by the circulation of a great number of pounds and shillings, would receive some increase and encouragement." *Philosophical Works*, vol. iii. p. 324. "A tax on German linen

to the notions then prevailing, he distinctly asserted that all commodities, though apparently bought by money, are in reality bought by labour.[82] Money, therefore, is not the subject of commerce, and is of no use except to facilitate it.[83] Hence, it is absurd for a nation to trouble itself about the balance of trade, or to make regulations to discourage the exportation of the precious metals.[84] Neither does the average rate of interest depend on their scarcity or abundance, but upon the operation of more general causes.[85] As a necessary consequence of these positions, Hume inferred that the established policy was wrong which made trading states look upon each other as rivals, while in point of fact the question, if considered from a certain height, was one not of rivalry but of co-operation; every country being benefited by the increasing wealth of its neighbours.[86] Those who know the character of commercial legislation, and the opinions of even the most enlightened statesmen a century ago, will consider these views as extremely remarkable to have been propounded in the year 1752. But what is more remarkable still is that their author subsequently

encourages home manufactures, and thereby mulitiplies our people and industry." p. 365. These are cardinal errors, which go to the very root of political economy; and when we fairly estimate what has been done by Malthus and Ricardo, it will be evident that Hume's doctrines do not "rule the world of science." This is no disparagement of Hume, who, on the contrary, effected wonderful things, considering the then state of knowledge. The mistake is, in imagining that such a rapidly advancing science as political economy can be governed by doctrines propounded more than a century ago. [Apart from the last two citations, the statements quoted from Hume are not errors at all. The workers *can* raise their wages in certain cases by combination. Poor countries *can* manufacture more cheaply than rich, and so undersell them. And our silver coin *has* been depreciated below face value without raising prices, though the further theory about bettering trade is a fallacy. Smith's economics, it should be added, have been improved upon, as well as Hume's.—ED.]

[82] "Everything in the world is purchased by labour, and our passions are the only causes of labour." *Essay I. On Commerce*, in *Hume's Philosophical Works*, vol. iii. p. 294. Hence he saw the fallacy of the assertion of the French economists, "that all taxes fall ultimately upon land." p. 388.

[83] "Money is not, properly speaking, one of the subjects of commerce, but only the instrument which men have agreed upon to facilitate the exchange of one commodity for another." *Essay on Money*, in *Philosophical Works*, vol. iii. p. 317. "It is indeed evident that money is nothing but the representation of labour and commodities, and serves only as a method of rating or estimating them." p. 321.

[84] See *Essay V. on the Balance of Trade*, in *Hume's Philosophical Works*, vol. iii. pp. 348–367.

[85] *Hume's Philosophical Works*, vol. iii. pp. 333–335. Even now, a knowledge of this truth is so little diffused that lately, when Australia and California began to yield immense quantities of gold, a notion was widely circulated that the interest of money would consequently fall; although nothing can be more certain than that if gold were to become as plentiful as iron, the interest of money would be unaffected. The whole effect would fall upon price. The remarks on this subject in *Ritchie's Life of Hume*, London, 1807, pp. 332, 333, are interesting, as illustrating the slow progress of opinion, and the difficulty which minds not specially trained experience when they attempt to investigate these subjects.

[86] "Nothing is more usual, among states which have made some advance in commerce, than to look on the progress of their neighbours with a suspicious eye, to consider all trading states as their rivals, and to suppose that it is impossible for any of them to flourish, but at their expense. In opposition to this narrow and malignant opinion, I will venture to assert that the increase of riches and commerce in any one nation, instead of hurting, commonly promotes the riches and commerce of all its neighbours." . . . "I go farther, and observe that where an open communication is preserved among nations, it is impossible but the domestic industry of every one must receive an increase from the improvements of the others." *Essay on the Jealousy of Trade*, in *Hume's Philosophical Works*, vol. iii. pp. 368, 369.

detected the fundamental error which Adam Smith committed, and which vitiates many of his conclusions. The error consists in his having resolved price into three components, namely, wages, profit, and rent; whereas it is now known that price is a compound of wages and profit, and that rent is not an element of it, but a result of it.* This discovery is the corner-stone of political economy; but it is established by an argument so long and so refined that most minds are unable to pursue it without stumbling, and the majority of those who acquiesce in it are influenced by the great writers to whom they pay deference, and whose judgment they follow. It is therefore a striking proof of the sagacity of Hume, that in an age when the science was but dawning, and when he could receive little help from his predecessors, he should have discovered a mistake of this sort, which lies so far beneath the surface. Directly the *Wealth of Nations* appeared, he wrote to Adam Smith, disputing his position that rent is a part of price;[87] and this letter, written in the year 1776, is the first indication of that celebrated theory of rent which, a little later, Anderson,† Malthus, and West, saw and imperfectly developed, but which it was reserved for the genius of Ricardo to build up on a broad and solid foundation.

It is very observable that Hume and Adam Smith, who made such immense additions to our knowledge of the principles of trade, had no practical acquaintance with it.[88] Hume had at an early period of his life been in a mercantile house; but he threw up that employment in disgust, and buried himself in a provincial town, to think, rather than to observe.[89] Indeed, one of the capital defects of his mind was a disregard of facts. This did not proceed, as is too often the case, from that worst form of moral obliquity, an indifference to truth;

[87] This letter, which I have referred to above, p. 143, was published for, I believe the first time, in 1846, in *Burton's Life and Correspondence of Hume*, vol. ii. p. 486. It is however very difficult to determine what Adam Smith's opinion really was upon this subject, and how far he was aware that rent did not enter into price. In one passage in the *Wealth of Nations* (book i. chap. vi. p. 21) he says of wages, profit, and rent, "In every society, the price of every commodity finally resolves itself into some one or other, or all of those three parts; and *in every improved society all the three enter, more or less, as component parts, into the price of the far greater part of commodities.*" But in book i. chap. x. p. 61, he says, "High or low wages and profit are the causes of high or low price; high or low rent is the effect of it." This latter opinion we now know to be the true one: it is, however, incompatible with that expressed in the first passage. For if rent is the effect of price, it cannot be a component of it.

[88] Hence when the *Wealth of Nations* appeared, one of our wise men gravely said that "Dr. Smith, who had never been in trade, could not be expected to write well on that subject, any more than a lawyer upon physic." See *Boswell's Life of Johnson*, edit. Croker, 1848, p. 478, where this remark is ascribed to Sir John Pringle.

[89] "He was sent to a mercantile house at Bristol in 1734; but he found the drudgery of this employment intolerable, and he retired to Rheims." *Brougham's Life of Hume*, Glasgow, 1856, p. 169. See also *Ritchie's Life of Hume*, p. 6. In *Roberts' Memoirs of Hannah More*, 2nd ed. 1834, vol. i. p. 16, it is said that "two years of his life were spent in a merchant's counting-house in Bristol, whence he was dismissed on account of the promptitude of his pen in the correction of the letters intrusted to him to copy." The latter part of this story is improbable; the former part is certainly incorrect; since Humehimself says, "In 1734 I went to Bristol, with some recommendations to eminent merchants, but *in a few months* found that scene totally unsuitable to me. I went over to France, with a view of prosecuting my studies in a country retreat." *Own Life*, p. v.

[* As goods are at times sold below cost price, the formula in the text is not truly comprehensive; and as regards manufactured goods, rent may as truly be said to "enter into" normal price as profits, seeing that practically no goods are produced save in plaes that pay monopoly rent, and factory rents do not rise with prices or profits. Strictly, however, price is an equation between supply and demand.—Ed.]

[† Anderson's exposition of the law of rent—which Buckle here mentions, though he ovrlooked it in a previous reference to the subject—is not fairly to be called imperfect; and Ricardo did not essentially improve upon it.—Ed.]

since he on the contrary was an ardent lover of it, and was moreover a man of the purest and most exemplary character, utterly incapable of falsehood, or of prevarication of any kind.[90] In him, a contempt for facts was merely the exaggerated result of a devotion to ideas. He not only believed, with perfect justice, that ideas are more important than facts, but he supposed that they should hold the first place in the order of study, and that they should be developed before the facts are investigated. The Baconian philosophy, which, though it allows a preliminary and tentative hypothesis, strongly insists upon the necessity of first collecting the facts and then proceeding to the ideas, excited his aversion; and this, I have no doubt, is the reason why he, who was usually so lenient in his judgments, and who was so keen an admirer of intellectual greatness, is nevertheless grossly unfair towards Bacon, with whose method it was impossible for him to sympathize, though he could not deny its utility in physical science.[91] If Hume had followed the Baconian scheme, of always rising from

[90] What Sir James Mackintosh says of him is only a faint echo of the general voice of his contemporaries. "His temper was calm, not to say cold; but though none of his feelings were ardent, all were engaged on the side of virtue. He was free from the slightest tincture of malignity or meanness; his conduct was uniformly excellent." *Mackintosh's Memoirs*, vol. ii. p. 162. A greater than Mackintosh, and a man who knew Hume intimately, expresses himself in much warmer terms. "Upon the whole," writes Adam Smith, "Upon the whole, I have always considered him, both in his lifetime and since his death, as approaching as nearly to the idea of a perfectly wise and virtuous man as perhaps the nature of human frailty will permit." *Hume's Philosophical Works*, vol. i. p. xxv. Some notices of Hume will be found in an interesting work just published, *Autobiography of Alexander Carlyle*, Edinburgh, 1860, pp. 272–278. But Carlyle, though a man of considerable practical skill, was incapable of large views, and was therefore unable, I will not say to measure, but even to conceive, the size of such an understanding as that possessed by David Hume. Of his want of speculative power a decisive instance appears in his remarks on Adam Smith. He gravely says (*Autobiography*, p. 281), "Smith's fine writing is chiefly displayed in his book on *Moral Sentiment*, which is the pleasantest and most eloquent book on the subject. His *Wealth of Nations*, from which he was judged to be an inventive genius of the first order, is tedious and full of repetition. His separate essays in the second volume have the air of being occasional pamphlets, without much force or determination. On political subjects his opinions were not very sound." It is rather too much when a village-preacher writes in this strain of the greatest man his country has ever produced.

[91] He speaks of him in the following extraordinary terms. "If we consider the variety of talents displayed by this man; as a public speaker, a man of business, a wit, a courtier, a companion, an author, a philosopher, he is justly the object of great admiration. If we consider him merely as an author and philosopher, the light in which we view him at present, though very estimable, *he was yet inferior to his contemporary Galileo, perhaps even to Kepler*." . . . "The national spirit which prevails among the English, and which forms their great happiness, is the cause why they bestow on all their eminent writers, and on Bacon among the rest, such praises and acclamations as may often appear partial and excessive." *Hume's History of England*, vol. vi. pp. 194, 195, London, 1789. [It is now very generally agreed that Bacon's *method* was of little or no service to physical science, though he certainly stimulated scientific thought. Compare Ellis's General Preface to his and Spedding's edition of *Bacon's Works*, i. 38; Brewster, *Life of Newton*, 1855, ii. 400–4; Lange, *History of Materialism*, Eng. tr. i. 236–7; Jevons, *Principles of Science*, 1-vol. ed. p. 576; Mill, *System of Logic*, b. vi. ch. v. § 5; Tyndall, *Scientific Use of the Imagination*, etc. 3rd ed. pp. 4, 8–9, 42–43; Bagehot, *Postulates of English Political Economy*, Student's ed. pp. 17–19. See also Buckle's own admissions in his essay on *Mill on Liberty* (*Misc. and Posth. Works*, abridged ed. i. 9–101,) and below, above *note* 149. These admissions go far to justify Hume's language. Certainly Bacon did less for science than did Galileo and Kepler; and he rejected the Copernican theory, as Hume notes. It is true, however, that Hume met the anti-Scotch animus common in England in his day by a certain anti-English animus, seen in his remarks on Shakspere. (*Buckle's Misc. Works*, as cited, ii. 235).—Ed.]

particulars to generals, and from each generalization to that immediately above it, he would hardly have written one of his works. Certainly his economical views would never have appeared, since political economy is as essentially a deductive science as geometry itself.[92] Reversing the inductive process, he was in favour of beginning with what he termed general arguments, by which he hoped to demonstrate the inaccuracy of opinions which facts were supposed to have proved.[93] He did not stop to investigate the facts from which the inference had been drawn, but he inverted the order by which the inference was to be obtained. The same dislike to make the facts of trade the basis of the science of trade was displayed by Adam Smith, who expresses his want of confidence in statistics, or, as it was then termed, political arithmetic.[94] It is however evident that statistical facts are as good as any other facts, and, owing to their mathematical form, are very precise.[95] But when they concern human actions, they are the result of all the motives which govern those actions ; in other words, they are the result not merely of selfishness, but also of sympathy. And as Adam Smith in the *Wealth of Nations* dealt with only one of these passions, namely selfishness, he would have found it impossible to conduct his generalization from statistics, which are necessarily collected from the products of both passions. Such statistical facts were in their origin too complex to be generalized ; especially as they could not be experimented upon, but could only be observed and arranged. Adam Smith, perceiving them to be unmanageable, very properly rejected them as the basis of his science, and merely used them by way of illustration, when he could select what he liked. The same remark applies to other facts which he drew from the history of trade, and indeed from the general history of society. All of these are essentially subsequent to the argument. They make the argument more clear, but not more certain. For it is no exaggeration to say that if all the commercial and historical facts in the *Wealth of Nations* were false, the book would still remain,

[92] See the note above, p. 143. See ed. note above, p. 143, and Cairnes, as there cited. A fresh difficulty now arises over the proper definition of "political economy." Cairnes, with Mill, held that it is an essentially deductive science. But Mr. J. N. Keynes (*Scope and Method of Political Economy*, 1891, p. 18), here agreeing with Professor Sidgwick (*Principles of Political Economy*, 1883, pp. 34 seq.), points out that "Mill and other economists of his school have always employed an inductive and analytical method, the deductive element in their reasonings being in this part of their subject essentially subordinate. Mill is even more distinctly an inductive economist in his elaborate discussion of peasant proprietorship in its economic aspects. . . . Cairnes, again, in his work on the *Slave Power*, . . . establishes some important economic doctrines by a careful inductive study of facts, little use being made of deductive reasoning." It might be argued that the reasonings in question are extraneous to "political economy" as commonly defined ; but such discrepancies at least suggest the need for caution in formal generalization on the subject.—Ed.]

[93] Thus, for instance, in his remarkable *Essay on the Balance of Trade*, he says (*Philosophical Works*, vol. iii. p. 349), "Every man who has ever reasoned on this subject has always *proved his theory, whatever it was, by facts and calculations*, and by an enumeration of all the commodities sent to all foreign kingdoms ;" therefore (p. 350), "it may here be proper to form a general argument to prove the impossibility of this event, so long as we preserve our people and our industry."

[94] "I have no great faith in political arithmetic." *Wealth of Nations*, book iv. chap. v. p. 218.

[95] Indeed, the only possible objection to them is that the language of their collectors is sometimes ambiguous ; so that by the same return one statistician may mean one thing, and another statistician may mean something quite different. This is well exemplified in medical statistics ; whence several writers, unacquainted with the philosophy of scientific proof, have supposed that medicine is incapable of mathematical treatment. In point of fact, however, the only real impediment is the shameful state of clinical and pathological terminology, which is in such confusion as to throw doubt upon all extensive numerical statements respecting disease.

and its conclusions would hold equally good, though they would be less attractive. In it everything depends upon general principles, and they, as we have seen, were arrived at in 1752, that is, twenty-four years before the work was published in which those principles were applied. They must therefore have been acquired independently of the facts which Adam Smith subsequently incorporated with them, and which he learnt during that long period of twenty-four years. And the ten years which he employed in composing his great work were not spent in one of those busy haunts of men where he might have observed all the phenomena of industry, and studied the way in which the operations of trade affect human character and are affected by it. He did not resort to one of those vast marts and emporiums of commerce where the events were happening which he was seeking to explain. That was not his method. On the contrary, the ten years during which he was occupied in raising to a science the most active department of life, were passed in complete seclusion in Kirkcaldy, his quiet little birthplace.[96] He had always been remarkable for absence of mind, and was so little given to observation as to be frequently oblivious of what was passing around him.[97] In that obliviousness he, amid the tranquil scenes of his childhood, could now indulge without danger. There, cheered indeed by the society of his mother, but with no opportunity of observing human nature upon a large scale, and far removed from the hum of great cities, did this mighty thinker, by the force of his own mind, unravel the numerous and complicated phenomena of wealth, detect the motives which regulate the conduct of the most energetic and industrious portion of mankind, and lay bare the schemes and the secrets of that active life from which he was shut out, while he, immured in comparative solitude, was unable to witness the very facts which he succeeded in explaining.

The same determination to make the study of principles precede that of facts is exhibited by Hume in one of his most original works, the *Natural History of Religion*. In reference to the title of this treatise, we must observe that, according to the Scotch philosophers, the natural course of any movement is by no means the same as its actual course. This discrepancy between the ideal and the real was the unavoidable result of their method.[98] For as they argued

[96] "Upon his return to England in the autumn of 1766, he went to reside with his mother at his native town of Kirkcaldy, and remained there for ten years. All the attempts of his friends in Edinburgh to draw him thither were vain; and from a kind and lively letter of Mr. Hume upon the subject, complaining that, though within sight of him on the opposite side of the Frith of Forth, he could not have speech of him, it appears that no one was aware of the occupations in which those years were passed." *Brougham's Life of Adam Smith*, p. 189. Occasionally, however, he saw his literary friends. See *Dugald Stewart's Biographical Memoirs*, p. 73, Edinb. 1811, 4to.

[97] "He was certainly not fitted for the general commerce of the world, or for the business of active life. The comprehensive speculations with which he had been occupied from his youth, and the variety of materials which his own invention constantly supplied to his thoughts, rendered him habitually inattentive to familiar objects and to common occurrences; and he frequently exhibited instances of absence, which have scarcely been surpassed by the fancy of La Bruyère." *Stewart's Biographical Memoirs*, p. 113. See also *Ramsay's Reminiscences*, 5th edit., Edinb. 1859, p. 236. Carlyle, who knew him well, says, "He was the most absent man in company that I ever saw, moving his lips, and talking to himself, and smiling, in the midst of large companies." *Autobiography of the Rev. Alexander Carlyle*, 2nd edition, Edinburgh, 1860, p. 279.

[98] A Scotch philosopher of great repute, but, as it appears to me, of ability not quite equal to his repute, has stated very clearly and accurately this favourite method of his countrymen. "In examining the history of mankind, as well as in examining the phenomena of the material world, when we cannot trace the process by which an event *has been* produced, it is often of importance to be able to show how it *may have been* produced by natural causes." . . . "To this species of philosophical investigation, which has no appropriated name in our language, I shall take the liberty of giving the title of *Theoretical* or *Conjectural History*; an expression which coincides pretty nearly

deductively from fixed premisses, they could not take into account the perturbations to which their conclusions were liable, from the play and friction of the surrounding society. To do that required a separate inquiry. It would have been needful to investigate the circumstances which caused the friction, and thus prevented the conclusions from being, in the world of fact, the same as they were in the world of speculation. What we call accidents are constantly happening, and they prevent the real march of affairs from being identical with the natural march. And as long as we are unable to predict those accidents there will always be a want of complete harmony between the inferences of a deductive science and the realities of life ; in other words, our inferences will tend towards truth, but never completely attain it.[99]

With peculiar propriety, therefore, did Hume term his work a *Natural History of Religion*. It is an admirable specimen of the deductive method. Its only fault is that he speaks too confidently of the accuracy of the results to which, on such a subject, that method could attain. He believed that by observing the principles of human nature, as he found them in his own mind, it was possible to explain the whole course of affairs, both moral and physical.[100] These principles were to be arrived at by experiments made on himself ; and having thus arrived at them, he was to reason from them deductively, and so construct the entire scheme. This he contrasts with the inductive plan, which he calls a tedious and lingering process ; and while others might follow that slow and patient method of gradually working their way towards first principles, his project was to seize them at once, or, as he expresses himself, not to stop at the frontier, but to march directly on the capital, being possessed of which, he could gain an easy victory over other difficulties, and could extend his conquests over the sciences.[101] According to Hume, we are not to reason, in order to obtain ideas, but we are to have clear ideas before we reason.[102] By this means

in its meaning with that of *Natural History* as employed by Mr. Hume, and with what some French writers have called Histoire Raisonnée." *Dugald Stewart's Biographica Memoirs*, pp. 48, 49. Hence (p. 53), " in most cases it is of more importance to ascertain the progress that is most simple, than the progress that is most agreeable to fact; for, paradoxical as the proposition may appear, it is certainly true, that *the real progress is not always the most natural*. It may have been determined by particular accidents, which are not likely again to occur, and which cannot be considered as forming any part of that general provision which nature has made for the improvement of the race."

[99] Part of this view is well expressed in *Hume's Treatise of Human Nature*, book iii. part ii. " This, however, hinders not but that philosophers may, if they please, extend their reasoning to the supposed *state of nature* ; provided they allow it to be a mere philosophical fiction, which never had and never could have any reality." . . . " The same liberty may be permitted to moral, which is allowed to natural philosophers ; and 'tis very usual with the latter to consider any motion as compounded and consisting of two parts separate from each other, though, at the same time, they acknowledge it to be in itself uncompounded and inseparable." *Philosophical Works*, vol. ii. p. 263.

[100] And, conversely, that whatever was " demonstratively false " could " never be distinctly conceived by the mind." *Philosophical Works*, vol. iv. p. 33. Here, and sometimes in other passages, Hume, though by no means a Cartesian, reminds us of Descartes.

[101] " Here, then, is the only expedient from which we can hope for success in our philosophical researches, *to leave the tedious, lingering method*, which we have hitherto followed, and instead of taking now and then a castle or village on the frontier, to march up directly to the capital, or centre of these sciences, to human nature itself ; which being once masters of, we may everywhere else hope for an easy victory. From this station we may extend our conquests over all those sciences which more immediately concern human life, and may afterwards proceed, at leisure, to discover more fully those which are the objects of pure curiosity." *Hume's Philosophical Works*, vol. i. p. 8. See also, in vol. ii. pp. 73, 74, his remarks on the way " to consider the matter *à priori*."

[102] " No kind of reasoning can give rise to a new idea, such as this of power is ; but

we arrive at philosophy ; and her conclusions are not to be impugned, even if they do happen to clash with science. On the contrary, her authority is supreme, and her decisions, being essentially true, must always be preferred to any generalization of the facts which the external world presents.[103]

Hume therefore believed that all the secrets of the external world are wrapped up in the human mind. The mind was not only the key by which the treasure could be unlocked ; it was also the treasure itself. Learning and science might illustrate and beautify our mental acquisitions, but they could not communicate real knowledge ; they could neither give the prime original materials, nor could they teach the design according to which those materials must be worked.

In conformity with these views the *Natural History of Religion* was composed. The object of Hume in writing it was to ascertain the origin and progress of religious ideas ; and he arrives at the conclusion that the worship of many gods must everywhere have preceded the worship of one God. This he regards as a law of the human mind, a thing not only that always has happened, but that always must happen. His proof is entirely speculative. He argues that the earliest state of man is necessarily a savage state ; that savages can feel no interest in the ordinary operations of nature, and no desire to study the principles which govern those operations ; that such men must be devoid of curiosity on all subjects which do not personally trouble them ; and that, therefore, while they neglect the usual events of nature, they will turn their minds to the unusual ones.[104] A violent tempest, a monstrous birth, excessive cold, excessive rain, sudden and fatal diseases, are the sort of things to which the attention of the savage is confined, and of which alone he desires to know the causes. Directly he finds that such causes are beyond his control, he reckons

wherever we reason, we must antecedently be possessed of clear ideas, which may be the objects of our reasoning." *Hume's Philosophical Works*, vol. i. p. 217. Compare vol. ii. p. 276, on our arriving at a knowledge of causes " by a kind of taste or fancy." Hence, the larger view preceding the smaller, and being essentially independent of it, will constantly contradict it ; and he complains, for instance, that " difficulties, which seem unsurmountable in theory, are easily got over in practice." vol. ii. p. 357 ; and again, in vol. iii. p. 326, on the effort needed to " reconcile reason to experience." But, after all, it is rather by a careful study of his works, than by quoting particular passages, that his method can be understood. In the two sentences, however, just cited, the reader will see that theory and reason represent the larger view ; while practice and experience represent the smaller.

[103] " 'Tis certainly a kind of indignity to philosophy, whose sovereign authority ought everywhere to be acknowledged, to oblige her on every occasion to make apologies for her conclusions, and justify herself to every particular art and science which may be offended at her. This puts one in mind of a king arraigned for high treason against his subjects." *Hume's Philosophical Works*, vol. i. pp. 318, 319.

[104] " A barbarous, necessitous animal (such as a man is on the first origin of society), pressed by such numerous wants and passions, has no leisure to admire the regular face of nature, or make inquiries concerning the cause of those objects to which, from his infancy, he has been gradually accustomed. On the contrary, the more regular and uniform, that is the more perfect, nature appears, the more is he familiarized to it, and the less inclined to scrutinize and examine it. A monstrous birth excites his curiosity, and is deemed a prodigy. It alarms him from its novelty, and immediately sets him a trembling, and sacrificing, and praying. But an animal complete in all its limbs and organs, is to him an ordinary spectacle, and produces no religious opinion or affection. Ask him whence that animal arose ? He will tell you, from the copulation of its parents. And these, whence ? From the copulation of theirs. A few removes satisfy his curiosity, and sets the objects at such a distance that he entirely loses sight of them. Imagine not that he will so much as start the question whence the first animal, much less whence the whole system or united fabric of the universe arose. Or, if you start such a question to him, expect not that he will employ his mind with any anxiety about a subject so remote, so uninteresting, and which so much exceeds the bounds of his capacity." *Natural History of Religion*, in *Hume's Philosophical Works*, vol. iv. p. 439. See also pp. 463–465.

them superior to himself, and, being incapable of abstracting them, he personifies them ; he turns them into deities ; polytheism is established ; and the earliest creed of mankind assumes a form which can never be altered as long as men remain in this condition of pristine ignorance.[105]

These propositions, which are not only plausible but are probably true, ought, according to the inductive philosophy, to have been generalized from a survey of facts ; that is, from a collection of evidence respecting the state of religion, and of the speculative faculties among savage tribes. But this Hume abstains from doing. He refers to none of the numerous travellers who have visited such people ; he does not, in the whole course of his work, mention even a single book where facts respecting savage life are preserved. It was enough for him that the progress from a belief in many gods to a belief in one God was the natural progress ; which is saying in other words that it appeared to his mind to be the natural progress.[106] With that he was satisfied. In other parts of his essay, where he treats of the religious opinions of the ancient Greeks and Romans, he displays a tolerable though by no means remarkable learning ; but the passages which he cites do not refer to that entirely barbarous society in which, as he supposes, polytheism first arose. The premisses, therefore, of the argument are evolved out of his own mind. He reasons deductively from the ideas which his powerful intellect supplied, instead of reasoning inductively from the facts which were peculiar to the subject he was investigating.

Even in the rest of his work, which is full of refined and curious speculation, he uses facts, not to demonstrate his conclusions, but to illustrate them. He therefore selected those facts which suited his purpose, leaving the others untouched. And this, which many critics would call unfair, was not unfair in him ; because he believed that he had already established his principles without the aid of those facts. The facts might benefit the reader by making the argument clearer, but they could not strengthen the argument. They were more intended to persuade than to prove ; they were rather rhetorical than logical. Hence a critic would waste his time if he were to sift them with a minuteness which would be necessary, supposing that Hume had built an inductive argument upon them. Otherwise, without going far, it might be

[105] " By degrees the active imagination of men, uneasy in this abstract conception of objects, about which it is incessantly employed, begins to render them more particular, and to clothe them in shapes more suitable to its natural comprehension. It represents them to be sensible, intelligent beings like mankind ; actuated by love and hatred, and flexible by gifts and entreaties, by prayers and sacrifices. Hence the origin of religion. And hence the origin of idolatry, or polytheism." *Hume's Philosophical Works*, vol. iv. p. 472. " The primary religion of mankind arises chiefly from an anxious fear of future events." p. 498.

[106] " *It seems certain that, according to the natural progress of human thought*, the ignorant multitude must first entertain some grovelling and familiar notion of superior powers, before they stretch their conception to that perfect Being who bestowed order on the whole frame of nature. *We may as reasonably imagine that men inhabited palaces before huts and cottages*, or studied geometry before agriculture, as assert that the Deity appeared to them a pure spirit, omniscient, omnipotent, and omnipresent, before he was apprehended to be a powerful though limited being, with human passions and appetites, limbs and organs. The mind rises gradually from inferior to superior. By abstracting from what is imperfect, it forms an idea of perfection ; and slowly distinguishing the nobler parts of its own frame from the grosser, it learns to transform only the former, much elevated and refined, to its divinity. Nothing could disturb this *natural progress of thought* but some obvious and invincible argument, which might immediately lead the mind into the pure principles of theism, and make it overleap, at one bound, the vast interval which is interposed between the human and the Divine nature. But though I allow that the order and frame of the universe, when accurately examined, affords such an argument, yet *I can never think* that this consideration could have an influence on mankind, when they formed their first rude notions of religion." *Natural History of Religion*, in *Philosophical Works*, vol. iv. p. 438.

curious to contrast them with the entirely different facts which Cudworth, eighty years before, had collected from the same source and on the same subject. Cudworth, who was much superior to Hume in learning, and much inferior to him in genius,[107] displayed in his great work on the *Intellectual System of the Universe* a prodigious erudition, to prove that in the ancient world the belief in one God was a prevailing doctrine. Hume, who never refers to Cudworth, arrives at a precisely opposite conclusion. Both quoted ancient writers; but while Cudworth drew his inferences from what he found in those writers, Hume drew his from what he found in his own mind.* Cudworth, being more learned, relied on his reading; Hume, having more genius, relied on his intellect. Cudworth, trained in the school of Bacon, first collected the evidence and then passed the judgment. Hume, formed in a school entirely different, believed that the acuteness of the judge was more important than the quantity of the evidence; that witnesses were likely to prevaricate; and that he possessed in his own mind the surest materials for arriving at an accurate conclusion. It is not therefore strange that Cudworth and Hume, pursuing opposite methods, should have obtained opposite results, since such a discrepancy is, as I have already pointed out, unavoidable when men investigate according to different plans a subject which, in the existing state of knowledge, is not amenable to scientific treatment.

The length to which this chapter has already extended, and the number of topics which I have still to handle, will prevent me from examining in detail the philosophy of Reid, who was the most eminent among the purely speculative thinkers of Scotland, after Hume and Adam Smith, though in point of merit he must be placed far below them. For he had neither the comprehensiveness of Smith nor the fearlessness of Hume. The range of his knowledge was not wide enough to allow him to be comprehensive; while a timidity, almost amounting to moral cowardice, made him recoil from the views advocated by Hume, not so much on account of their being false, as on account of their being dangerous. It is however certain that no man can take high rank as a philosopher who allows himself to be trammelled by considerations of that kind. A philosopher should aim solely at truth, and should refuse to estimate the practical tendency of his speculations. If they are true, let them stand; if they are false, let them fall. But whether they are agreeable or disagreeable, whether they are consolatory or disheartening, whether they are safe or mischievous, is a question not for philosophers but for practical men. Every new truth which has ever been propounded has for a time caused mischief; it has produced discomfort, and often unhappiness, sometimes by disturbing social or religious arrangements, and sometimes merely by the disruption of old and cherished associations of thought. It is only after a certain interval, and when the framework of affairs has adjusted itself to the new truth, that its good effects preponderate; and the preponderance continues to increase, until at length the truth causes nothing but good. But at the outset there is always harm. And if the truth is very great as well as very new, the harm is serious. Men are made uneasy; they flinch; they cannot bear the sudden light; a general restlessness supervenes; the face of society is disturbed, or perhaps convulsed; old interests and old beliefs are destroyed before new ones have been created. These symptoms are the precursors of revolution;

[107] Not that he was by any means devoid of genius, though he holds a rank far below so great and original a thinker as Hume. He had however collected more materials than he was able to wield; and his work on the *Intellectual System of the Universe*, which is a treasure of ancient philosophy, is badly arranged, and in many parts feebly argued. There is more real power in his posthumous treatise on *Eternal and Immutable Morality*.

[* This is very doubtful. Cudworth set out with a *parti pris*, the ordinary orthodox belief (founded on the Bible) in a primeval tradition; and sought in the ancient authors for the evidence he wanted. Hume, though he made little investigation at that point, professed to start from an accepted historical truth, and then argued deductively that the facts "necessarily must have been" so.—Ed.]

they have preceded all the great changes through which the world has passed; and while, if they are not excessive, they forebode progress, so, if they are excessive, they threaten anarchy. It is the business of practical men to moderate such symptoms, and to take care that the truths which philosophers discover are not applied so rashly as to dislocate the fabric, instead of strengthening it. But the philosopher has only to discover the truth and promulgate it; and that is hard work enough for any man, let his ability be as great as it may. This division of labour between thinkers and actors secures an economy of force, and prevents either class from wasting its power. It establishes a difference between science, which ascertains principles, and art, which applies them. It also recognizes that, the philosopher and the practical man having each a separate part to play, each is in his own field supreme. But it is a sad confusion for either to interfere with the other. In their different spheres, both are independent, and both are worthy of admiration. Inasmuch, however, as practical men should never allow the speculative conclusions of philosophers, whatever be their truth, to be put in actual operation, unless society is in some degree ripe for their reception; so, on the other hand, philosophers are not to hesitate and tremble and stop short in their career because their intellect is leading them to conclusions subversive of existing interests. The duty of a philosopher is clear. His path lies straight before him. He must take every pains to ascertain the truth; and having arrived at a conclusion, he, instead of shrinking from it because it is unpalatable, or because it seems dangerous, should on that very account cling the closer to it, should uphold it in bad repute more zealously than he would have done in good repute; should noise it abroad far and wide, utterly regardless what opinions he shocks, or what interests he imperils; should on its behalf court hostility and despise contempt, being well assured that if it is not true it will die, but that if it is true it must produce ultimate benefit, albeit unsuited for practical adoption by the age or country in which it is first propounded.

But Reid, notwithstanding the clearness of his mind and his great powers of argument, had so little of the real philosophic spirit that he loved truth not for its own sake, but for the sake of its immediate and practical results. He himself tells us that he began to study philosophy merely because he was shocked at the consequences at which philosophers had arrived.* As long as the speculations of Locke and of Berkeley were not pushed to their logical conclusions, Reid acquiesced in them, and they were good in his eyes.[108] While they were safe and tolerably orthodox, he was not over-nice in inquiring into their validity. In the hands of Hume, however, philosophy became bolder and more inquisitive; she disturbed opinions which were ancient, and which it was pleasant to hold; she searched into the foundation of things, and by forcing men to doubt and to inquire she rendered inestimable service to the cause of truth. But this was precisely the tendency at which Reid was displeased. He saw that such

[108] "I once believed this doctrine of ideas so firmly as to embrace the whole of Berkeley's system in consequence of it; till, finding other consequences to follow from it, which gave me more uneasiness than the want of a material world, it came into my mind more than forty years ago to put the question, What evidence have I for this doctrine that all the objects of my knowledge are ideas in my own mind? From that time to the present, I have been candidly and impartially, as I think, seeking for the evidence of this principle, but can find none, excepting the authority of philosophers." *Reid's Essays on the Powers of the Human Mind*, edit. Edinburgh, 1808, vol. i. p. 172. And, in a letter which he wrote to Hume in 1763, he, with a simple candour which must have highly amused that eminent philosopher, confesses that "your system appears to me not only coherent in all its parts, but likewise justly deduced from principles commonly received among philosophers; principles which I never thought of calling in question, until the conclusions you draw from them in the 'Treatise of Human Nature' made me suspect them." *Burton's Life and Correspondence of Hume*, vol. ii. p. 155.

[* This was after all no bad motive. Kant avowed that Hume roused him from his "dogmatic slumber," which is only another way of saying what Reid said.—Ed.]

disturbance was uncomfortable ; he saw that it was hazardous ; therefore he endeavoured to prove that it was groundless. Confusing the question of practical consequences with the totally different question of scientific truth, he took for granted that, because to his age the adoption of those consequences would be mischievous, they must be false. To the profound views of Hume respecting causation, he gravely objects that if they were carried into effect the operation of criminal law would be imperilled.[109] To the speculations of the same philosopher concerning the metaphysical basis of the theory of contracts, he replies that such speculations perplex men, and weaken their sense of duty ; they are therefore to be disapproved of on account of their tendency.[110] With Reid the main question always is not whether an inference is true, but what will happen if it is true. He says that a doctrine is to be judged by its fruits ; [111] forgetting that the same doctrine will bear different fruits in different ages, and that the consequences which a theory produces in one state of society are often diametrically opposed to those which it produces in another. He thus made his own age the standard of all future ones. He also trammelled philosophy with practical considerations ; diverting thinkers from the pursuit of truth, which is their proper department, into the pursuit of expediency, which is not their department at all. Reid was constantly stopping to inquire, not whether theories were accurate, but whether it was advisable to adopt them ; whether they were favourable to patriotism, or to generosity, or to friendship ; [112] in a word, whether they were comfortable, and such as we should at present like to believe.[113] Or else he would take other ground, still lower, and still more

[109] " Suppose a man to be found dead on the highway, his skull fractured, his body pierced with deadly wounds, his watch and money carried off. The coroner's jury sits upon the body, and the question is put, ' What was the cause of this man's death ? Was it accident, or *felo de se*, or murder by persons unknown ? ' Let us suppose an adept in Mr. Hume's philosophy to make one of the jury, and that he insists upon the previous question, whether there was any cause of the event, or whether it happened without a cause." *Reid's Essays on the Powers of the Mind*, vol. ii. p. 286. Compare vol. iii. p. 33 : " This would put an end to all speculation, as well as to all the business of life."

[110] " The obligation of contracts and promises is a matter so sacred, and of such consequence to human society, that speculations which have a *tendency to weaken that obligation*, and to perplex men's notions on a subject so plain and so important, ought to *meet with the disapprobation of all honest men*. Some such speculations, I think, we have in the third volume of Mr. Hume's ' Treatise of Human Nature,' and in his ' Enquiry into the Principles of Morals ; ' and my design in this chapter is to offer some observations on the nature of a contract or promise, and on two passages of that author on this subject. I am far from saying or thinking that Mr. Hume meant to weaken men's obligations to honesty and fair dealing, or that he had not a sense of these obligations himself. It is not the man I impeach, but his writings. Let us think of the first as charitably as we can, while we freely examine the import and *tendency* of the last." *Reid's Essays on the Powers of the Mind*, vol. iii. p. 444. In this, as in most passages, the italics are my own.

[111] " Without repeating what I have before said of causes in the first of these Essays, and in the second and third chapters of this, I shall here mention some of the consequences that may be justly deduced from this definition of a cause, that we may judge of it by its fruits." *Reid's Essays*, vol. iii. p. 339.

[112] " Bishop Berkeley surely did not duly consider that it is by means of the material world that we have any correspondence with thinking beings, or any knowledge of their existence, and that by depriving us of the material world, he deprived us at the same time of family, friends, country, and every human creature ; of every object of affection, esteem or concern, except ourselves. The good Bishop surely never intended this. He was too warm a friend, too zealous a patriot, and too good a Christian, to be capable of such a thought. *He was not aware of the consequences of his system* " (poor, ignorant Berkeley), " and therefore they ought not to be imputed to him ; but we must impute them to the system itself. It stifles every generous and social principle." *Reid's Essays*, vol. ii. pp. 251, 252.

[113] In his *Essays*, vol. i. p. 179, he says of Berkeley, one of the deepest and most un-

unworthy of a philosopher. In opposing, for instance, the doctrine that our faculties sometimes deceive us,—a doctrine which, as he well knew, had been held by men whose honesty was equal to his own, and whose ability was superior to his own,—he does not scruple to enlist on his side the prejudices of a vulgar superstition ; seeking to blacken the tenet which he was unable to refute. He actually asserts that they who advocate it insult the Deity, by imputing to the Almighty that He has lied. Such being the consequence of the opinion, it of course follows that the opinion must be rejected without further scrutiny, since to accept it would produce fatal results on our conduct, and would, indeed, be subversive of all religion, of all morals, and of all knowledge.[114]

In 1764 Reid published his *Inquiry into the Human Mind* ; and in that, and in his subsequent work entitled *Essays on the Powers of the Mind*, he sought to destroy the philosophy of Locke, Berkeley and Hume. And as Hume was the boldest of the three, it was chiefly his philosophy which Reid attacked. Of the character of this attack some specimens have just been given ; but they rather concern his object and motives, while what we have now to ascertain is his method, that is, the tactics of his warfare. He clearly saw that Hume had assumed certain principles, and had reasoned deductively from them to the facts, instead of reasoning inductively from the facts to them. To this method he strongly and perhaps fairly objects. He admits that Hume had reasoned so accurately that if his principles were conceded, his conclusions must likewise be conceded.[115] But, he says, Hume had no right to proceed in such a manner. He had no right to assume principles and then to argue from them. The laws of nature were to be arrived at not by conjecturing in this way, but by a patient induction of facts.[116] Discoveries depended solely on observation and experiment ; and any other plan could only produce theories, ingenious perhaps and plausible, but quite worthless.[117] For theory should yield to fact, and not fact to theory.[118] Speculators, indeed, might talk about first principles, and raise a system by reasoning from them. But the fact was that there was no agreement as to how a first principle was to be recognized ; since a principle which one man would deem self-

answerable of all speculators, " But there is one *uncomfortable consequence* of his system which he seems not to have attended to, and from which it will be found difficult, if at all possible, to guard it."

[114] " This doctrine is dishonourable to our Maker, and lays a foundation for universal scepticism. It supposes the Author of our being to have given us one faculty on purpose to deceive us, and another by which we may detect the fallacy, and find that he imposed upon us." . . . " The genuine dictate of our natural faculties is the voice of God, no less than what he reveals from heaven ; and to say that it is fallacious, is to impute a lie to the God of truth." . . . " Shall we impute to the Almighty what we cannot impute to a man without a heinous affront ? Passing this opinion, therefore, as shocking to an ingenious mind, and, in its consequences, subversive of all religion, all morals, and all knowledge," etc. *Reid's Essays*, vol. iii. p. 310. See also vol. i. p. 313.

[115] " His reasoning appeared to me to be just ; there was, therefore a necessity to call in question the principles upon which it was founded, or to admit the conclusion." *Reid's Inquiry into the Human Mind*, p. v. " The received doctrine of ideas is the principle from which it is deduced, and of which, indeed, it seems to be a just and natural consequence." p. 53. See also *Reid's Essays*, vol. i. pp. 199, 200, vol. ii. p. 211.

[116] " The laws of nature are the most general facts we can discover in the operations of nature. Like other facts, they are not to be hit upon by a happy conjecture, but justly deduced from observation. Like other general facts, they are not to be drawn from a few particulars, but from a copious, patient, and cautious induction." *Reid's Inquiry into the Human Mind*, pp. 262, 263.

[117] " Such discoveries have always been made by patient observation, by accurate experiments, or by conclusions drawn by strict reasoning from observations and experiments ; and such discoveries have always tended to refute, but not to confirm, the theories and hypotheses which ingenious men had invented." *Reid's Essays*, vol. i. p. 46.

[118] " This is Mr. Hume's notion of a cause." . . . " But theory ought to stoop to fact, and not fact to theory." *Reid's Essays*, vol. iii. p. 276.

evident, another would think it necessary to prove, and a third would altogether deny.[119]

The difficulties of deductive reasoning are here admirably portrayed. It might have been expected that Reid would have built up his own philosophy according to the inductive plan, and would have despised that assumption of first principles with which he taunts his opponents. But it is one of the most curious things in the history of metaphysics that Reid, after impeaching the method of Hume, follows the very same method himself. When he is attacking the philosophy of Hume, he holds deduction to be wrong. When he is raising his own philosophy, he holds it to be right. He deemed certain conclusions dangerous, and he objects to their advocates that they argued from principles instead of from facts; and that they assumed themselves to be in possession of the first principles of truth, although people were not agreed as to what constituted a first principle. This is well put and hard to answer. Strange however to say, Reid arrives at his own conclusions by assuming first principles to an extent far greater than had been done by any writer on the opposite side. From them he argues; his whole scheme is deductive; and his works scarcely contain a single instance of that inductive logic which, when attacking his opponents, he found it convenient to recommend. It is difficult to conceive a better illustration of the peculiar character of the Scotch intellect in the eighteenth century, and of the firm hold which what may be called the anti-Baconian method had upon that intellect. Reid was a man of considerable ability, of immaculate honesty, and was deeply convinced that it was for the good of society that the prevailing philosophy should be overthrown. To the performance of that task he dedicated his long and laborious life; he saw that the vulnerable point of the adverse system was its method; he indicated the deficiencies of that method, and declared, perhaps wrongly, but at all events sincerely, that it could never lead to truth. Yet, and notwithstanding all this, such was the pressure of the age in which he lived, and so completely did the force of circumstances shape his understanding, that in his own works he was unable to avoid that very method of investigation which he rebuked in others. Indeed, so far from avoiding it, he was a slave to it. The evidence of this I will now give, because, besides its importance for the history of the Scotch mind, it is valuable as one of many lessons which teach us how we are moulded by the society which surrounds us; how even our most vigorous actions are influenced by general causes of which we are often ignorant, and which few of us care to study; and, finally, how lame and impotent we are when as individuals we try to stem the onward current, resisting the great progress instead of aiding it, and vainly opposing our little wishes to that majestic course of events which admits of no interruption, but sweeps on, grand and terrible, while generation after generation passes away, successively absorbed in one mighty vortex.

Directly Reid, ceasing to refute the philosophy of Hume, began to construct his own philosophy, he succumbed to the prevailing method. He now assures us that all reasoning must be from first principles, and that, so far from reasoning to those principles, we must at once admit them, and make them the basis of all subsequent arguments.[120] Having admitted them, they become a thread to

[119] "But yet there seems to be great difference of opinions among philosophers about first principles. What one takes to be self-evident, another labours to prove by arguments, and a third denies altogether." *Reid's Essays*, vol. ii. p. 218. "Mr. Locke seems to think first principles of very small use." p. 219.

[120] "All reasoning must be from first principles; and for first principles no other reason can be given but this, that by the constitution of our nature we are under a necessity of assenting to them." *Reid's Inquiry*, p. 140. "All reasoning is from principles." . . . "Most justly, therefore, do such principles disdain to be tried by reason, and laugh at all the artillery of the logician when it is directed against them." p. 372. "All knowledge got by reasoning must be built upon first principles." *Reid's Essays*, vol. ii. p. 220. "In every branch of real knowledge there must be first principles, whose truth is known intuitively, without reasoning, either probable or demonstrative. They are not grounded on reasoning, but all reasoning is grounded on them," p. 360.

guide the inquirer through the labyrinth of thought.[121] His opponents had no right to assume them, but he might do so, because to him they were intuitive.[122] Whoever denied them was not fit to be reasoned with.[123] Indeed, to investigate them, or to seek to analyze them, was wrong as well as foolish, because they were part of the constitution of things; and of the constitution of things no account could be given, except that such was the will of God.[124]

As Reid obtained his first principles with such ease, and as he carefully protected them by forbidding any attempt to resolve them into simpler elements, he was under a strong temptation to multiply them almost indefinitely, in order that, by reasoning from them, he might raise a complete and harmonious system of the human mind. To that temptation he yielded with a readiness which is truly surprising when we remember how he reproached his opponents with doing the same thing. Among the numerous first principles which he assumes, not only as unexplained, but as inexplicable, are the belief in Personal Identity;[125] the belief in the External World;[126] the belief in the Uniformity of Nature;[127] the belief in the Existence of Life in Others;[128] the belief in Testimony,[129] also in the power of distinguishing truth from error,[130] and even in the correspondence of the face and voice to the thoughts.[131] Of belief generally, he asserts that there are many principles,[132] and he regrets that any one should have rashly attempted to explain them.[133] Such things are mysterious, and not to be pried into. We have also other faculties, which being original and indecomposable, resist all inductive treatment, and can neither be resolved into simpler elements nor referred to more general laws. To this class Reid assigns Memory,[134] Perception,[135] Desire of Self-Approbation,[136] and not only Instinct, but even Habit.[137] Many of our ideas,

[121] "For, when any system is grounded upon first principles, and deduced regularly from them, we have a thread to lead us through the labyrinth." *Reid's Essays*, vol. ii. p. 225.

[122] "I call these 'first principles,' because they *appear to me* to have in themselves an intuitive evidence which *I cannot resist.*" *Reid's Essays*, vol. iii. p. 375.

[123] "If any man should think fit to deny that these things are qualities, or that they require any subject, *I leave him to enjoy his opinion, as a man who denies first principles, and is not fit to be reasoned with.*" *Reid's Essays*, vol. i. p. 38.

[124] "No other account can be given of the constitution of things, but the will of Him that made them." *Reid's Essays*, vol. i. p. 115.

[125] Ibid., vol. i. pp. 36, 37, 340, 343; vol. ii. p. 245.

[126] Ibid., vol. i. pp. 115, 116, 288–299; vol. ii. p. 251.

[127] Or, as he expresses it, "our belief of the continuance of the laws of nature." *Reid's Inquiry*, pp. 426–435; also his *Essays*, vol. i. p. 305; vol. ii. p. 268.

[128] *Reid's Essays*, vol. ii. p. 259.

[129] *Reid's Inquiry*, p. 422; and his *Essays*, vol. ii. p. 266.

[130] "Another first principle is, 'That the natural faculties by which we distinguish truth from error are not fallacious.'" *Reid's Essays*, vol. ii. p. 256.

[131] "Another first principle I take to be, 'That certain features of the countenance, sounds of the voice, and gestures of the body, indicate certain thoughts and dispositions of mind.'" *Reid's Essays*, vol. ii. p. 261. Compare his *Inquiry*, p. 416.

[132] "We have taken notice of several original principles of belief in the course of this inquiry; and when other faculties of the mind are examined, we shall find more, which have not occurred in the examination of the five senses." *Reid's Inquiry*, p. 471.

[133] "And if no philosopher had attempted to define and explain belief, some paradoxes in philosophy, more incredible than ever were brought forth by the most abject superstition, or the most frantic enthusiasm, had never seen the light." *Reid's Inquiry*, p. 45.

[134] *Reid's Essays*, vol. i. pp. 329, 334; vol. ii. p. 247.

[135] Ibid., vol. i. pp. 9, 71, 303, 304.

[136] Ibid., vol. ii. p. 60.

[137] "I see no reason to think that we shall ever be able to assign the physical cause, either of instinct or of the power of habit. Both seem to be parts of our original constitution. Their end and use is evident; but we can assign no cause of them but the will of Him who made us." *Reid's Essays*, vol. iii. p. 119.

such as those concerning Space and Time, are equally original ; [138] and other first principles there are, which have not been enunciated, but from which we may reason.[139] They therefore are the major premisses of the argument ; no reason having yet been given for them, they must be simple ; and not having yet been explained, they are of course inexplicable.[140]

All this is arbitrary enough. Still in justice to Reid it must be said that, having made these assumptions, he displayed remarkable ability in arguing from them, and that in attacking the philosophy of his time he subjected it to a criticism which has been extremely serviceable. His lucidity, his dialectic skill, and the racy and masculine style in which he wrote, made him a formidable opponent and secured to his objections a respectful hearing. To me, however, it appears that notwithstanding the attempts first of M. Cousin, and afterwards of Sir William Hamilton, to prop up his declining reputation, his philosophy as an independent system is untenable, and will not live. In this I may be mistaken ; but what is quite certain is that nothing can be more absurd than to suppose, as some have done, that he adopted the inductive, or, as it is popularly called, Baconian method. Bacon indeed would have smiled at such a disciple, assuming all sorts of major premisses, taking general principles for granted with the greatest recklessness, and reserving his skill for the task of reasoning from propositions for which he had no evidence, except that on a cursory, or as he termed it, a common-sense inspection, they appeared to be true.[141] This refusal to analyze preconceived notions comes under the head of what Bacon stigmatized as the *anticipatio naturæ*, and which he deemed the greatest enemy of knowledge, on account of the dangerous confidence it places in the spontaneous and uncorrected conclusions of the human mind. When, therefore, we find Reid holding up the Baconian philosophy as a pattern which it behoved all inquirers to follow ; [142] and when we moreover find Dugald Stewart, who, though a somewhat superficial thinker, was at all events a careful writer, supposing that Reid had followed

[138] "I know of no ideas or notions that have a better claim to be accounted simple and original, than those of space and time." *Reid's Essays*, vol. i. p. 354.

[139] "I do not at all affirm that those I have mentioned are all the first principles from which we may reason concerning contingent truths. Such enumerations, even when made after much reflection, are seldom perfect." *Reid's Essays*, vol. ii. p. 270.

[140] "Why sensation should compel our belief of the present existence of the thing, memory a belief of its past existence, and imagination no belief at all, *I believe no philosopher can give a shadow of reason*, but that such is the nature of these operations. They are all simple and original, and *therefore inexplicable* acts of the mind." *Reid's Inquiry*, p. 40. "We can *give no reason* why the retina is, of all parts of the body, the only one on which pictures made by the rays of light cause vision ; and *therefore we must resolve this solely into a law of our constitution.*" p. 258.

[141] In a recent work of distinguished merit an instance is given of the loose manner in which he took for granted that certain phenomena were ultimate, in order that, instead of analyzing them, he might reason from them. "Dr. Reid has no hesitation in classing the voluntary command of our organs, that is, the sequence of feeling and action implied in all acts of will, among instincts. The power of lifting a morsel of food to the mouth is, according to him, an instinctive or pre-established conjunction of the wish and the deed ; that is to say, the emotional state of hunger, coupled with the sight of a piece of bread, is associated, through a primitive link of the mental constitution, with the several movements of the hand, arm, and mouth, concerned in the act of eating. *This assertion of Dr. Reid's may be simply met by appealing to the facts.* It is not true that human beings possess at birth any voluntary command of their limbs whatsoever. A babe of two months old cannot use its hands in obedience to its desires. The infant can grasp nothing, hold nothing, can scarcely fix its eyes on anything." . . . "If the more perfect command of our voluntary movements implied in every art be an acquisition, so is the less perfect command of these movements that grows upon a child during the first year of life." *Bain on the Senses and the Intellect*, London, 1855, pp. 292, 293.

[142] See *Reid's Inquiry*, pp. 436, 446, as well as other parts of his works : see also an extract from one of his letters to Dr. Gregory in *Stewart's Biographical Memoirs*, p. 432.

it,[143] we meet with fresh proof of how difficult it was for Scotchmen of the last age to imbibe the true spirit of inductive logic, since they believed that a system which flagrantly violated its rules had been framed in strict accordance with them.

Leaving mental philosophy, I now come to physical science, in which, if anywhere, we might expect that the inductive plan would predominate, and would triumph over the opposite or deductive one. How far this was the case, I will endeavour to ascertain, by an examination of the most important discoveries which have been made by Scotchmen concerning the organic and inorganic world. And as my object is merely to indicate the turn and character of the Scotch mind, I shall avoid all details respecting the practical effects of those discoveries, and shall confine myself to such a narration as will exhibit their purely scientific aspect, so as to enable the reader to understand what additions were made to our knowledge of the laws of nature, and in what way the additions were made. The character of each discovery and its process will be stated, but nothing more. Neither here nor in any part of this Introduction do I pretend to investigate questions of practical utility, or to trace the connexion between the discoveries of science and the arts of life. That I shall do in the body of the work itself, where I hope to explain a number of minute social events, many of which are regarded as isolated, if not incongruous. For the present, I solely aim at those broad principles which, by marking out the epochs of thought, underlie the whole fabric of society, and which must be clearly apprehended before history can cease to be a mere empirical assemblage of facts, of which the scientific basis being unsettled, the true order and coherence must be unknown.

Among the sciences which concern the inorganic world, the laws of heat occupy a conspicuous place. On the one hand they are connected with geology, being intimately allied, and indeed necessarily bound up with every speculation respecting the changes and present condition of the crust of the earth. On the other hand they touch the great questions of life, both animal and vegetable; they have to do with the theory of species and of race; they modify soil, food and organization; and to them we must look for valuable help towards solving those great problems in biology which, of late years, have occupied the attention of the boldest and most advanced philosophers.

Our present knowledge of the laws of heat may be briefly stated as branching into five fundamental divisions. These are: latent heat; specific heat; the conduction of heat; the radiation of heat; and finally, the undulatory theory of heat; by which last we are gradually discarding our old material views, and are accustoming ourselves to look upon heat as simply one of the forms of force, all of which, such as light, electricity, magnetism, motion, gravitation, and chemical affinity, are constantly assuming each other's shape, but in their total amount

[143] "The idea of prosecuting the study of the human mind on a plan analogous to that which had been so successfully adopted in physics by the followers of Lord Bacon, if not first conceived by Dr. Reid, was, at least, first carried successfully into execution in his writings." *Stewart's Biographical Memoirs*, p. 419. "The influence of the general views opened in the *Novum Organum*, may be traced in almost every page of his writings; and indeed the circumstance by which they are so strongly and characteristically distinguished is that they exhibit the first systematical attempt to exemplify, in the study of human nature, the same plan of investigation which conducted Newton to the properties of light and to the law of gravitation." p. 421. From this passage one might hazard a supposition that Dugald Stewart did not understand Bacon much better than he did Aristotle or Kant. Of the two last most profound thinkers he certainly knew little or nothing, except what he gathered secondhand. Consequently, he underrates them. [It is hardly warrantable to charge Stewart with not understanding Bacon because he credits Reid with trying to apply the Baconian method to psychology. If Reid did not consistently apply Bacon's propounded method, he therein resembled Bacon himself. "When Bacon can proceed no further as an experimental investigator of nature, he becomes, in spite of his method, a speculative natural philosopher" (Kuno Fischer, *Francis Bacon*, Eng. tr. 1857, p. 118).—Ed.]

are incapable either of increase or of diminution.[144] This grand conception, which is now placing the indestructibility of force on the same ground as the indestructibility of matter, has an importance far above its scientific value, considerable as that undoubtedly is. For by teaching us that nothing perishes, but that on the contrary the slightest movement of the smallest body in the remotest region produces results which are perpetual, which diffuse themselves through all space, and which, though they may be metamorphosed, cannot be destroyed, it impresses us with such an exalted idea of the regular and compulsory march of physical affairs, as must eventually influence other and higher departments of inquiry. Our habits of thought are so connected and interwoven, that notions of law and of the necessary concatenation of things can never be introduced into one field of speculation without affecting other fields which lie contiguous to it. When, therefore, the modern doctrine of conservation of force[145] becomes firmly coupled with the older doctrine of conservation of matter, we may rest assured that the human mind will not stop there, but will extend to the study of Man inferences analogous to those already admitted in the study of Nature. Having once recognized that the condition of the material universe, at any one moment, is simply the result of everything which has happened at

[144] The theory of the indestructibility of force has been applied to the law of gravitation by Professor Faraday in his *Discourse on the Conservation of Force*, 1857; an essay full of thought and power, and which should be carefully studied by every one who wishes to understand the direction which the highest speculations of physical science are now taking. I will quote only one passage from the opening, to give the reader an idea of its general scope, irrespective of the more special question of gravitation. "The progress of the strict science of modern times has tended more and more to produce the conviction that force can neither be created nor destroyed; and to render daily more manifest the value of the knowledge of that truth in experimental research." . . . . . "Agreeing with those who admit the conservation of force to be a principle in physics, as large and sure as that of the indestructibility of matter or the invariability of gravity, I think that no particular idea of force has a right to unlimited or unqualified acceptance, that does not include assent to it."

[145] As an illustration of this doctrine I cannot do better than quote the following passage from one of the most suggestive and clearly reasoned books which has been written in this century by an English physicist: "Wave your hand; the motion which has apparently ceased is taken up by the air, from the air by the walls of the room, etc., and so by direct and re-acting waves, continually comminuted, but never destroyed. It is true that at a certain point we lose all means of detecting the motion, from its minute subdivision, which defies our most delicate means of appreciation, but we can indefinitely extend our power of detecting it accordingly as we confine its direction, or increase the delicacy of our examination. Thus if the hand be moved in unconfined air, the motion of the air would not be sensible to a person at a few feet distance; but if a piston of the same extent of surface as the hand be moved with the same rapidity in a tube, the blast of air may be distinctly felt at several yards' distance. There is no greater absolute amount of motion in the air in the second than in the first case, but its direction is restrained, so as to make its means of detection more facile. By carrying on this restraint, as in the air-gun, we get a power of detecting the motion, and of moving other bodies at far greater distances. The puff of air which would in the air-gun project a bullet a quarter of a mile if allowed to escape without its direction being restrained, as by the bursting of a bladder, would not be perceptible at a yard's distance, though the same absolute amount of motion be impressed on the surrounding air." *Grove's Correlation of Physical Forces*, London, 1855, pp. 24, 25. In a work now issuing from the press, and still unfinished, it is suggested, with considerable plausibility, that Persistence of Force would be a more accurate expression than Conservation of Force. See Mr. Herbert Spencer's *First Principles*, London, 1861, p. 251. The title of this book gives an inadequate notion of the importance of the subjects with which it deals, and of the reach and subtlety of thought which characterize it. Though some of the generalizations appear to me rather premature, no well-instructed and disciplined intellect can consider them without admiration of the remarkable powers displayed by their author.

all preceding moments, and that the most trivial disturbance would so violate the general scheme as to render anarchy inevitable,* and that to sever from the total mass even the minutest fragment, would, by dislocating the structure, bury the whole in one common ruin, we, thus admitting the exquisite adjustment of the different parts, and discerning, too, in the very beauty and completeness of the design the best proof that it has never been tampered with by the Divine Architect who called it into being, in whose Omniscience both the plan and the issue of the plan resided with such clearness and unerring certainty that not a stone in that superb and symmetrical edifice has been touched since the foundation of the edifice was laid,† are, by ascending to this pitch and elevation of thought, most assuredly advancing towards that far higher step which it will remain for our posterity to take, and which will raise their view to so commanding a height as to insure the utter rejection of those old and eminently irreligious dogmas of supernatural interference with the affairs of life, which superstition has invented, and ignorance has bequeathed, and the present acceptance of which betokens the yet early condition of our knowledge, the penury of our intellectual resources, and the inveteracy of the prejudices in which we are still immersed.

It is, therefore, natural that the physical doctrine of indestructibility applied to force as well as to matter, should be essentially a creation of the present century, notwithstanding a few allusions made to it by some earlier thinkers, all of whom, however, groped vaguely, and without general purpose.‡ No preceding age was bold enough to embrace so magnificent a view as a whole, nor had any preceding philosophers sufficient acquaintance with nature to enable them to defend such a conception, even had they desired to entertain it. Thus, in the case now before us, it is evident that while heat was believed to be material it could not be conceived as a force, and therefore no one could grasp the theory of its metamorphosis into other forces; though there are passages in Bacon which prove that he wished to identify it with motion. It was first necessary to abstract heat into a mere property or affection of matter, and there was no chance of doing this until heat was better understood in its immediate antecedents, that is, until by the aid of mathematics its proximate laws had been generalized. But with the single exception of Newton, whose efforts, notwithstanding his gigantic powers, were on this subject very unsatisfactory, and who moreover had a decided leaning towards the material theory, no one attempted to unravel the mathematical laws of heat till the latter half of the eighteenth century, when Lambert and Black began the career which Prevost and Fourier followed up. The mind, having been so slow in mastering the preliminaries and outworks of the inquiry, was not ripe for the far more difficult enterprise of idealizing heat itself, and so abstracting it as to strip it of its material attributes, and leave to it nothing but the speculative notion of an immaterial force.

From these considerations, which were necessary to enable the reader to appreciate the value of what was done in Scotland, it will be seen how essential it was that the laws of the movement of heat should be studied before its nature was investigated, and before the emission theory could be so seriously attacked as to allow of the possibility of that great doctrine of the indestructibility of force which, I make no doubt, is destined to revolutionize our habits of thought, and to give to future speculations a basis infinitely wider than any previously known. In regard to the movements of heat, we owe the laws of conduction and of radiation chiefly to France and Geneva, while the laws of specific heat and those of latent heat were discovered in Scotland. The doctrine of specific heat, though interesting, has not the scientific importance which belongs to the other

[* This trope merely amounts to saying that if two and two made five, anarchy would be inevitable. Anarchy in this sense is unthinkable.—Ed.]

[† Buckle here appears to be assume *creatio ex nihilo*, which is of course conceptually excluded by the law of the conservation of energy. Some would call it an "irreligious dogma," as Buckle does the doctrine of "supernatural interference with the affairs of life."—Ed.]

[‡ This seems to make too little of the thinking of Leibnitz on the subject. Cp. Tyndall, *Heat a Mode of Motion*, 6th ed. p. 175.—Ed.]

departments of this great subject ; but the doctrine of latent heat is extremely curious, not only in itself, but also on account of the analogies it suggests with various branches of physical inquiry.

What is termed latent heat is exhibited in the following manner. If, in consequence of the application of heat, a solid passes into a liquid, as ice, for instance, into water, the conversion occupies a longer time than could be explained by any theory which had been propounded down to the middle of the eighteenth century. Neither was it possible to explain how it is that ice never rises above the temperature of 32° until it is actually melted, no matter what the heat of the adjacent bodies may be. There were no means of accounting for these circumstances. And though practical men, being familiar with them, did not wonder at them, they caused great astonishment among thinkers, who were accustomed to analyze events, and to seek a reason for common and every-day occurrences.

Soon after the middle of the eighteenth century, Black, who was then one of the professors in the University of Glasgow, turned his attention to this subject.[146] He struck out a theory which, being eminently original, was violently attacked, but is now generally admitted. With a boldness and reach of thought not often equalled, he arrived at the conclusion that whenever a body loses some of its consistence, as in the case of ice becoming water, or water becoming steam, such body receives an amount of heat which our senses, though aided by the most delicate thermometer, can never detect. For this heat is absorbed ; we lose all sight of it, and it produces no palpable effect on the material world, but becomes as it were a hidden property. Black therefore called it latent heat, because, though we conceive it as an idea, we cannot trace it as a fact. The body is properly speaking hotter ; and yet its temperature does not rise. Directly however the foregoing process is inverted, that is to say, directly the steam is condensed into water, or the water hardened into ice, the heat returns into the world of sense ; it ceases to be latent, and communicates itself to the surrounding objects. No new heat has been created ; it has indeed appeared and disappeared so far as our senses are concerned ; but our senses were deceived, since there has in truth been neither addition nor diminution.[147] That this remarkable theory paved the way for the doctrine of the indestructibility of force, will be obvious to whoever has examined the manner in which, in the history of the human mind, scientific conceptions are generated. The process is always so slow, that no single discovery has ever been made, except by the united labours of several successive generations.

[146] He was appointed professor in 1756 ; and "it was during his residence in Glasgow, between the years 1759 and 1763, that he brought to maturity those speculations concerning the combination of heat with matter, which had frequently occupied a portion of his thoughts." *Thomson's History of Chemistry*, vol. i. pp. 319, 320.

[147] *Black's Lectures on Chemistry*, vol. i. pp. 116, 117 ; and in various places. Dr. Robinson, the editor of these Lectures, says, p. 513, "Nothing could be more simple than his doctrines of latent heat. The experience of more than a century had made us consider the thermometer as a sure and an accurate indicator of heat, and of all its variations. We had learned to distrust all others. Yet in the liquefaction and vaporization of bodies, we had proofs uncontrovertible of the entrance of heat into the bodies. And we could, by suitable processes, get it out of them again. Dr. Black said that it was concealed in them,—*latent*,—it was as much concealed as carbonic acid is in marble, or water in zeolite, —it was concealed till Dr. Black detected it. He called it Latent Heat. He did not mean by this term that it was a different kind of heat from the heat which expanded bodies, but merely that it was concealed from our sense of heat, and from the thermometer." See also p. xxxvii. : "Philosophers had long been accustomed to consider the thermometer as the surest means for detecting the presence of heat or fire in bodies, and they distrusted all others." [The physicists of to-day state the phenomena in somewhat different terms from those of Black and Buckle. Thus Tyndall : "According to our present theory, the heat expended in melting is consumed in overcoming molecular attractions, and in conferring potential energy upon the separated molecules of their poles. It is virtually the lifting of a weight" (*Heat a Mode of Motion*, 6th ed. p. 191. Cp. p. 318). Tyndall, strangely enough, omits to mention Black in his historic retrospect.—Ed.]

In estimating, therefore, what each man has done, we must judge him not by the errors he commits, but by the truths he propounds. Most of his errors are not really his own. He inherits them from his predecessors ; and if he throws some of them off we should be grateful, instead of being dissatisfied that he has not rejected all. Black, no doubt, fell into the error of regarding heat as a material substance, which obeys the laws of chemical composition.[148] But this was merely an hypothesis which was bequeathed to him, and with which the existing state of thought forced him to encumber his theory. He inherited the hypothesis, and could not get rid of his troublesome possession. The real service which he rendered is that in spite of that hypothesis, which clung to him to the last, he, far more than any of his contemporaries, contributed towards the great conception of idealizing heat, and thus enabled his successors to admit it into the class of immaterial and supersensual forces. Once admitted into that class, the list of forces became complete ; and it was comparatively easy to apply to the whole body of force the same notion of indestructibility which had previously been applied to the whole body of matter. But it was hardly possible to effect this object while heat stood, as it were, midway between force and matter, yielding opposite results to different senses ; amenable to the touch, but invisible to the eye. What was wanting was to remove it altogether out of the jurisdiction of the senses, and to admit that, though we experience its effects, we can only conceive its existence. Towards accomplishing this Black took a prodigious stride. Unconscious, perhaps, of the remote tendency of his own labours, he undermined that doctrine of material heat which he seemed to support. For by his advocacy of latent heat he taught that its movements constantly baffle not only some of our senses, but all of them; and that, while our feelings make us believe that heat is lost, our intellect makes us believe that it is not lost. Here we have apparent destructibility, and real indestructibility. To assert that a body received heat without its temperature rising, was to make the understanding correct the touch, and defy its dictates. It was a bold and beautiful paradox, which required courage as well as insight to broach, and the reception of which marks an epoch in the human mind, because it was an immense step towards idealizing matter into force. Some indeed have spoken of invisible matter ; but that is a contradiction in terms which will never be admitted as long as the forms of speech remain unchanged. Nothing can be invisible except force, mind, and the Supreme Cause of all.* We must therefore ascribe to Black the signal merit that he first, in the study of heat, impeached the authority of the senses, and thereby laid the foundation of everything which was afterwards done. Besides the relation which his discovery bears to the indestructibility of force, it is also connected with one of the most splendid achievements effected by this generation in inorganic physics ; namely, the establishment of the identity of light and heat. To the senses, light and heat, though in some respects similar, are in most respects dissimilar. Light, for instance, affects the eye and not the touch. Heat affects the touch, but, under ordinary circumstances, does not affect the eye. The capital difference, however, between them is, that heat, unlike light, possesses the property of temperature ; and this property is so characteristic, that until our understandings are invigorated by science, we cannot conceive heat separated from temperature, but are compelled to confuse one with the other. Directly, however, men began to adopt the method followed by Black, and were resolved to consider heat as supersensual, they entered the road which led to the discovery of light and heat being

[148] " Fluidity is the consequence of a certain combination of calorific matter with the substance of solid bodies," &c. *Black's Lectures*, vol. i. p. 133. Compare p. 192, and the remarks in *Turner's Chemistry*, 1847, vol. i. p. 31, on Black's views of the " chemical combination " of heat. Among the backward chemists, we still find traces of the idea of heat obeying chemical laws. [Tyndall (*Heat*, p. 38) mentions that in his youth it was still common even for eminent chemists to employ the old conception.—Ed.]

[* It is difficult to see how Buckle can on this view dispose of the hypothetical ether of the physicists.—Ed.]

merely different developments of the same force. Ignoring the effects of heat on themselves, or on any part of the creation which was capable of feeling its temperature, and would therefore be deceived by it, nothing was left for them to do but to study its effects on the inanimate world. Then all was revealed. The career of discovery was fairly opened; and analogies between light and heat, which even the boldest imagination had hardly suspected, were placed beyond a doubt. To the reflection of heat, which had been formerly known, were now added the refraction of heat, its double refraction, its polarization, its depolarization, its circular polarization, the interference of its rays, and their retardation; while, what is more remarkable than all, the march of our knowledge on these points was so swift that before the year 1836 had come to a close the chain of evidence was completed by the empirical investigations of Forbes and Melloni, they themselves little witting that everything which they accomplished was prepared before they were born, that they were but the servants and followers of him who indicated the path in which they trod, and that their experiments, ingenious as they were, and full of resource, were simply the direct practical consequence of one of those magnificent ideas which Scotland has thrown upon the world, and the memory of which is almost enough so to bribe the judgment as to tempt us to forget that, while the leading intellects of the nation were engaged in such lofty pursuits, the nation itself, untouched by them, passed them over with cold and contemptuous indifference, being steeped in that deadening superstition which turns a deaf ear to every sort of reason, and will not hearken to the voice of the charmer, charm he never so wisely.

By thus considering the descent and relationship of scientific conceptions, we can alone understand what we really owe to Black's discovery of latent heat. In regard to the method of the discovery little need be said, since every student of the Baconian philosophy must see that the discovery was of a kind for which none of the maxims of that system had provided. As latent heat escapes the senses, it could not obey the rules of a philosophy which grounds all truth on observation and experiment. The subject of the inquiry being supersensual, there was no scope for what Bacon called crucial experiments and separations of nature. The truth was in the idea; experiments therefore might illustrate it, might bring it up to the surface, and so enable men to grasp it, but could not prove it. And this, which appears on the very face of the discovery, is confirmed by the express testimony of Dr. Thomson, who knew Black, and was indeed one of the most eminent of his pupils. We are assured by this unimpeachable witness that Black about the year 1759 began to speculate concerning heat; that the result of those speculations was the theory of latent heat; that he publicly taught that theory in the year 1761; but that the experiments which were necessary to convince the world of it were not made till 1764,[149] though, as I need hardly add, according to the inductive method, it was a breach of all the rules of philosophy to be satisfied with the theory three years before the experiments were made,

[149] "So much was he convinced of this, that he taught the doctrine in his lectures in 1761, before he had made a single experiment on the subject." . . . "The requisite experiments were first attempted by Dr. Black in 1764." *Thomson's History of Chemistry*, vol. i. p. 324. See also pp. 319, 320; and on the history of the idea in Black's mind as early as the year 1754, see the interesting extracts from his note-books in Robinson's appendix to *Black's Lectures*, vol. i. pp. 525, 526.

The statement by Dr. Thomson refers to the completion, or last stage, of the discovery, namely, the vaporific combination of heat. But from a letter which Black wrote to Watt in 1780 (*Muirhead's Life of Watt*, London, 1859, p. 303), it appears that Thomson has even understated the question, and that Black, instead of first teaching his theory in 1761, taught it three years earlier, that is *six* years before the decisive experiments were made. "I began," writes Black, "to give the doctrine of latent heat in my lectures at Glasgow in the winter 1757–58, which, I believe, was the first winter of my lecturing there; or if I did not give it that winter, I certainly gave it in the 1758–59; and I have delivered it every year since that time in my winter lectures, which I continued to give at Glasgow until winter 1766–67, when I began to lecture in Edinburgh."

and it was a still greater breach not only to be satisfied with it, but to have openly promulgated it as an original and unquestionable truth, which explained, in a new manner, the economy of the material world.

The intellect of Black belonged to a class which in the eighteenth century was almost universal in Scotland,* but was hardly to be found in England, and which, for want of a better word, we are compelled to call deductive, though fully admitting that even the most deductive minds have in them a large amount of induction, since, indeed, without induction the common business of life could not be carried on. But for the purposes of scientific classification we may say that a man or an age is deductive, when the favourite process is reasoning from principles instead of reasoning to them, and when there is a tendency to underrate the value of specific experience. That this was the case with the illustrious discoverer of latent heat, we have seen, both fom the nature of the discovery, and from the decisive testimony of his friend and pupil. And a further confirmation may be found in the circumstance that, having once propounded his great idea, he, instead of instituting a long series of laborious experiments by which it might be verified in its different branches, preferred reasoning from it according to the general maxims of dialectic ; pushing it to its logical consequences, rather than tracking it into regions where the senses might either confirm or refute it.[150] By following this process of thought, he was led to some beautiful speculations, which are so remote from experience that even now, with all the additional resources of our knowledge, we cannot tell whether they are true or false. Of this kind were his views respecting the causes of the preservation of man, whose existence would, he thought, be endangered, except for the power which heat possesses of lying latent and unobserved. Thus, for example, when a long and severe winter was followed by sudden warmth, it appeared natural that the ice and snow should melt with corresponding suddenness ; and if this were to happen, the result would be such terrible inundations that it would be hardly possible for man to escape from their ravages. Even if he escaped, his works, that is, the material products of his civilization, would perish. From this catastrophe nothing saves him but the latent power of heat. Owing to this power, directly the ice and snow begin to melt at their surface, the heat enters their structure, where a large part of it remains in abeyance, and thus losing much of its power, the process of liquefaction is arrested. This dreadful agent is lulled, and becomes dormant. It is weakened at the outset of its career, and is laid up, as in a storehouse, from which it can afterwards emerge, gradually, and with safety to the human species.[151]

In this way, as summer advances, a vast magazine of heat is accumulated, and is preserved in the midst of water, where it can do man no injury, since, indeed, his senses are unable to feel it. There the heat remains buried, until, in the rotation of the seasons, winter returns, and the waters are congealed into ice. In the process of congelation, that treasury of heat, which had been hidden

[150] And he distinctly states that, even in other matters, when he did make experiments, their object was to confirm theory, and not to suggest it. Thus, to give one of many instances, in his *Lectures*, vol. i. p. 354, he says, respecting salts, "When we examine the solidity of this reasoning by an experiment, *we have the pleasure to find facts agree exactly with the theory*."

[151] See a good summary of this idea in *Black's Lectures on Chemistry*, vol. i. p. 118. Contrasting his theory of heat with that previously received, he says, "But were the ice and snow to melt as suddenly as they must necessarily do, were the former opinion of the action of heat in melting them well founded, the torrents and inundations would be incomparably more irresistible and dreadful. They would tear up and sweep away every thing, and that so suddenly, that mankind should have great difficulty to escape from their ravages."

[* Here again there is a contradiction in the use of terms. Buckle had expressly stated that the deductive method could not appeal to the majority. For "almost universal" read "normal among the class of independent thinkers." The rest of the sentence seriously modifies the previous propositions on the subject.—Ed.]

all the summer, reappears ; it ceases to be latent ; and now, for the first time, striking the senses of man,* it tempers, on his behalf, the severity of winter. The faster the water freezes, the faster the heat is disengaged ; so that, by virtue of this great law of nature, cold actually generates warmth, and the inclemency of every season, though it cannot be hindered, is softened in proportion as the inclemency is more threatening.[152]

Thus, again, inasmuch as heat becomes latent and flies from the senses, not only when ice is passing into water, but also when water is passing into steam, we find in this latter circumstance one of the reasons why man and other animals can live in the tropics, which, but for this, would be deserted. They are constantly suffering from the heat which is collected in their bodies, and which, considered by itself, is enough to destroy them. But this heat causes thirst, and they consequently swallow great quantities of fluid, much of which exudes through the pores of the skin in the form of vapour. And as, according to the theory of latent heat, vapour cannot be produced without a vast amount of heat being buried within it, such vapour absorbs and carries off from the body that which, if left in the system, would prove fatal. To this we must add that in the tropics the evaporation of water is necessarily rapid, and the vapour which is thus produced becomes another storehouse of heat, and a vehicle by which it is removed from the earth, and prevented from unduly interfering with the economy of life.[153]

[152] " Dr. Black quickly perceived the vast importance of this discovery, and took a pleasure in laying before his students a view of the extensive and beneficial effects of this habitude of heat in the economy of nature. He made them remark how by this means there was accumulated, during the summer season, a vast magazine of heat, which, by gradually emerging, during congelation, from the water which covers the face of the earth, serves to temper the deadly cold of winter. Were it not for this quantity of heat, amounting to 145 degrees, which emerges from every particle of water as it freezes, and which diffuses itself through the atmosphere, the sun would no sooner go a few degrees to the south of the equator, than we should feel all the horrors of winter." *Robinson's Preface to Black's Lectures*, vol. i. p. xxxviii.

[153] As I am writing an account of Black's views, and not a criticism of them, I shall give them, without comment, in his own words, and in the words of one of his pupils. " Here we can also trace another magnificent train of changes, which are nicely accommodated to the wants of the inhabitants of this globe. In the equatorial regions, the oppressive heat of the sun is prevented from a destructive accumulation by copious evaporation. The waters, stored with their vaporific heat, are thus carried aloft into the atmosphere, till the rarest of the vapour reaches the very cold regions of the air, which immediately forms a small portion of it into a fleecy cloud. This also further tempers the scorching heat by its opacity, performing the acceptable office of a screen. From thence, the clouds are carried to the inland countries, to form the sources in the mountains, which are to supply the numberless streams that water the fields. And, by the steady operation of causes, which are tolerably uniform, the greater part of the vapours pass on to the circumpolar regions, there to descend in rains and dews ; and in this beneficent conversion into rain, by the cold of those regions, each particle of steam gives up the 700 or 800 degrees of heat which were latent in it. These are immediately diffused, and soften the rigour of those less comfortable climates." . . . " I am persuaded that the heat absorbed in spontaneous evaporation greatly contributes to enable animals to bear the heat of the tropical climates, where the thermometer frequently continues to show the temperature of the human body. Such heats, indeed, are barely supportable, and enervate the animal, making it lazy and indolent, indulging in the most relaxed postures, and avoiding every exertion of body or mind. The inhabitants are induced to drink large draughts of diluting liquors, which transude through their pores most copiously, carrying off with them a vast deal of this troublesome and exhausting heat. There is in the body itself a continual laboratory, or manufacture of heat, and were the surrounding air of such

[* This is not warranted by the argument, which alleges simply modification of the cold. On the other hand, the presence of *water* sensibly modifies winter temperatures. (Tyndall, *Heat*, p. 213).—Ed.]

From these and many other arguments, all of which were so essentially speculative, and dealt with such hidden processes of nature, that even now we are not justified either in confidently admitting them or in positively denying them, Black was led to that great doctrine of the indestructibility of heat,[154] which, as I have pointed out, has in its connexion with the indestructibility of force a moral and social importance even superior to its scientific value. Though the evidence of which he was possessed was far more scanty than what we now have, he, by the reach of his commanding intellect rather than by the number and accuracy of his facts, became so penetrated with a conviction of the stability of physical affairs, that he not only applied that idea to the subtle phenomena of heat, but, what was much harder to do, he applied it to cases in which heat so entirely escapes the senses that man has no cognizance of it, except through the medium of the imagination. According to his view, heat passes through an immense variety of changes, during which it appears to be lost ; changes which no eye can ever see, which no touch can ever experience, and which no instrument can ever measure. Still, and in the midst of all these changes, it remains intact. From it nothing can be taken, and to it nothing can be added. In one of those fine passages of his Lectures, which, badly reported as they are,[155] bear the impress of his elevated genius, Black, after stating what would probably happen if the total amount of heat existing in the world were to be diminished, proceeds to speculate on the consequences of its being increased. Were it possible for any power to add to it ever so little, it would at once overstep its bounds ; the equilibrium would be disturbed ; the framework of affairs would be disjointed. The evil rapidly increasing, and acting with accumulated force, nothing would be able to stop its ravages. It must continue to gain ground till all other principles are absorbed and conquered. Sweeping on, unhindered and irresistible, before it every animal must perish, the whole vegetable world must disappear, the waters must pass into vapour, and the solid parts of the globe be merged and melted, until at length the glorious fabric, loosened and dissolved, would fall away, and return to that original chaos out of which it had been evolved.[156]

These, like many other of the speculations of this great thinker, will find small favour with those purely inductive philosophers, who not only suppose, perhaps rightly, that all our knowledge is in its beginning built upon facts, but who countenance what seems to me the very dangerous opinion that every increase

a temperature as not to carry it off, it would soon accumulate so as to destroy life. The excessive perspiration, supplied by diluting draughts, performs the same office as the cold air without the tropics, in guarding us from this fatal accumulation." *Black's Lectures*, vol. i. pp. xlvi. 214. [Black has here invented his facts to strengthen his theory. The inhabitants of hot climates do *not* drink large quantities of water, and those who go from temperate to hot climates generally learn the wisdom of similar abstention. A state of profuse perspiration is not, as Black seems to have supposed, a comfortable one for a permanency.—Ed.]

[154] See his strong protest against the notion that heat is ever destroyed, in his *Lectures* vol. i. pp. 125, 126, 164, 165.

[155] They were published after his death from such scanty materials that their editor, Dr. Robinson, says (*Preface to Black's Lectures*, vol. i. p. x.) : "When I then entered seriously on the task, I found that the notes were (with the exception of perhaps a score of lectures) in the same imperfect condition that they had been in from the beginning, consisting entirely of single leaves of paper, in octavo, full of erasions, interlinings, and alterations of every kind ; so that, in many places, it was not very certain which of several notes was to be chosen."

[156] "On the other hand, were the heat which at present cherishes and enlivens this globe, allowed to increase beyond the bounds at present prescribed to it ; beside the destruction of all animal and vegetable life, which would be the immediate and inevitable consequence, the water would lose its present form, and assume that of an elastic vapour like air ; the solid parts of the globe would be melted and confounded together, or mixed with the air and water in smoke and vapour ; and nature would return to the original chaos." *Black's Lectures*, vol. i. pp. 246, 247.

of knowledge must be preceded by an increase of facts.* To such men it will appear that Black had far better have occupied himself in making new observations, or devising new experiments, than in thus indulging his imagination in wild and unprofitable dreams. They will think that these flights of fancy are suitable, indeed, to the poet, but unworthy of that severe accuracy, and of that close attention to facts, which ought to characterize a philosopher. In England especially there is among physical inquirers an avowed determination to separate philosophy from poetry, and to look upon them not only as different but as hostile. Among that class of thinkers, whose zeal and ability are beyond all praise, and to whom we owe almost unbounded obligations, there dots undoubtedly exist a very strong opinion that in their own pursuit the imagination is extremely dangerous, as leading to speculations of which the basis is not yet assured, and generating a desire to catch too eagerly at distant glimpses before the intermediate ground has been traversed. That the imagination has this tendency is undeniable. But they who object to it on this account, and who would therefore divorce poetry from philosophy, have, I apprehend, taken a too limited view of the functions of the human mind, and of the manner in which truth is obtained. There is in poetry a divine and prophetic power, and an insight into the turn and aspect of things, which if properly used would make it the ally of science instead of the enemy. By the poet, nature is contemplated on the side of the emotions ; by the man of science, on the side of the understanding. But the emotions are as much a part of us as the understanding ; they are as truthful ; they are as likely to be right. Though their view is different, it is not capricious. They obey fixed laws ; they follow an orderly and uniform course ; they run in sequences ; they have their logic and method of inference. Poetry, therefore, is a part of philosophy, simply because the emotions are a part of the mind. If the man of science despises their teaching, so much the worse for him. He has only half his weapons ; his arsenal is unfilled. Conquests, indeed, he may make, because his native strength may compensate the defects of his equipment. But his success would be more complete and more rapid if he were properly furnished and made ready for the battle. And I cannot but regard as the worst intellectual symptom of this great country what I must venture to call the imperfect education of physical philosophers, as exhibited both in their writings and in their trains of thought. This is the more serious, because they as a body form the most important class in England whether we look at their ability, or at the benefits we have received from them, or at the influence they are exercising, and are likeiy to exercise, over the progress of society. It cannot however be concealed that they display an inordinate respect for experiments, an undue love of minute detail, and a disposition to overrate the inventors of new instruments, and the discoverers of new but often insignificant facts. Their predecessors of the seventeenth century, by using hypotheses more boldly, and by indulging their imagination more frequently, did certainly effect greater things, in comparison with the then state of knowledge, than our contemporaries, with much superior resources, have been able to achieve. The magnificent generalizations of Newton and Harvey could never have been completed in an age absorbed in one unvarying round of experiments and observations. We are in that predicament that our facts have outstripped our knowledge, and are now encumbering its march. The publications of our scientific institutions, and of our scientific authors, overflow with minute and countless details, which perplex the judgment, and which no memory can retain. In vain do we demand that they should be generalized and reduced into order. Instead of that, the heap continues to swell. We want ideas, and we get more facts. We hear constantly of what nature is doing, but we rarely hear of what man is thinking. Owing to the indefatigable industry of this and the preceding century, we are in possession of a huge and incoherent mass of observations, which have been stored up with great care, but which, until they are connected by some presiding idea, will be utterly useless. The most effective way of turning

[* " Fact " is, of course, here understood to mean an observed phenomenon as distinct from an inferred law of causation.—Ed.]

them to account would be to give more scope to the imagination, and incorporate the spirit of poetry with the spirit of science. By this means our philosophers would double their resources, instead of working, as now, maimed, and with only half their nature. They fear the imagination, on account of its tendency to form hasty theories. But surely all our faculties are needed in the pursuit of truth, and we cannot be justified in discrediting any part of the human mind. And I can hardly doubt that one of the reasons why we in England made such wonderful discoveries during the seventeenth century, was because that century was also the great age of English Poetry. The two mightiest intellects our country has produced are Shakspeare and Newton ; and that Shakspeare should have preceded Newton was, I believe, no casual or unmeaning event.* Shakspeare and the poets sowed the seed which Newton and the philosophers reaped. Discarding the old scholastic and theological pursuits, they drew attention to nature, and thus became the real founders of all natural science. They did even more than this. They first impregnated the mind of England with bold and lofty conceptions. They taught the men of their generation to crave after the unseen. They taught them to pine for the ideal, and to rise above the visible world of sense. In this way, by cultivating the emotions, they opened one of the paths which lead to truth. The impetus which they communicated survived their own day, and like all great movements was felt in every department of thought. But now it is gone ; and, unless I am greatly mistaken, physical science is at present suffering from its absence. Since the seventeenth century we have had no poet of the highest order, though Shelley, had he lived, would perhaps have become one. He had something of that burning passion, that sacred fire, which kindles the soul, as though it came fresh from the altar of the gods. But he was cut off in his early prime, when his splendid genius was still in its dawn. If we except his immature, though marvellous, efforts, we may assuredly say that for nearly two hundred years England has produced no poetry which bears those unmistakable marks of inspiration which we find in Spenser, in Shakspeare, and in Milton.† The result is that we, separated by so long an interval from those great feeders of the imagination who nurtured our ancestors, and being unable to enter fully into the feelings of poets, who wrote when nearly all opinions, and therefore nearly all forms of emotion, were very different to what they now are, cannot possibly sympathize with those immortal productions so closely as their contemporaries did. The noble English poetry of the sixteenth and seventeenth centuries is read more than ever, but it does not colour our thoughts ; it does not shape our understandings as it shaped the understandings of our forefathers. Between us and them is a chasm which we cannot entirely bridge. We are so far removed from the associations amid which those poems were composed, that they do not flash upon us with that reality and distinctness of aim which they would have done had we lived when they were written. Their garb is strange, and belongs to another time. Not merely their dialect and their dress, but their very complexion and their inmost sentiments, tell of bygone days of which we have no firm hold. There is no doubt a certain ornamental culture which the most highly educated persons receive from the literature of the past, and by which they sometimes refine their taste, and sometimes enlarge their ideas. But the real culture of a great people, that which supplies each generation with its principal strength, consists of what it learnt from the generation immediately preceding. Though we are often unconscious of the process, we build nearly all our conceptions on the basis recognized by those who went just before us. Our closest contact is not with our forefathers, but with our fathers. To them we are linked by a genuine affinity, which, being

[* The only meaning attachable to this phrase is that Shakspeare's work had a direct or indirect effect on Newton's thought. For this there is no evidence whatever, though Newton seems to have read Milton.—Ed.]

[† This surprising judgment, which rules out the poetry of Wordsworth, Coleridge, and Keats, and all that Tennyson and Browning had produced down to 1860, is discussed in the editor's *Buckle and his Critics*, pp. 531–533.—Ed.]

spontaneous, costs us no effort, and from which indeed we cannot escape. We inherit their notions, and modify them, just as they modified the notions of their predecessors. At each successive modification something is lost and something is gained, until at length the original type almost disappears. Therefore it is, that ideas entertained several generations ago bear about the same relation to us as ideas preserved in a foreign literature. In both cases, the ideas may adorn our knowledge, but they are never so thoroughly incorporated with our minds as to be the knowledge itself. The assimilation is incomplete, because the sympathy is incomplete. We have now no great poets; and our poverty in this respect is not compensated by the fact that we once had them, and that we may and do read their works. The movement has gone by; the charm is broken; the bond of union, though not cancelled, is seriously weakened. Hence our age, great as it is, and in nearly all respects greater than any the world has yet seen, has, notwithstanding its large and generous sentiments, its unexampled toleration, its love of liberty, and its profuse and almost reckless charity, a certain material, unimaginative, and unheroic character, which has made several observers tremble for the future. So far as I can understand our present condition, I do not participate in these fears, because I believe that the good we have already gained is beyond all comparison greater than what we have lost. But that something has been lost is unquestionable. We have lost much of that imagination which, though in practical life it often misleads, is in speculative life one of the highest of all qualities, being suggestive as well as creative. Even practically we should cherish it, because the commerce of the affections mainly depends on it. It is, however, declining; while at the same time the increasing refinement of society accustoms us more and more to suppress our emotions, lest they should be disagreeable to others. And as the play of the emotions is the chief study of the poet, we see in this circumstance another reason which makes it difficult to rival that great body of poetry which our ancestors possessed. Therefore it is doubly incumbent on physical philosophers to cultivate the imagination. It is a duty they owe to their own pursuits, which would be enriched and invigorated by such an enlargement of their resources. It is also a duty which they owe to society in general; since they, whose intellectual influence is already greater than that of any other class, and whose authority is perceptibly on the increase, might have power enough to correct the most serious deficiency of the present age, and to make us some amends for our inability to produce such a splendid imaginative literature as that which our forefathers created, and in which the choicest spirits of the seventeenth century did, if I may so say, dwell and have their being.

If, therefore, Black had done nothing more than set the example of a great physical philosopher giving free scope to the imagination, he would have conferred upon us a boon, the magnitude of which it is not easy to overrate. And it is very remarkable that, before he died, that department of inorganic physics which he cultivated with such success was taken up by another eminent Scotchman, who pursued exactly the same plan, though with somewhat inferior genius. I allude, of course, to Leslie, whose researches on heat are well known to those who are occupied with this subject; while, for our present purpose, they are chiefly interesting as illustrating that peculiar method which in the eighteenth century seemed essential to the Scotch mind.

About thirty years after Black propounded his famous theory of heat, Leslie began to investigate the same topic, and, in 1804, published a special dissertation upon it.[157] In that work, and in some papers in his *Treatises on Philosophy*, are

[157] Mr. Napier, in his *Memoirs of Leslie*, pp. 16, 17 (prefixed to *Leslie's Treatises on Philosophy*, Edinb. 1838), says that he "composed the bulk of his celebrated work on Heat in the years 1801 and 1802;" but that in 1793 he propounded "some of its theoretical opinions, as well as the germs of its discoveries." It appears, however, from his own statement, that he was making experiments on heat, at all events, as early as 1791. See *Leslie's Experimental Inquiry into the Nature and Propagation of Heat*. London, 1804, p. 409.

contained his views, several of which are now known to be inaccurate,[158] though some are of sufficient value to mark an epoch in the history of science. Such was his generalization respecting the connexion between the radiation of heat and its reflection: bodies which reflect it most, radiating it least, and those which radiate it most, reflecting it least. Such, too, was another wide conclusion, which the best inquirers have since confirmed, namely, that while heat is radiating from a body, the intensity of each ray is as the sine of the angle which it makes with the surface of that body.

These were important steps, and they were the result of experiments preceded by large and judicious hypotheses. In relation, however, to the economy of nature, considered as a whole, they are of small account, in comparison with what Leslie effected towards consolidating the great idea of light and heat being identical, and thus preparing his contemporaries for that theory of the interchange of forces, which is the capital intellectual achievement of the nineteenth century. But it is interesting to observe that, with all his ardour, he could not go beyond a certain length. He was so hampered by the material tendencies of his time that he could not bring himself to conceive heat as a purely supersensual force, of which temperature was the external manifestation.[159] For this the age was barely ripe. We accordingly find him asserting that heat is an elastic fluid, extremely subtle, but still a fluid.[160] His real merit was that, notwithstanding the difficulties which beset his path, he firmly seized the great truth that there is no fundamental difference between light and heat. As he puts it, each is merely a metamorphosis of the other. Heat is light in complete repose. Light is heat in rapid motion. Directly light is combined with a body, it becomes heat; but when it is thrown off from that body, it again becomes light.[161]

Whether this is true or false, we cannot tell; * and many years, perhaps many generations, will have to elapse before we shall be able to tell. But the service rendered by Leslie is quite independent of the accuracy of his opinion as to the manner in which light and heat are interchanged. That they are interchanged is the essential and paramount idea. And we must remember that he made this idea the basis of his researches at a period when some very important facts, or, I should rather say, some very conspicuous facts, were opposed to it; while the main facts which favoured it were still unknown. When he composed his work, the analogies between light and heat with which we are now acquainted had not been discovered; no one being aware that double refraction, polarization, and other curious properties are common to both. To grasp so wide a truth in the face of such obstacles was a rare stroke of sagacity. But on account of the obstacles, the inductive mind of England refused to receive the truth, as it was not generalized from a survey of all the facts. And Leslie, unfortunately for himself, died too soon to enjoy the exquisite pleasure

[158] For specimens of some of his most indefensible speculations, see *Leslie's Treatises on Philosophy*, pp. 38, 43.

[159] Though he clearly distinguishes between the two. "It is almost superfluous to remark, that the term heat is of ambiguous import, denoting either a certain sensation, or the external cause which excites it." *Leslie on Heat*, p. 137.

[160] "Heat is an elastic fluid extremely subtle and active." *Leslie on Heat*, p. 150. At p. 31, "Calorific and frigorific fluid." See also pp. 143, 144; and the attempt to measure its elasticity, in pp. 177, 178.

[161] "Heat is only light in the state of combination." *Leslie on Heat*, p. 162. "Heat in the state of emission constitutes light." p. 174. "It is, therefore, the same subtle matter, that, according to its different modes of existence, constitutes either heat or light. Projected with rapid celerity, it forms light; in the state of combination with bodies it acts as heat." p. 188. See also p. 403, "Different states of the same identical substance."

[* It has just been asserted, a few lines above, that it is a "great truth." It is clear that Buckle here wrote in an increasingly disturbed state of mind.—Ed.]

of witnessing the empirical corroboration of his doctrine by direct experiment, although he clearly perceived that the march of discovery, in reference to polarization, was leading the scientific world to a point of which his keen eye had discerned the nature, when, to others, it was an almost invisible speck, dim in the distant offing.[162]

In regard to the method adopted by Leslie, he assures us that in assuming the principles from which he reasoned he derived great aid from poetry; for he knew that the poets are, after their own manner, consummate observers, and that their united observations form a treasury of truths which are nowise inferior to the truths of science, and of which science must either avail herself, or else suffer from neglecting them.[163] To apply these truths rightly, and to fit them to the exigencies of physical inquiry, is no doubt a most difficult task, since it involves nothing less than holding the balance between the conflicting claims of the emotions and the understanding. Like all great enterprises, it is full of danger, and if undertaken by an ordinary mind would certainly fail. But there are two circumstances which make it less dangerous in our time than in any earlier period. The first circumstance is that the supremacy of the human understanding, and its right to judge all theories for itself, is now more generally admitted than ever; so that there can be little fear of our leaning to the opposite side, and allowing poetry to encroach on science. The other circumstance is that our knowledge of the laws of nature is much greater than that possessed by any previous age; and there is consequently less risk of the imagination leading us into error, inasmuch as we have a large number of well-ascertained truths, which we can confront with every speculation, no matter how plausible or ingenious it may appear.

On both these grounds, Leslie was, I apprehend, justified in taking the course which he did. At all events, it is certain that by following it he came nearer than would otherwise have been possible to the conceptions of the most advanced scientific thinkers of our day. He distinctly recognized that in the material world there is neither break nor pause; so that what we call the divisions of nature have no existence except in our minds.[164] He was even almost prepared to do away with that imaginary difference between the organic and inorganic world which still troubles many of our physicists, and prevents them from comprehending the unity and uninterrupted march of affairs. They, with their old notions of inanimate matter, are unable to see that all matter is

[162] In 1814, that is ten years after his great work was published, and about twenty years after it was begun, he writes from Paris: "My book on heat is better known" here "than in England. I was even reminded of some passages in it which in England were considered as fanciful, but which the recent discoveries on the polarity of light have confirmed." *Napier's Memoirs of Leslie*, p. 28, prefixed to *Leslie's Philosophical Treatises*, edit. Edinb. 1838. Leslie died in 1832 (p. 40); and the decisive experiments of Forbes and Melloni were made between 1834 and 1836.

[163] "The easiest mode of conceiving the subject, is to consider the heat that permeates all bodies, and unites with them in various proportions, as merely the subtle fluid of light in a state of combination. When forcibly discharged, or suddenly elicited from any substance, it again resumes its radiant splendour." . . . "The same notion was embraced by the poets, and gives sublimity to their finest odes." . . . "Those poetical images which have descended to our own times were hence founded on a close observation of nature. Modern philosophy need not disdain to adopt them, and has only to expand and reduce to precision the original conceptions." *Leslie's Treatises on Philosophy*, pp. 308, 309. Again, at p. 416: "This is not the first occasion in which we have to admire, through the veil of poetical imagery, the sagacity and penetration of those early sages. It would be weakness to expect nice conclusions in the infancy of science; but it is arrogant presumption to regard all the efforts of unaided genius with disdain."

[164] "We should recollect that in all her productions Nature exhibits a chain of perpetual gradation, and that the systematic divisions and limitations are entirely artificial, and designed merely to assist the memory and facilitate our conceptions." *Leslie on Heat*, p. 506.

living, and that what we term death is a mere expression by which we signify a fresh form of life. Towards this conclusion all our knowledge is now converging; and it is certainly no small merit in Leslie that he, sixty years ago, when really comprehensive views, embracing the whole creation, were scarcely known among scientific men, should have strongly insisted that all forces are of the same kind, and that we have no right to distinguish between them, as if some were living and others were dead.[165]

We owe much to him by whom such views were advocated. But they were then, and in a certain though far smaller degree they are now, so out of the domain of physical experience that Leslie never could have obtained them by generalizing in the way which the inductive philosophy enjoins. His great work on heat was executed as well as conceived on the opposite plan;[166] and his prejudices on this point were so strong that we are assured by his biographer that he would allow no merit to Bacon, who organised the inductive method into a system, and to whose authority we in England pay a willing, and I had almost said a servile, homage.[167]

Another curious illustration of the skill with which the Scotch mind, when once possessed of a principle, worked from it deductively, appears in the geological speculations of Hutton, late in the eighteenth century. It is well known that the two great powers which have altered the condition of our planet, and made it what it is, are fire and water. Each has played so considerable a part that we can hardly measure their relative importance. Judging, however, from the present appearance of the crust of the earth, there is reason to believe that the older rocks are chiefly the result of fusion, and that the younger are aqueous deposits. It is therefore not unlikely that, in the order in which the energies of nature have unfolded themselves, fire preceded water, and was its necessary precursor.[168] But all that we are as yet justified in asserting is that these

[165] "All forces are radically of the same kind, and the distinction of them into *living* and *dead* is not grounded on just principles." *Leslie on Heat*, p. 133. Compare p. 299: "We shall perhaps find, that this prejudice, like many others, has some semblance of truth; and that even dead or inorganic substances must, in their recondite arrangements, exert such varying energies, and *so like sensation itself*, as if fully unveiled to our eyes, could not fail to strike us with wonder and surprise."

[166] Mr. Napier, in his *Life of Leslie*, p. 17, says of it, very gravely, "Its hypotheses are not warranted by the sober maxims of inductive logic."

[167] "Notwithstanding the contrary testimony, explicitly recorded by the founders of the English experimental school, he denied all merit and influence to the immortal delineator of the inductive logic." *Napier's Life of Leslie*, p. 42.

[168] The supposition that volcanic agencies were formerly more potent than they are now is by no means inconsistent with the scientific doctrine of uniformity, though it is generally considered to be so. It is one thing to assert the uniformity of natural laws; it is quite another thing to assert the uniformity of natural causes. Heat may once have produced far greater effects than it can do at present, and yet the laws of nature be unchanged, and the order and sequence of events unbroken. What I would venture to suggest to geologists is that they have not taken sufficiently into account the theory of the interchange of forces, which seems to offer a solution of at least part of the problem. For by that theory a large portion of the heat which formerly existed may have been metamorphosed into other forces, such as light, chemical affinity, and gravitation. The increase of these forces consequent on the diminution of heat would have facilitated the consolidation of matter; and until such forces possessed a certain energy, water, which afterwards became so prominent, could not have been formed. If the power of chemical affinity, for instance, were much weaker than it is, water would assuredly resolve itself into its component gases. Without wishing to lay too much stress on this speculation, I submit it to the consideration of competent judges, because I am convinced that any hypothesis not absolutely inconsistent with the known laws of nature is preferable to that dogma of interference which what may be called the miraculous school of geologists wish to foist upon us, in utter ignorance of its incompatibility with the conclusions of the most advanced minds in other departments of thought.

The remarks in Sir Roderick Murchison's great work (*Siluria*, London, 1854, pp. 475,

two causes, the igneous and the aqueous, were in full operation long before man existed, and are still busily working. Perhaps they are preparing another change in our habitation, suitable to new forms of life, as superior to man as man is superior to the beings who occupied the earth before his time. Be this as it may, fire and water are the two most important and most general principles with which geologists are concerned; and though on a superficial view each is extremely destructive, it is certain that they can really destroy nothing, but can only decompose and recompose; shifting the arrangements of nature, but leaving nature herself intact. Whether one of these elements will ever again get the upper hand of its opponent is a speculation of extreme interest. For there is reason to suspect that at one period fire was more active than water, and that at another period water was more active than fire. That they are engaged in incessant warfare is a fact with which geologists are perfectly familiar, though in this as in many other cases the poets were the first to discern the truth. To the eye of the geologist, water is constantly labouring to reduce all the inequalities of the earth to a single level; while fire, with its volcanic action, is equally busy in restoring those inequalities, by throwing up matter to the surface, and in various ways disturbing the crust of the globe.[169] And as the beauty of the material world mainly depends on that irregularity of aspect without which scenery would have presented no variety of form, and but little variety of colour, we shall, I think, not be guilty of too refined a subtlety if we say that fire, by saving us from the monotony to which water would have condemned us, has been the remote cause of that development of the imagination which has given us our poetry, our painting, and our sculpture, and has thereby not only wonderfully increased the pleasures of life, but has imparted to the human mind a completeness of function to which, in the absence of such a stimulus, it could not have attained.

When geologists began to study the laws according to which fire and water had altered the structure of the earth, two different courses were open to them, namely the inductive and the deductive. The deductive plan was to compute the probable consequences of fire and water, by reasoning from the sciences of thermotics and hydro-dynamics; tracking each element by an independent line of argument, and afterwards co-ordinating into a single scheme the results which had been separately obtained. It would then only remain to inquire how far this imaginary scheme harmonized with the actual state of things; and if the discrepancy between the ideal and the actual were not greater than might fairly be expected from the perturbations produced by other causes, the ratiocination would be complete, and geology would in its inorganic department become a

476) on the "grander intensity of former causation," and on the difficulty this opposes to the "uniformitarians," apply merely to those who take for granted that *each* force has always been equally powerful: they do not affect those who suppose that it is only the *aggregate* of force which remains unimpaired. Though the distribution of forces may be altered, their gross amount is not susceptible of change, so far as the highest conceptions of our actual science extend. Consequently, there is no need for us to believe that, in different periods, the intensity of causation varies; though we may believe that some one agent, such as heat, had at one time more energy than it has ever had since.

[169] "The great agents of change in the inorganic world may be divided into two principal classes, the aqueous and the igneous. To the aqueous belong rain, rivers, torrents, springs, currents, and tides; to the igneous, volcanos and earthquakes. Both these classes are instruments of decay as well as of reproduction; but they may also be regarded as antagonistic forces. For the aqueous agents are incessantly labouring to reduce the inequalities of the earth's surface to a level; while the igneous are equally active in restoring the unevenness of the external crust, partly by heaping up new matter in certain localities, and partly by depressing one portion, and forcing out another, of the earth's envelope." *Lyell's Principles of Geology*, 9th edit., London 1853, p. 198. [Lyell seems to have forgotten that aqueous agencies create "unevenness"—*e.g.* in the action of rivers and streams. His statement, "the igneous are equally active," would not now be endorsed by geologists.—Ed.]

deductive science. That our knowledge is ripe for such a process, I am far indeed from supposing ; but this is the path which a deductive mind would take, so far as it was able. On the other hand, an inductive mind, instead of beginning with fire and water, would begin with the effects which fire and water had produced, and would first study these two agents, not in their own separate sciences, but in their united action as exhibited on the crust of the earth. An inquirer of this sort would assume that the best way of arriving at truth would be to proceed from effects to causes, observing what had actually happened, and rising from the complex results up to a knowledge of the simple agents, by whose power the results had been brought about.

If the reader has followed the train of thought which I have endeavoured to establish in this chapter, and in part of the preceding volume, he will be prepared to expect that when, in the latter half of the eighteenth century, geology was first seriously studied, the inductive plan of proceeding from effects to causes became the favourite one in England ; while the deductive plan of proceeding from causes to effects was adopted in Scotland and in Germany. And such was really the case. It is generally admitted that in England scientific geology owes its origin to William Smith, whose mind was singularly averse to system, and who, believing that the best way of understanding former causes was to study present effects, occupied himself between the years 1790 and 1815 in a laborious examination of different strata.[170] In 1815 he, after traversing the whole of England on foot, published the first complete geological map which ever appeared, and thus took the first great step towards accumulating the materials for an inductive generalization.[171] In 1807, and therefore before he had brought his arduous task to an end, there was formed in London the Geological Society, the express object of which, we are assured, was to observe the condition of the earth, but by no means to generalize the causes which had produced that condition.[172] The resolution was perhaps a wise one. At all events, it was highly characteristic of the sober and patient spirit of the English intellect. With what energy and unsparing toil it has been executed, and how the most eminent members of the Geological Society have, in the pursuit of truth, not only explored every part of Europe, but examined the shell of the earth in America and in Northern Asia, is well known to all who are interested in these.

[170] Dr. Whewell, comparing him with his great German contemporary, Werner, says " In the German, considering him as a geologist, the ideal element predominated." . . . " Of a very different temper and character was William Smith. No literary cultivation of his youth awoke in him the *speculative love of symmetry and system* ; but a singular clearness and precision of the classifying power, which he possessed as a native talent, was exercised and developed by exactly those geological facts among which his philosophical task lay." . . . "We see great vividness of thought and activity of mind, *unfolding itself exactly in proportion to the facts with which it had to deal.*" . . . " He dates his attempts to discriminate and connect strata from the year 1790." *Whewell's History of the Inductive Sciences*, London, 1847, vol. iii. pp. 562–564.

[171] " The execution of his map was completed in 1815, and remains a lasting monument of original talent and extraordinary perseverance ; for he had explored the whole country on foot without the guidance of previous observers, or the aid of fellow-labourers, and had succeded in throwing into natural divisions the whole complicated series of British rocks." *Lyell's Principles of Geology*, p. 58. Geological maps of parts of England had, however, been published before 1815. See *Conybeare on Geology*, in *Second Report of the British Association*, p. 373.

[172] " A great body of new data were required ; and the Geological Society of London, founded in 1807, conduced greatly to the attainment of this desirable end. To multiply and record observations, and patiently to await the result at some future period, was the object proposed by them ; and it was their favourite maxim that the time was not yet come for a general system of geology, but that all must be content for many years to be exclusively engaged in furnishing materials for future generalizations." *Lyell's Principles of Geology*, p. 59. Compare *Richardson's Geology*, 1851, p. 40.

matters; nor can it be denied that the great works of Lyell and Murchison * prove that the men who are capable of such laborious enterprises are also capable of the still more difficult achievement of generalizing their facts and refining them into ideas. They did not go as mere observers, but they went with the noble object of making their observations subservient to a discovery of the laws of nature. That was their aim; and all honour be to them for it. Still, it is evident that their process is essentially inductive; it is a procedure from the observation of complex phenomena up to the elements to which those phenomena are owing; it is, in other words, a study of natural effects, in order to learn the operation of natural causes.

Very different was the process in Germany and Scotland. In 1787, that is, only three years before William Smith began his labours, Werner, by his work on the classification of mountains, laid the foundation of the German school of geology.[173] His influence was immense; and among his pupils we find the names of Mohs, Raumer, and Von Buch, and even that of Alexander Humboldt.[174] But the geological theory which he propounded depended entirely on a chain of argument from cause to effect. He assumed that all the great changes through which the earth had passed were due to the action of water. Taking this for granted, he reasoned deductively from premisses with which his knowledge of water supplied him. Without entering into details respecting his system, it is enough to say, that, according to it, there was originally one vast and primeval sea, which, in the course of time, deposited the primitive rocks. The base of all was granite; then gneiss; and others followed in their order. In the bosom of the water, which at first was tranquil, agitations gradually arose, which, destroying part of the earliest deposits, gave birth to new rocks, formed out of their ruins. The stratified thus succeeded to the unstratified, and something like variety was established. Then came another period, in which the face of the waters, instead of being merely agitated, was convulsed by tempests, and amid their play and collision life was generated, and plants and animals sprung into existence. The vast solitude was slowly peopled, the sea gradually retired; and a foundation was laid for that epoch during which man entered the scene, bringing with him the rudiments of order and of social improvement.[175]

These were the leading views of a system which, we must remember, exercised great sway in the scientific world, and won over to its side minds of considerable power. Erroneous and far-fetched though it was, it had the merit of calling attention to one of the two chief principles which have determined the present

[173] Cuvier, in his Life of Werner, says (*Biographie Universelle*, vol. L. pp. 376, 377), "La connaissance des positions respectives des minéraux dans la croûte du globe, et ce que l'on peut en conclure relativement aux époques de leur origine, forment une autre branche de la science qu'il appelle Géognosie. Il en présenta les premières bases en 1787, dans un petit écrit intitulé 'Classification et description des montagnes.'"

[174] *Whewell's History of the Inductive Sciences*, vol. iii. p. 567.

[175] "Une mer universelle et tranquille dépose en grandes masses les roches primitives, roches nettement cristallisées, où domine d'abord la silice. Le granit fait la base de tout; au granit succède le gneiss, qui n'est qu'un granit commençant à se feuilleter." . . . "Des agitations intestines du liquide détruisent une partie de ces premiers dépots; de nouvelles roches se forment de leurs débris réunis par des cimens. C'est parmi ces tempêtes que naît la vie." . . . "Les eaux, de nouveau tranquillisées, mais dont le contenu a changé, déposent des couches moins épaisses et plus variées, où les débris des corps vivans s'accumulent successivement dans un ordre non moins fixe que celui des roches qui les contiennent. Enfin, la dernière retraite des eaux répand sur le continent d'immenses alluvions de matières meubles, premiers siéges de la végétation, de la culture et de la sociabilité." *Eloge de Werner*, in *Cuvier, Recueil des Eloges Historiques*, vol. ii. pp. 321–323.

[* Murchison was not an Englishman but a Scotch Highlander. His work should therefore stand, on the racial principle, for "the sober and patient spirit of the *Gaelic* intellect."—Ed.]

condition of our planet. It had the further merit of provoking a controversy which was eminently serviceable to the interests of truth. For the great enemy of knowledge is not error, but inertness. All that we want is discussion, and then we are sure to do well, no matter what our blunders may be. One error conflicts with another ; each destroys its opponent,* and truth is evolved. This is the course of the human mind, and it is from this point of view that the authors of new ideas, the proposers of new contrivances, and the originators of new heresies, are benefactors of their species. Whether they are right or wrong is the least part of the question. They tend to excite the mind ; they open up the faculties ; they stimulate us to fresh inquiry ; they place old subjects under new aspects ; they disturb the public sloth ; and they interrupt, rudely, but with most salutary effect, that love of routine which, by inducing men to go grovelling on in the ways of their ancestors, stands in the path of every improvement as a constant, an outlying, and, too often, a fatal obstacle.

The method adopted by Werner was evidently deductive, since he argued from a supposed cause, and reasoned from it to the effects. In that cause he found his major premiss, and thence he worked downwards to his conclusion, until he reached the world of sense and of reality. He trusted in his one great idea, and he handled that idea with consummate skill. On that very account did he pay less attention to existing facts. Had he chosen, he, like other men, could have collected them, and subjected them to an inductive generalization. But he preferred the opposite path. To reproach him with this is irrational ; for, in his journey after truth, he chose one of the only two roads which are open to the human mind. In England, indeed, we are apt to take for granted that one road is infinitely preferable to the other. It may be so ; but on this, as on many other subjects, assertions are current which have never been proved. At all events, Werner was so satisfied with his method that he would not be at the pains of examining the position of rocks and their strata as they are variously exhibited in different countries ; he did not even explore his own country, but, confining himself to a corner of Germany, he began and completed his celebrated system without investigating the facts on which, according to the inductive method, that system should have been built.[176]

Exactly the same process, on the same subject, and at the same time, was going on in Scotland. Hutton, who was the founder of Scotch geology, and who in 1788 published his *Theory of the Earth*, conducted the inquiry just as Werner did ; though when he began his speculations he had no knowledge of what Werner was doing. [177] The only difference between them was, that while Werner reasoned from the agency of water, Hutton reasoned from the agency of fire. The cause of this may, I think, be explained. Hutton lived in a country

[176] "If it be true that delivery be the first, second, and third requisite in a popular orator, it is no less certain that to travel is of first, second, and third importance to those who desire to originate just and comprehensive views concerning the structure of our globe. Now, Werner had not travelled to distant countries : he had merely explored a small portion of Germany, and conceived, and persuaded others to believe, that the whole surface of our planet, and all the mountain chains in the world, were made after the model of his own province." . . . "It now appears that he had misinterpreted many of the most important appearances even in the immediate neighbourhood of Freyberg. Thus, for example, within a day's journey of his school, the porphyry, called by him primitive, has been found not only to send forth veins, or dykes, through strata of the coal formation, but to overlie them in mass." *Lyell's Principles of Geology*, p. 47.

[177] Though Hutton's *Theory of the Earth* was first published in 1788, the edition of 1795, which is the one I have used, contains a great number of additional illustrations of his views, and was evidently re-written. But the main features are the same ; and we learn from his friend Playfair that "the great outline of his system" was completed "several years" before 1788. *Life of Hutton*, in *Playfair's Works*, vol. iv. p. 50, Edinburgh, 1822.

[* Read rather: "each elicits criticism which destroys it."—Ed.]

where some of the most important laws of heat had for the first time been generalized, and where, consequently, that department of inorganic physics had acquired great reputation. It was natural for a Scotchman to take more than ordinary interest in a subject in which Scotland had been so successful, and had obtained so much fame. We need not therefore wonder that Hutton, who, like all men, felt the intellectual bent of the time in which he lived, should have yielded to an influence of which he was perhaps unconscious. In obedience to the general mental habits of his country, he adopted the deductive method. In further obedience to the more special circumstances connected with his own immediate pursuits, he gathered the principles from which he reasoned from a study of fire, instead of gathering them, as Werner did, from a study of water.

Hence it is that, in the history of geology, the followers of Werner are known as Neptunists, and those of Hutton as Plutonists.[178] And these terms represent the only difference between the two great masters. In the most important points, namely, their method, they were entirely agreed. Both were essentially one-sided ; both paid a too exclusive attention to one of the two principal agents which have altered, and are still altering, the crust of the earth ; both reasoned from those agents, instead of reasoning to them ; and both constructed their system without sufficiently studying the actual and existing facts ; committing, in this respect, an error which the English geologists were the first to rectify.

As I am writing a history not of science but of scientific method, I can only briefly glance at the nature of those services which Hutton rendered to geology, and which are so considerable that his system has been called its present basis.[179] This, however, is too strongly expressed ; for though Hutton was far from denying the influence of water,[180] he did not concede enough to it, and there is a tendency among several geologists to admit that the system of Werner, considered as an aqueous theory, contains a larger amount of truth than the advocates of the igneous theory are willing to allow. Still, what Hutton did was most remarkable, especially in reference to what are now termed metamorphic rocks, the theory of whose formation he was the first to conceive.[181] Into this, and into their connexion on the one hand with the sedimentary rocks, and on the other hand with those rocks whose origin is perhaps purely igneous, I could not enter without treading on debatable ground. But, putting aside what is yet uncertain, I will mention two circumstances respecting Hutton which are undisputed, and which will give some idea of his method, and of the turn of his mind. The first circumstance is that, although he ascribed to subterranean heat, as exhibited in volcanic action, a greater and more constant energy than any previous inquirers had ventured to do,[182] he preferred speculating on the probable consequences of that action, rather than drawing inferences from the facts which the action presented ; he being on this point so indifferent that he arrived at his conclusions without inspecting even a single region of

[178] Kirwan appears to have been the first who called Hutton's theory "the Plutonic System." See *Illustrations of the Huttonian Theory* in *Playfair's Works*, vol. i. p. 145. On the distinction between Neptunists and Plutonists, see the same work, pp. 504, 505.

[179] "Has not only supplanted that of Werner, but has formed the foundation of the researches and writings of our most enlightened observers, and is justly regarded as the basis of all sound geology at the present day." *Richardson's Geology*, London, 1851, p. 38.

[180] *Hutton's Theory of the Earth*, Edinb. 1795, vol. i. pp. 34, 41, 192, 290, 291, 593, vol. ii. pp. 236, 369, 378, 555.

[181] "In his writings, and in those of his illustrator, Playfair, we find the germ of the metamorphic theory." *Lyell's Manual of Geology*, London, 1851, p. 92.

[182] The shortest summary of this view is in his *Theory of the Earth*, Edin. 1795, vol. ii. p. 556. "The doctrine, therefore, of our theory is briefly this: That whatever may have been the operation of dissolving water, and the chemical action of it upon the materials accumulated at the bottom of the sea, the general solidity of that mass of earth, and the placing of it in the atmosphere above the surface of the sea, has been the immediate operation of fire or heat melting and expanding bodies."

active volcanos, where he might have watched the workings of nature, and seen what she was really about.[183] The other circumstance is equally characteristic. Hutton, in his speculations concerning the geological effects of heat, naturally availed himself of the laws which Black had unfolded. One of those laws was that certain earths owe their fusibility to the presence of fixed air in them before heat has expelled it ; so that, if it were possible to force them to retain their fixed air, or carbonic acid gas, as we now call it, no amount of heat could deprive them of the capability of being fused. The fertile mind of Hutton saw, in this discovery, a principle from which he could construct a geological argument. It occurred to him that great pressure would prevent the escape of fixed air from heated rocks, and would thus enable them to be fused, notwithstanding their elevated temperature. He then supposed that, at a period anterior to the existence of man, such a process had taken place under the surface of the sea, and that the weight of so great a column of water had prevented the rocks from being decomposed while they were subjected to the action of fire. In this way their volatile parts were held together, and they themselves might be melted, which could not have happened except for this enormous pressure. By following this line of argument, he accounted for the consolidation of strata by heat ; since, according to the premisses from which he started, the oily or bituminous parts would remain, in spite of the efforts of heat to disperse them.[184] This striking speculation led to the inference that the volatile components of a substance and its fixed components may be made to cohere, in the very teeth of that apparently irresistible agent whose business it is to effect their separation. Such an inference was contrary to all experience ; or, to say the least, no man had ever seen an instance of it.[185] Indeed the event was only supposed to happen in consequence of circumstances which were never met with on the surface of the globe, and which, therefore, were out of the range of all human observation.[186] The utmost that could be expected was that, by means of our instruments, we might perhaps on a small scale imitate the process which Hutton had imagined. It was possible

[183] "Although Hutton had never explored any region of active volcanos, he had convinced himself that basalt and many other trap rocks were of igneous origin." *Lyell's Principles of Geology*, London, 1853, p. 51. To this I may add, that he wrote his work without having examined granite. He says (*Theory of the Earth*, vol. i. p. 214), "It is true, I met with it on my return by the east coast, when I just saw it, and no more, at Peterhead and Aberdeen ; but that was all the granite I had ever seen when I wrote my *Theory of the Earth*. I have, since that time, seen it in different places ; because I went on purpose to examine it, as I shall have occasion to describe in the course of this work." Hutton's theory of granite is noticed in *Bakewell's Geology*, Lond. 1838, p. 101 ; but Mr. Bakewell does not seem to be aware that the theory was formed before the observations were made.

[184] *Huttonian Theory*, in *Playfair*, vol. i. pp. 38–40, 509, 510. Compare *Playfair's Life of Hutton*, p. 61.

[185] Hence the objections of Kirwan were invalid ; because his argument against Hutton was "grounded on experiments, where that very separation of the volatile and fixed parts takes place, which it excluded in that hypothesis of subterraneous heat." *Huttonian Theory*, in *Playfair*, vol. i. p. 193, Edinb. 1822.

[186] Hutton says (*Theory of the Earth*, Edinb. 1795, vol. i. p. 94), "The place of mineral operations is not on the surface of the earth ; and we are not to limit nature with our imbecility, or estimate the powers of nature by the measure of our own." See also p. 159, "mineral operations proper to the lower regions of the earth." And p. 527, "The mineral operations of nature lie in a part of the globe which is necessarily inaccessible to man, and where the powers of nature act under very different conditions from those which we find take place in the only situation where we can live." Again, in vol. ii. p. 97, "The present Theory of the Earth holds for principle that the strata are consolidated in the mineral regions far beyond the reach of human observation." Similarly, vol. ii. p. 484, "we judge not of the progress of things from the actual operations of the surface."

that a direct experiment might artificially combine great pressure with great heat, and that the result might be that the senses would realize what the intellect had conceived.[187] But the experiment had never been tried, and Hutton, who delighted in reasoning from ideas rather than from facts, was not likely to undertake it.[188] He cast his speculation on the world, and left it to its fate.[189] Fortunately, however, for the reception of his system, a very ingenious and skilful experimenter of that day, Sir James Hall, determined to test the speculation by an appeal to facts; and as nature did not supply the facts which he wanted, he created them for himself. He applied heat to powdered chalk, while, at the same time, with great delicacy of manipulation, he subjected the chalk to a pressure about equal to the weight of a column of water half a mile high. The result was that under that pressure the volatile parts of the chalk were held together; the carbonic acid gas was unable to escape; the generation of quicklime was stopped; the ordinary operations of nature were baffled,* and the whole composition, being preserved in its integrity, was fused, and on subsequently cooling actually crystallized into solid marble.[190] Never was triumph more complete. Never did a fact more fully confirm an idea.[191] But in the mind of Hutton the idea preceded the fact by a long interval; since, before the fact was known, the theory had been raised, and the system which was built upon it had indeed been published several years. It therefore appears that one of the chief parts of the Huttonian Theory, and certainly its most successful part, was conceived in opposition to all preceding experience; that

[187] Hutton, however, did not believe that this could be done. "In the Theory of the Earth which was published, I was anxious to warn the reader against the notion that subterraneous heat and fusion could be compared with that which we induce by our chemical operations on mineral substances here upon the surface of the earth." *Hutton's Theory of the Earth*, vol. i. p. 251.

[188] See, in the *Life of Hutton*, in *Playfair's Works*, vol. iv. p. 62, *note*, a curious remark on his indifference to experimental verification. Innumerable passages in his work indicate this tendency, and show his desire to reason immediately from general principles. Thus, in vol. i. p. 17. "Let us strictly examine our principles in order to avoid fallacy in our reasoning." . . . "We are now, in reasoning from principles, come to a point decisive of the question." vol. i. p. 177. "Let us now reason from our principles." vol. ii. p. 308. Hence his constantly expressed contempt for experience; as in vol. ii. p. 367, where he says that we must "overcome those prejudices which contracted views of nature, and *magnified opinions of the experience of man* may have begotten."

[189] Playfair (*Life of Hutton*, p. 64) says that it drew "their attention" (*i.e.* the attention of "men of science") "very slowly, so that several years elapsed before any one showed himself publicly concerned about it, either as an enemy or a friend." He adds, as one of the reasons of this, that it contained "too little detail of facts for a system which involved so much that was new, and opposite to the opinions generally received."

[190] The account of these experiments was read before the Royal Society of Edinburgh in 1805, and is printed in their *Transactions*, vol. vi. pp. 71–185, Edinb. 1812, 4to. The general result was (pp. 148, 149), "That a pressure of 52 atmospheres, or 1700 feet of sea, is capable of forming a limestone in a proper heat; That under 86 atmospheres, answering nearly to 3000 feet, or about half a mile, a complete marble may be formed: and lastly, That, with a pressure of 173 atmospheres, or 5700 feet, that is little more than one mile of sea, the carbonate of lime is made to undergo complete fusion, and to act powerfully on other earths." See also p. 160: "The carbonic acid of limestone cannot be constrained in heat by a pressure less than that of 1708 feet of sea." There is a short and not very accurate notice of these instructive experiments in *Bakewell's Geology*, London, 1838, pp. 249, 250.

[191] As Sir James Hall says, "The truth of the most doubtful principle which Dr. Hutton has assumed has thus been established by direct experiment." *Transactions of the Royal Society of Edinburgh*, vol. vi. p. 175.

[* In the terms of the case, this operation of nature is as "ordinary" as any other; and the term "baffled" is irrelevant to the subject.—Ed.]

it presupposed a combination of events which no one had ever observed, and the mere possibility of which nothing but artificial experiment could prove; and, finally, that Hutton was so confident of the validity of his own method of inquiry that he disdained to make the experiment himself, but left to another mind that empirical branch of the investigation which he deemed of little moment, but which we in England are taught to believe is the only safe foundation of physical research.[192]

I have now given an account of all the most important discoveries made by Scotland in the eighteenth century respecting the laws of the inorganic world. I have said nothing of Watt, because, although the steam-engine, which we owe to him, is of incalculable importance, it is not a discovery but an invention. An invention it may justly be termed, rather than an improvement.[193] Notwithstanding what had been effected in the seventeenth century by De Caus, Worcester, Papin, and Savery, and notwithstanding the later additions of Newcomen and others, the real originality of Watt is unimpeachable. His engine was essentially a new invention; but under its scientific aspect it was merely a skilful adaptation of laws previously known; and one of its most important points, namely, the economy of heat, was a practical application of ideas promulgated by Black.[194] The only discovery made by Watt was that of the composition of water. Though his claims are disputed by the friends of Cavendish, it would appear that he was the first who ascertained that water, instead of being an element, is a compound of two gases.[195] This discovery was a considerable step in the history of chemical analysis, but it neither involved nor

[192] See the remarks of Sir James Hall, in *Transactions*, vol. vi. pp. 74, 75. He observes that Hutton's "system, however, involves so many suppositions, apparently in contradiction to common experience, which meet us on the very threshold, that most men have hitherto been deterred from an investigation of its principles, and only a few individuals have justly appreciated its merits." . . . "I conceived that the chemical effects ascribed by him to compression ought in the first place to be investigated." . . . "It occurred to me that this principle was susceptible of being established in a direct manner by experiment, and *I urged him to make the attempt; but he always rejected this proposal*, on account of the immensity of the natural agents, whose operation he supposed to lie far beyond the reach of our imitation; and he seemed to imagine that any such attempt must undoubtedly fail, and thus *throw discredit on opinions, already sufficiently established, as he conceived, on other principles*."

[193] It may be traced back, certainly to the beginning of the seventeenth century, and probably still higher. Yet the popular opinion seems to be correct, that Watt was its real inventor; though of course he could not have done what he did without his predecessors. This, however, may be said of all the most eminent and successful men, as well as of the most ordinary men.

[194] On the obligations of Watt to Black, compare *Brougham's Life of Watt* (*Brougham's Works*, vol. i. pp. 25, 36–38, edit. Glasgow, 1855), with *Muirhead's Life of Watt*, second edit. London, 1859, pp. 66, 83. At p. 301 Mr. Muirhead says of Watt, that "his principal inventions connected with the steam-engine, with all their prodigious results, were founded, as we have seen, on the attentive observation of great philosophical truths; and the economy of fuel, increase of productive power, and saving of animal labour, which gradually ensued, all originated in the sagacious and careful thought with which he investigated the nature and properties of heat." But whatever investigations Watt made into heat, he discovered no new law respecting it, or, at all events, no new law which is large enough to be noted in the history of thermotics, considered purely as a science, and apart from practical application. Mr. Muirhead, in his interesting work which I have just quoted, has published (pp. 484–486) some remarks made on the subject by Watt, several years after the death of Black, which, though perfectly fair and candid, show that Watt had a rather confused notion of the real difference between an invention and a discovery.

[195] Mr. Muirhead, in his *Life of Watt*, pp. 301–370, seems to have put the priority of Watt beyond further doubt; though he is somewhat hard upon Cavendish, who, there can be little question, made the discovery for himself.

suggested any new law of nature, and has therefore no claim to mark an epoch in the history of the human mind.[196] There is, however, one circumstance connected with it which is too characteristic to be passed over in silence. The discovery was made in 1783 by Watt, the Scotchman, and by Cavendish, the Englishman, neither of whom seems to have been aware of what the other was doing.[197] But between the two there was this difference. Watt, for several years previously, had been speculating on the subject of water in connexion with air, and having by Black's law of latent heat associated them together, he was prepared to believe that one is convertible into the other.[198] The idea of an intimate analogy between the two bodies having once entered his mind, gradually ripened; and when he at last completed the discovery, it was merely

[196] I would not wish to diminish one jot of the veneration in which the great name of Watt is justly held. But when I find the opinion of Dr. Withering, the botanist, quoted to the effect that his "abilities and acquirements placed him next, if not superior, to Newton" (*Muirhead's Life of Watt*, p. 302), I cannot but protest against such indiscriminate eulogy, which would rank Watt in the same class as one of those godlike intellects of which the whole world has not produced a score, and which are entitled to be termed inspired, if ever human being was so. Another instance of this injudicious panegyric will be found in the same otherwise excellent work (*Muirhead*, pp. 324, 325), where we read that Watt's discovery that water consists of oxygen and hydrogen, was "the commencement of a new era, the dawn of a new day in physical inquiry, the real foundation of the new system of chemistry; nay, even a discovery 'perhaps of greater importance than any single fact which human ingenuity has ascertained either before or since.'" [The terms "godlike" and "inspired" do not assist judgment on such an issue. It is obvious that Newton dealt with much vaster issues than those taken up by Watt; but it is necessary to remember that Newton held certain erroneous theories in physics, and had no real competence in the historical questions he discussed.—Ed.]

[197] That there was no plagiarism on the part of Watt we know from positive evidence; that there was none on the part of Cavendish may be fairly presumed, both from the character of the man and also from the fact that in the then state of chemical knowledge the distovery was imminent, and could not have been long delayed. It was antecedently probable that the composition of water would be ascertained by different persons at the same time, as we have seen in many other discoveries which have been simultaneously made, when the human mind, in that particular department of inquiry, had reached a certain point. We are too apt to suspect philosophers of stealing from each other what their own abilities are sufficient to work out for themselves. It is however certain that Watt thought himself ill-treated by Cavendish. See *Watt's Correspondence on the Composition of Water*, London, 1846, pp. 48, 61.

[198] On 26th November, 1783, he writes: "For many years I have entertained an opinion that air was a modification of water; which was originally founded on the facts, that in most cases where air was actually made, which should be distinguished from those wherein it is only extricated from substances containing it in their pores, or otherwise united to them in the state of air, the substances were such as were known to contain water as one of their constituent parts, yet no water was obtained in the processes, except what was known to be only loosely connected with them, such as the water of the crystallization of salts. *This opinion arose from a discovery that the latent heat contained in steam diminished, in proportion as the sensible heat of the water from which it was produced increased*; or, in other words, that the latent heat of steam was less when it was produced under a greater pressure, or in a more dense state, and greater when it was produced under a less pressure, or in a less dense state; which led me to conclude, that when a very great degree of heat was necessary for the production of the steam, the latent heat would be wholly changed into sensible heat; and that, in such cases, the steam itself might suffer some remarkable change. I now abandon this opinion, in so far as relates to the change of water into air, as I think that may be accounted for on better principles." See this remarkable passage, which is quite decisive as to the real history of Watt's discovery, in *Correspondence of James Watt on the Composition of Water*, London, 1846, pp. 84, 85. Compare p. cxxiv. and p. 248 *note*.

by reasoning from data which others possessed besides himself. Instead of bringing to light new facts, he drew new conclusions from former ideas.[199] Cavendish, on the other hand, obtained his result by the method natural to an Englishman.* He did not venture to draw a fresh inference until he had first ascertained some fresh facts. Indeed, his discovery was so completely an induction from his own experiments, that he omitted to take into consideration the theory of latent heat, from which Watt had reasoned, and where that eminent Scotchman had found the premisses of his argument.[200] Both of these great inquirers arrived at truth, but they accomplished their journeys by different paths. And this antithesis is accurately expressed by one of the most celebrated of living chemists, who, in his remarks on the composition of water, truly says that while Cavendish established the facts, Watt established the idea.[201]

Thus much as to what was effected by the Scotch in the department of inorganic science. If we now turn to organic science, we shall find that there also their labours were very remarkable. To those who are capable of a certain elevation and compass of thought, it will appear in the highest degree probable that between the organic and inorganic world there is no real difference. That they are separated, as is commonly asserted, by a sharp line of demarcation, which indicates where one abruptly ends, and the other abruptly begins, seems to be a supposition altogether untenable. Nature does not pause and break off in this fitful and irregular manner. In her works there is neither gap nor chasm. To a really scientific mind, the material world presents one vast and uninterrupted series, gradually rising from the lowest to the highest forms, but never stopping. In one part of that series we find a particular structure which, so far as our observations have yet extended, we, in another part, cannot find. We also observe particular functions, which correspond to the structure, and, as we believe, result from it. This is all we know. Yet, from these scanty facts, we who at present are still in the infancy of knowledge, and have but

[199] In the paper which he communicated to the Royal Society, announcing his discovery, he, well knowing the empirical character of the English mind, apologizes for this; and says, "I feel much reluctance to lay my thoughts on these subjects before the public in their present indigested state, and *without having been able to bring them to the test of such experiments as would confirm or refute them.*" *Watt's Correspondence on the Discovery of the Composition of Water*, pp. 77, 78. Eleven months earlier, that is in December, 1782, he writes (*Ibid.* p. 4): "Dr. Priestley has made a most surprising discovery, which *seems to confirm my theory* of water's undergoing some very remarkable change at the point where all its latent heat would be changed into sensible heat."

[200] "He" (*i.e.* Cavendish) "here omits entirely the consideration of latent heat; an omission which he even attempts to justify in one of the passages interpolated by Blagden. But it is well known to every one acquainted with the first principles of chemical science, even as it was taught in the days of Black, and it was indisputably familiar to Mr. Watt, that no aeriform fluid can be converted into a liquid, nor any liquid into a solid, without the evolution of heat, previously latent. This essential part of the process, Mr. Cavendish's theory does not embrace; but without it no theory on the subject can be complete; and it will presently be seen that Mr. Watt took it fully into account." *Muirhead's Life of Watt*, p. 315.

[201] "Cavendish and Watt both discovered the composition of water. Cavendish established the facts; Watt the idea." . . . "*The attaching too high a value to the mere facts is often a sign of a want of ideas.*" *Liebig's Letters on Chemistry*, London, 1851, p. 48. The last sentence of this illustrious philosopher, which I have put in italics, should be well pondered in England. If I had my way, it should be engraved in letters of gold over the portals of the Royal Society and of the Royal Institution.

[* As Watt followed the method of Newton, Priestley, Dalton, and Davy; and as Buckle has above admitted that a deductive tendency was clearly exhibited in English science at the beginning of the nineteenth century, the expression in the text is inappropriate.—Ed.]

skimmed the surface of things, are expected to infer that there must be a point in the chain of existence where both structure and function suddenly cease, and after which we may vainly search for signs of life. It would be difficult to conceive a conclusion more repugnant to the whole march and analogy of modern thought. In every department the speculations of the greatest thinkers are constantly tending to co-ordinate all phenomena, and to regard them as different indeed in degree, but by no means as different in kind. Formerly men were content to ground their conviction of this difference in kind on the evidence of the eye, which, on a cursory inspection, saw an organization in some bodies, and not in others. From the organization they inferred the life, and supposed that plants, for instance, had life, but that minerals had none. This sort of argument was long deemed satisfactory; but in the course of time it broke down; more evidence was required, and since the middle of the seventeenth century it has been universally admitted that the eye, by itself, is an untrustworthy witness, and that we must employ the microscope, instead of relying on the unaided testimony of our own puny and precarious senses. But the microscope is steadily improving, and we cannot tell what limits there are to its capacity for improvement. Consequently, we cannot tell what fresh secrets it may disclose. Neither can we say that it may not be altogether superseded by some new artificial resource, which shall furnish us with evidence as superior to any yet supplied, as our present evidence is superior to that of the naked eye. Even already, and notwithstanding the shortness of the time during which the microscope has been a really effective instrument, it has revealed to us organizations the existence of which no one had previously suspected. It has proved that what for thousands of years had been deemed mere specks of inert matter, are in truth animals possessing most of the functions which we possess, reproducing their species in regular and orderly succession, and endowed with a nervous system, which shows that they must be susceptible of pain and enjoyment. It has detected life hidden in the glaciers of Switzerland; it has found it embedded in the polar ice; and if it can flourish there it is hard to say from what quarter it can be shut out. So unwilling, however, are most men to relinquish old notions, that the resources of chemistry have been called in to ascertain the supposed difference between organic and inorganic matter; it being asserted that in the organic world there is a greater complexity of molecular combination than in the inorganic.[202] Chemists further assert that in organic nature there is a predominance of carbon, and in inorganic a predominance of silicon.[203] But chemical analysis, like microscopic observation, is making such rapid strides that each generation, I had almost said each year, is unsettling some of the conclusions previously established; so that now, and for a long time hence, we must regard those conclusions as empirical, and indeed as merely tentative. Surely a permanent and universal inference cannot be drawn from shifting and precarious facts, which are admitted to-day and may be overthrown to-morrow. It would therefore appear that in favour of the opinion that some bodies are living and that others are dead, we have nothing except the circumstance that our researches, so far as they have yet gone, have shown that cellular structure, growth, and reproduction are not the invariable properties of matter, but are excluded from a large part of the visible world, which on that account we call inanimate. This is the whole of the argument

[202] "Organic substances, whether directly derived from the vegetable or animal kingdom, or produced by the subsequent modification of bodies which thus originate, are remarkable as a class for a degree of complexity of constitution far exceeding that observed in any of the compounds yet described." *Fownes' Chemistry*, 3rd edit., London, 1850, p. 353. I quote this, as the first authority at hand, for a doctrine which is universally admitted by chemists, and which is indubitably true, *so far as our experiments have at present extended.*

[203] "As the organic world is characterized by the predominance, in quantity, of carbon, so the mineral or inorganic world is marked by a similar predominance of silicon." *Turner's Chemistry*, edited by Liebig and Gregory, vol. ii. p. 678, London, 1847.

on that side of the question. On the other side, we have the fact that our sight, and the artificial instruments by whose aid we have arrived at this conclusion, are confessedly imperfect ; and we have the further fact that, imperfect as they are, they have proved that the organic kingdom is infinitely more extensive than the boldest dreamer had ever imagined, while they have not been able to enlarge the boundaries of the inorganic kingdom to anything like the same amount. This shows that, so far as our opinions are concerned, the balance is steadily inclining in one given direction ; in other words, as our knowledge advances, a belief in the organic is encroaching upon a belief in the inorganic.[204] When we moreover add that all science is manifestly converging towards one simple and general theory, which shall cover the whole range of material phenomena, and that, at each successive step, some irregularities are explained away, and some inequalities are reduced, it can hardly be doubted that such a movement tends to weaken those old distinctions, the reality of which has been too hastily assumed ; and that in their place we must sooner or later substitute the more comprehensive view that life is a property of all matter, and that the classification of bodies into animate and inanimate, or into organic and inorganic, is merely a provisional arrangement, convenient, perhaps, for our present purposes, but which, like all similar divisions, will eventually be merged in a higher and wider scheme.

Until however that step is taken, we must be content to reason according to the evidence supplied by our imperfect instruments, or by our still more imperfect senses. We therefore recognize the difference between organic and inorganic nature, not as a scientific truth, but as a scientific artifice, by which we separate in idea what is inseparable in fact ; hoping in this way to pursue our course with the greater ease, and ultimately to obtain results which will make the artifice needless. Assuming then this division, we may refer all investigations of organic bodies to one of two objects. The first object is to ascertain the law of those bodies in their usual healthy, or as we somewhat erroneously phrase it, normal course. The other object is to ascertain their law in their unusual, unhealthy, or abnormal course. When we attempt to do the first of these things we are physiologists. When we attempt to do the second we are pathologists.[205]

Physiology and pathology are thus the two fundamental divisions of all organic science.[206] Each is intimately connected with the other ; and eventually, no

[204] I mean, of course, to apply this remark only to the globe we inhabit, and not to extra-terrestrial phenomena. Respecting the organization or non-organization of what exists out of this earth, we have no evidence, and can hardly expect to have any for centuries. Inferences have indeed been drawn from telescopic observations ; and attempts are now being made, abroad, to determine by a still more refined process the physical composition of some of the heavenly bodies. But without venturing, in this note, to enter into such discussions, or even to state their purport, I may say that the difficulty of *verification* will long prove an insuperable barrier to our knowledge of the truth or falsehood of any results which may be obtained.

[205] Mr. Simon, in his thoughtful and suggestive Lectures, says, " We may describe pathology to consist in the Science of Life under other conditions than those of ideal perfection." *Simon's Lectures on Pathology*, London, 1850, p. 14. This is by far the best description I have met with ; though, as it involves a negative, it cannot be accepted as a definition. Indeed, the context shows that Mr. Simon does not suppose it to be one.

[206] In my former volume I adopted the commonly received division of organic statics and organic dynamics ; the statics being anatomy, and the dynamics being physiology. But I now think that our knowledge is not sufficiently advanced to make this so convenient as the division into physiological and pathological, or into normal and abnormal, provided we remember that in reality nothing is abnormal. The practically useful but eminently unscientific doctrine that there can be alteration of function without alteration of structure, has effaced some of the most essential distinctions between anatomy and physiology and especially between morbid anatomy and morbid physiology. Until those distinctions are recognized, the scientific conceptions of professional writers must be confused, however valuable their practical suggestions may be. While men are capable of believing

doubt, both will be fused into a single study by the discovery of laws which will prove that here as elsewhere nothing is really abnormal or irregular. Hitherto, however, the physiologists have immeasurably outstripped the pathologists in the comprehensiveness of their views, and therefore in the value of their results. For the best physiologists distinctly recognize that the basis of their science must include not only the animals below man, but also the entire vegetable kingdom, and that, without this commanding survey of the whole realm of organic nature, we cannot possibly understand even human physiology, still less general physiology. The pathologists, on the other hand, are so much in arrear, that the diseases of the lower animals rarely form part of their plan; while the diseases of plants are almost entirely neglected, although it is certain that until all these have been studied, and some steps taken to generalize them, every pathological conclusion will be eminently empirical, on account of the narrowness of the field from which it is collected.

The science of pathology being still so backward in the conception, as well as in the execution, that even men of real ability believe that it can be raised from a mere study of the human frame, it will hardly be expected that the Scotch, notwithstanding the marvellous boldness of their speculations, should have been able in the eighteenth century to anticipate a method which the nineteenth century has yet to employ. But they produced two pathologists of great ability, and to whom we owe considerable obligations. These were Cullen and John Hunter.[207] Cullen was eminent only as a pathologist; but Hunter, whose fine and discursive genius took a much wider range, was great both in physiology and in pathology. A short account of their generalizations respecting organic science will be a fitting sequel to the notices I have already given of what was done by their countrymen for inorganic science during the same period. It will complete our survey of the Scotch intellect, and will enable the reader to form some idea of the brilliant achievements of that most remarkable people, who, contrary to the course of affairs in all other modern nations, have shown that scientific discoveries do not necessarily weaken superstition,* and that it is possible for two hostile principles to flourish side by side without ever coming into actual collision, or without sensibly impairing each other's vigour.

In 1751 Cullen was appointed professor of medicine in the University of Glasgow;[208] from which, however, in 1756, he was removed to the University of

that it is *possible* for variations of function to proceed from any cause except variations of structure, the philosophic importance of anatomy will be imperfectly appreciated, and its true relation to physiology will remain undefined. Inasmuch however as, with our actual resources, the most careful dissection is often unable to detect (in insanity, for instance) those changes of structure which produce changes of function, superficial thinkers are placed under a strong temptation to deny their invariable connexion; and while the microscope is so imperfect, and chemistry so backward, it is impossible that experiments should always convince them of their mistake. Hence I believe that until our means of empirical research are greatly improved, all such investigations, notwithstanding their immense value in other respects, will tend to lead mere inductive minds into error, by making them rely too much on what they call the facts of the case, to the prejudice of the reason. This is what I mean by saying that our knowledge is not sufficiently advanced to make it advisable to divide the sciences of organic bodies into physiological and anatomical. At present, and probably for some time yet, the humbler division into physiological and pathological may be deemed safer, and more likely to produce solid results.

[207] Hunter, as we shall presently see, did take an extraordinarily comprehensive view of pathology, including the whole of the organic world, and even the aberrations of form in the inorganic.

[208] *Thomson's Life of Cullen*, vol. i. p. 70, Edinburgh, 1832.

[* The phrasing here is loose and misleading. Scientific discoveries *do* weaken superstition in those who know or assimilate them. In Scotland the trouble was that the science was unknown to the superstitious mass.—Ed.]

Edinburgh,[209] where he delivered those celebrated lectures on which his fame now depends. During the early part of his career he paid great attention to inorganic physics, and propounded some remarkable speculations, which are supposed to have suggested the theory of latent heat to Black, who was his pupil.[210] But to follow out those views would have required a number of minute experiments, which it did not suit the habit of his mind to make. Having therefore put forth his ideas, he left them to germinate, and passed on to his arduous attempt to generalize the laws of disease as they are exhibited in the human frame. In the study of disease, the phenomena being more obscure and less amenable to experiment, there was greater latitude for speculation; hence he could more easily indulge in that love of theory which was his ruling passion, and with an extreme devotion to which he has been reproached.[211] That the reproach is not altogether unjust, must, I think, be admitted, since we find him laying down the doctrine that inasmuch as in the treatment of disease, theory could not be separated from practice, it was unimportant which came first.[212] This was tantamount to saying that a medical practitioner might allow his theories to control his observations; for it is certain that in an immense majority of cases men are so tenacious of the opinions they imbibe, that whatever in any pursuit first occupies their understanding is likely to mould all that comes afterwards. In ordinary minds, associations of ideas, if firmly established, become indissoluble; and the power of separating them, and of arranging them in new combinations, is one of the rarest of our endowments. An average intellect, when once possessed by a theory, can hardly ever escape from it. Hence, in practical matters, theory should be feared just as in scientific matters it should be cherished; because practical pursuits are chiefly engrossed by the lower class of minds, where associations and the force of prejudice are extremely strong, while scientific pursuits concern the higher class, where such prepossessions are comparatively weak and where close associations are more easily severed. The most powerful intellects are most accustomed to new arrangements of thought, and are therefore most able to break up old ones. On them belief sits lightly, because they well know how little evidence we have for many of even our oldest beliefs. But the average, or as we must say, without meaning offence, the inferior minds, are not disturbed by these refinements. Theories which they have once heartily embraced they can hardly ever get rid of, and they often dignify them with the name of essential truths, and resent every attack upon them as a personal injury. Having inherited such theories from their fathers, they regard them with a sort of filial piety, and cling to them as if they were some rich acquisition which no one has a right to touch.

To this latter class nearly all men belong who are more engaged in practical pursuits than in speculative ones. Among them are the ordinary practitioners,

[209] *Thomson's Life of Cullen*, vol. i. p. 96. Bower states that Cullen "was appointed to the chair in 1755." *Bower's History of the University of Edinburgh*, vol. ii. p. 216, Edinburgh, 1817.

[210] "It seems impossible to peruse the passages I have quoted from Dr. Cullen's manuscript lectures and papers, and from his Essay on Evaporation, without perceiving that his investigations with regard to the heat and cold occasioned by the combination, liquefaction, and evaporation of bodies, must not only have assisted to direct the attention of his pupil Dr. Black to similar inquiries, but must also have furnished him with several of the data from which his simple and comprehensive theory of Latent Heat was afterwards so philosophically deduced." *Thomson's Life of Cullen*, vol. i. p. 56.

[211] "It is allowed by the admirers of this great man, that he was perhaps too fond of theory." *Bower's History of the University of Edinburgh*, vol. iii. p. 278.

[212] In 1759 he wrote to Dr. Balfour Russell, one of his favourite pupils: "You will not find it possible to separate practice from theory altogether; and therefore, if you have a mind to begin with the theory, I have no objection." *Thomson's Life of Cullen*, vol. i. p. 130. Compare his *Introductory Lectures to the Practice of Physic*, where, asserting truly "that reasoning in physic is unavoidable" (*Cullen's Works*, vol. i. p. 417), he boldly infers "that to render it safe, it is *necessary to cultivate theory in its full extent.*"

whether in medicine or in any other department, extremely few of whom are willing to break up trains of thought to which they are inured.[213] Though they profess to despise theory, they are in reality enslaved by it. All that they can do is to conceal their subjection by terming their theory a necessary belief. It must therefore be deemed a remarkable proof of Cullen's love of deductive reasoning, that he, sagacious and clear-sighted as he was, should have supposed that, in so practical an art as medicine, theory could with impunity precede practice. For it is most assuredly true that, taking men in the average, their minds are so constructed that it cannot precede it without controlling it. It is equally true that such control must be hurtful. Even now, and notwithstanding the great steps which have been taken in morbid anatomy, in animal chemistry, and in the microscopic investigation both of the fluids and solids of the human frame, the treatment of disease is a question of art far more than a question of science. What chiefly characterizes the most eminent physicians, and gives them their real superiority, is not so much the extent of their theoretical knowledge,—though that too is often considerable,—but it is that fine and delicate perception which they owe partly to experience, and partly to a natural quickness in detecting analogies and differences which escape ordinary observers. The process which they follow is one of rapid and in some degree unconscious induction. And this is the reason why the greatest physiologists and chemists whom the medical profession possesses are not as a matter of course the best curers of disease. If medicine were a science they would always be the best. But medicine, being still essentially an art, depends mainly upon qualities which each practitioner has to acquire for himself, and which no scientific theory can teach. The time for a general theory has not yet come, and probably many generations will have to elapse before it does come. To suppose, therefore, that a theory of disease should as a matter of education precede the treatment of disease, is not only practically dangerous but logically false. With its practical danger I am not now concerned; but its logical aspect is a curious illustration of that passion for systematic and dialectic reasoning which characterized Scotland. It shows that Cullen, in his eagerness to argue from principles to facts, instead of from facts to principles, could in the most important of all arts recommend a method of procedure for which even our knowledge is not ripe, but which in his time was so singularly rash and immature that nothing can explain its adoption by a man of such vigorous understanding, except the circumstance of his living in a country in which that peculiar method reigned supreme.

It must however be admitted that Cullen wielded the method with great ability, especially in his application of it to the science of pathology, to which it was far better suited than to the art of therapeutics. For we must always remember that the science which investigates the laws of disease is quite a different thing from the art which cures it. The science has a speculative interest which is irrespective of all practical considerations, and which depends simply on the fact that, when it is completed, it will explain the aberrations of the whole organic world. Pathology aims at ascertaining the causes which determine every departure from the natural type, whether of form or of function. Hence it is that no one can take a comprehensive view of the actual state of knowledge without studying the theoretic relations between pathology and other departments of inquiry. To do this is the business not of practical men, but of philosophers, properly so-called. The philosophic pathologist is as different from the physician as a jurist is different from an advocate, or as an agricultural chemist

[213] Even Cullen himself says rather roughly, "The great horde of physicians are always servile imitators, who can neither perceive nor correct the faults of their system, and are always ready to growl at and even to worry the ingenious person that could attempt it. Thus was the system of Galen secured in the possession of the schools of physic, till soon after the irruption of the Goths and Vandals destroyed every vestige of literature in the western parts of Europe, and drove all that remained of it to seek a feeble protection at Constantinople." *Lectures Introductory to the Practice of Physic*, in *Cullen's Works*, vol. i. p. 386, Edinburgh, 1827.

is different from a farmer, or as a political economist is different from a statesman, or as an astronomer, who generalizes the laws of the heavenly bodies, is different from a captain who navigates his ship by a practical application of those laws. The two sets of functions may be united, and occasionally, though very rarely, they are, but there is no necessity for their being so. While, therefore, it would be absurdly presumptuous for an unprofessional person to pass judgment on the therapeutical system of Cullen, it is perfectly legitimate for any one who has studied the theory of these matters to examine his pathological system ; because that, like all scientific systems, must be amenable to general considerations, which are to be taken partly from the adjoining sciences, and partly from the universal logic of philosophic method.

It is from this latter or logical point of view that Cullen's pathology is interesting for the purposes of the present chapter. The character of his investigations may be illustrated by saying that his method in pathology is analogous to that which Adam Smith adopted at the same time, though in a very different field. Both were deductive ; and both, before arguing deductively, suppressed some of the premisses from which they reasoned. That this suppression is the key to Adam Smith's method, and was an intentional part of his plan, I have already shown ; as also that in each of his two works he supplied the premisses in which the other work was deficient. In this respect he was far superior to Cullen. For though Cullen, like Smith, began by mutilating his problem in order to solve it more readily, he, unlike Smith, did not see the necessity of instituting another and parallel inquiry which should complete the scheme, by starting from the premisses that had been previously omitted.

What I have termed the mutilation of the problem was effected by Cullen in the following manner. His object was to generalize the phenomena of disease as they are exhibited in the human frame ; and it was obvious to him, as to every one else, that the human frame consists partly of solids and partly of fluids. The peculiarity of his pathology is that he reasons almost entirely from the laws of the solids, and makes so little account of the fluids that he will only allow them to be the indirect causes of disease, which in a scientific view are to be deemed strictly subordinate to the direct causes, as represented by the solid constituents of our body.[214] This assumption, though false, was perfectly justifiable, since by curtailing the problem he simplified its study ; just as Adam Smith, in his *Wealth of Nations*, simplified the study of human nature by curtailing it of all its sympathy. But this most comprehensive thinker was careful, in his *Theory of Moral Sentiments*, to restore to human nature the quality of which the *Wealth of Nations* had deprived it *; and by thus establishing two different lines of argument, he embraced the whole subject. In the same way it was incumbent on Cullen, after having constructed a theory of disease by reasoning from the solids, to have constructed another theory by reasoning from the fluids ; so that a coordination of the two theories might have raised a science of pathology as complete as the then state of knowledge allowed.[215] But to this his mind was unequal.

[214] This idea runs through the whole of his writings. In the following passage it is more succinctly stated than in any other: "In pathology, and in the prognosis of particular diseases, it is absolutely necessary to enter into the distinction of these causes. I call the one *direct* causes, those which act upon the nervous system directly ; and the other *indirect* causes, those which produce the same effect, but by destroying those organs which are necessary to the support of the excitement, viz. the whole system of circulation." *Cullen's Works*, vol. i. p. 135. Even this passage, clear as it seems, can only be rightly interpreted by taking the context into consideration.

[215] For, as is truly observed by probably the greatest pathologist of our time, "Humoral pathology is simply a requirement of common practical sense ; and it has always held a place in medical science, although the limits of its domain have, no doubt, been variously circumscribed or interpreted at different times. Of late years, it has met with a new basis and support in morbid anatomy, which, in the inadequacy of its discoveries in the

* [Buckle appears here to forget that the *Moral Sentiments* appeared long before the *Wealth of Nations*.—Ed.]

Able though he was, he lacked the grasp of intellect which characterized Adam Smith, and which made that great man perceive that every deductive argument which is founded on a suppression of premisses must be compensated by a parallel argument which takes those premisses into account.[216] So little was Cullen aware of this, that having built up that system of pathology which is known to medical writers as Solidism, he never took the pains to accompany it by another system which gave the first rank to the fluids. On the contrary, he believed that his plan was complete and exhaustive, and that what is termed Humoral Pathology was a fiction which had too long usurped the place of truth.[217]

Several of the views advocated by Cullen were taken from Hoffmann, and several of the facts from Gaubius; but that his pathology, considered as a whole, is essentially original, is evident from a certain unity of design which is inconsistent with extensive plagiarism, and which proves that he had thoroughly thought out his subject for himself. Without, however, stopping to inquire how much he borrowed from others, I will briefly indicate a few of the salient points of his system, in order to enable the reader to understand its general character.

According to Cullen, all the solids in the human body are either simple or vital. The simple solids retain, after death, the properties which they possessed during life. But the vital solids, which form the fundamental part of the nervous system, are marked by properties which disappear directly death occurs.[218] Hence the simple solids, having fewer functions than the vital, have also fewer diseases; and the maladies to which they are liable admit of easy classification.[219] The real difficulty lies in the vital solids, because on their peculiarities the whole nervous system depends, and nearly all disorders are immediately due to changes in them. Cullen, therefore, made the nervous system the basis of his pathology; and in speculating on its functions, he assigned the chief place to an occult principle, which he termed the Animal Power, or Energy, of the brain.[220] This

solids to account for disease and death, has been compelled to seek for an extension of its boundary through a direct examination of the blood itself." *Rokitansky's Pathological Anatomy*, vol. i. p. 362, London, 1854.

[216] Unless, as in the case in geometry, the premisses, which are suppressed, are so slight as to be scarcely perceptible. [It cannot be said that Smith in either of his works applies one theory to all the phenomena. Thus the *Wealth of Nations* does not make good any deficiency in the earlier treatise *as a theory of morals*. The books are therefore not truly complementary.—Ed.]

[217] He was so indignant at the bare idea of a humoral pathology, that even Hoffmann, who before himself was the most eminent advocate of solidism, fell under his displeasure for allowing some little weight to the humoral doctrines. He says that Hoffmann "has not applied his fundamental doctrine so extensively as he might have done; and he has everywhere intermixed an humoral pathology, as incorrect and hypothetical as any other." *Cullen's Works*, vol. i. p. 410. At p. 470, "I have, therefore, assumed the general principles of Hoffmann. And, if I have rendered them more correct, and more extensive in their application, and, *more particularly, if I have avoided introducing the many hypothetical doctrines of the Humoral Pathology which disfigured both his and all the other systems that have hitherto prevailed*, I hope I shall be excused for attempting a system which, upon the whole, may appear new."

[218] "The solid parts of the body seem to be of two kinds: one whose properties are the same in the dead as in the living, and the same in the animate as in many inanimate bodies; the other, whose properties appear only in living bodies. In the last, a peculiar organization, or addition, is supposed to take place; in opposition to which the first are called the simple solids. Of these only we shall treat here; and of the others, which may be called vital solids, being the fundamental part of the nervous system, we shall treat under that title in the following section." *Cullen's Works*, vol. i. p. 10.

[219] These diseases are laxity, flaccidity, &c. See the enumeration of "the diseases of the simple solids," in *Cullen's Works*, vol. i. p. 14.

[220] *Cullen's Works*, vol. i. pp. 65, 600, vol. ii. p. 364. Dr. Thomson, who had access to papers and lectures of Cullen's, which have never been published, says (*Life of Cullen*, vol. i. p. 265), "His speculations with regard to the different functions of the nervous system, but more particularly with regard to that of the Animal Power or Energy of the

principle acted on the vital solids. When the principle worked well, the body was healthy; when it worked ill, the body was unhealthy. Since, then, the state of the vital solids was the main cause of disorder, and since the Energy of the brain was the main cause of the state of the vital solids, it became important to know what the influences were which acted on the Energy, because in them we should find the beginning of the series. Those influences were divided by Cullen into physical and mental. The physical were heat, cold, and effluvia, the three most potent of the material disturbers of the human frame.[221] The mental influences, which excited the brain to act on the solids, were comprised under six different heads, namely, the will, the emotions, the appetites, the propensities, and, finally, the two great principles of habit and of imitation, on which he, with good reason, laid considerable stress.[222] In arguing from these mental causes, and in generalizing the relations between them and the sensations of the body, he, faithful to his favourite method, proceeded deductively from the metaphysical principles then in vogue, without inquiring inductively into their validity, such an induction being, he thought, no part of his duty.[223] He was too anxious to get on with his dialectic to be interrupted by so trifling a matter as the truth or falsehood of the premisses on which the reasoning rested. What he did in the metaphysical part of his pathology, he also did in its physical part. Although the blood and the nerves are the two leading features of the human economy, he did not search into them by a separate induction; he subjected them neither to chemical experiments in order to learn their composition, nor to microscopic observations in order to learn their structure.[224] This is the more

brain, were incorporated with every opinion which he taught concerning the phenomena of the animal economy, the causes of diseases, and the operation of medicines; and they may be said to constitute a most important part, if not the sole basis, of that system of the Practice of Physic which he made the subject of prelection, as well as of study, for a period of nearly forty years, before he ventured to give it to the public." I should mention that Cullen, under the term "brain," included the contents of the vertebral column as well as of the cranium.

[221] *Cullen's Works*, vol. i. pp. 40, 546, 558, 648, vol. ii. p. 321.

[222] Ibid., pp. 86, 91, 100, 101, 108, 115, 116, 553, 592, vol. ii. pp. 35, 366. Compare the summary of causes in *Thomson's Life of Cullen*, vol. i. p. 289.

[223] He says (*Works*, vol. i. pp. 31, 32), "Whoever has the smallest tincture of metaphysics will know the distinction pointed at here between the qualities of bodies as primary and secondary." . . . "*Whether these distinctions be well or ill founded, it is not my business to inquire.*" But though he did not deem it his business to inquire into the accuracy of these and similar distinctions, he thought himself justified in assuming them, and reasoning from them as if they could explain the working of those sensations whose perversion formed the point of contact between metaphysics and pathology. See, for instance, in his *Works*, vol. i. p. 46, the long series of unproved and unprovable assertions respecting the combination and comparison of sensations giving rise to memory, imagination, and the like.

[224] Cullen, with that admirable candour which was one of the most attractive peculiarities of his fine intellect, confesses his want of acquaintance with the microscope: "It leaves me, who am not conversant in such observations, altogether uncertain with respect to the precise nature of this part of the blood." *Cullen's Works*, vol. i. p. 195. A pathologist without a microscope is an unarmed man, indeed. In regard to his animal chemistry, one passage may be quoted as a specimen of the manner in which he arrived at conclusions speculatively, instead of subjecting the phenomena to experimental investigation. "We may remark it to be highly probable, that all animal matter is originally formed of vegetable; because all animals either feed directly and entirely on vegetables, or upon other animals that do so. From hence it is probable that all animal substances may be traced to a vegetable origin; and *therefore*, if we would inquire into the production of animal matter, we *must first inquire* in what manner vegetable matter may be converted into animal." *Cullen's Works*, vol. i. pp. 177, 178. The *therefore* and the *must*, resulting merely from an antecedent probability, are characteristic of that over-boldness into which deduction is apt to degenerate, and which is strongly contrasted with the opposite vice of over-timidity, by which inductive reasoners are tainted.

observable, because though we must admit that animal chemistry was then generally neglected, and that its real meaning was scarcely understood until the wonderful labours of Berzelius revealed its importance, still the microscope was ready to Cullen's hands; it having been invented a hundred and fifty years before he completed his pathology, and having been in common scientific use for about a hundred years. But his love of synthesis overcame him. His system is constructed by reasoning from general principles; and of that process he certainly was a consummate master. Between the premisses and the conclusion he hardly ever lets error creep in. And in reference to the results of his speculations, he had one immense merit which will always secure to him a conspicuous place in the history of pathology. By insisting on the importance of the solids, he, one-sided though he was, corrected the equal one-sidedness of his predecessors; for, with extremely few exceptions, all the best pathologists, from Galen downwards, had erred in ascribing too much to the fluids, and had upheld a purely humoral pathology. Cullen turned the minds of men in the other direction; and though, in teaching them that the nervous system is the sole primary seat of disease, he committed a great mistake, it was a mistake of the most salutary kind. By leaning on that side, he restored the balance. Hence, I have no doubt, he indirectly encouraged those minute researches into the nerves which he would not himself stop to make, but which, in the next generation, gave rise to the capital discoveries of Bell, Shaw, Mayo, and Marshall Hall. At the same time, the old humoral pathology, which had prevailed for many centuries, was practically pernicious, because, assuming that all diseases are in the blood, it produced that constant and indiscriminate venesection which destroyed innumerable lives, besides the irreparable injury it often inflicted both on body and mind; weakening those whom it was unable to slay. Against this merciless onslaught, which made medicine the curse of mankind, the Solid Pathology was the first effective barrier.[225] Practically, therefore, as well as speculatively, we must hail Cullen as a great benefactor of his species; and we must regard his appearance as an epoch in the history of human comfort, as well as in the history of human thought.

It may perhaps facilitate the conceptions of unprofessional readers if I give, in as few words as possible, a specimen of the way in which Cullen employed his method in investigating the theory of some one class of diseases. For this

[225] Dr. Watson (*Principles and Practice of Physic*, 4th edit. London, 1857, vol. i. p. 41) says of the humoral pathology, that "the absurdity of the hypotheses, and *still more the dangerous practice which this doctrine generated*, began to be manifest, and led to its total abandonment." But, with every respect for this eminent authority, I venture to observe that this supposition of Dr. Watson's is contradicted by the whole history of the human mind. There is no well-attested case on record of any theory having been abandoned because it produced dangerous results. As long as a theory is believed, men will ascribe its evil consequences to any cause except the right one. [This is an *ignoratio elenchi*: Watson assumed recognized evil results.—Ed.] And a theory which is once established will always be believed, until there is some change in knowledge which shakes its foundation. Every practical change may, by careful analysis, be shown to depend in the first instance on some change of speculative opinions. Even at the present day many doctrines are generally held in the most civilized countries which are producing dangerous practical consequences, and have produced those consequences for centuries. But the mischief which the doctrine engenders does not weaken the doctrine itself. Nothing can do that but the general progress of knowledge, which, by altering former opinions, modifies future conduct. [This argument resolves itself into a contradiction. First "change of speculative opinions" is posited as the prime factor; then "the general progress of knowledge"—the latter being Buckle's usual doctrine. He has fallen into contradiction through failing to note that "the mischief which the doctrine engenders" is not recognized as such by those who cling to the doctrine. Below, pp. 891, 893, he affirms that the deductive method does not diffuse knowledge, while the inductive does, because "facts seem to come home to every one and are undeniable." There is a radical failure of co-ordination in these concluding reasonings.—Ed.]

purpose I will select his doctrine of fever, which, though now generally abandoned, once exercised more influence than any other part of his pathology. Here as elsewhere he reasons from the solids.[226] Disregarding the state of the blood, he says that the cause of all fever is a diminished energy of the brain.[227] Such diminution may be produced by various sedatives, the most common of which are effluvia, whether marsh or human, intemperance, fear, and cold.[228] Directly the energy of the brain is impaired, the disease begins. Rapidly passing through the nervous system, its first palpable effect is a chill, or cold fit, which is accompanied by a spasm on the extremities of the arteries, particularly where they touch the surface of the body.[229] This spasm on the extreme vessels irritates the heart and arteries, and the irritation continues till the spasm is relaxed.[230] At the same time, the increased action of the heart restores the energy of the

[226] Some writers, who have taken notice of Cullen, have been deceived in this respect by his occasional use of the expression "nervous fluid," as if he were willing to let in the idea of humorism. But in one place he distinctly guards himself against such misconstruction. "Now, to avoid determining anything with regard to these opinions, I have used the term of *nervous power*; but as this is a little ambiguous, I choose to express it by *nervous fluid*; not that I suppose, with Dr. Boerhaave, that the brain is an excretory, and that a fluid is secreted from it: *I mean nothing more than that there is a condition of the nerves which fits them for the communication of motion.* But I defer the consideration of these opinions for the present, and perhaps *ad Græcas calendas*; but nothing shall be rested upon the nervous fluid, it shall be considered merely as *a power* fitted for communicating motions." *Cullen's Works*, vol. i. p. 17. Without this passage, his remarks on "the nervous fluid in the brain" (*Works*, vol. i. p. 129) might easily be misunderstood.

[227] "Together with this, the languor, inactivity, and debility of the animal motions, the imperfect sensations, the feeling of cold, while the body is truly warm, and some other symptoms, all show that the energy of the brain is, on this occasion, greatly weakened; and I presume that, as the weakness of the action of the heart can hardly be imputed to any other cause, this weakness also is a proof of the diminished energy of the brain. So I conclude, that a debility of the nervous power forms the beginning of the cold fit, and lays the foundation of all the other phenomena." *Practice of Physic*, in *Cullen's Works*, vol. i. p. 492.

[228] "To render our doctrine of fever consistent and complete, it is necessary to add here, that those remote causes of fever, human and marsh effluvia, seem to be of a debilitating or sedative quality." . . . "Though we have endeavoured to show that fevers generally arise from marsh or human effluvia, we cannot, with any certainty, exclude some other remote causes, which are commonly supposed to have at least a share in producing those diseases. And I proceed, therefore, to inquire concerning these causes; the first of which that merits attention is the power of cold applied to the human body." . . . "Besides cold, there are other powers that seem to be remote causes of fever; such as fear, intemperance in drinking, excess in venery, and other circumstances, which evidently weaken the system. But whether any of these sedative powers be alone the remote cause of fever, or if they only operate either as concurring with the operation of marsh or human effluvia, or as giving an opportunity to the operation of cold, are questions not to be positively answered." *Practice of Physic*, in *Cullen's Works*, vol. i, pp. 546, 552. One part of this view has been corroborated since the time of Cullen. "The experiments of Chossat and others clearly prove cold to be a direct sedative." *Williams' Principles of Medicine*, second edit. London, 1848, p. 11. Compare *Watson's Principles and Practice of Physic*, 4th edit. London, 1857, vol. i. pp. 87–92, 249. Hence, perhaps, the "irresistible tendency to sleep caused by exposure to severe or long-continued cold." *Erichsen's Surgery*, second edit. London, 1857, p. 336; but as to this Dr. Watson (*Principles of Physic*, vol. i. p. 89) is sceptical, and thinks that, in those cases which are recorded, the drowsiness ascribed to cold is in a great measure the result of fatigue.

[229] *Cullen's Works*, vol. i. p. 493. Compare, respecting his general theory of spasm, p. 84, and vol. ii. p. 400.

[230] "The idea of fever, then, may be, that a spasm of the extreme vessels, however induced, proves an irritation to the heart and arteries; and that this continues till the spasm is relaxed or overcome." *Cullen's Works*, vol. i. p. 494.

brain ; the system rallies ; the extreme vessels are relieved ; while, as a consequence of the whole movement, sweat is excreted, and the fever abates.[231] Shutting out, therefore, all consideration of the fluids of the body, the successive stages of languor, cold fit, and hot fit, might, in Cullen's opinion, be generalized by reasoning merely from the solids, which, furthermore, produced his well-known distinction between fevers the continuance of which is owing to an excess of spasm, and those the continuance of which is owing to an excess of debility.[232]

A similar process of thought gave birth to his *Nosology*, or general classification of diseases, which some have regarded as the most valuable part of his labours ; [233] though, for reasons already mentioned, we must, I think, reject all such attempts as premature, and as likely to work more harm than good, unless they are simply used as a contrivance to aid the memory. At all events, the *Nosology* of Cullen, though it exhibits clear traces of his powerful and organizing mind, is fast falling into disrepute, and we may be sure that for a long time yet a similar fate will await its successors. Our pathological knowledge is still too young for so great an enterprise.[234] We have every reason to expect that, with the aid of chemistry and of the microscope, it will continue to grow more rapidly than it has hitherto done. Without venturing to predict the rate of its increase, we may form some idea of it by considering what has been effected with resources very inferior to those we now possess. In a work of great authority, published in the year 1848, it is stated that since the appearance of Cullen's *Nosology* our mere enumeration of diseases has almost doubled, while our knowledge of the facts relating to disease has more than doubled.[235]

[231] "Such however is at the same time the nature of the animal economy, that this debility proves an indirect stimulus to the sanguiferous system ; whence, by the intervention of the cold stage and spasm connected with it, the action of the heart and larger arteries is increased, and continues so till it has had the effect of restoring the energy of the brain, of extending this energy to the extreme vessels, of restoring, therefore, their action, and thereby especially overcoming the spasm affecting them ; upon the removing of which, the excretion of sweat, and other marks of the relaxation of excretories take place." *Practice of Physic*, in *Cullen's Works*, vol. i. pp. 501, 502. See also p. 636, § cciii. Or, as he elsewhere expresses himself (vol. i. p. 561): "With regard to the event of fevers, this is the fundamental principle : *in fevers, nature cures the disease* ; that is, certain motions tending to death continue the disease, but, in consequence of the laws of the animal economy, other motions are excited by these which have a tendency to remove it."

[232] "If we may trust to our conclusions with respect to the proximate cause, it follows most naturally from the view there given that the continued fever is always owing to an excess of spasm, or to an excess of debility : as the one or other of these prevails, it will give one or other of the two forms, either the Synocha or inflammatory fever, or the Typhus or nervous fever." *Cullen's Works*, vol. i. p. 518.

[233] "Cullen's most esteemed work is his *Nosology*." *Hamilton's History of Medicine*, London, 1831, vol. ii. p. 279. "His *Nosology* will probably survive all his other works ; it is indisputably the best system which has yet appeared." *Lives of British Physicians*, London, 1830, p. 213. "Celle de Cullen, qui parut en 1772, et qui constitue un véritable progrès." *Renouard, Histoire de la Médecine*, Paris, 1846, vol. ii. p. 231. See also *Hooper's Medical Dictionary*, edited by Dr. Grant, London, 1848, p. 937. But in the most celebrated medical works which have appeared in England during the last twelve or fifteen years, I doubt if there is any instance of the adoption of Cullen's nosological arrangement. Abroad, and particularly in Italy, it is more valued.

[234] "I had rather not be cramped and hampered by attempting what abler heads than mine have failed to achieve, and what, in truth, I believe, in the present state of our science, to be impossible, a complete methodical system of nosology." *Watson's Principles and Practice of Physic*, London, 1857, vol. i. p. 9. This is the wisdom of a powerful understanding.

[235] "Now, when the diseases of Cullen's nosology have been almost doubled, and the facts relating to them have been more than doubled." *Williams' Principles of Medicine*, London, 1848, p. 522.

I have now only one more name to add to this splendid catalogue of the great Scotchmen of the eighteenth century.[236] But it is the name of a man who, for comprehensive and original genius, comes immediately after Adam Smith, and must be placed far above any other philosopher whom Scotland has produced.* I mean, of course, John Hunter, whose only fault was an occasional obscurity, not merely of language, but also of thought. In this respect, and perhaps in this alone, Adam Smith had the advantage; for his mind was so flexible, and moved so freely, that even the vastest designs were unable to oppress it. With Hunter, on the contrary, it sometimes seemed as if the understanding was troubled by the grandeur of its own conceptions, and doubted what path it ought to take. He hesitated; the utterance of his intellect was indistinct.[237] Still, his powers were so extraordinary that among the great masters of organic science he belongs, I apprehend, to the same rank as Aristotle, Harvey, and Bichat, and is somewhat superior either to Haller or Cuvier. As to this classification, men will differ according to their different ideas of the nature of science, and, above all, according to the extent to which they appreciate the importance of philosophic method. It is from this latter point of view that I have at present to consider the character of John Hunter; and in tracing the movements of his most remarkable mind we shall find that in it deduction and induction were more intimately united than in any other Scotch intellect, either of the seventeenth or eighteenth century. The causes of this unusual combination I will now endeavour to ascertain. When they are understood, they will not only explain many peculiarities in his works, but will afford materials for speculation to those who love to examine the development of ideas, and who are able to discern the way in which different schemes of national thought have given different shapes to national character, and have thereby modified the whole course of human affairs to an extent of which the ordinary compilers of history have not the slightest suspicion.

[236] I had intended giving some account of the once celebrated Brunonian system, which was founded by Dr. John Brown, who was first the pupil of Cullen and afterwards his rival. But a careful perusal of his works has convinced me that the real basis of his doctrine, or the point from which he started, was not pathology, but therapeutics. His hasty division of all diseases into sthenic and asthenic has no claim to be deemed a scientific generalization, but was a mere artificial arrangement, resulting from a desire to substitute a stimulating treatment in the place of the old lowering one. He, no doubt, went to the opposite extreme; but that being a purely practical subject, this Introduction has no concern with it. For the same reason I omit all mention of Currie, who, though an eminent therapeutician, was a commonplace pathologist. That so poor and thinly-peopled a country as Scotland should, in so short a period, have produced so many remarkable men, is extremely curious.

[237] Mr. Ottley (*Life of Hunter*, p. 186) says, "In his writings we occasionally find an obscurity in the expression of his thoughts, a want of logical accuracy in his reasonings, and an incorrectness in his language, resulting from a deficient education." But a deficient education will never make a man obscure. Neither will a good education make him lucid. The only cause of clearness of expression is clearness of thought; and clearness of thought is a natural gift, which the most finished and systematic culture can but slightly improve. Uneducated men, without a thousandth part of John Hunter's intellect, are often clear enough. On the other hand, it as frequently happens that men who have received an excellent education cannot speak or write ten consecutive sentences which do not contain some troublesome ambiguity. In Hunter's works such ambiguities are abundant; and this is probably one of the reasons why no one has yet given a connected view of his philosophy. On his obscurity, compare *Cooper's Life of Sir Astley Cooper*, London, 1843, vol. i. pp. 151, 152; *Paget's Lectures on Surgical Pathology*, London, 1853, vol. i. p. 419; and the remarks of his enemy, Foot, in *Foot's Life of Hunter*, London, 1794, p. 59.

[* No philosophic student will now endorse this judgment, which in setting Hunter above Hume is as arbitrary as that of the patriot who set Watt beside or above Newton. —Ed.]

Hunter remained in Scotland till the age of twenty, when he settled in London ; and though he was abroad for about three years, he abandoned his own country, and became socially and intellectually a native of England.[238] Hence the early associations of his mind were formed in the midst of a deductive nation ; the later associations in the midst of an inductive one.* For twenty years he lived among a people who are perhaps the acutest reasoners in Europe, if you concede to them the principles from which they reason ; but who, on the other hand, owing to their proneness to this method, are so greedy after general principles that they will accept them on almost any evidence,† and are therefore at once very credulous and very logical. In that school, and surrounded by those habits, the intellect of John Hunter was nurtured during the most impressible period of his life. Then the scene suddenly shifted. Coming to England, he passed forty years in the heart of the most empirical nation in Europe ; a nation utterly abhorring all general principles, priding itself on its common sense, boasting, and with good reason too, of its practical sagacity, proclaiming aloud the superiority of facts over ideas, and despising every theory, unless some direct and immediate benefit could be expected to accrue from it. The young and ardent Scotchman found himself transplanted into a country totally different from that which he had just quitted ; and such a difference could not fail to influence his mind. He saw on every side marks of prosperity and of long and uninterrupted success, not only in practical but also in speculative ‡ life ; and he was told that these things were effected by a system which made facts the first consideration. He was ambitious of fame, but he perceived that the road to fame was not the same in England as in Scotland. In Scotland a great logician would be deemed a great man § ; in England little account would be made of the beauty of his logic, unless he was careful that the premisses from which he argued were trustworthy, and verified by experience. A new machine, a new experiment, the discovery of a salt or of a bone, would in England receive a wider homage than the most profound speculation from which no obvious results were apprehended. That this way of contemplating affairs has produced great good is certain. But it is also certain that it is a one-sided way, and satisfies only part of the human mind. Many of the noblest intellects crave for something which it cannot supply. In England, however, during the greater part of the eighteenth century, it was even more supreme than it is now, and was indeed so universal that, from the year 1727 until nearly the close of the century, our country did not possess in any branch of science a speculator who had sufficient force to raise himself above those narrow views which were then deemed the perfection of wisdom.[239] Much was added to our knowledge, but its distant boundaries were not enlarged. Though there was an increase of curious and valuable details, and though several of the small and proximate laws of nature were generalized, it must be admitted that those lofty generalizations which we owe to the seventeenth century

[238] He was born in 1728, and came to London in 1748. *Adams' Life of John Hunter*, second edit. London, 1818, pp. 20, 203. According to Adams (pp. 30–35), he was abroad as surgeon in the English army from 1761 to 1763 ; though, in *Foot's Life of Hunter*, London, 1794, p. 78, he is said to have returned to England in 1762. Mr. Ottley says that he returned in 1763. *Ottley's Life of Hunter*, p. 22, in vol. i. of *Hunter's Works*, edited by Palmer, London, 1835.

[239] Above, pp. 500, 501.

[* See edit. note above, after *note* 199.—Ed.]

[† This is a new proposition, not warranted by anything in the previous inquiry save the details as to superstition, which hold equally good of all nations. The Scots Protestants had rejected the evidence on which Catholics accepted transubstantiation, the Papacy, and many miracles ; and Hume and Smith, Black and Cullen, were certainly not specially credulous.—Ed.]

[‡ Compare the sentence below, beginning "In England."—Ed.]

[§ This hardly consists with the subsequent remarks (pp. 891, 893 : cp. edit. notes) as to the failure of the Scotch deductive thinkers to influence their countrymen.—Ed.]

remained stationary, and that no attempt was made to push beyond them. When John Hunter arrived in London in 1748, Newton had been dead more than twenty years, and the English people, absorbed in practical pursuits, and now beginning for the first time to enter into political life, had become more averse than ever to inquiries which aimed at truth without regard to utility, and had accustomed themselves to value science chiefly for the sake of the direct and tangible benefit which they might hope to derive from it.

That Hunter must have been influenced by these circumstances will be obvious to whoever considers how impossible it is for any single mind to escape from the pressure of contemporary opinion. But inasmuch as all his early associations had inclined him in another direction, we perceive that during his long residence in England he was acted on by two conflicting forces. The country of his birth made him deductive ; the country of his adoption made him inductive. As a Scotchman, he preferred reasoning from general principles to particular facts ; as an inhabitant of England, he became inured to the opposite plan of reasoning from particular facts to general principles. In every country men naturally give the first place to what is most valued. The English respect facts more than principles, and therefore begin with the facts. The Scotch consider principles as most important, and therefore begin with the principles. And I make no doubt that one of the reasons why Hunter, in investigating a subject, is often obscure, is that on such occasions his mind was divided between these two hostile methods, and that, leaning sometimes to one and sometimes to the other, he was unable to determine which he should choose. The conflict darkened his understanding. Adam Smith, on the other hand, in common with all the great Scotchmen who remained in Scotland, was remarkably clear. He, like Hume, Black, and Cullen, never wavered in his method. These eminent men were not acted on by English influence. Of all the most illustrious Scotchmen of the eighteenth century, Hunter alone underwent that influence, and he alone displayed a certain hesitation and perplexity of thought, which seems unnatural to so great a mind, and which, as it appears to me, is best explained by the peculiar circumstances in which he was placed.

One of the ablest of his commentators has justly observed that his natural inclination was to conjecture what the laws of nature were, and then reason from them, instead of reasoning to them by slow and gradual induction.[240] This process of deduction was, as I have shown, the favourite method of all Scotchmen, and therefore was precisely the course which we should have expected him to adopt. But inasmuch as he was surrounded by the followers of Bacon,[241] this natural bias was warped, and a large part of his marvellous activity was employed in observations and experiments such as no Scotch thinker living in

[240] " He followed his natural inclination. He preferred the more delusive, apparently the more direct, road, which has seduced so many philosophers. He sought to arrive at the general laws of nature at once by conjecture; rather than by a close and detailed study of her inferior operations, to ascend step by step through a slow and gradual induction to those laws which govern her general procedure." Babington's Preface to Hunter's *Treatise on the Venereal Disease*, in *Hunter's Works*, vol. ii. p. 129. Compare the narrow and carping criticism in *Foot's Life of Hunter*, p. 163.

[241] That I may not be suspected of exaggeration, I will quote what by far the greatest of all the historians of medicine has said upon this subject. " La majorité des médecins qui prétendaient s'être formés d'après Bâcon, n'avaient hérité de lui qu'une répugnance invincible pour les hypothèses et les systèmes, une grande vénération pour l'expérience, et un désir extrême de multiplier le nombre des observations. Ce fut chez les Anglais que la méthode empirique en médecine trouva le plus de partisans, et c'est principalement aussi chez eux qu'elle s'est répandue jusqu'aux temps les plus rapprochés de nous. Sa propagation y fut favorisée, non-seulement par le profond respect que les Anglais continuent toujours de porter à l'immortel chancelier, mais encore par la haute importance que la nation entière attache au sens commun, *common sense*, et elle y demeura l'ennemie irréconciliable de tous les systèmes qui ne reposent pas sur l'observation." *Sprengel, Histoire de la Médecine*, vol. v. p. 411, Paris, 1815.

Scotland would ever have engaged in. He himself declared that thinking was his delight ; [242] and there can be no doubt that, had he been differently situated, thinking would have been his principal pursuit. As it was, the industry with which he collected facts is one of the most conspicuous features in his career. His researches covered the whole range of the animal kingdom, and were conducted with such untiring zeal that he dissected upwards of five hundred different species, exclusive of dissections of different individuals, and exclusive, too, of dissections of a large number of plants.[243] The results were carefully arranged and stored up in that noble collection which he formed, and of the magnitude of which we may gain some idea from the statement that at his death it contained upwards of ten thousand preparations illustrative of the phenomena of nature.[244] By this means he became so intimately acquainted with the animal kingdom that he made a vast number of discoveries which, considered singly, are curious, but which when put together constitute an invaluable body of new truths. Of these the most important are, the true nature of the circulation in crustacea and insects ; [245] the organ of hearing in cephalopods ; [246] the power possessed by mollusks of absorbing their shells ; [247] the fact that bees do not collect wax, but secrete it ; [248] the semicircular canals of the cetacea ; [249] the lymphatics of

[242] Clive says, "Much as Mr. Hunter did, he thought still more. He has often told me, his delight was to think." *Abernethy's Hunterian Oration*, London, 1819, p. 26.

[243] Mr. Owen, in his interesting Preface to the fourth volume of *Hunter's Works*, says (p. vii.), "There is proof that Hunter anatomized at least five hundred different species of animals, exclusive of repeated dissections of different individuals of the same species, besides the dissections of plants to a considerable amount."

[244] "Some idea may be formed of Hunter's extraordinary diligence, by the fact that his museum contained at the time of his death upwards of 10,000 preparations, illustrative of human and comparative anatomy, physiology, and pathology, and natural history." *Weld's History of the Royal Society*, London, 1848, vol. ii. p. 92.

[245] "I have tested the conflicting evidence of these observers by dissection of the heart in the lobster ; and you will perceive by this preparation that it is more complicated than even the Danish naturalist supposed, and fully bears out the opinion of Hunter in regard to the mixed nature of the circulation in the crustacea." *Owen's Lectures on the Comparative Anatomy and Physiology of the Invertebrate Animals*, 2nd edit. London, 1855, p. 318. "Cuvier, misled by the anomalous diffused condition of the venous system, supposed that there was no circulation of the blood in insects ; yet the dorsal vessel was too conspicuous a structure to be overlooked. Such, however, was the authority of the great anatomist, that the nature of the heart began to be doubted, and the strangest functions to be attributed to it. Hunter, however, who was prepared to appreciate the true state of the circulating system in insects, by his discovery of the approximately diffused and irregular structure of the veins in the crustacea, has described, in his work on the blood, all the leading characters of the circulation in insects as it is recognized by comparative physiologists of the present day." *Ibid.*, p. 383. Compare *Hunter's Essays and Observations on Natural History*, London, 1861, vol. i. p. 108.

[246] "The class called Sepia has the organ of hearing, though somewhat differently constructed from what it is in fishes." *An Account of the Organ of Hearing in Fishes*, in *Hunter's Works*, vol. iv. p. 294. At the bottom of the page Mr. Owen observes, in a note, "This is the first announcement of the existence of an organ of hearing in the Cephalopoda."

[247] "Hunter discovered that the molluscous inhabitant of a shell had the power of absorbing part of its dwelling." *Owen's Lectures on the Comparative Anatomy and Physiology of the Invertebrate Animals*, London, 1855, p. 544. "Every shell-fish has the power of removing a part of its shell, so as to adapt the new and the old together, which is not done by any mechanical power, but by absorption." *Anatomical Remarks on a New Marine Animal*, in *Hunter's Works*, vol. iv. p. 469, edit. Palmer. In a note to this passage it is said that "the doctrine of the absorption of shell has been lately" (*i.e.* in 1833) "adduced as a new discovery."

[248] "His keen observation did not fail to detect several errors which preceding naturalists had fallen into, especially with regard to the formation of the wax, which

birds ; [250] and the air-cells in the bones of birds.[251] We are also assured that he anticipated the recent discoveries respecting the embryo of the Kangaroo ; [252] and his published works prove that, in the human subject, he discovered the muscularity of the arteries,[253] the muscularity of the iris,[254] and the digestion of the stomach after death by its own juice.[255] Although in his time animal chemistry was not yet raised to a system, and was consequently little heeded by physiologists, Hunter endeavoured by its aid to search out the qualities of the blood, so as to ascertain the properties of its constituents.[256] He also

he proved to be secreted, not collected, by the animal." *Ottley's Life of Hunter*, p. 122. "The wax is formed by the bees themselves ; it may be called an external secretion of oil, and I have found that it is formed between each scale of the under side of the belly." *Observations on Bees*, in *Hunter's Works*, vol. iv. p. 433.

[249] "In the terminating part there are a number of perforations into the cochlea, and one into the semicircular canals, which afford a passage to the different divisions of the auditory nerve." *Observations on the Structure and Œconomy of Whales*, in *Hunter's Works*, vol. iv. pp. 383, 384. "The semicircular canals of the cetacea, described by Hunter in the paper on Whales, a structure which Cuvier rightly states that Camper overlooked, but incorrectly claims the discovery as his own." Preface to vol. iv. of *Hunter's Works*, p. xxi.

[250] Dr. Adams, in his somewhat hasty *Life of Hunter*, says (pp. 27, 28), "Mr. Hewson always claimed the discovery of lymphatics in birds." But the truth is that Hewson never claimed it. He says, "It may be necessary to mention here, that the dispute between Dr. Monro and me is, who first discovered the lacteals of birds ? for as to the lymphatics in their necks (mentioned in this gentleman's note), these we both allow were discovered by Mr. John Hunter, about ten years ago." And, again, "These lymphatics in the necks of fowls were first discovered by Mr. John Hunter." *Hewson's Works*, edit. Gulliver (Sydenham Soc.), pp. 102, 145.

[251] *Hunter's Works*, vol. iv. pp. xxi. 176.

[252] "See Nos. 3731, 3734, 3735, in the Physiological series of the Hunterian Museum, in which there are evidences that Mr. Hunter had anticipated most of the anatomical discoveries which have subsequently been made upon the embryo of the Kangaroo." *Rymer Jones' Organization of the Animal Kingdom*, London, 1855, pp. 829, 380.

[253] "The muscularity of arteries, of which John Hunter made physiological proof, is now a matter of eyesight." *Simon's Pathology*, London, 1850, p. 69. "To prove the muscularity of an artery, it is only necessary to compare its action with that of elastic substances." . . . "When the various uses of arteries are considered, such as their forming different parts of the body out of the blood, their performing the different secretions, their allowing at one time the blood to pass readily into the smaller branches, as in blushing, and at another preventing it altogether, as in paleness from fear : and if to these we add the power of producing a diseased increase of any or every part of the body, we cannot but conclude that they are possessed of muscular powers." *Hunter's Works*, vol. iii. p. 157. See also vol. iv. p. 254. Mr. Gulliver, in his edition of *Hewson's Works*, London, 1846, says (p. 125), that Hunter's "experiments on the functions of the arteries are supported by the latest and best observations on their structure."

[254] "The fact of the muscularity of the iris, which is here presumed from analogy by Mr. Hunter, has been since directly proved by the observations of Bauer and Jacob (*Phil. Trans.* 1822), and indirectly by Berzelius, who found that the iris possesses all the chemical properties of muscle." Palmer's note in *Hunter's Works*, vol. iii. p. 146, London, 1837.

[255] *Adams' Life of Hunter*, pp. 59, 60, 245. *Hunter's Works*, vol. i. p. 43 ; vol. iv. pp. 116–121. *Watson's Principles of Physic*, vol. ii. p. 440.

[256] "Hunter subjects the blood to both mechanical and chemical analysis, and endeavours to determine the characteristic properties of its different constituents." Owen's Preface to vol. iv. of *Hunter's Works*, p. xii. But this gives, perhaps, rather too high an idea of his animal chemistry ; for such was then the miserable state of this extremely important branch of knowledge, that he arrived at the conclusion that "blood gives no analysis excepting that of common animal matter." *Principles of Surgery*, chap. iii. in *Hunter's Works*, vol. i. p. 229.

examined it in different stages of embryonic life, and by minutely tracking it through its periods of development, he made the capital discovery that the red globules of the blood are formed later than its other components. His contemporaries, however, were so little alive to the importance of this great physiological truth that it fell dead upon them, and, being forgotten, it was about fifty years afterwards rediscovered, and was announced in 1832 as a law of nature which had just been brought to light.[257] This is one of many instances in the history of our knowledge which proves how useless it is for a man to advance too far beyond the age in which he lives.[258] But Hunter, besides making the discovery, also saw its meaning. From it he inferred that the function of the red globules is to minister to the strength of the system rather than to its repair.[259] This is now universally admitted ; but it was not admitted till long after his death. Its recognition is chiefly owing to the rapid advance of animal chemistry, and to improvements in the microscope. For by the employment of these resources it has become manifest that the red globules, the respiratory process, the production of animal heat, and the energy of the locomotive organs, are but different parts of a single scheme.[260] Their connexion with each other is established, not only by a comparison of different species, but also by a comparison of different members of the same species. In human beings, for example, the locomotive and other animal functions are more active in persons of a sanguine temperament than in those of a lymphatic temperament ; while in sanguine temperaments the globules are more numerous than in lymphatic ones. The knowledge of this fact we owe to Lecanu ; [261] and to him we are also indebted for an analogous

[257] " In seeking to determine the respective importance of the different constituents of the blood, by the philosophical and most difficult inquiry into their respective periods of formation in the development of the embryo, Hunter made the interesting discovery that the vessels of the embryo of a red-blooded animal circulated in the first instance colourless blood, as in the invertebrate animals. ' The red globules,' he observes, ' seemed to be formed later in life than the other two constituents, for we see while the chick is in the egg the heart beating, and it then contains a transparent fluid before any red globules are formed, which fluid we may suppose to be the serum and the lymph.' I well remember the feelings of surprise with which I listened, while at Paris in 1832, to a memoir read before the Academy of Science, by MM. Delpech and Coste, the object of which was the announcement of the same fact as a novel and important discovery. The statement of the French observers was received with all the consideration which its importance justly merited, without its being suspected that our great physiologist had half a century before embraced it, with all its legitimate deductions, in the extended circle of his investigations." Owen's Preface to vol. iv. of *Hunter's Works*, p. xiii.

[258] Indeed, if we may rely on the references recently given by Mr. Gulliver, which, from his great general accuracy, there seems no reason to question, the fact that the pale blood precedes the red was known even in the time of Glisson. See Gulliver's learned edition of *Hewson's Works*, London, 1846, p. 222. But to the contemporaries of Glisson such a fact was isolated, and consequently useless. Nothing is valuable while it appears to stand alone.

[259] " From the above account it appears that whatever may be their utility in the machine, the red globules certainly are not of such universal use as the coagulating lymph, since they are not to be found in all animals, *nor so early in those that have them* ; nor are they pushed into the extreme arteries, where we must suppose the coagulating lymph reaches ; neither do they appear to be so readily formed. This being the case, *we must conclude them not to be the important part of the blood in contributing to growth, repair, &c. Their use would seem to be connected with strength.*" *A Treatise on the Blood, Inflammation, and Gun-shot Wounds*, in *Hunter's Works*, vol. iii. p. 68. In another remarkable passage, he touches on the possibility of an increase in the amount of red globules being connected with an increase in the amount of heat. " I will not pretend to determine how far this may assist in keeping up the animal heat." *Observations on the Structure and Œconomy of Whales*, in *Hunter's Works*, vol. iv. p. 364.

[260] The evidence of this is collected in the notes above, pp. 33-36.

[261] " According to Lecanu, temperament has an influence upon the composition of the blood. He infers from his analyses that the blood of lymphatic persons is poorer in

fact corroborating the same view. He has shown that the blood of women contains more water and fewer red globules than the blood of men ;[262] so that here again we discern the relation between these globules and the energy of animal life. Inasmuch, however, as these researches were not made until many years after the death of Hunter, the coincidence between them and his speculative conclusions is a striking instance of his power of generalization, and of that unrivalled knowledge of comparative anatomy which supplied him with materials from which, in spite of the backwardness of animal chemistry, he was able to draw an inference which later and minuter researches have decisively verified.[263]

Having thus, by a comprehensive survey of the animal world, associated its remarkable faculty of movement with the state of its blood, Hunter turned his attention to another aspect of the question, and took into consideration the movements of the vegetable world, in the hope that by comparing these two divisions of nature he might detect some law which, being common to both, should unite into one study all the principles of organic motion. Though he failed in this great undertaking, some of his generalizations are very suggestive, and well illustrate the power and grasp of his mind. Looking at the organic kingdom as a whole, he supposed that its capacity of action, both in animals and in vegetables, was of three kinds. The first kind was the action of the individual upon the materials it already possessed ; and this gave rise to growth, secretion, and other functions, in which the juice of the plant was equivalent to the blood of the animal.[264] The second kind of action had for its object to

solid constituents, and especially in blood corpuscules, than that of persons of sanguineous temperament, while the quantity of albumen is much the same in both." *Simon's Animal Chemistry with reference to the Physiology and Pathology of Man*, London, 1845, vol. i. p. 236. Compare *Thomson's Chemistry of Animal Bodies*, Edinburgh, 1843, p. 370.

[262] *Simon's Animal Chemistry*, vol. i. pp. 234, 235. Subsequent experiments have confirmed this. "The proportion of red globules *dried* to 1000 parts of blood, is in healthy males estimated at 127 parts by Andral and Gavarret ; lower and higher figures have been given by other analysts, but this probably is the result of somewhat different modes of proceeding. *In females the proportion of globules is lower.* Becquerel and Rodier make the difference to be about 15 parts per 1000." *Jones and Sieveking's Pathological Anatomy*, London, 1854, p. 23. Hence the greater specific gravity of male blood. See the interesting results of Dr. Davy's experiments in *Davy's Physiological and Anatomical Researches*, London, 1839, vol. ii. p. 32.

[263] Hunter died in 1793. The researches of Lecanu were published in 1831.

Another and still more remarkable proof of the extent to which Hunter outstripped his own age, appears in the following passage, which has just been published in his posthumous works, and in which he anticipates the grandest and most suggestive of all the ideas belonging to the physiology of the nineteenth century. "If we were capable of following the progress of increase of the number of the parts of the most perfect animal, as they first formed in succession, from the very first to its state of full perfection, we should probably be able to compare it with some one of the incomplete animals themselves, of every order of animals in the Creation, being at no stage different from some of the inferior orders. Or, in other words, if we were to take a series of animals, from the more imperfect to the perfect, we should probably find an imperfect animal corresponding with some stage of the most perfect." *Essays and Observations by John Hunter, being his Posthumous Papers*, London, 1861, vol. i. p. 203.

[264] "The natural salutary actions, arising from stimuli, take place both in animals and vegetables, and may be divided into three kinds. The first kind of action, or self-motion, is employed simply in the œconomical operations, by which means the immediate functions are carried on, and the necessary operations performed, with the materials the animal or vegetable is in possession of, such as growth, support, secretion, &c. The blood is disposed of by the actions of the vessels, according to their specific stimulus, producing all the above effects. The juices of a plant are disposed of according to the different actions of the sap-vessels, arising also from their specific stimulus, which is different from that of blood-vessels, but equally produces growth ; but a vine will grow twenty feet in one summer, while a whale, probably, does not grow so much in as many years." *Croonian Lectures on Muscular Motion*, in *Hunter's Works*, vol. iv. p. 199.

increase these materials; it was always excited by want, and its result was to nourish and preserve the individual.[265] The third kind was entirely due to external causes, including the whole material world, all the phenomena of which were a stimulus to some kind of action.[266] By combining, in different ways, these different sources of motion, and by studying every incitement to action, first in reference to one of the three great divisions just indicated, and secondly in reference to the *power* of action, as distinguished from the *quantity* of action,[267] Hunter believed that some fundamental truths might be obtained, if not by himself, at all events by his successors. For he thought that, though animals can do many things which plants cannot, still the immediate cause of action is in both cases the same.[268] In animals there is more variety of motion, but in plants there is more real power. A horse is certainly far stronger than a man. Yet a small vine can not only support, but can raise, a column of fluid five times higher than a horse can. Indeed, the power which a plant exercises of holding a leaf erect during an entire day, without pause and without fatigue, is an effort of astonishing vigour, and is one of many proofs that a principle of compensation is at work, so that the same energy which in the animal world is weakened by being directed to many objects, is in the vegetable world strengthened by being concentrated on a few.[269]

[265] "The second kind of action is in pursuit of external influence, and arises from a compound of internal and external stimulus; it is excited by the state of the animal or vegetable, which gives the stimulus of want, and being completed by external stimulus, produces the proper supplies of nourishment. It produces motions of whole parts: thus we see the *Hedysarum gyrans* moving its lesser foliola. This is an action apparently similar to breathing in animals, though, perhaps, it does not answer the same purpose; yet there is an alternate motion in both." *Croonian Lectures*, in *Hunter's Works*, vol. iv. p. 200.

[266] "The third kind of motion is from external stimulus, and consists principally of the motion of whole parts, which is not inconsiderable in vegetables, as in the *Dionæa muscipula* and *Mimosa pudica* is very evident." . . . "These actions are similar to what arise in many animals from external stimulus." *Ibid.*, vol. iv. p. 201.

[267] "I make a material difference between the power and the quantity of action. Some motions may be very small, yet act with great force; while others are of considerable extent, although very weak." *Ibid.*, vol. iv. p. 204.

[268] "The immediate cause of motion in all vegetables is most probably the same, and it is probably the same in all animals; but how far they are the same in both classes, has not yet been determined. But I think it will appear, in the investigation of this subject, that vegetables and animals have actions evidently common to both, and that the causes of these actions are apparently the same in both; and most probably there is not an action in the vegetable which does not correspond or belong to the animal, although the mode of action in the parts may not be the same, or muscular, in both." *Croonian Lectures*, in *Hunter's Works*, vol. iv. p. 196. Compare the section "Of Motion in Vegetables," in *Hunter's Essays*, London, 1861, vol. i. p. 24.

[269] "The variety of motions is greater in animals, and more purposes are answered by them." . . . "The first kind of action appears to be stronger in its power, although less in quantity, in vegetables than in animals; for a small vine was capable of sustaining, and even of raising, a column of sap 43 feet high, while a horse's heart was only capable of supporting a column of blood 8 feet 9 inches high; both of which columns must have been supported by the action of the internal parts, for we must suppose the heart equal, or nearly so, to the strength or action of the other parts of the vascular system; and when we consider that the sap of the tallest tree must be supported, and even raised from the root to the most distant branches, it must appear that the power of such vegetables far exceeds the power of any animal, and, indeed, it is such as the texture of a vegetable only can support. The power of supporting a leaf erect for a whole day is as great an effort of action as that of the elevator palpebrarum muscle of the eye of an animal." *Hunter's Works*, vol. iv. pp. 203, 204. See also *Hunter's Essays*, vol. i. p. 342: "It is probable that the vegetable which can the least bear a suspension of its actions, can do so more than the animal which can bear it longest."

In pursuing these speculations, which, amid much that is uncertain, contain, I firmly believe, a large amount of important though neglected truth, Hunter was led to consider how motion is produced by various forces, such as magnetism, electricity, gravitation, and chemical attraction.[270] This carried him into inorganic science, where, as he clearly saw, the foundation of all organic science must be laid. Just as, on the one hand, the human frame could never be successfully studied except by the aid of principles which had been collected from an investigation of animals below man,[271] so, on the other hand, the laws of those very animals must, he said, be approached through the laws of common or inorganic matter.[272] He therefore aimed at nothing less than to unite all the branches of physical science, taking them in the order of their relative complexity, and proceeding from the simplest to the most intricate. With this view he examined the structure of the mineral kingdom, and by an extensive comparison of crystals he sought to generalize the principles of form, in the same way as, by a comparison of animals, he sought to generalize the principles of function. And in doing this he took into account not only regular crystals, but also irregular ones.[273] For he knew that in nature nothing is really irregular or disorderly; though our imperfect apprehension, or rather the backwardness of our knowledge, prevents us from discerning the symmetry of the universal scheme.

The beauty of the plan, and the necessity of the sequence, are not always perceptible. Hence we are too apt to fancy that the chain is broken because we cannot see every link in it. From this serious error Hunter was saved by his genius, even more than by his knowledge. Being satisfied that everything which happens in the material world is so connected and bound up with its antecedents as to be the inevitable result of what had previously occurred, he looked with a true philosophic eye at the strangest and most capricious shapes, because to him they had a meaning and a necessary purpose. To him they were neither strange nor capricious. They were deviations from the natural

[270] *Hunter's Works*, vol. iv. p. 255.

[271] In his *Principles of Surgery*, he says (*Hunter's Works*, vol. i. p. 220), "The human body is what I mean chiefly to treat of; but I shall often find it necessary to illustrate some of the propositions which I shall lay down from animals of an inferior order, in whom the principles may be more distinct and less blended with others, or where the parts are differently constructed, in order to show, from many varieties of structure, and from many different considerations, what are the uses of the same parts in man; or, at least, to show that they are not for the uses which have been commonly assigned to them; and as man is the most complicated part of the whole animal creation, it will be proper, in the first place, to point out general principles, common to all this species of matter, that I may be better understood when I come to the more complicated machine, namely, the human."

[272] "Before we endeavour to give an idea of an animal, it is necessary to understand the properties of that matter of which an animal is composed; but the better to understand animal matter, it is necessary to understand the properties of common matter; else we shall be often applying our ideas of common matter, which are familiar to us, to animal matter, an error hitherto too common, but which we should carefully avoid." *Principles of Surgery*, in *Hunter's Works*, vol. i. p. 211. "In the natural history of vegetables and animals, therefore, it will be necessary to go back to the first or common matter of this globe, and give its general properties; then see how far these properties are introduced into the vegetable and animal operations; or rather, perhaps, how far they are of use or subservient to their actions." *Hunter's Essays*, vol. i. p. 4. "Every property in man is similar to some property, either in another animal, or probably in a vegetable, or even in inanimate matter. Thereby (man) becomes classible with those in some of his parts." *Ibid.*, p. 10.

[273] He made "a valuable collection of crystallizations, both of regular and irregular forms, which he was accustomed to use in his lectures to exemplify the difference between the laws which regulate the growth of organic and the increase of inorganic bodies." *Ottley's Life of Hunter*, p. 138.

course ; but it was a fundamental tenet of his philosophy that nature, even in the midst of her deviations, still retains her regularity.[274] Or, as he elsewhere expresses it, deviation is under certain circumstances part of the law of nature.[275]

To generalize such irregularities, or, in other words, to show that they are not irregularities at all, was the main object of Hunter's life, and was the noblest part of his mission. Hence, notwithstanding his vast achievements in physiology, his favourite pursuit was pathology,[276] where, the phenomena being more complex, the intellect has more play. In this great field he studied the aberrations of structure and of function in the vegetable, as well as in the animal, world ; [277] while, for the aberrations of form, which are the external manifestations of disturbed structure, he took into consideration the appearances presented by the mineral kingdom. There the power of crystallization is the leading feature, and there violations of symmetry constitute the essential disorder, whether the deformity of the crystal is subsequent to its production, or whether, being the result of what happened before its production, it is an original and, if we may so say, congenital defect. In either case, it is a deviation from the normal type, and as such is analogous to the monstrosities, both of animals and of vegetables.[278] The mind of Hunter, by sweeping through this immense range

[274] " Nature is always uniform in her operations, and when she deviates is still regular in her deviations." *Principles of Surgery*, in *Hunter's Works*, vol. i. p. 485 ; see also vol. iv. pp. 44, 45.

[275] " It certainly may be laid down, as one of the principles or laws of nature, to deviate under certain circumstances." *Hunter's Works*, vol. iv. p. 278.

[276] Dr. Adams, who knew him personally, says that he studied " physiology, more particularly as connected with pathology." *Adams' Life of Hunter*, p. 77.

[277] His *Principles of Surgery* contain some curious evidence of his desire to establish a connexion between animal and vegetable pathology. See, for instance, his remarks on " local diseases " (*Works*, vol. i. p. 341) ; on the influence of the seasons in producing diseases (vol. i. pp. 345, 346) ; and on the theory of inflammation exhibited in an oak-leaf (vol. i. p. 391). But even now too little is known of the diseases of the vegetable world to enable their study to be incorporated with the science of the diseases of the animal world ; and in the time of Hunter the attempt was still less promising. Still, the effort shows the grandeur and range of the man's mind ; and though little was effected, the method was right. So, too, in one of his essays on the *Power of Producing Heat*, he says, " In the course of a variety of experiments on animals and vegetables, I have frequently observed that the result of experiments in the one has explained the œconomy of the other, and pointed out some principle common to both." *Hunter's Works*, vol. iv. p. 136.

[278] " Nature being pretty constant in the kind and number of the different parts peculiar to each species of animal, as also in the situation, formation, and construction of such parts, we call everything that deviates from that uniformity a ' monster,' whether (it occur in) crystallization, vegetation, or animalization. There must be some principle for those deviations from the regular course of nature, in the economy of such species as they occur in. In the present inquiry it is the animal creation I mean to consider. Yet, as there may be in some degree an analogy between all the three (kingdoms of nature), I shall consider the other two, so far as this analogy seems to take place." . . . " Monsters are not peculiar to animals : they are less so in them, perhaps, than in any species of matter. The vegetable (kingdom) abounds with monsters ; and perhaps the uncommon formation of many crystals may be brought within the same species of production, and accounted for upon the same principle, viz. some influence interfering with the established law of regular formation. Monsters in crystals may arise from the same cause, as mentioned in the ' Introduction ; ' viz. either a wrong arrangement of the parts of which the crystal is to be composed, or a defect in the formation, from the first setting out being wrong, and (the formation) going on in the same (wrong) line. The principle of crystallization is in the solution ; yet it requires more to set it a going, or into action, such, e.g., as a solid surface. The deficiency in the production of a true crystal may be in the solution itself ; or I can conceive that a very slight circumstance might alter the form of a crystal, and even give the disposition for one (crystal) to form upon another.

of thought, attained to such commanding views of the philosophy of disease, that in that department he is certainly without a rival. As a physiologist he was equalled, or perhaps excelled, by Aristotle; but as a pathologist he stands alone, if we consider what pathology was when he found it, and what it was when he left it.[279] Since his death the rapid advance of morbid anatomy and of chemistry has caused some of his doctrines to be modified, and some of them to be overturned. This has been the work of inferior men, wielding superior chemical and microscopical resources. To say that the successors of John Hunter are inferior to him is no disparagement to their abilities, since he was one of those extremely rare characters who only appear at very long intervals, and who, when they do appear, remodel the fabric of knowledge. They revolutionize our modes of thought; they stir up the intellect to insurrection; they are the rebels and demagogues of science. And though the pathologists of the nineteenth century have chosen a humbler path, this must not blind us to their merits, or prevent us from being grateful for what they have done. We cannot, however, be too often reminded that the really great men, and those who are the sole permanent benefactors of their species, are not the great experimenters, nor the great observers, nor the great readers, nor the great scholars, but the great thinkers. Thought is the creator and vivifier of all human affairs. Actions, facts, and external manifestations of every kind, often triumph for a while; but it is the progress of ideas which ultimately determines the progress of the world. Unless these are changed, every other change is superficial, and every improvement is precarious. It is however evident that in the present state of our knowledge all ideas respecting nature must refer either to the normal or to the abnormal; that is to say, they must be concerned either with what is regular, uniform, and obedient to recognized principles, or else with what is irregular, perturbed, and disobedient. Of these two divisions, the first belongs to science; the second, to superstition. John Hunter formed the superb conception of merging both classes of ideas into one, by showing that nothing is irregular, that nothing is perturbed, that nothing is disobedient. Centuries, perhaps, may elapse before that conception will be consummated. But what Hunter effected towards it places him at the head of all pathologists, ancient or modern. For with him the science of pathology did not mean the laws of disease in man alone, or even in all animals, or even in the whole organic kingdom; but it meant the laws of disease and of malformation in the entire material world, organic and inorganic. His great object was to raise a science of the abnormal. He determined to contemplate nature as a vast and united whole, exhibiting, indeed, at different times different appearances, but preserving amidst every change a principle of uniform and uninterrupted order, admitting of no deviation, undergoing no disturbance, and presenting no real irregularity, albeit to the common eye irregularities abound on every side.

As pathology was the science to which Hunter was most devoted, so also was it that in which his natural love of deduction was most apparent. Here, far more than in his physiological inquiries, do we find a desire to multiply

Quickness in the progress of crystallization produces irregularity and diminution in size." *Hunter's Essays*, London, 1861, vol. i. pp. 239–241. The reader must remember that when these remarks were written, the phenomena of crystallization had not been subjected to that exact mathematical treatment which subsequently revealed so many of their laws. Indeed, the goniometer was then so coarse an instrument that it was impossible to measure the angles of crystals with accuracy.

[279] Abernethy says, "He appears to me as a new character in our profession; and, briefly to express his peculiar merit, I may call him the first and great physionosologist, or expositor of the nature of disease." *Abernethy's Hunterian Oration*, p. 29, London, 1819. "He may be regarded as the first who applied the great truths of anatomical and pyhsiological science to these most important subjects, by tracing the processes which, nature employs in the construction of organic changes, in building up new formations, and in repairing the effects of injury or disease." *Hodgson's Hunterian Oration*, 1855, p. 32.

original principles from which he could reason; in opposition to the inductive method, which always aims at diminishing these principles by gradual and successive analysis.* Thus, for instance, in his animal pathology, he attempted to introduce, as an ultimate principle from which he could argue, the idea that all diseases move more rapidly towards the skin than towards internal parts, by virtue of some hidden force, which also obliges vegetables to approach the surface of the earth.[280] Another favourite proposition, which he often used as a major premiss, and by its aid constructed deductively a pathological argument, was that in no substance, be it what it may, can two processes go on in the same part at the same time.[281] By applying this universal proposition to the more limited phenomena of animal life, he inferred that two general diseases cannot coexist in the same individual; and he relied so much on this ratiocination that he refused to credit any testimony by which it was impugned.[282] There is reason to believe that his conclusion is erroneous, and that different diseases can so accompany each other as to be united in the same individual, at the same time, and in the same part.[283] Whether or not this be the case, it is equally inter-

[280] "The specific qualities in diseases also tend more rapidly to the skin than to the deeper-seated parts, except the cancer: although, even in this disease, the progress towards the superficies is more quick than its progress towards the centre." . . . "In short, this is a law of nature, and it probably is upon the same principle by which vegetables always approach the surface of the earth." *A Treatise on the Blood, Inflammation, and Gun-shot Wounds*, in *Hunter's Works*, vol. iii. p. 285. "Granulations always tend to the skin, which is exactly similar to vegetation, for plants always grow from the centre of the earth towards the surface; and this principle was taken notice of when we were treating of abscesses coming towards the skin." *Ibid.*, pp. 489, 490.

[281] "It may be admitted as an axiom that two processes cannot go on at the same time in the same part of any substance." *Hunter's Works*, vol. iv. p. 96. Compare *Hunter's Essays*, vol. ii. p. 333; "As it appears, in general, that Nature can hardly make one part perform two actions with advantage."

[282] "Thus, we hear of pocky itch and of scurvy and the venereal disease combined; but this supposition appears to me to be founded in error. I have never seen any such cases, *nor do they seem to be consistent with the principles of morbid action* in the animal œconomy. It appears to me beyond a doubt that no two actions can take place in the same constitution, or in the same part, at one and the same time." *Hunter's Works*, vol. ii. p. 132. "As I reckon every operation in the body an action, whether universal or partial, *it appears to me beyond a doubt* that no two actions can take place in the same constitution, nor in the same part, at one and the same time; the operations of the body are similar in this respect to actions or motions in common matter. *It naturally results from this principle*, that no two different fevers can exist in the same constitution, nor two local diseases in the same part, at the same time. There are many local diseases which have dispositions totally different, but having very similar appearances, have been supposed by some to be one sort of disease, by others to be a different kind, and by others again a compound of two diseases." . . . "These, therefore, are often supposed to be mixed, and to exist in the same part. Thus we hear of a pocky-scurvy, a pocky-itch, rheumatic-gout, &c. &c., which names, *according to my principle*, imply a union that cannot possibly exist." *Ibid.*, vol. iii. pp. 3, 4.

[283] Dr. Robert Williams (*Encyclopædia of the Medical Sciences*, London, 1847, 4to, p. 688), says, "The diagnosis between gout and rheumatism is often exceedingly difficult, so much so that nosologists have given a mixed class, or rheumatic gout. Mr. Hunter warmly opposed this compound appellation, for, in his opinion, no two distinct diseases, or even distinct diatheses, can co-exist in the same constitution; a law, it must be admitted, to have many exceptions." Compare *Watson's Principles and Practice of Physic*, London, 1857, vol. i. p. 312: "Acting upon the aphorism of John Hunter (an aphorism, however, which requires some qualification), that two diseases or actions cannot go on in a part at the same time." According to another authority, "There can be little doubt

[* See edit. note above, p. 792.—Ed.]

esting to notice the process of thought which led Hunter to bestow infinitely more pains in arguing from the general theory than in arguing to it. Indeed, he can hardly be said to have argued to it at all, since he obtained it by a rough and hasty generalization from what seemed to be the obvious properties of inorganic matter. Having thus obtained it, he applied it to the pathological phenomena of the organic world, and especially of the animal world. That he should have adopted this course is a curious proof of the energy of his deductive habits, and of the force of mind which enabled him so to set at naught the traditions of his English contemporaries as to follow a method which, in the opinion of every one who surrounded him, was not only full of danger, but could never lead to truth.

Other parts of his pathology abound with similar instances, which show how anxious he was to assume principles on which he could build arguments. Of this kind were his ideas respecting sympathy, as connected with action. He suggested that the simplest forms of sympathy would probably be found in the vegetable world, because there the general arrangements are less intricate than in the animal world.[284] On this supposition he constructed a series of curious and refined speculations, of which, however, I must confine myself to giving a very short summary. As animals sympathize more than vegetables, this helps us to understand why it is that their movements are more numerous. For sympathy, being a susceptibility to impression, is also a principle of action.[285] Like other principles of action, it may be either natural or diseased.[286] But whichever it be, it can in plants have only one mode of development, because in them it can only be influenced by stimulus; while in animals, which have sensation, it has necessarily three modes, one from stimulus, one from sensation, and a third compounded of the other two.[287] These are the largest divisions of sympathy, if we consider the organic world as a whole. In single cases, however, sympathy admits of still further subdivision. We may reason from it in reference to the age of the individual;[288] we may also reason from it in reference to temperament, since, in point of fact, temperament is nothing but susceptibility

that two or more zymotic processes do often go on simultaneously in the blood and body; a fact of profound interest to the pathologist, and worthy of attentive investigation." *Report on the Public Health for* 1847, in *Journal of the Statistical Society*, vol. xi. p. 168, London, 1848. See also, on the co-existence of specific poisons, *Erichsen's Surgery*, 2nd edit. London, 1857, p. 430. Mr. Paget, in his striking and eminently suggestive *Lectures on Pathology*, London, 1853, vol. ii. pp. 537, 538, has made some interesting remarks on one part of the theory of coexistence; and his observations, so far as they go, tend to corroborate Hunter's view. He has put very forcibly the antagonism between cancer and other specific diseases; and especially between the cancerous diathesis and the tuberculous.

[284] "The most simple sympathy is perhaps to be found in vegetables, these being much more simple than the most simple animal." *Principles of Surgery*, in *Hunter's Works*, vol. i. p. 327.

[285] "This principle of action, called sympathy," &c. *Ibid.*, vol. i. p. 318.

[286] "Sympathy may be divided into two kinds, the natural and the diseased." *Principles of Surgery*, in *Hunter's Works*, vol. i. p. 320; see also *A Treatise on the Blood, Inflammation, &c.*, in *Works*, vol. iii. p. 6.

[287] *Croonian Lectures on Muscular Motion*, in *Hunter's Works*, vol. iv. p. 207; and exactly the same words in his *Phytology*, in *Hunter's Essays*. London, 1861, vol. i. p. 361.

[288] "Local or partial sympathy is found more in old than in young; whereas universal sympathy is more in young than in old. Sympathy is less determined in young persons, every part being then ready to sympathize with other parts under disease." . . . "As the child advances, the power of sympathy becomes partial, there not being now, in the constitution, that universal consent of parts, but some part, which has greater sympathy than the rest, falls into the whole irritation; therefore the whole disposition to sympathy is directed to some particular part. The different organs acquire more and more of their own independent actions, as the child grows older." *Hunter's Works*, vol. i. pp. 322, 323.

to action.[289] And when sympathy is in action, we may, by analyzing our idea of it, reduce it to five different heads, and may classify it as continued, or contiguous, or remote, or similar, or dissimilar.[290] All these supplied Hunter with principles from which, by reasoning deductively, he attempted to explain the facts of disease; for, according to him, disease merely consists in a want of combination of actions.[291] By this process of thought, he was induced to neglect those predisposing causes to which inductive pathologists pay great attention, and with which the works of his English contemporaries were much occupied. Such causes could only be generalized from observation, and Hunter made no account of them. Indeed, he even denies their real existence, and asserts that a predisposing cause is simply an increased susceptibility to form disposition to action.[292]

By reasoning from the twofold ideas of action and of sympathy, Hunter constructed the deductive or synthetic part of his pathology. This he did as a Scotchman, and to this, had he always lived in Scotland, he would probably have confined himself. But being for forty years surrounded by Englishmen, and having his mind impregnated by English habits, he contracted something of their mode of thought. We accordingly find that a considerable portion of his pathology is as inductive as the most eager disciple of Bacon could desire; forming in this respect a striking contrast to the purely synthetic method of Cullen, the other great pathologist of Scotland. In the attempt, however, which Hunter made to mix these two methods, he perplexed both himself and his readers. Hence that obscurity which even his warmest admirers have noticed, though they have not perceived its cause.* Vast as his powers were, he was unable to effect a complete union between induction and deduction. That this should have happened will not surprise any one who considers how some of the greatest thinkers have failed in this, the most difficult of all enterprises. Among the ancients, Plato failed in induction, and all his followers failed with him; since none of them have placed sufficient confidence in facts, and in the process of reasoning from particulars to generals. Among the moderns, Bacon was deficient in deduction, and every Baconian has been similarly defi-

[289] "Susceptibilities for dispositions and actions appear to me to be the same with what are usually understood by temperament. Temperament is the state of the body fitting it for the disposition or action it is then in." *Hunter's Works*, vol. i. p. 307.

[290] *Hunter's Works*, vol. iii. p. 393.

[291] "As every natural action of the body depends, for its perfection, on a number of circumstances, we are led to conclude that all the various combining actions are established while the body is in health, and well disposed; but this does not take place in diseased actions, for disease, on the contrary, consists in the want of this very combination." *Hunter's Works*, vol. iii. p. 10. Compare vol. i. p. 310: "I have explained that a disease is a disposition for a wrong action, and that the action is the immediate effect of the disposition, and that either the actions, or the effects of those actions, *produce the symptoms which are generally called the disease*; such as sensations, which are commonly pain of all kinds, sickness, alteration visible or invisible in the structure of the part or parts that act, and sympathy."

[292] "There is no such thing, strictly speaking, as a predisposing cause. What is commonly understood by a predisposing cause is an increased susceptibility to form disposition to action. When I say I am predisposed for such and such actions, it is only that I am very susceptible of such and such impressions." *Hunter's Works*, vol. i. p. 303. See also p. 301: "The most simple idea I can form of an animal being capable of disease is, that every animal is endued with a power of action, and a susceptibility of impression, which impression forms a disposition, which disposition may produce action, which action becomes the immediate sign of the disease; all of which will be according to the nature of the impression and of the part impressed."

[* The explanation is probably simpler than Buckle makes out. Hunter was lacking in verbal or expository faculty to start with, and his obscurity has often nothing to do with his theoretic standpoint.—ED.]

cient ; it being the essential vice of that school to despise reasoning from general propositions, and to underrate the value of the syllogism. It may indeed be doubted if the history of the world supplies more than two instances of physical philosophers being as great in one form of investigation as in the other. They are Aristotle and Newton, who wielded each method with equal ease, combining the skill and boldness of deduction with the caution and perseverance of induction, masters alike of synthesis and of analysis, as capable of proceeding from generals to particulars, as from particulars to generals, sometimes making ideas precede facts, and sometimes making facts precede ideas, but never faltering, never doubting which course to take, and never allowing either scheme unduly to encroach on its opposite.* That Hunter should be unable to perform this, merely proves that he was inferior to these two men, whose almost incredible achievements entitle them to be termed the prodigies of the human race. But what he did was wonderful, and, in his own department, has never been rivalled. Of the character and extent of his inquiries I have given a sketch which, notwithstanding its imperfections, may serve to illustrate the antagonism of the Scotch and English intellects, by showing how the methods peculiar to each nation struggled for mastery in that great mind, which was exposed to the action of both. Which method predominated in Hunter it would be hard to say. But it is certain that his understanding was troubled by their conflict. It is also certain that, owing to his love of deduction, or of reasoning from general ideas, he exercised much less sway over his English contemporaries than he would have done if he had exclusively followed their favourite method of reasoning from particular facts. Hence the disproportion between his influence and his merits. As to his merits, it is now admitted that, in addition to his physiological discoveries, and the great pathological views which he propounded, we may trace to him nearly all the surgical improvements which were introduced within about forty years after his death.[293] He was the first who explained, and indeed the first who recognized, the disease of inflammation of the veins, which is of frequent occurrence, and under the name of phlebitis has latterly been much studied, but which before his time had been ascribed to the most erroneous causes.[294] On general inflammation he threw so much light that the

[293] Hunter died in 1793. In 1835 Mr. Palmer writes : "Those who have traced the progress of modern surgery to its true source, will not fail to have discerned, in the principles which Hunter established, the germs of almost all the improvements which have been since introduced." *Hunter's Works*, vol. i. p. vii. Eighteen years later, Mr. Paget says of Hunter's views respecting the healing of injuries : "In these sentences Mr. Hunter has embodied the principle on which is founded the whole practice of subcutaneous surgery ; a principle of which, indeed, it seems hardly possible to exaggerate the importance." *Paget's Lectures on Surgical Pathology*, London, 1853, vol. i. p. 170. At pp. 197, 198 : "After what I have said respecting the process of immediate union, it may appear that Mr. Hunter was more nearly right than his successors."

[294] "Inflammation of the veins, originally studied by Hunter, has of late years attracted the attention of many distinguished Continental and British pathologists." *Erichsen's Surgery*, London, 1857, p. 475. "No subject more amply illustrates the essential services which the science and art of medicine have derived from pathological anatomy than that of phlebitis. By this study many a dark point in the phenomena of disease has been either thoroughly elucidated, or, at all events, rendered more comprehensible. We need only refer to the so-termed malignant intermittents, consequent upon wounds and surgical operations,—to certain typhoid conditions, puerperal diseases, and the like. John Hunter, the elder Meckel, and Peter Frank, were the first to commence the investigation." *Hasse's Anatomical Description of the Diseases of the Organs of Circulation and Respiration*, London, 1846, p. 10. "Hunter was the first to open the way, and since that period the scalpel has shown that many previously unintelligible

[* Whatever is to be said of Newton, this eulogy of Aristotle will not now be widely concurred in. Compare Benn, *The Greek Philosophers*, 1882, vol. i. ch. 6 ; Berry, *Short History of Astronomy*, 1898, p. 33 ; Lange, *Hist. of Materialism*, Eng. tr. i. 82–90.—Ed.]

doctrines which he advocated, and which were then ridiculed as whimsical novelties, are now taught in the schools, and have become part of the common traditions of the medical profession.[295] He moreover introduced what is probably the most capital improvement in surgery ever effected by a single man; namely, the practice in aneurism of tying the artery at a distance from the seat of disease. This one suggestion has saved thousands of lives; and both the suggestion and the first successful execution of it are entirely owing to John

malignant conditions are attributable to phlebitis." *Jones and Sieveking's Pathological Anatomy*, London, 1854, p. 362. On the application of this discovery to the theory of inflammation of the spleen, see *Rokitansky's Pathological Anatomy*, vol. ii. p. 173, London, 1849; compare vol. iv. p. 335.

[295] Sir Benjamin Brodie says: "It is true that the essential parts of John Hunter's doctrines as to inflammation and its consequences are now so incorporated with what is taught in the schools, that to be acquainted with them you need not seek them in his works; but I recommend you, nevertheless, to make these your especial study, for the sake of the other valuable information which they contain, and the important views in physiology and pathology which, in almost every page, are offered to your contemplation." *Brodie's Lectures on Pathology and Surgery*, London, 1846, p. 25. "John Hunter, whose treatise on Inflammation is a mine in which all succeeding writers have dug." *Watson's Principles and Practice of Physic*, London, 1857, vol. i. p. 146. "The appeal to philosophical principles in Hunter's works was indeed the cause of their being a closed volume to his less enlightened contemporaries; but though the principles implied or expressed subjected them to the scorn and neglect of those less imbued with the spirit of philosophy, the results of those principles, verified as they were by facts, have gradually and insensibly forced themselves on the conviction of the profession; and though adopted silently and without acknowledgment, as if the authors themselves had forgotten or were ignorant from whence they were derived, they now form the very groundwork of all books, treatises, and lectures on professional subjects." *Green's Vital Dynamics*, London, 1840, p. 81. Finally, I will quote the very recent testimony of Mr. Simon, who, in his masterly and singularly beautiful essay on Inflammation, has not only brought together nearly everything which is known on that interesting subject, but has shown himself to be possessed of powers of generalization rare in the medical profession, or indeed in any other profession. "Without undue partiality, an Englishman may be glad to say that the special study of Inflammation dates from the labours of John Hunter. An indefatigable observer of nature, untrammelled by educational forms, and thoroughly a sceptic in his method of study, this large-minded surgeon of ours went to work at inflammation with a full estimate of the physiological vastness of his subject. He saw that, in order to understand inflammation, he must regard it, not as one solitary fact of disease, but in connexion with kindred phenomena—some of them truly morbid in their nature, but many of them within the limits of health. He saw that, for any one who would explain inflammation, all inequalities of blood-supply, all periodicities of growth, all actions of sympathy, were part of the problem to be solved." . . . "He cannot be understood without more reflection than average readers will give; and only they who are content to struggle through a veil of obscure language, up to the very reality of his intent, can learn with how great a master they are communing." . . . "Doubtless, he was a great discoverer. But it is for the spirit of his labours, even more than for the establishment of new doctrine, that English surgery is for ever indebted to him. Of facts in pathology, he may, perhaps, be no permanent teacher; but to the student of medicine he must always be a noble pattern. Emphatically, it may be said of him, that he was the physiological surgeon. Others before him (Galen, for instance, eminently) had been at once physiologists and practitioners; but science in their case had come little into contact with practice. Never had physiology been so incorporated with surgery, never been so applied to the investigation of disease and the suggestion of treatment, as it was by this master-workman of ours. And to him, so far as such obligations can be personal, we assuredly owe it that for the last half-century the foundations of English surgery have, at least professedly, been changing from a basis of empiricism to a basis of science." *Simon on Inflammation*, in *A System of Surgery*, edited by T. Holmes, London, 1860, vol. i. pp. 134–136.

Hunter, who, if he had done nothing else, would on this account alone have a right to be classed among the principal benefactors of mankind.[296]

But so far as his own immediate reputation was concerned, all was in vain. He was in the midst of a people who had no sympathy with that mode of thought which was most natural to him. They cared nothing for ideas, except with a view to direct and tangible results; he valued ideas for themselves, and for the sake of their truth, independently of all other considerations. His English contemporaries, prudent, sagacious, but short-sighted, seeing few things at a time, but seeing those things with admirable clearness, were unable to appreciate his comprehensive speculations. Hence, in their opinion, he was little else than an innovator and an enthusiast.[297] Hence, too, even the practical improvements which he introduced were coldly received, because they proceeded from so suspicious a source. The great Scotchman, thrown among a nation whose habits of mind were uncongenial to his own, stood, says one of the most celebrated of his disciples, in a position of solitary and comfortless superiority.[298] Indeed, so little was he regarded by that very profession of which he was the chiefest ornament, that during the many years in which he delivered lectures in London on anatomy and on surgery, his audience never amounted to twenty persons.[299]

I have now completed my examination of the Scotch intellect as it unfolded itself in the seventeenth and eighteenth centuries. The difference between

[296] Mr. Bowman, in his *Principles of Surgery* (*Encyclopædia of the Medical Sciences*, London, 4to, 1847) says (p. 831): "Before the time of Hunter, the operation was performed by cutting into the sac of the aneurism, and tying the vessel above and below. So formidable was this proceeding in its consequences, that amputation of the limb was frequently preferred, as a less dangerous and fatal measure. The genius of Hunter led him to tie the femoral artery, in a case of popliteal aneurism, leaving the tumour untouched. The safety and efficacy of this mode of operating have now been fully established, and the principle has been extended to all operations for the cure of this formidable disease." See also p. 873; *Paget's Surgical Pathology*, vol. i. pp. 36, 37; and *Erichsen's Surgery*, pp. 141, 142, 508, 509.

[297] "The majority of Hunter's contemporaries considered his pursuits to have little connexion with practice, charged him with attending to physiology more than surgery, and looked on him as little better than an innovator and an enthusiast." *Ottley's Life of Hunter*, p. 126. In a work which was written by a surgeon only the year after Hunter died, the reader is told, in regard to his remarkable inquiries respecting animal heat, that "his experiments, if they be true, carry with them no manner of information:—if they be true, no effect for the benefit of man can possibly be derived from them." *Foot's Life of Hunter*, London, 1794, p. 116. At p. 225, the same practitioner reproaches the great philosopher with propounding "purely a piece of theory, without any practical purpose whatever." Foot, indeed, wrote under the influence of personal feelings, but he rightly judged that these were the sort of charges which would be most likely to prejudice the English public against Hunter. It never occurred to Foot, any more than it would occur to his readers, that the quest of truth as truth is a magnificent object, even if its practical benefit is imperceptible. One other testimony is worth quoting. Sir Astley Cooper writes of Cline: "His high opinion of Mr. Hunter shows his judgment; for almost all others of Mr. Hunter's contemporaries, although they praise him now, abused him while he lived." *The Life of Sir Astley Cooper, by Bransby Blake Cooper*, London, 1843, vol. ii. p. 337.

[298] "Those who far precede others must necessarily remain alone; and their actions often appear unaccountable, nay, even extravagant, to their distant followers, who know not the causes that give rise to them, nor the effects which they are designed to produce. In such a situation stood Mr. Hunter with relation to his contemporaries. It was a comfortless precedence, for it deprived him of sympathy and social co-operation." *Abernethy's Hunterian Oration*, p. 49.

[299] "These he continued for several years; but so far were his talents and his enlightened views from exciting the attention they merited, that his hearers never amounted to twenty." *Ottley's Life of Hunter*, p. 28.

those two periods must strike every reader. In the seventeenth century the ablest Scotchmen wasted their energies on theological subjects, respecting which we have no trustworthy information, and no means of obtaining any. On these topics different persons and different nations, equally honest, equally enlightened, and equally competent, have entertained, and still entertain, the most different opinions, which they advocate with the greatest confidence, and support by arguments perfectly satisfactory to themselves, but contemptuously rejected by their opponents. Each side deeming itself in possession of the truth, the impartial inquirer, that is, he who really loves truth and knows how difficult it is to obtain it, seeks for some means by which he may fairly adjudicate between these conflicting pretensions, and determine which is right and which is wrong. The further he searches, the more he becomes convinced that no such means are to be found, and that these questions, if they do not transcend the limits of the human understanding, do certainly transcend its present resources, and have no chance of being answered, while other and much simpler problems are still unsolved. It would be strange indeed if we, ignorant of so many lower and subordinate matters, should be able to reach and penetrate these remote and complicated mysteries. It would be strange if we, who, notwithstanding the advances we have made, are still in the infancy of our career, and who, like infants, can only walk with unsteady gait, and are scarce able to move without stumbling, even on plain and level ground, should nathless succeed in scaling those dizzy heights which, overhanging our path, lure us on where we are sure to fall. Unfortunately, however, men are in every age so little conscious of their deficiencies that they not only attempt this impossible task, but believe they have achieved it. Of those who are a prey to this delusion, there are always a certain number who, seated on their imaginary eminence, are so inflated by the fancied superiority, as to undertake to instruct, to warn, and to rebuke the rest of mankind. Giving themselves out as spiritual advisers, and professing to teach what they have not yet learned, they exhibit in their own persons that most consistent of all combinations, a combination of great ignorance with great arrogance. From this other evils inevitably follow. The ignorance produces superstition; the arrogance produces tyranny. Hence it is that in a country like Scotland, where the pressure of long-continued and adverse circumstances has consolidated the power of these pretenders to wisdom, such sad results become conspicuous in every direction. Not only the national character, but also the national literature, feels their influence, and is coloured by them. It was therefore natural that in Scotland in the seventeenth century, when the authority of the clergy was most uncontrolled, the consequences of that authority should be most apparent. It was natural that a literature should be created such as that of which I have given some account; a literature which encouraged superstition, intolerance, and bigotry; a literature full of dark misgivings, and of still darker threats; a literature which taught men that it was wrong to enjoy the present, and that it was right to tremble at the future; a literature, in a word, which, spreading gloom on every side, soured the temper, corrupted the affections, numbed the intellect, and brought into complete discredit those bold and original inquiries without which there can be no advance in human knowledge, and consequently no increase of human happiness.

To this the literature of the eighteenth century offered a striking and most exhilarating contrast. It seemed as if in a moment all was changed. The Baillies, the Binnings, the Dicksons, the Durhams, the Flemings, the Frasers, the Gillespies, the Guthries, the Halyburtons, the Hendersons, the Rutherfords, and the rest of that monkish rabble, were succeeded by eminent and enterprising thinkers, whose genius lighted up every department of knowledge, and whose minds, fresh and vigorous as the morning, opened for themselves a new career, and secured for their country a high place in the annals of European intellect. Something of what they effected I have endeavoured to narrate; much, however, has been left untold. But I have brought forward sufficient evidence to convince even the most sceptical reader of the splendour of their achievements, and of the difference between the noble literature which they produced and those wretched compositions which disfigured the preceding century.

Still, great as the difference was, the two literatures had, as I have shown, one important point in common. Both were essentially deductive ; and the proof of this I have given at considerable length, because, though it has, so far as I am aware, escaped the attention of all previous inquirers, its consequences were of the utmost moment to the fortunes of Scotland, and are moreover full of interest to those who, in their investigations of human affairs, desire to penetrate below the mere surface and symptoms of things.

If we take a general view of those countries where science has been cultivated, we shall find that, wherever the deductive method of inquiry has predominated, knowledge, though often increased and accumulated, has never been widely diffused. On the other hand we shall find that, when the inductive method has predominated, the diffusion of knowledge has always been considerable, or at all events has been beyond comparison greater than when deduction was prevalent. This holds good not only of different countries, but also of different periods in the same country. It even holds good of different individuals in the same period, and in the same country. If in any civilized nation two men equally gifted were to propound some new and startling conclusion, and one of these men were to defend his conclusion by reasoning from ideas or general principles, while the other man defended his by reasoning from particular and visible facts, there can be no doubt that, supposing all other things the same, the latter man would gain most adherents. His conclusion would be more easily diffused, simply because a direct appeal, in the first instance, to palpable facts, strikes the vulgar with immediate effect ; while an appeal to principles is beyond their ken, and as they do not sympathize with it, they are apt to ridicule it. Facts seem to come home to every one, and are undeniable.* Principles are not so obvious, and, being often disputed, they have, to those who do not grasp them, an unreal and illusory appearance, which weakens their influence. Hence it is that inductive science, which always gives the first place to facts, is essentially popular, and has on its side those innumerable persons who will not listen to the more refined and subtle teachings of deductive science. Hence, too, we find historically that the establishment of the modern inductive philosophy, with its varied and attractive experiments, its material appliances, and its constant appeal to the senses, has been intimately connected with the awakening of the public mind, and coincides with that spirit of inquiry, and with that love of liberty, which have been constantly advancing since the sixteenth century. We may assuredly say that scepticism and democracy are the two leading features of this great scientific movement. The seventeenth century, which ushered in the Baconian philosophy, was remarkable for its insubordinate spirit, especially in the country where that philosophy originated, and where it most flourished. In the next age it was transplanted into France, and there too it worked upon the popular mind, and was, as I have already pointed out, one of the principal causes of the French Revolution.

If we look still closer into this interesting question, we shall find further corroboration of the view that the inferences of an inductive philosophy are more likely to be diffused than those of a deductive one. Inductive science rests immediately upon experience, or at all events upon experiment, which is merely experience artificially modified. Now an immense majority of mankind, even in the most advanced countries, are by the constitution of their minds incapable of seizing general principles and applying them to daily affairs, without doing serious mischief either to themselves or to others. Such an application requires not only great dexterity but also a knowledge of those disturbing causes which affect the operation of all general theorems. The task, being so difficult to perform, is rarely attempted ; and average men, possessed of a tolerably sound

[* It depends upon the nature of the facts. As Buckle has shown, the clergy found general acceptance for their " principles " because certain doctrinal " facts " were taken for granted. But the Copernican theory, which established a new order of facts, was slow to win acceptance ; and the facts of geology and biology and the " higher criticism " fared similarly.—Ed.]

judgment, do with good reason rely mainly on experience, which is to them a safer and more useful guide than any principle, however accurate and scientific it might be. This begets in their minds a prejudice on behalf of experimental inquiries, and a corresponding dislike of the opposite and more speculative method. And it can, I think, hardly be doubted that one of the causes of the triumph of the Baconian philosophy is the growth of the industrious classes, whose business-like and methodical habits are eminently favourable to empirical observations of the uniformities of sequence, since, indeed, on the accuracy of such observations the success of all practical affairs depends. Certainly we find that the overthrow of the purely deductive scholasticism of the Middle Ages has been everywhere accompanied by the spread of trade ; and whoever will carefully study the history of Europe will discern many traces of a connexion between the two movements, both of which are marked by an increasing respect for material and empirical interests, and a disregard of ideal and speculative pursuits.

The relation between all this and the popular tendency of induction is obvious. For one person who can think, there are at least a hundred persons who can observe. An accurate observer is no doubt rare ; but an accurate thinker is far rarer. Of this the proofs are too abundant to be disputed. Indeed, no one can mix with his fellow-creatures without seeing how much more natural it is for them to notice than to reflect ; and how extremely unusual it is to meet with any one whose conversation or whose writings bear marks of patient and original thought. And inasmuch as thinkers are more prone to accumulate ideas, while observers are more prone to accumulate facts, the overwhelming predominance of the observing class is a decisive reason why induction, which begins with facts, is always more popular than deduction, which begins with ideas. It is often said, and probably with truth, that all deduction is preceded by induction ; so that, in every syllogism, the major premiss, however obvious and necessary it may appear, is merely a generalization of facts, or a record of what the senses had already observed. But this opinion, whether true or false, does not affect what I have just stated, because it concerns the origin of our knowledge, and not its subsequent treatment ; that is to say, it is a metaphysical opinion, rather than a logical one. For, even supposing that all deduction rests ultimately on induction, it is, nevertheless, certain that there are innumerable cases in which the induction takes place at so early a period of life that we are unconscious of it, and can by no effort recall the process. The axioms of geometry afford a good specimen of this. No one can tell when or how he first believed that the whole is greater than its part, or that things which are equal to the same thing are equal to one another. All these preliminary steps are concealed from us, and the strength and dexterity of deduction are displayed in the subsequent steps by which the major premiss is adjusted, and, as it were, fitted to the minor. This often requires great subtlety of thought, and in every instance the external world is put aside, and lost sight of. The process, being ideal, has no concern either with observations or experiments. The suggestions of the senses are shut out, while the mind passes through a long train of successive syllogisms, in which each conclusion is turned into the premiss of a new argument, until at length an inference is deductively obtained which, to those who merely hear it enunciated, seems to have no connexion with the first premisses, though in reality it is the necessary consequence of them.

A method so recondite, and so hidden from the public gaze, can never command the public sympathy. Unless, therefore, the human mind should undergo some remarkable change in its nature as well as in its resources, the sensuous process of working upwards from particular facts to general principles will always be more attractive than the ideal process of working downwards from principles to facts. In both cases there is no doubt a line of argument essentially ideal ; just as in both cases there is an assemblage of facts essentially sensuous. No method is pure, or stands entirely by itself. But inasmuch as in induction the facts are more prominent than the ideas, while in deduction the ideas are more prominent than the facts, it is evident that conclusions arrived at by the former plan will as a general rule obtain a wider assent than conclusions arrived at by the latter plan. Obtaining a wider assent, they will produce more decisive

results, and will be more likely to shape the national character and influence the course of national affairs.

The only exception to this is theology. There the inductive method, as I have already observed, is inapplicable, and nothing remains but deduction, which is quite sufficient for the purposes of the theologian. For he has a peculiar resource which supplies him with general principles from which he can argue; and the possession of this resource forms the fundamental difference between him and the man of science. Science is the result of inquiry; theology is the result of faith. In the one the spirit of doubt; in the other the spirit of belief. In science originality is the parent of discovery, and is therefore a merit; in theology it is the parent of heresy, and is therefore a crime. Every system of religion the world has yet seen recognizes faith as an indispensable duty; but to every system of science it is a hindrance instead of a duty, inasmuch as it discourages those inquisitive and innovating habits on which all intellectual progress depends. The theologian, thus turning credulity into an honour, and valuing men in proportion as they are simple-minded and easy of belief, has little need to trouble himself with facts, which indeed he sets at open defiance in his eagerness to narrate portentous and often miraculous events. To the inductive philosopher such a licence is forbidden. He is obliged to ground his inferences on facts which no one disputes, or which, at all events, any one can either verify for himself, or see verified by others. And if he does not adopt this course, his inferences, be they ever so true, will have the greatest difficulty in working themselves into the popular mind, because they will savour of a subtlety and refinement of thought which, more than anything else, predisposes common understandings to reject the conclusions at which philosophers arrive.

From the facts and arguments contained in this and the preceding chapter, the reader will, I trust, be able to see why it was that the Scotch intellect during the seventeenth and eighteenth centuries was pre-eminently deductive; and also why it was that, in the eighteenth century, the Scotch literature, notwithstanding its brilliancy, its power, and the splendid discoveries of which it was the vehicle, produced little or no effect on the nation at large. That literature, by its bold and innovating character, seemed peculiarly fitted to disturb ancient prejudices, and to rouse up a spirit of inquiry. But its method, both of investigation and of proof, was too refined to suit ordinary understandings.* Therefore, upon ordinary understandings it was inoperative. In Scotland, as in ancient Greece and in modern Germany, the intellectual classes, being essentially deductive, have been unable to influence the main body of the people.† They have considered things at too great an altitude, and at too great a remove. In Greece, Aristotle alone had a true idea of what induction really was. But even he knew nothing of crucial instances and the theory of averages, the two capital resources of that inductive philosophy which we now possess. Neither did he, nor any of the great German philosophers, nor any of the great Scotch philosophers, attach sufficient importance ‡ to the slow and cautious method of gradually rising from each generalization to the one immediately above it, without omitting any intermediate generalization. On this method Bacon, indeed, insists too strongly,

[* There is a perplexity here which Buckle has not sought to solve. If "the Scotch intellect" was deductive, why should deductive reasoning fail to "suit" it, even in the case of the common people? If they could best be appealed to by inductive reasoning, why say the national intellect is deductive? It seems necessary to restate the case. Deductive dialectic resulted from the pulpit practice; but pulpit authority, rooted in a popular form of church government, excluded sceptical doctrine of all kinds. The obstacle was thus secondary, not primary.—Ed.]

[† The clergy, in terms of Buckle's own exposition, are "essentially deductive," and yet *have* a great influence over the people. It is thus not the dialectic method, but the preliminary beliefs, and the state of culture as determining these, that explain the small influence of the critical literature in the period in question.—Ed.]

[‡ Above, p. 873, Aristotle has been credited with a perfect sense of the relative importance of the two methods.—Ed.]

since many most important discoveries have been made independently of it, or, I should rather say, in contradiction to it. But it is a wonderful weapon, and none except men of real genius can dispense with its use. And when they do dispense with it, they cut themselves off from the general sympathies of their age and country. For these small and proximate generalizations, which they neglect, are precisely those parts of philosophy which, being least removed from the region of visible facts, are best understood by the people, and therefore form the only common ground between thinkers and practitioners. They are a sort of middle term, which, being comprehended by both classes, is accessible to either. In all deductive reasoning this intermediate and, if I may so say, neutral territory disappears, and the two classes have no meeting-place. Hence it is that the Scotch philosophy, like the German philosophy, and like the Greek philosophy, has had no national influence. But in England since the seventeenth century, and in France since the eighteenth century, the prevailing philosophy has been inductive, and has therefore not only affected the intellectual classes, but also moved the public mind. The German philosophers are far superior, both in depth and in comprehensiveness, to the philosophers either of France or of England. Their profound researches have however done so little for their country that the German people are every way inferior to the French and English people. So too in the philosophy of ancient Greece we find a vast body of massive and original thought, and, what is infinitely better, we find a boldness of inquiry and a passionate love of truth such as no modern nation has surpassed, and few modern nations have equalled. But the method of that philosophy was an insuperable barrier to its propagation. The people were untouched, and went grovelling on in their old folly, a prey to superstitions, most of which the great thinkers despised and often attacked, but could by no means root out. Bad, however, as those superstitions were, we may confidently say that they were less noxious, that is, less detrimental to the happiness of man, than the repulsive and horrible notions advocated by the Scotch clergy, and sanctioned by the Scotch people. And on those notions the Scotch philosophy could make no impression. In Scotland, during the eighteenth century, superstition and science, the most irreconcilable of all enemies, flourished side by side, unable to weaken each other, and unable indeed to come into collision with each other.* There was coexistence without contact. The two forces kept apart, and the result was that while the Scotch thinkers were creating a noble and most enlightened literature, the Scotch people, refusing to listen to those great masters of wisdom which their country possessed, remained in darkness, leaving the blind to follow the blind, and no one there to help them.

It is indeed curious to observe how little effect was produced by the many great works written by Scotchmen in the eighteenth century. If we except the *Wealth of Nations*, I can hardly call to mind one which has perceptibly influenced public opinion. The reason of this exception may be easily explained. The *Wealth of Nations* restricted the action of government within narrower limits than had ever been assigned to it by any other book of great merit. No previous political writer of admitted genius had left so much to the people, and had demanded for them so much liberty in managing their own affairs, as Adam Smith did. The *Wealth of Nations*, being thus eminently a democratic book, was sure to find favour in Scotland, which was eminently a democratic country. Directly men heard its conclusions, they were prejudiced in favour of its arguments. So, too, in England, that love of liberty which for many centuries has been our leading characteristic, and which does us more real honour than all our conquests, all our literature, and all our philosophy put together, invariably causes a popular bias on behalf of any claim to freedom. We, therefore, notwithstanding the activity of interested parties, were predisposed to the side of free trade as one of the means of letting each man do what he liked with his own. But to imagine that ordinary minds are capable of mastering such a work as the

[* An exaggeration. Superstition was certainly weakened in the eighteenth as compared with the seventeenth century.—Ed.]

Wealth of Nations, and of following without confusion its long and intricate arguments, is simply absurd. It has been read by tens of thousands of persons who accept its conclusions because they like them; which is merely saying because the movement of the age tends that way.* The other great work of Adam Smith, namely the *Theory of Moral Sentiments*, has had no influence except on a very small class of metaphysicians, although its style is, as some think, superior to that of the *Wealth of Nations*, and it is certainly easier to understand. It is moreover much shorter, which to most readers is no small recommendation; and it deals with subjects of great interest, which come home to the feelings of all. But the age, not caring for its conclusions, neglected its arguments. On the other hand, the *Wealth of Nations* harmonized with the general tendency, and its success was supreme. It quickly moved, not only philosophers, but even statesmen and politicians, who eventually † put into force its leading recommendations, though, as their laws and their speeches abundantly prove, they have never succeeded in mastering those great principles which underlie it, and of which the freedom of trade is but a minor accessory.

Putting aside the *Wealth of Nations*, we shall find that the Scotch literature of the eighteenth century did scarcely anything for Scotland, considered as a whole. How it has failed in its great aim of weakening superstition is but too apparent to whoever has travelled in that country, and observed the habits and turn of mind still predominant. Many able and enlightened men who live there are so cowed by the general spirit that for their own comfort, and for the peace of their families, they make no resistance, but tacitly comply with what they heartily despise. That they err in doing so, I at least firmly believe; though I know that many honest and in every respect competent judges are of opinion that no man is bound to be a martyr, or to jeopardize his personal interests, unless he clearly sees his way to some immediate public good. To me however it appears that this is a narrow view, and that the first duty of every one is to set his face in direct opposition to what he believes to be false, and, having done that, leave the results of his conduct to take care of themselves. Still, the temptation to a contrary course is always very strong, and in a country like Scotland is by many deemed irresistible. In no other Protestant nation, and indeed in no Catholic nation except Spain, will a man who is known to hold unorthodox opinions find his life equally uncomfortable.‡ In a few of the large towns he may possibly escape animadversion if his sentiments are not too bold, and are not too openly expressed. If he is timid and taciturn, his heresy may perchance be overlooked. But even in large towns impunity is the exception, and not the rule. Even in the capital of Scotland, in that centre of intelligence which once boasted of being the Modern Athens, a whisper will quickly circulate that such an one is to be avoided, for that he is a free-thinker; as if free-thinking were a crime, or as if it were not better to be a free-thinker than a slavish thinker. In other parts, that is, in Scotland generally, the state of things is far worse. I speak not on vague rumour, but from what I know as existing at the present time, and for the accuracy of which I vouch and hold myself responsible. I challenge any one to contradict my assertion, when I say that, at this moment, nearly all over Scotland the finger of scorn is pointed at every man who, in the exercise of his sacred and inalienable right of free judgment, refuses to acquiesce in those religious notions and to practise those religious

[* Here again it is in effect denied that Smith in any degree *made* the movement of the age. On that view, wherein lay the importance of his book? And how can any book be important? Below, it is avowed that Smith's book *moved* politicians. On the general principles above laid down, however, it was radically unfitted to influence either Scotland or England, the former being theological in its deductiveness, and the latter too inductive to care for deduction. It is more reasonable to say that Smith modified the habits of thought of both countries.—Ed.]

[† I.e., after seventy years! Such practical success is not exactly dazzling.—Ed.]

[‡ Probably matters were as bad, when Buckle wrote, in Scandinavia. Certainly they were in Ulster.—Ed.]

customs which time, indeed, has consecrated, but many of which are repulsive to the eye of reason, though to all of them, however irrational they may be, the people adhere with sullen and inflexible obstinacy. Knowing that these words will be widely read and circulated in Scotland, and averse as I naturally am to bring on myself the hostility of a nation for whose many sterling and valuable qualities I entertain sincere respect, I do nevertheless deliberately affirm that in no civilized country is toleration so little understood, and that in none is the spirit of bigotry and of persecution so extensively diffused. Nor can any one wonder that such should be the case, who observes what is going on there. The churches are as crowded as they were in the Middle Ages, and are filled with devout and ignorant worshippers, who flock together to listen to opinions of which the Middle Ages alone were worthy.* Those opinions they treasure up, and when they return to their homes, or enter into the daily business of life, they put them in force. And the result is that there runs through the entire country a sour and fanatical spirit, an aversion to innocent gaiety, a disposition to limit the enjoyments of others, and a love of inquiring into the opinions of others, and of interfering with them, such as is hardly anywhere else to be found; while in the midst of all this there flourishes a national creed, gloomy and austere to the last degree, a creed which is full of forebodings and threats and horrors of every sort, and which rejoices in proclaiming to mankind how wretched and miserable they are, how small a portion of them can be saved, and what an overwhelming majority is necessarily reserved for excruciating, unspeakable, and eternal agony.

Before bringing this volume to a close, it may be fitting that I should narrate an event which, notwithstanding its recent occurrence, and the great attention it excited at the time, has, amid the pressure of weightier matters, fallen into comparative oblivion, although it is full of interest to those who study the various forms of national character, while it moreover supplies an admirable illustration of the essential antagonism which still exists between the Scotch and English minds; an antagonism extremely remarkable when found among nations both of whom, besides being contiguous and constantly mixing together, speak the same language, read the same books, belong to the same empire, and possess the same interests, and yet are in many important respects as different as if there had never been any means of their influencing each other, and as if they had never had any thing in common.

In the year 1853 the cholera, after having committed serious ravages in many parts of Europe, visited Scotland. There it was sure to find numerous victims among a badly fed, badly housed, and not over-cleanly people. For if there is one thing better established than another respecting this disease, it is that it invariably attacks with the greatest effect those classes who from poverty or from sloth are imperfectly nourished, neglect their persons, and live in dirty, ill-drained, or ill-ventilated dwellings. In Scotland such classes are very numerous. In Scotland, therefore, the cholera must needs be very fatal. In this there was nothing mysterious. On the contrary, the mystery would have been if an epidemic like the Asiatic cholera had spared a country like Scotland, where all the materials were collected on which pestilence feeds, and where filth, penury, and disorder abound on every side.

Under these circumstances it must have been evident, not merely to men of science but to all men of plain, sound understanding, who would apply their minds to the matter without prejudice, that the Scotch had only one way of successfully grappling with their terrible enemy. It behoved them to feed their

[* The amount of progress made since Buckle wrote may be gathered from a report in the *Weekly Scotsman* of May 30, 1903, bearing the headings :—"What do our Ministers Believe?" "Suckled in a Creed Outworn." The report is an account of a speech in the General Assembly of the Church of Scotland by Principal Story of Glasgow, on the question of creed subscription. Dr. Story makes reference to "the steady, the growing dissatisfaction" with the rule of subscription, and goes on to indict some of the ethical doctrines of the Confession in a fashion suggestive of a free-thinking lecture.—ED.]

poor, to cleanse their cesspools, and to ventilate their houses. If they had done this, and done it quickly, thousands of lives would have been spared. But they neglected it, and the country was thrown into mourning. Nay, they not only neglected it, but, moved by that dire superstition which sits like an incubus upon them, they adopted a course which, if it had been carried into full operation, would have aggravated the calamity to a frightful extent. It is well known that whenever an epidemic is raging, physical exhaustion and mental depression make the human frame more liable to it, and are therefore especially to be guarded against. But though this is a matter of common notoriety, the Scotch clergy, backed, sad to say, by the general voice of the Scotch people, wished the public authorities to take a step which was certain to cause physical exhaustion, and to encourage mental depression. In the name of religion, whose offices they thus abused and perverted to the detriment of man, instead of employing them for his benefit, they insisted on the propriety of ordering a national fast, which in so superstitious a country was sure to be rigidly kept, and, being rigidly kept, was equally sure to enfeeble thousands of delicate persons, and, before twenty-four hours were passed, prepare them to receive that deadly poison which was already lurking around them, and which hitherto they had just strength enough to resist. The public fast was also to be accompanied by a public humiliation, in order that nothing might be wanting to appal the mind and fill it with terror. On the same occasion the preachers were to thunder from their pulpits and proclaim aloud the sins of the land ; while the poor benighted people, panic-struck, were to sit in awe, were to remain the whole day without proper nourishment, and retire to their beds, weeping and starved. Then it was hoped that the Deity would be propitiated, and the plague be stayed. As soon as the entire nation had taken the course which of all others was most certain to increase the mortality, it was believed that man having done his worst, the Almighty would interpose, would violate the laws of nature, and, by working a miracle, would preserve his creatures from what, without a miracle, would be the inevitable consequence of their own deliberate act.

This was the scheme projected by the Scotch clergy, and they were determined to put it into execution. To give greater effect to it, they called upon England to help them, and in the autumn of 1853 the Presbytery of Edinburgh, thinking that from their position they were bound to take the lead, caused their Moderator to address a letter, ostensibly to the English Minister, but in reality to the English nation. In this choice production, a copy of which is now lying before me, the Home Secretary is assured that the members of the Presbytery had delayed appointing a day for fasting and humiliation on their own ecclesiastical authority, because they thought it likely that one would be appointed by the royal authority. But as this had not been done, the Presbytery respectfully requested to be informed if it was intended to be done. They apologized for the liberty they were taking ; they had no desire unduly to intrude themselves ; neither did they wish the Home Secretary to answer their question unless he felt himself justified in doing so. Still, if he were able to answer it, they would be glad. For there was no doubt that Asiatic cholera was in the country ; and such being the case, the Presbytery of Edinburgh were interested in knowing if the appointment by the Queen of a national fast was in contemplation.[300]

This letter, which, through the medium of the press, was sure to become well known and to be widely read, was evidently intended to act on public opinion in England. It was in fact a covert reproach on the English Government for having neglected its spiritual duties, and for not having perceived that fasting

[300] "The members were of opinion," writes the Moderator, "The members were of opinion that it was likely, in the circumstances, that a national fast would be appointed on royal authority. For this reason, they delayed making an appointment for this locality, and directed me, in the meantime, respectfully to request that you would be pleased to say—if you feel yourself at liberty to do so—whether the appointment of a national fast by the Queen is in contemplation. The Presbytery hope to be excused for the liberty they use in preferring this request."

was the most effectual way of stopping an epidemic. In Scotland, generally, it received great praise, and was regarded as a dignified rebuke addressed to the irreligious habits of the English people, who, seeing the cholera at their doors, merely occupied themselves with sanitary measures, and carnal devices to improve the public health, showing thereby that they trusted too much to the arms of the flesh. In England, on the other hand, this manifesto of the Scotch Church was met with almost universal ridicule, and indeed found no favourers except among the most ignorant and credulous part of the nation.* The minister to whom it was addressed was Lord Palmerston, a man of vast experience, and perhaps better acquainted with public opinion than any politician of his time. He, being well aware of the difference between Scotland and England, knew that what was suitable for one country was not suitable for the other, and that notions which the Scotch deemed religious, the English deemed fanatical. On a former occasion, the imperial government, yielding to the clamour which a few active and interested men succeeded in raising, had been foolish enough to set themselves in this matter in opposition to the temper of the age, and to enjoin public observances which, happily, were not strictly obeyed, but which, in so far as they were obeyed, heightened the general terror by reinforcing natural fears with supernatural ones, and thus, depressing the nervous system, increased the chance of mortality from the pestilence. To have the plague in our country is bad enough, since, do what we may, many victims will be struck down by it. But a fearful responsibility is entailed upon those who, at such a period, instead of exerting themselves to check its ravages, either by precautionary measures or by soothing and reassuring the people, do everything in their power to aggravate the calamity, by encouraging that superstitious dread which weakens the popular energy at the very moment when energy is most requisite, and troubles the coolness, the self-reliance, and self-possession, without which no crisis of national danger can ever be averted.

This time, however, there was no risk of the government committing so serious a blunder. Lord Palmerston, who knew that the sound sense of the English people would support him in what he was doing, directed a letter to be sent to the Presbytery of Edinburgh, which, unless I am greatly mistaken, will in future ages be quoted as an interesting document for illustrating the history of the progress of public opinion. A century ago, any statesman who had written such a letter would have been driven from office by a storm of general indignation. Two centuries ago, the consequences to him would have been still more disastrous, and would indeed have ruined him socially, as well as politically. For in it he sets at defiance those superstitious fancies respecting the origin of disease which were once universally cherished as an essential part of every religious creed. Traditions, the memory of which is preserved in the theological literature of all Pagan countries, of all Catholic countries, and of all Protestant countries, are quietly put aside as if they were matters of no moment, and as if it were not worth while to discuss them. The Scotch clergy, occupying the old ground on which the members of their profession had always been accustomed to stand, took for granted that the cholera was the result of the Divine anger, and was intended to chastize our sins. In the reply which they now received from the English Government, a doctrine was enunciated which to Englishmen seems right enough, but which to Scotchmen sounded very profane.† The Presbytery were informed that the affairs of this world are regulated by natural laws, on the observance or neglect of which the weal or woe of mankind depends.[301] One

[301] "The weal or woe of mankind depends upon the observance or neglect of those laws."

[* Buckle here somewhat overstates the English enlightenment of his day. The ignorant and credulous, then as now, formed a large party.—Ed.]

[† This passage, which affirms that Englishmen in general were rationalistic, and Scotchmen in general supernaturalistic, is one of the fallacies which flow from the habit of taking nations as entities in matters of opinion.—Ed.]

of those laws connects disease with the exhalations of bodies ; and it is by virtue of this law that contagion spreads, either in crowded cities, or in places where vegetable decomposition is going on. Man, by exerting himself, can disperse or neutralize these noxious influences. The appearance of the cholera proves that he has not exerted himself. The towns have not been purified ; hence the root of the evil. The Home Secretary, therefore, advised the Presbytery of Edinburgh that it was better to cleanse than to fast. He thought that the plague being upon them, activity was preferable to humiliation. It was now autumn, and before the hot weather would return a considerable period must elapse. That period should be employed in destroying the causes of disease, by improving the abodes of the poor. If this were done, all would go well. Otherwise, pestilence would be sure to revisit them, " in spite "—I quote the words of the English minister—" in spite of all the prayers and fastings of a united but inactive nation." [302]

This correspondence between the Scotch clergy and the English statesman is not to be regarded as a mere passing episode of light or temporary interest. On the contrary, it represents that terrible struggle between theology and science which, hav ng begun in the persecution of science and in the martyrdom of scientific men, has in these later days taken a happier turn, and is now manifestly destroying that old theological spirit which has brought so much misery and ruin upon the world. The ancient superstition, which was once universal, but is now slowly though surely dying away, represented the Deity as being constantly moved to anger, delighting in seeing His creatures abase and mortify themselves, taking pleasure in their sacrifices and their austerities, and, notwithstanding all they could do, constantly inflicting on them the most grievous punishments, among which the different forms of pestilence were conspicuous. It is by science, and by science alone, that these horrible delusions are being dissipated. Events which formerly were deemed supernatural visitations are now shown to depend upon natural causes, and to be amenable to natural remedies. Man can predict them, and man can deal with them. Being the inevitable result of their own antecedents, no room is left for the notion of their being special inflictions. This great change in our opinions is fatal to theology, but is serviceable to religion. For by it science, instead of being the enemy of religion, becomes its ally. Religion is to each individual according to the inward light with which he is endowed. In different characters, therefore, it assumes different forms, and can never be reduced to one common and arbitrary rule. Theology on the other hand, claiming authority over all minds, and refusing to recognize their essential divergence, seeks to compel them to a single creed, and sets up one standard of absolute truth, by which it tests every one's opinions ; presumptuously condemning those who disagree with that standard. Such arrogant pretensions need means of support. Those means are threats which in ignorant times are universally believed, and which by causing fear produce submission. Hence it is that the books of every theological system narrate acts of the grossest cruelty, which, without the least hesitation, are ascribed to the direct interposition of God. Humane and gentle natures revolt at such cruelties, even while they try to believe them. It is the business of science to purify theology, by showing that there has been no cruelty, because there has been no interposition. Science ascribes to natural causes what theology ascribes to supernatural ones. According to this view, the calamities with which the

[302] " Lord Palmerston would therefore suggest that the best course which the people of this country can pursue to deserve that the further progress of the cholera should be stayed, will be to employ the interval that will elapse between the present time and the beginning of next spring in planning and executing measures by which those portions of their towns and cities which are inhabited by the poorest classes, and which, from the nature of things, must most need purification and improvement, may be freed from those causes and sources of contagion which, if allowed to remain, will infallibly breed pestilence, and be fruitful in death, in spite of all the prayers and fastings of a united but inactive nation."

world is afflicted are the result of the ignorance of man, and not of the interference of God. We must not, therefore, ascribe to Him what is due to our own folly, or to our own vice. We must not calumniate an all-wise and all-merciful Being by imputing to Him those little passions which move ourselves, as if He were capable of rage, of jealousy, and of revenge, and as if He, with outstretched arm, were constantly employed in aggravating the sufferings of mankind, and making the miseries of the human race more poignant than they would otherwise be.

That this remarkable improvement in religious ideas is due to the progress of physical science is apparent not only from general arguments which would lead us to anticipate that such must be the case, but also from the historical fact that the gradual destruction of the old theology is everywhere preceded by the growth and diffusion of physical truths. The more we know of the laws of nature, the more clearly do we understand that everything which happens in the material world, pestilence, earthquake, famine, or whatever it may be, is the necessary result of something which had previously happened. Cause produces effect, and the effect becomes in its turn a cause of other effects. In that operation we see no gap, and we admit of no pause. To us the chain is unbroken ; the constancy of nature is unviolated. Our minds become habituated to contemplate all physical phenomena as presenting an orderly, uniform, and spontaneous march, and running on in one regular and uninterrupted sequence. This is the scientific view. It is also the religious view. Against it we have the theological view ; but that which has already lost its hold over the intellect of men is now losing its hold over their affections, and is so manifestly perishing that at present no educated person ventures to defend it, without so limiting and guarding his meaning as to concede to its opponents nearly every point which is really at issue.

While, however, in regard to the material world, the narrow notions formerly entertained are in the most enlightened countries almost extinct, it must be confessed that in regard to the moral world the progress of opinion is less rapid. The same men who believe that Nature is undisturbed by miraculous interposition, refuse to believe that Man is equally undisturbed. In the one case they assert the scientific doctrine of regularity ; in the other they assert the theological doctrine of irregularity. The reason of this difference of opinion is that the movements of nature are less complex than the movements of man. Being less complex, they are more easily studied, and more quickly understood. Hence we find that while natural science has long been cultivated, historical science hardly yet exists. Our knowledge of the circumstances which determine the course of mankind is still so imperfect, and has been so badly digested, that it has produced scarcely any effect on popular ideas. Philosophers indeed are aware that here as elsewhere there must be a necessary connexion between even the most remote and dissimilar events. They know that every discrepancy is capable of being reconciled, though we, in the present state of knowledge, may be unequal to the task. This is their faith, and nothing can wean them from it. But the great majority of people have a different faith. They believe that what is unexplained is inexplicable, and that what is inexplicable is supernatural. Science has explained an immense number of physical phenomena, and therefore, even to the vulgar, those phenomena no longer seem supernatural, but are ascribed to natural causes. On the other hand, science has not yet explained the phenomena of history ; consequently the theological spirit lays hold of them, and presses them into its own service. In this way there has arisen that famous and ancient theory which has received the name of the moral government of the world. It is a high-sounding title, and imposes on many who, if they examined its pretensions, would never be duped by them. For, like that other notion which we have just considered, it is not only unscientific but it is eminently irreligious. It is in fact an impeachment of one of the noblest attributes of the Deity. It is a slur on the Omniscience of God. It assumes that the fate of nations, instead of being the result of preceding and surrounding events, is specially subject to the control and interference of Providence. It assumes that there are great public emergencies in which such interference is needed. It assumes that, without the interference, the course of affairs could not

run smoothly; that they would be jangled and out of tune; that the play and harmony of the whole would be incomplete. And thus it is that the very men who at one moment proclaim the Divine Omniscience, do at the next moment advocate a theory which reduces that Omniscience to nothing, since it imputes to an All-Wise Being that the scheme of human affairs, of which He must from the beginning have foreseen every issue and every consequence, is so weakly contrived as to be liable to be frustrated; that it has not turned out as He could have wished; that it has been baffled by His own creatures; and that to preserve its integrity its operations must be tampered with, and its disorders redressed. The great Architect of the universe, the Creator and Designer of all existing things, is likened to some clumsy mechanic, who knows his trade so ill that he has to be called in to alter the working of his own machine, to supply its deficiencies, to fill up its flaws, and to rectify its errors.

It is time that such unworthy notions should come to an end. It is time that what has long been known to philosophers should also be known to historians, and that the history of mankind should cease to be troubled by what, to those who are imbued with the scientific spirit, must seem little better than arrant trifling. Of two things, choose one. Either deny the Omniscience of the Creator, or else admit it. If you deny it, you deny what, to my mind at least, is a fundamental truth, and on these matters there can be no sympathy between us. But if you admit the Omniscience of God, beware of libelling what you profess to defend. For when you assert what is termed the moral government of the world, you slander Omniscience, inasmuch as you declare that the mechanism of the entire universe, including the actions both of Nature and of Man, planned as it is by Infinite Wisdom, is unequal to its duties, unless that same Wisdom does from time to time interfere with it. You assert, in fact, either that Omniscience has been deceived, or that Omnipotence has been defeated. Surely, they who believe, and whose pride and happiness it is to believe, that there is a Power above all and before all, knowing all and creating all, ought not to fall into such a snare as this. They who, dissatisfied with this little world of sense, seek to raise their minds to something which the senses are unable to grasp, can hardly fail, on deeper reflection, to perceive how coarse and material is that theological prejudice which ascribes to such a Power the vulgar functions of a temporal ruler, arrays Him in the garb of an earthly potentate, and represents Him as meddling here and meddling there, uttering threats, inflicting punishments, bestowing rewards. These are base and grovelling conceptions, the offspring of ignorance and of darkness. Such gross and sordid notions are but one remove from actual idolatry. They are the draff and offal of a bygone age, and we will not have them obtruded here. Well suited they were to those old and barbarous times when men, being unable to refine their ideas, were therefore unable to purify their creed. Now, however, they jar upon us; they do not assimilate with other parts of our knowledge; they are incongruous; their concord is gone.* Everything is against them. They stand alone; there is nothing left with which they harmonize. The whole scope and tendency of modern thought force upon our minds conceptions of regularity and of law to which they are diametrically opposed. Even those who cling to them do so from the influence of tradition, rather than from complete and unswerving belief. That child-like and unhesitating faith with which the doctrine of interposition was once received, is succeeded by a cold and lifeless assent, very different from the enthusiasm of former times. Soon, too, this will vanish, and men will cease to be terrified by phantoms which their own ignorance has reared. This age, haply, may not witness the emancipation; but so surely as the human mind advances, so surely will that emancipation come. It may come quicker than any one expects. For we are stepping on far and fast. The signs of the time are all around, and they who list may read. The handwriting is on the wall; the fiat has gone forth; the ancient empire shall be subverted; the dominion of superstition, already decaying, shall break away, and crumble

[* Compare the closing sentence and note thereon.—Ed.]

into dust; and new life being breathed into the confused and chaotic mass, it shall be clearly seen that from the beginning there has been no discrepancy, no incongruity, no disorder, no interruption, no interference; but that all the events which surround us, even to the furthest limits of the material creation, are but different parts of a single scheme which is permeated by one glorious principle of universal and undeviating regularity.*

[* It is hardly necessary to repeat, in conclusion, that such propositions as the above concerning "discrepancy," "disorder," "interruption," and so on, merely empty these terms of all meaning. But it may be well to note that the general doctrine of these closing pages cancels that put forth at the close of the section on Spain.—Ed.]
